The printing frame for use in the making of sun prints consists of a rectangular frame, or box, as shown in Fig. 1, on one side of which is fixed a pane of clear plate glass, a. The tracing is then laid in the frame against the glass, as shown at h, and the printing paper next, as shown at c. A felt pad, d, is then spread over the back of the paper, and the wooden backing, e, is put in, to hold the paper and tracing against the glass. The arms, f, are then turned down, and the springs, g, pressing against the cleat, h, keep everything tight in place, while the

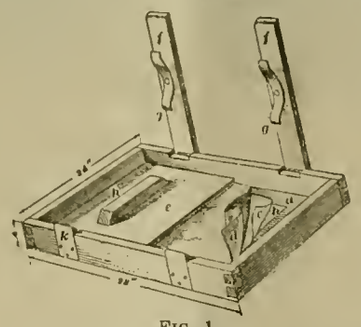

FIG. 1.

catches, k, hold the arms down. The frame is then turned over, and so placed that the sun may shine through the glass and tracing onto the printing paper.

The backing is usually made in two or more pieces, as shown, in order that the frame may be partially opened and the progress of the printing examined, while one of the arms is still clamped down and secures the end of the tracing and paper from slipping. If the print is then found to be insufficiently printed, the back may be replaced and the exposure continued.

When the printing frames are large and not easily handled, it is customary to build a track out through a window, as shown in Fig. 2. The frame is then

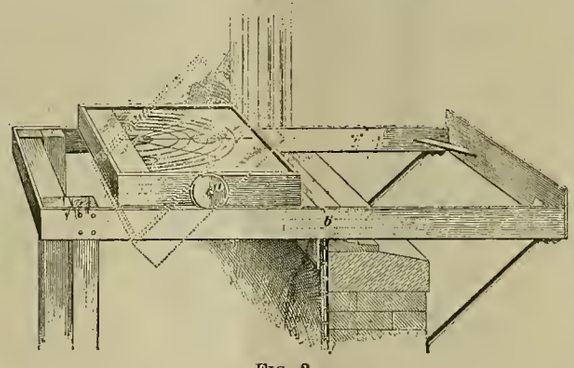

FIG. 2.

provided on each side with a flangewheel, a, for running on the track, h. When the frame is taken in to remove the print, or to put in a new tracing, it is simply turned over on the wheels, as shown by the dotted lines. The back is removed, the tracing and paper adjusted, and the back replaced. The frame is then turned glass side up, pushed on the track, and left in the sun till the printing is completed.

Next in simplicity to the ordinary blueprint process is the blueline process, whereby the reproduction shows in clear blue lines on a perfectly white ground.

The paper is coated with the following solution:

Gum arabic, grains	385
Perchloride of iron, grains	123
Tartaric acid, grains	62
Sodium chloride, grains	46
Water, ounces	3½

When dry, the paper is exposed under a tracing, as in the previously described process, and, when sufficiently printed, is immersed in a saturated solution of ferrocyanide of potassium until the lines are fully developed. It is then rinsed in a dilute solution of hydrochloric acid to remove any yellow stains due to the ferrocyanide, and is finally washed in water.

Alterations in the finished print may be made with an ordinary pen and a rather thickly ground solution of Prussian blue water color. Existing lines may be removed with the soda solution previously described.

The processes for printing black lines on a white ground are numerous, but somewhat complicated. One of the earliest forms consisted of a process of double printing, and, though more complex and expensive than later methods, it gives results that leave nothing to be desired.

A sheet of thin but close-grained paper is immersed for half a minute in a solution of common table salt and then dried; it is then brushed over with a solution of ten grains of nitrate of silver in one ounce of water, and again dried. The paper is then exposed under the tracing and printed until the lines just commence to change color, while the ground becomes a deep bronze color. The print is then soaked for ten minutes in a solution of one ounce of hyposulphite of soda to ten ounces of water, and afterwards well washed in water and dried. When dry, the print is rubbed over with sweet oil, to render it transparent, and is then put in the printing frame in the place formerly occupied by the tracing. A new print is now made under the oiled copy, and this second print is soaked in the soda solution and washed in water, the same as the first one. The result is a clear white ground, on which the lines of the drawing are duplicated in a deep bronze black, equal in every respect to an inked drawing. Any number of prints can be made through the oiled copy; but the process is so troublesome, and takes so much time, that it never found much favor except for special work and small sizes of drawings.

A paper for direct printing of black lines on a white ground may be prepared as follows: In nine ounces of water dissolve

	Drams.
Gelatine	3
Perchloride of iron solution	.6
Tartaric acid	3
Ferric sulphate of iron	3

Apply two coats of this solution to the surface of a heavy sized paper, allowing each coat to dry thoroughly. Print as usual, under a tracing having somewhat heavy and well defined lines, and develop the print in a solution consisting of six drams of gallic acid dissolved in thirty-two ounces of water and six and one-half ounces of alcohol. The lines will appear strong and of a deep purple-black color, and the ground will assume a cream tint, afterwards changing to pale gray. The print should then be washed in several changes of water and hung up to dry. Additional lines on this form of print can be made with ordinary drawing ink; existing lines can be removed only by carefully rubbing with an ink eraser.

The quality of any print produced by the agency of sunlight is dependent very largely upon the tracing from which it is made. The lines of the original should be strong and of an even density, and the ink used should be absolutely opaque.

The best results are obtained when the ink with which the tracing is made is mixed with a small quantity of thickly ground chrome-yellow water color. If the color refuses to mix freely with the ink medium, a drop of ox-gall will clear it and cause it to flow more freely—though too much gall will give it a tendency to blot.

Regardless of the numerous disadvantages, nearly all mechanical drawings of the present day are reproduced by some one or other of the sun-printing processes. There is, however, an increasing tendency among users—architects particularly—to adopt the more recent method of printing by means of mechanical transfer. This consists of making duplicate copies of an inked drawing or tracing by placing it in contact with some prepared surface that will absorb a portion of the inked lines and afterward transfer them to other sheets.

The disadvantage lies in the fact that the ink necessary for the purpose must be colored with an aniline dye, thus becoming very difficult to handle and dirty to use. It has a corresponding advantage, however, inasmuch as different parts of a drawing can be made with different colored inks, and the copy will show these color relations.

The materials necessary for the transfer process may be prepared as follows: Soak four ounces of white glue in five ounces of water and three ounces of strong aqua ammonia. When the glue is soft, warm the solution, by setting the vessel containing it in a pan or pail containing boiling water. When the glue is dissolved, add three ounces of granulated sugar and eight ounces of gelatine; then let it come to the boiling point until the whole becomes liquid. While still hot, paint the solution on sheets of heavy white blotting paper until the latter is thoroughly saturated; then lay them away to dry for two or three days.

When ready for use, slightly moisten the surface of a sheet with a sponge dipped in cold water, and lay the drawing or tracing (which has been executed with the prepared inks already described) over the pad so that every part of the inked lines comes in contact with the sheet. Rub the drawing on the back into close contact with the prepared blotter, and after two or three minutes carefully remove it. Sheets of plain white paper laid over the pad and gently rubbed into contact will receive a complete impression nearly as clear as the original; from six to ten copies may be thus obtained from a single impression. After use, the pad should be laid aside for twenty-four hours.

The inks required for these pads may be mixed as follows:

Black ink: Aniline black, 1 ounce; water, 14 ounces; glycerine, 4 ounces.

Blue ink: Aniline blue, 1 ounce; hot water, 7 ounces.

Add when cool: Spirits of wine, 1 ounce; glycerine, one-fourth ounce; ether, 10 minims.; carbolic acid, 1 minim.

Red, violet or green ink may be prepared by substituting the desired color of aniline for the one mentioned above.

Modern Methods in Ore Treatment by Cyanidation.*

NUMBER III.—CONCLUDED.

Written by EDWIN O. WATT.

Experiments made with unroasted sulpho-telluride ore and potassium cyanide solutions did not give an extraction equal in any case to 60% of the gold contents. The results, however, proved so satisfactory that it was decided to continue to work the process.

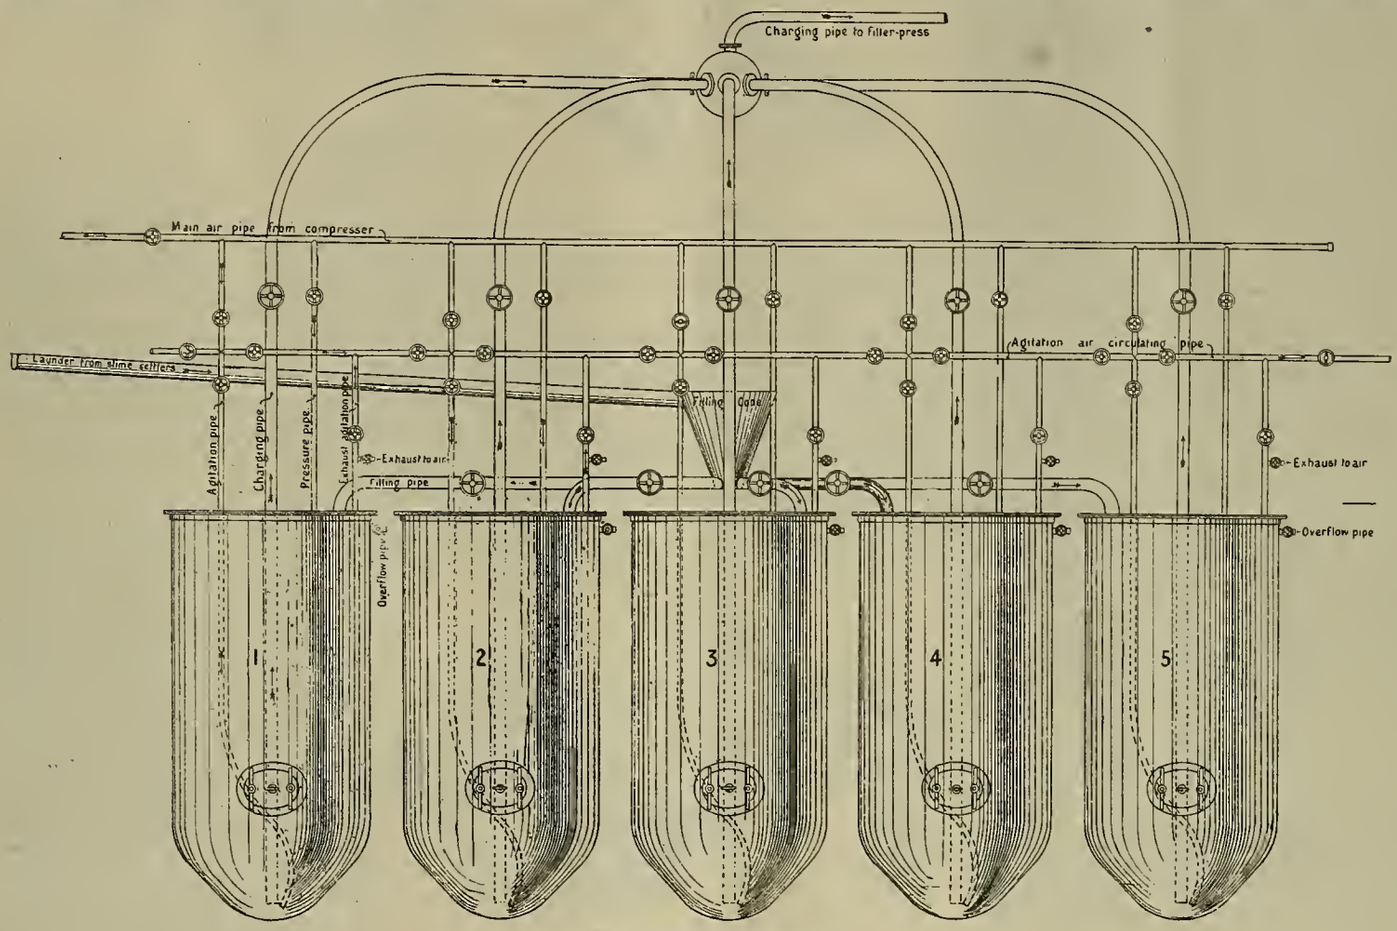

Fig. 8 —Pneumatic Agitators.

The exhausting air smelt so strongly of cyanogen that it was realized that a still greater saving of cyanide might be effected hy passing the air through a series of pressure tanks, instead of allowing it to exhaust direct through the atmosphere. On the treatment works there were only two pressure tanks and it was decided to install a set of five, using the same stream of air for the series. Some alterations were made in the design of the pressure tanks, and the necessary pipes were attached to convey the air in a continuous stream through the pulp in each tank. The accompanying diagram (Fig. 8) shows the arrangement by which the combined pneumatic agitators and filter press pressure tanks are heing worked at present on the Kalgurli mine. For the sake of clearness of illustration the set is shown in a straight line, hut they are really heing worked in a circular pit, as shown in the smaller diagram (Fig. 9). The plan of the top of the tank is shown in Fig. 10. Each agitator is 6 feet 6 inches in diameter and 13 feet 6 inches deep, and is usually charged with about 6 tons of slime in a cyanide solution of 0.10% of available potassium cyanide. After agitating for three hours the circulating air is shut off and the high pressure air is turned onto the top of the pulp. This drives the slime up the filter press charging pipe into filter presses, where, as previously explained, the auriferous cyanide solutions are recovered from the pulp. After discharging the slime from the agitators the tank remains full of compressed air at a pressure of about 30 pounds per square inch. Instead of being allowed to hlow into the atmosphere, as is usual under these circumstances, the air is used for discharging another agitator, or is allowed to circulate for agitation until it falls helow the pressure required for that purpose. The air pressure required to agitate one agitator is ahout 3½ pounds per square inch, and for five agitators about 22 pounds, hut this pressure varies slightly, according to the consistency of the pulp. For charging filter presses it is not convenient to work with an air pressure much under 30 pounds per square inch, for, although it was found that a pressure of 10 pounds would charge a 5-ton filter press full, it took nearly an hour to do it, whereas a pressure of 30 pounds per square inch will charge a 5-ton press in ten minutes. An experiment made with the present set of five pneumatic agitators may prove of interest to metallurgists. The agitators were charged with, approximately, 6 tons of ordinary slime in a solution of 0.10% of availahle potassium cyanide and the usual stream of air was passed through for three hours. A sample of the solution was then taken from each agitator. No. 1 agitator, which first received the air, indicated .060%, No. 2 .100%, No. 3 .115%, No. 4 .115%, and No. 5, from which the air exhausted into the atmosphere, .060% of availahle potassium cyanide.

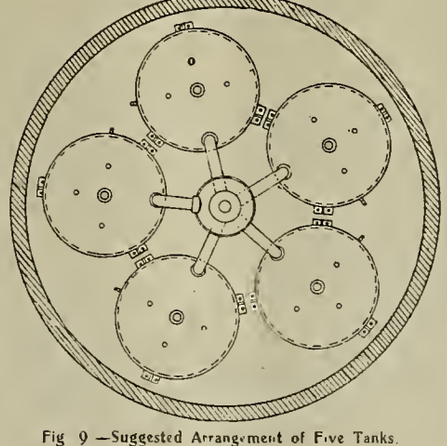

Fig 9 —Suggested Arrangement of Five Tanks.

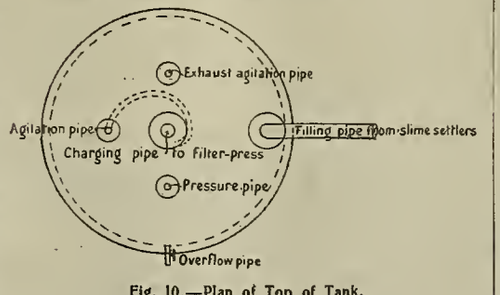

Fig. 10.—Plan of Top of Tank.

This experiment showed that in two of the series there was an actual increase in the amount of cyanogen in the solution, due to the volatile cyanogen passing over from the preceding agitators. The results of this experiment have been confirmed by other tests made on the Kalgurli mine and hy lahoratory tests made on other mines on the fields. When the Kalgurli mine agitated the slimes by mechanical stirrers for twenty-four hours it cost about 2½ pounds of potassium cyanide per ton to ohtain a good extraction. With the present pneumatic agitators the consumption of potassium cyanide has fallen to about 1 pound per ton, and the extractions are hetter.

The composition of the ore is practically the same and the consumption of potassium cyanide on the separated sands has not varied. While I am of the opinion that the introduction of compressed air to the pulp in this way is heneficial in consequence of the fact that it oxygenates the cyanide solutions, I think that the beneficial action is more largely due to mechanical than to chemical causes, as instanced hy the great attrition that takes place hy the ore particles ruhhing against each other, especially when these particles are not already in a very fine state of division. By reference to the diagram it will be seen that the agitation pipe is peculiarly hent, so as to give a violent rotary movement to the pulp.

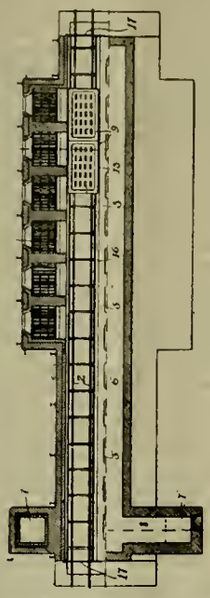
This, combined with the action caused hy the surging of the air through the material, causes the particles to rub heavily against each other. The larger particles are thus worn away and the gold is cleaned and burnished, and thus rendered readily amenahle to dissolution in cyanide solutions. This process of agitation has now heen at work on the Kalgurli mine for ten months and has heen subjected to severe tests and has not failed. Its originality consists only in the method hy which the air is admitted and used. The numher of pipes and valves over the agitators appear at first glance somewhat complicated, hut in actual practice it has not heen found to he so, and the management have not experienced any difficulty in getting the attendants to understand the arrangements after a few minutes' explanation. No time has heen lost by any fault of the arrangement, and no part of the plant has shown any perceptihle wear.

Coal Miners' Wages in Bohemia.

The wages paid in the coal districts of Bohemia, per nine-hour shift, are as follows:

Class.	Wages—Crowns.	Wages—Value.
Pick men	5.00	$1 02
Carpenters	3.60	73
Engine men	3.40	69
Other men working in pits	4.00	81
Overseers	4.50	91
Workmen at pit's mouth	3.50	71
Boys	2.00	41
Women	1.55	31

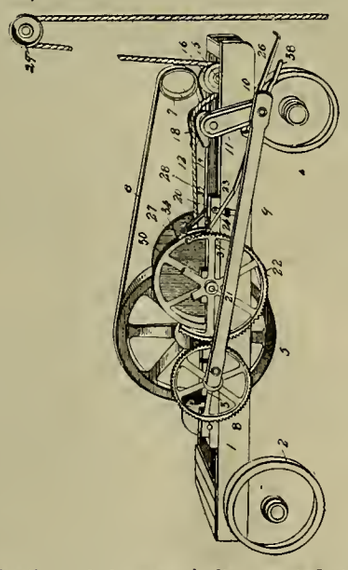
The pick men are paid by the joh; all others are paid hy the day. The labor day of all miners is nine hours, including the going in and out. The men at the pit's mouth work twelve hours, with two hours' rest at midday.



* Trans. Australian Inst. Min. Engrs. (Condensed.)

Mining and Metallurgical Patents.

PATENTS ISSUED AUGUST 25, 1903.

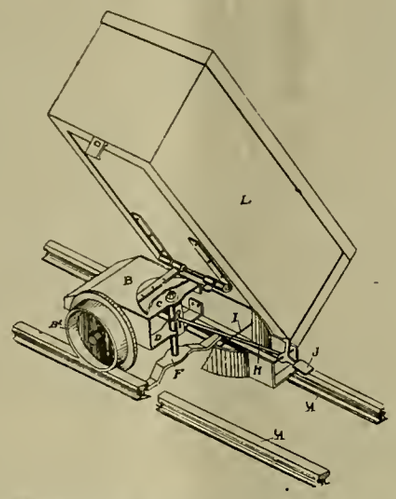


Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ROASTING FURNACE.—No. 736,929; E. C. Brice, Colwyn, Pa.

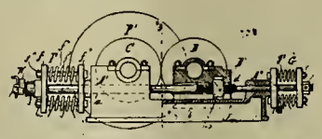
Roasting furnace comprising tunnel, trackway therein, fireboxes communicating with upper part of tunnel, and passageways communicating between latter and smokestack, in combination with series of cars on trackway having receptacle of refractory material, sides of receptacles having openings therethrough, bottom portion thereof having lateral passageways, vertical passageways communicating therewith, sides of receptacles adjacent to fireboxes extending close to roof of tunnel.

OIL DRILLING MACHINE.—No. 736,993; D. A. Messner, Akron, O.



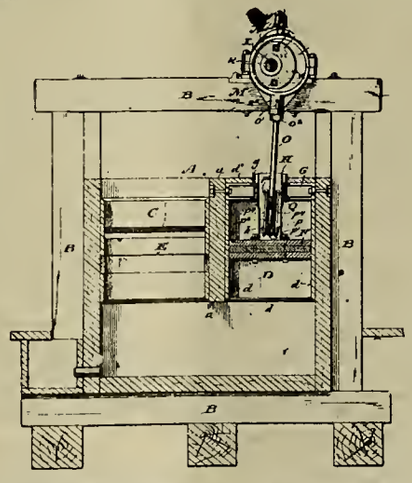
Combination of frame, shaft mounted therein, means for driving shaft, gearwheel on one end of shaft, pitman having one end connected with gearwheel, shaft parallel with driving shaft, crank arm secured thereto connected to other end of pitman, arm secured to last-mentioned shaft, guide pulley carried by free end of arm, angle lever, link pivotally connected with short arm of lever, lever pivotally connected with opposite end of link, movably mounted bearing box, shaft mounted therein, drum carried by shaft, rigid rope guide secured to frame, in alinement with guide pulley, rope or cable passing round guide pulley supported upon guide adapted to be raised and lowered by rocking of pulley.

TREATING REFRACTORY ORES.—No. 737,059; A. M. Beam, Denver, Colo.



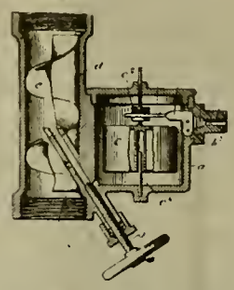
Pulverizing the ore, subjecting it, in connection with suitable oxidizing flux or reagent mixed therewith, in closed oven or muffle, to action of low degree of indirect heat while air is excluded for short time, until sulphides of base metals are partially converted into sulphates, so that air may be afterward admitted without burning sulphur or causing cementation or coating of ore particles with sulphur or other residuum; admitting air to ore in muffle, completing conversion of sulphides of base metals into sulphates and releasing gold or precious metals to free or amalgamating condition by subjecting ore for further short time to low degree of indirect heat.

DEVICE FOR LOCKING ORE CARS TO TRACKS.—No. 737,006; G. G. Newcomb, Denver, Colo.



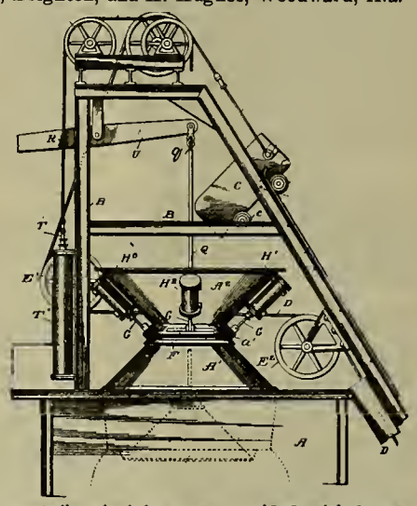
In device for locking cars to rails or track, combination, comprising supporting bars C and D secured to truck B; inserted through circular aperture C′, swinging in elongated aperture D′ in hollow cylindrical mandrel E which is provided with spiral slot E^2, secured to lower end crossbar F, mandrel G inserted into mandrel E, secured to it pin E^3 extended outward through spiral slot E^2 into adjusting rod H pivoted upon rod I, adjusting rod extending outward under trip finger J being held in desired position by means of coiled spring.

CRUSHING ROLLS.—No. 737,130; C. W. McArthur & F. Cazin, Denver, Colo.



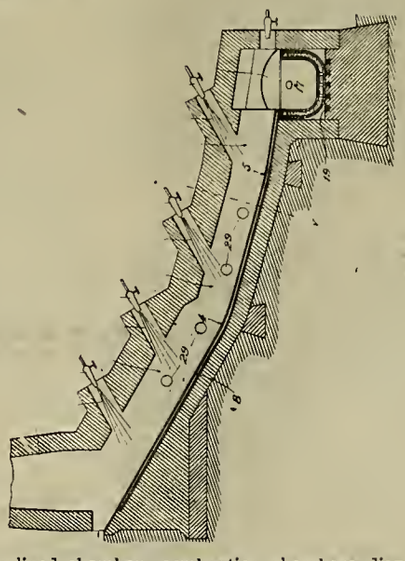
Combination with bed or frame and fixed movable bearings, rolls journaled therein, adjusting rods extending longitudinally through portions of bed or frame in threaded engagement between ends with movable bearings to adjust them with relation to stationary bearings, spring mechanisms at one end of rods to permit movable bearing and its roll to yield and return same to normal position, cushioning mechanism between frame and opposite ends of rods to cushion their return movement.

ORE JIGGER.—No. 737,264; E. J. Muller, Butte, Mont.



In ore jigger combination with tank separated by partition into compartments which communicate with each other below partition, and horizontally disposed screen vertically movable plunger arranged in compartments on opposite sides of partition, guide arranged in upper part of compartment containing plunger, hollow trunk attached to and extending upwardly from plunger into opening in guide in which it is adapted to reciprocate, driving shaft extending horizontally over tank and provided above plunger trunk with eccentric and strap, rod attached at upper end to strap provided at lower end with box pivoted on cross pin in lower part of trunk, box composed of two parts, one formed with socket in which lower end of rod is secured, the other connected by bolts with cross head loosely mounted on rod, and spring interposed between upper box member and cross head.

VAPORIZER FOR EXPLOSIVE ENGINES.—No. 737,463; C. F. Pearson, Chicago, Ill.



Vaporizer comprising walls forming air passage, spiral partition placed in passage to give air spiral movement, oil supply nozzle projected diagonally into air passage discharging into spiral partition, oil receptacle communicating with nozzle, valve controlling oil flow through nozzle, valve controlling admission of oil into oil receptacle, float actuating latter valve.

METALLURGICAL FURNACE.—No. 737,519; S. Stewart, Brighton, and H. Hughes, Woodward, Ala.

A metallurgical furnace provided with hopper at upper end, combination with frame mounted above furnace, inclined track having curved end carried by frame, car provided with four wheels traveling on track, hoisting rope or chain secured to rear end of car adapted to allow front end of car to swing down when it passes over curved end of track, bell normally closing top of furnace, sliding gates constituting gas seal mounted above bell, cylinder for each gate, piston rods and pistons for operating gates, valve and pipes for simultaneously admitting fluid pressure to all cylinders.

SMELTING FURNACE.—No. 737,487; E. Riveroll, Los Angeles, Cal.

Inclined chamber, combustion chambers disposed along inclined chambers communicating therewith, a floor of varying pitch, liquid fuel burners discharging through combustion chambers, toward floor of inclined chamber.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

J. MacDonald, superintendent of the Treadwell mines, says the Alaska-Treadwell G. M. Co. has bought all the Berners bay mines heretofore owned by the Nowells, including the Johnson, Eureka and Kensington lodes. They will be developed and machinery put in.

The shortage of workmen continues, so that the large mines of southeastern Alaska are unable to secure sufficient labor, though they pay high wages. The Treadwell mines can't get 500 men for Douglas island and in opening up the Berners Bay mines, which the company has bought. The closing of many Klondike mines last month because of a water shortage has led Superintendent McDonald, of the Treadwell mines, to announce that his company will employ outcoming miners to the number of 500, guaranteeing them steady work.

ARIZONA.

COCHISE COUNTY.

The Solomon Springs C. Co.'s mine has been bought by Eastern men for $500,000. The property is 5 miles southeast of Bisbee and consists of sixteen claims. The Houghton Dev. Co. has been organized to work and develop the property, and its directors are G. Pope, R. R. Goodell, J. H. Rice, F. G. Coggin, G. C. Lawton, of Houghton, Mich.; S. Kaufman of Marquette, Mich., and G. G. Barnum of Duluth, Minn. G. C. Lawton is superintendent and has started development work.

The Junction Dev. Co. of Bisbee report putting in an additional steam pump.

GRAHAM COUNTY.

The Shannon Co., near Clifton, is reducing 450 tons of copper ore per day. A tunnel has been run on the property and a new body of ore uncovered in the Carter, the deepest mine of their group.

MARICOPA COUNTY.

(Special Correspondence).—It is reported that La Gloria M. Co. will erect a smelter on their property in the White Tank mountains this fall.

J. M. Swetnam of Phœnix is interested in a number of claims near the Horton mine, 30 miles northwest of Phœnix, on which he says work will begin.

Phœnix, Aug. 28.

The Angel mine, west of Wickenburg, has resumed operations, says S. C. Bird of Bridgeport, Conn., manager. There is considerable ore on the dump which will be treated at the Wickenburg smelter.

Owing to the miner's union attempting to dictate to the owners of the Socorro mines, near Wickenburg, these mines are reported closed down, throwing eighty men out of work.

MOHAVE COUNTY.

M. P. Gilbert, manager of the Leland group of mines, near Kingman, says their 40-stamp mill is expected to be ready for operation by Oct. 1st. The ore runs $8 per ton in gold, and a cyanide plant will handle the tailings.

PIMA COUNTY.

The Twin Buttes copper mines, in San Xavier mining district, have been sold to the Twin Buttes M. & S. Co., with D. S. Rose of Minneapolis, Minn., president.

PINAL COUNTY.

(Special Correspondence) — The Pinal Paraffine Oil Co. will be ready next week to put the casing in their well; then drilling will be resumed. The well is down to a depth of 1217 feet.

Florence, Aug. 28.

YAVAPAI COUNTY.

The Model M. Co. at McCabe report construction work on the mill nearing completion. In addition, a shaft house is being built. A tramway will connect them.

Superintendent J. K. Truman of the Climax mine, near Prescott, says they have seven shafts on this property, with favorable prospects. The 10-stamp mill has been remodeled and two more concentrators and several cyaniding tanks added. A tramway is also being built.

The work of overhauling the 10-stamp mill and the cyanide plant at the mines of the Climax G. M. Co., at Quartz mountain, near Prescott, is progressing; additional concentrating tables are being put in.——The Mark Twain mine is reported showing 12 feet of ore. They are shipping to the smelter.

A strike is reported in the mines of the Eureka G. & C. M Co., near Jerome. The main tunnel cut a body of ore which assayed $20 per ton, principally in gold. The vein is of quartz.

YUMA COUNTY.

S. W. Pease, who has been drilling for artesian water, reports having struck oil last week at depth of 400 feet in a well he was sinking at the Choyas, a placer camp 6 miles from Quartzsite. The capacity of the rig is 1200 feet and the well will be put down to the limit to further test the ground.

ARKANSAS.

MARION COUNTY.

(Special Correspondence).—The Morning Star, Beulah and White Eagle mines are hauling their ore 10 miles to Buffalo City and shipping to the smelter at Ioia, Kansas.——Hickman Bros., who have been prospecting their land on Jimmies creek with a diamond drill, have gone through a 45-foot run of zinc.

This week Manager R. Harding, of the Missouri Pacific-Iron Mountain system, inspected the work through Boone and Marion counties and was much pleased with its progress.

The Olympia expects to resume operations at their shaft Oct. 1.——Last week, by a $6 blast at the Morning Star mine, enough ore-bearing rock was broken down from the hillside to keep the mill running for two weeks.

The Iron Mountain railway is now operating to Cotter, on the east border of Marion county. Thousands of men are employed on the line from Cotter to the Missouri State line. Some heavy work is encountered near the crossing of the State line, the cost of construction of 9 miles there being at the rate of $125,000 per mile. Jack is being found all along the line where the heavy work is being done.——The new core drill ordered by Dr. Wells and R. J. Williams has arrived. This drill was built under special plans furnished by Wells.

Yellville, Aug. 26.

The White River Zinc M. Co. has been incorporated, with G. L. Mallory of Little Rock as president, to operate near Yellville.

Work has been resumed on the shaft of the Appleton mine, near Yellville, owned by Winfield men.—— Work will be resumed on the Bald Hill mine by Estes Bros.

Superintendent Richards of the McIntosh mine, near Yellville, says he has completed shipment of ore for the present. The mine will be started up this month and operation be made regular now that the ore can be sent to the market.——The Zinc Belt Mineral Co. has been incorporated by A. L. Tuttle, D. J. Hyden, J. W. Buckingham, W. R. Lorton, B. T. Buffington, E. C. Waidren and I. L. Reaves.——Drift No. 1, at the Ioia Con. mine, near Yellville, has extended 40 feet into the ore body. A concentrating plant is to be built.

CALIFORNIA.

AMADOR COUNTY.

After working a few days on the Butte basin gravel claim, near Jackson, operations were suspended on account of the flow of water being too heavy for the pumps to handle.

At the Argonaut mine, at Jackson, supplies are being received and preparations made to resume operations, says the Amador Ledger. Whether it will commence operations when it gets in condition to do so will depend entirely on the labor outlook at that time.

CALAVERAS COUNTY.

D. Palmer has taken over the Lava Bed mine, at Railroad Flat, and will begin development work next week.

At the Forty-nine mine, at Douglas Flat, work is progressing and the gravel bed is expected to be reached this month.

At the Rose Rock mine, north of Murphys, a heavier engine has replaced the one formerly in use.

Williams Bros. report work progressing at their Napoleon mine, at Telegraph, near San Andreas. They have the shaft retimbered and in working order, and they are running crosscuts and sinking winzes.——Raymond & White of San Francisco have a lease on the Colver mine. They have the shaft retimbered and are hoisting out the water.——The directors of the Rosella mine have decided to build a mill this fall.

The Golden Leaf mine, worked by Mobley Bros., at Telegraph, is progressing. They have 1000 feet of underground work done and are making a raise for an air shaft. They will start their mill next week.

EL DORADO COUNTY.

(Special Correspondence).—J. A. Parker of Oakland has bonded Mrs. F. Silvia's property in Georgetown; also B. Wooley's ranch. This ranch covers the greater part of the once famous drift mines, Mamaluke hill, that has produced thousands in placer gold, said to be for a stock company for quartz mining. A 30-foot shaft is about all the development on this property. There a good many rumors of buying, bonding, etc., but no work toward development yet.

Georgetown, Sept. 1.

The Ancient Channel M. Co. of Latrobe is putting in machinery for the mine and will increase development work.

It is reported operations on the Greek mine, near El Dorado, were resumed last week and that development work will be increased.

KERN COUNTY.

The Kopje Oil Co. of Waterman Bros. et al is reported preparing to resume operations on its land at Kern river, near Bakersfield, which has been leased for several years to the Naught Five Co. The property adjoins the lands of the Faicom, Kern Oil & Dev. and Provident.

The Yellow Aster mine, at Randsburg, resumed Aug. 31st with thirty men, and more will be put on this week. The sheriff and his deputies are protecting the employes by armed guards, who accompany the men to and from work. A few of the former men have returned to work.

The Flamioflume M. Co. put on fifteen more men at its mine in Jaw Bone canyon, near Mojave, last week.——The Echo and Karma mills at Mojave are having considerable trouble at present on account of lack of water, says the Randsburg Miner.

The Pyramid M. Co., near Randsburg, continues opening up its ground. The drift being run on the 120-foot level is in 50 feet and in ore.

M. P. Gilbert of Kingman, Ariz., reports taking an option on a group of goid-bearing claims near Mojave.

NEVADA COUNTY.

On San Juan Ridge, near Nevada City, R. I. Thomas, manager, a company of San Francisco men reports operations begun on the Shady Creek placer mine. The plant to be put in will consist of a 10-inch dredging pump, capable of handling 2400 cubic yards daily; 100 H. P. will be used, and obtained from water under a 300-foot head. During the winter season the tailings that cover the older creek gravels to a depth of 15 feet will be stripped and the bottom gravels worked during the summer months.

The 10-stamp mill at the Posey mine, near Grass Valley, began crushing ore last week, says W. H. Bray, manager of the Posey and Huron mines.

Manager C. A. Pusheck of the Mountain Maid mine, near Grass Valley, says operations will be resumed at the mine and developments increased.

At the Sixteen to One mine, near the Spanish, above Washington, good results are reported being obtained with the Huntington mill in use, such as to lead the Sacramento men owning the property to consider building a 20-stamp mill.

The Grass Valley Morning Union reports the Gold Blossom mine near Grass Valley sold to C. A. Mau of San Francisco, F. C. Eldred of Toledo, Ohio, and J. E. Poignd estre of Grass Valley, who will incorporate the California-Ohio Mines Dev. Co. to operate it. The mine is on Union hill, ½ mile southeast from the Idaho-Maryland mine. Two tunnels have been run, the upper one being in 250 feet. The second one was started 90 feet lower and struck a new ledge, which has been uncovered for 300 feet. The ledges are about 20 inches in width. Machinery will be put in and a shaft sunk.

PLACER COUNTY.

Superintendent F. P. Jackson of the gold dredging plant operating on the North Fork of the American river, near Iowa Hill, reports work going ahead satisfactorily.

SAN MATEO COUNTY.

J. E. Kerr of San Francisco has drilled a number of wells at Half Moon Bay and is building another derrick. He intends drilling several shallow wells.

The Paxton Oil Co., at Half Moon Bay, will resume work this month, having been closed down for six weeks waiting for pipe. There is 200 feet of oil in their well.

SANTA BARBARA COUNTY.

The Pinal Oil Co., near Santa Maria, reports its pipe line in working order, and shipping of oil to San Francisco via the Pacific Coast railroad will begin. A number of tanks have been put up at Graciosa station.

SHASTA COUNTY.

At Keswick, furnace No. 3 of the Mountain C. Co. was blown in last week. This enlarges the working force at the smelter by sixty men to the shift. The number of men at the smelter will be increased from time to time as the tonnage is increased, and it is expected all the furnaces will be running this fall and the converters turning out double the amount of metal at present obtained.

C. S. Osborne, superintendent of the Shasta May Blossom mine, north of De Lamar, says preparations are being made to put in additional machinery, including an engine and compressor and a diamond drill for development work.

SIERRA COUNTY.

Near Alleghany, at Kanaka creek, D. Burger, manager of an Eastern company, says he is preparing to work the bed of Kanaka creek and has put fifteen men to work.

SISKIYOU COUNTY.

C. H. Bennett, for an English company, has taken an option on the Blue Ledge copper claims, in Applegate district, near the Oregon line and south of Ashland, Or.

Cameron & Son are developing a prospect in Quartz valley, near Yreka, near the Shores mine ——Work has been resumed at the McKean mine, near Callahans, with further development in extending No. 1 tunnel, and also making a station for hoisting machinery.——The Carlock & Morrison quartz mine, in Quartz valley, is being worked.

Manager Brokaw has men at work sinking a shaft on the Golden Eagle quartz mine at Indian creek, near Yreka.

TRINITY COUNTY.

Five more stamps are being added to the Dorleska mill at Dorleska. The main ore chute of the Dorleska is 17 feet wide and carries values in gold. The five stamps of the mill and a Huntington crusher are in full operation.

A number of Trinity county mines are shipping ore to Keswick, Shasta county, taking advantage of the custom smelting being done by the Mountain C. Co.'s smelter. These quartzose gold ores are desired as a flux at the smelter.

M. Rose reports opening a ledge of galena on his mine on Deakin gulch, in Coffee creek section, near Trinity Center. The ledge is 8 feet in width at the surface and was uncovered by sluicing the sidehill with water under pressure. Rose will develop the prospect.

J. C. Hyle and O. J. Hepburn of Philadelphia, Pa., of the Last Chance M. Co. have made arrangements to resume control of the Paulsen mines on Trinity river, near Weaverville. The Grass Valley water will be carried across the Trinity to Union hill and that placer property worked. The company will be reorganized.

TUOLUMNE COUNTY.

Superintendent G. Stayton reports a strike of gold ore at the Willietta quartz mine, 4 miles from Chinese, on the Tuolumne river. In driving a crosscut from an old tunnel, they struck a body of ore showing free gold.

The Big Creek G. M. Co., composed of Maine men, is operating 5 miles east of Groveland. Superintendent Watson says he has men at work on the Justice and also on the Katahdin.

At the Rawhide mine, near Jamestown, forty stamps are dropping in the mill.

At the Bell mine, near Tuttletown, a station has been cut at the 500-foot level, and sinking to the 600-foot point is progressing.

At the Mount Jefferson mine, at Groveland, the mill is running steadily on ore from the stopes and drifts on the 300, 400 and 500-foot levels.

Superintendent H. Argall has overhauled the pump and other machinery at the Cosmopollte mine, near Groveland, and expects to resume this month.

COLORADO.

(Special Correspondence).—With silver at 60 cents, a large number of mines which have been idle for a number of years would doubtless start up. With the advance it has already made, it will mean much to mines already producing silver.——The feeling all over the State seems to be to strike. In places they do not seem to have any special grievance—simply want to strike. In places it will be a question as to who can stand it the longest without work before the strike is settled—employe or employer. In other places it is a question as to who shall be the dictator—the man who puts in his time, money and brains (the man who risks everything), or the walking delegate or agitator, who has nothing to lose and everything to gain. At Idaho Springs the union seems ready to settle; but the operators, before taking them back, want them to agree not to go out on strike at the demands of the union.

Denver, Sept. 1.

BOULDER COUNTY.

A deposit of high-grade mica, of sufficient quantity and quality to pay for shipping, is reported found by J. Bruner and W. J. Korf, of Eldora. It is one of the spurs of the Snowy Range, known as Beach mountain, 9 miles southwest of Eldora. It averages squares of 3½x6 inches.

CLEAR CREEK COUNTY.

At Lawson work is progressing on the Commodore mine, and at the Princess of India tunnel, on the opposite side of the creek, which will take on more men this month. The Joe Reynolds tunnel is nearing the main shaft and continues a steady shipper. J. F. Standish is sinking on the

Last Chance and has discontinued tunnel driving for the present. R. C. Vidler of Georgetown continues the work for the East Red Elephant Co., which will operate on the same mountain as the Commodore.

A 40 H. P. steam hoist has been placed on the Gomer mine, near Georgetown, in place of a 12 H. P. gasoline plant. The Gomer M. Co. is operating up Spring gulch.

CHAFFEE COUNTY.

A strike of silver ore is reported in the 800-foot tunnel on the Eureka mine near Cottonwood lake, 12 miles west of Buena Vista, by Superintendent A. Closs.

CUSTER COUNTY.

The lessees of the Louella mine, near Silver Cliff, report opening a body of ore that runs 15% copper, 75 ounces of silver and some gold. The ore was opened at 150 feet depth. It is intended to sink the shaft to 250 feet, when regular shipments will begin. A lead carrying chloride of silver, which also shows gold and copper, has been opened near the King of the Carbonates mine by J. W. Preston and Prof. Ray.

EL PASO COUNTY.

The Telluride R. Co. has sold to the General Metals Co. of New York the Telluride mill at Colorado City, and the latter company will acquire the right to use the bromine process at all of its plants to be erected, paying royalty for such use to the Telluride R. Co, says the Mining Record. C. E. Finney, of New York, is manager of the General Metals Co., which has been organized to engage in the business of extracting gold from ores by the bromine process, and will build for the purpose a number of reduction mills throughout the North and South American countries. C. D. Grove will continue as superintendent of the Telluride mill.

The union men are out on a strike at the Telluride mill, in Colorado City, and Manager Fullerton states that no attempt will be made to resume operations until the Cripple Creek strike is ended. Fullerton refused to accede to the demands of the union that W. Keene be permanently discharged.

FREMONT COUNTY.

Work is progressing at the coal mine being opened near Williamsburg by S. Smith. A trestle has been built. A long slope is being driven to cut the coal measure, and will be completed by October 1.

A considerable tonnage of lime rock is going to the steel works at Pueblo from the Colorado Fuel & Iron Co.'s new lime rock quarries at Howard. It is said the company expects to be shipping from 100 to 150 carloads of lime rock from the quarry daily by October 1.

The ore at the Union mill at Florence having been run through, the mill has closed down till such time as the striking miners return to work. In the meantime the machinery will be overhauled and be put in repair. It is reported that the mill trust will dismantle the Metallic mill and remove it to the De Lamar-Wall group of mines in Utah. Some of the machinery was taken to Canyon City, to be used in reconstruction of the Canyon City smelter. It is also reported that the company will also remove its National mill south of Florence. The Dorcas mill is still running.

GUNNISON COUNTY.

The Eureka M. Co., near Crested Butte, has begun producing zinc-lead ore from the Garfield, one of its group of claims, and a jack train will deliver the ore from the mine to the concentrator.

HINSDALE COUNTY.

W. F. Butler has a bond and lease on the M. G. group in Horseshoe basin, near Lake City, and has put men to work there.

Machinery for the Hanna M. Co.'s mill at Capitol is on the ground and is being set up.

LAKE COUNTY.

The tonnage of Leadville district is holding up and shipments are averaging 2500 to 2750 tons a day from all classes of ores, says the Times. Cars are not plentiful. The production is well scattered over both the silver-lead and gold belts. Diamond drill operations in the "downtown" section continue with satisfactory results. The work with the diamond drill on the gold belt has also been successful, and the deepening of shafts of the Ibex, the Monarch and others, and the sinking of new deep shafts will be done, some of which is already under way. The zinc tonnage, which ten years ago was nil, now ranges to 8000 tons a month. The closing down of the smelters in Denver has been felt to some extent, but the plants at Leadville and at Salida are running full blast. If the Denver plants were going, it is expected the output of the district would run up to 3000 tons a day.

Operations continue at the Sharp placer mines, near Leadville, and development is being increased. The ditch water brought in to wash out the gravel in sluice boxes is turned into a large tank, from which it is pumped out and piped up to the embankment to be played on the gravel and wash it down. The plan of hauling the gravel out in cars and dumping it in a sluice was found too expensive and slow.——Owers & Co. of Idaho Springs have made arrangements to put down a drill hole near the Sharp placer operations and prospect the formations. One-half mile east of them, at the Homer mine ground, the work of prospecting has been renewed. Manager H. I. Higgins proposes to sink his shaft deeper.

Arrangements have been made to start up the Buckeye mine on Fryer hill, Leadville, this week. This is an iron proposition.——R. B. Estey and T. D. Kyle, who have the lease on the Fitzhugh group, expect to be shipping ore this month from the sulphide bodies which have been idle for several years. At present they are driving a drift at the 452-foot level to the stope.

The Resurrection mill at Leadville, after undergoing repairs, is running full force again, and 125 tons a day are being handled. It is expected the company will increase its shipments. —— The Crown Point mine, near the Bartlett mine, on Sugar Loaf mountain, has resumed after a shut down of twenty years, says the Carbonate Chronicle. The lease is in charge of W. B. Ridgley. The shaft has been opened.

LA PLATA COUNTY.

The work of developing the Mancos contact on the La Plata side of the divide between La Plata and East Mancos has been started by H. C. Deming of Harrisburg, Pa., who has a lease and bond on C. C. Carnell's group of claims at the head of Boren gulch, says the La Plata Miner. Shipments to the smelter began this week.

The Chief M. Co., near La Plata, is sinking a winze in the upper tunnel and it is expected work will be resumed on the lower tunnel next week.——Two shifts are working on the Little La Plata-Red Cloud mine and sacking shipping ore.

PARK COUNTY.

Superintendent A. E. Whiting of the Wolverine M. Co. at Tarryall says operations will be resumed on the company's property this week.

PITKIN COUNTY.

Smoke and gas are growing worse in the Smuggler mine, near Aspen, and those connected with it by tunnel; the underground workings have been temporarily abandoned and a few watchmen are all that are left on the property. The Mollie Gibson mill was compelled to close on account of not getting sufficient ore from the other mines. All of the Smuggler ore was treated at this mill.

RIO GRANDE COUNTY.

The T. M. Bowen mines at Summitville, comprising 174 acres of patented grounds, were sold last week to P. Schuch for $20,000. Schuch has the cyanide plant on the Reynolds mine at Summitville.

SAN JUAN COUNTY.

Work is progressing on the aerial tram at the Henrietta mine in Cement creek basin, near Silverton, and it is expected the tram will be in operation next week. The Henrietta is owned by the San Juan S. & R. Co. The cost of tramming the ore from the mine to the Gladstone Railroad will, it is said, be 15 cents a ton, whereas the former cost of transporting it by wagon from the mine to the basin, when the weather permitted, was $2 50 a ton. The daily capacity of the tram will be 500 tons.

SAN MIGUEL COUNTY.

On Sept. 1st all union mill men in the Telluride district went out on a strike. The Smuggler-Union Co.'s Pandora mill was forced to suspend operations, but at the company's new mill Manager Wells says he has enough non-union men to keep it in operation. The Liberty Bell, the Nellie and the Columbia Menono mills are closed down, and only one man is working at the Alta. The strikers demand an eight-hour day.

SUMMIT COUNTY.

H. L. Monroe of St. Louis, Mo., president of the Wire Patch G. Co. (reorganization of the Wire Patch G. M. & M. Co.), says preparations are being made to operate the Wire Patch group, near Breckenridge.

TELLER COUNTY.

Killian & Geer, operating in the seventh level of the Doctor-Jack Pot mine, near Cripple Creek, report getting out ore which yields 27 ounces in silver per ton, in addition to the gold values, which run 2 ounces.

J. Campbell & Co., who have a contract for sinking the shaft on the LeClair claim of the LeClair G. M. Co., near Cripple Creek, have put in an air compressor and will operate one drill. The shaft is down 325 feet. Sinking will continue to the 400-foot level when lateral work will be started. Crosscuts will be run out south and east to cut the Mary McKinney basalt from which values have been taken on that property.

The Acacia Gold M. Co. has given a two years' lease to Wyatt & Sharp on the Wrockioff shaft of the Burns claim at Cripple Creek. The lessees will sink the main shaft, now down 800 feet, to 1000 feet and pay from 15% to 30% royalty on all ore shipped. The purpose of sinking the shaft is to further open the Burns vein. The Wrockioff shaft is equipped with a steam plant.

The Hull City placer, near Cripple Creek, under lease to A. E. Carlton & Co., will be started as soon as the labor difficulty is settled, and meanwhile the machinery is being overhauled. Improvements have been made in the engines and compressor. A 250 H. P. boiler will be added.

The Ingham cyanide mill at Cripple Creek will increase its capacity to fifty tons per day. Larger elevators are to be put in also.

The Milwaukee M. & L. Co., sinking the shaft on the LeClair claim at Anaconda, has put in a one drill air compressor. The shaft is down 315 feet and it is intended to sink until the 400-foot level is reached, when lateral work will be started. A crosscut will be driven south and east with expectation of cutting the Mary McKinney flat basalt vein.

The Colorado M. & L. Co., operating on the Dexter claim on Bull hill, Cripple Creek, have a shaft down 500 feet and will sink to 1000 feet. Regular ore shipments are being maintained. The ore is giving returns of $30 in gold to the ton. Stoping is being done on the first, second and fourth levels. Another station will be cut at 570 feet. The management propose putting in an air compressor to supply air for three drills.

The heading of the Cripple Creek drainage tunnel, south of the El Paso shaft, broke through into the north lateral from the Ocean Wave shaft on the 24th ult., thus opening the tunnel for 3000 feet south from the main El Paso workings, says the Gazette. There then remained 73 feet of country rock between the port 1 heading and the south heading of the Ocean Wave shaft, which was expected to be broken out in five days. The contractors pumped out the Ocean Wave shaft and put men to work south toward the portal. When this is cut through the tunnel will be open from the portal to 1000 feet north of the El Paso shaft. August 25 was the original time limit for the completion of the tunnel, but as the contract carried a strike clause no penalty will be inflicted on the El Paso Co., which has been driving the bore. The tunnel was started seven months ago and was rushed through, gaining about ten days on the contract during the last thirty days prior to the strike, and would have been completed on August 15 had there been no strike interference, says Superintendent W. Bainbridge.

Cripple Creek advices of September 2nd say there seems to be a likelihood of the State troops being ordered to Cripple Creek. The sheriff of Teller county has not asked for troops, but it is understood that an appeal for protection has been made to the Governor by business men of the district. The C. K. & N. and the Old Gold mines, which adjoin the El Paso properties on Beacon hill, have resumed. Manager N. Franklin has fifteen men at work at the Eagle sampler, handling El Paso ore. Manager J. Burns has reopened the Portland mine and has 500 men at work. Arrangements were made by Burns with the union officials, whereby both union and non-union men would be taken on and soliciting membership allowed during the noon hour. The Vindicator mine, on Bull hill, pulled its pumps on the 28th ult. and the mine will be allowed to fill up with water. This action is said to be due to the Hull City and Findley properties having failed to pay their share of the cost of pumping which serves to unwater all the properties concerned. The Golden Cycle, as well as the other properties named, will probably be flooded.

IDAHO.

BOISE COUNTY.

The 10-stamp mill for the Magnolia mine, near Idaho City, is on the ground, and the company is putting up a saw mill. The shoot on the Magnolia has been opened for 200 feet. The ledge is 20 feet wide, averaging $10 a ton.

M. M. Gibson says work was resumed this week on the Grant and Globe quartz claims in Rocky Guich, near Idaho City. The tunnels will be driven ahead.

A development plant is proposed for the Osborne mine at Pearl, Idaho, owned by C. J. Bassett et al.

CUSTER COUNTY.

The Bachelor mountain mines are reported bonded to R. Macbeth et al. of Custer and of Salt Lake City, Utah, for $7500. The group is said to show a 21-foot ledge at a depth of 160 feet, with values in gold. Men have been put to work.

IDAHO COUNTY.

T. Hye of Spokane, Wash., manager of the Eureka mines at Newsome, says he has men at work running a tunnel 500 feet long, which is in 95 feet. They are following the ledge, which is 12 inches wide. The company plans to put on a 5 stamp mill in the spring.

Manager Perkins of a Pittsburg, Pa., company has bought the Fuller-Lawrence group of ten claims and three fractions for $100,000. The property adjoins the Dewey mines near Roosevelt, in Thunder Mountain district.

Machinery is being put in by the Pittsburg Tunnel M. Co. at their mines near Roosevelt, in Thunder Mountain district. The machinery consists of a shingle mill, planer and joiner, water wheel and engine and boiler. A sawmill is being set up and a 10-stamp mill will be built, says C. R. Dixon, a director. In the spring an electric dynamo will be put in to furnish lights for the mines and to operate the electric drills.

C. J. Perkins et al, of New York, have bought the H. Y. group of claims near Roosevelt and a cash first payment of $10,000 made.

KOOTENAI COUNTY.

W. T. Bailey of the Continental mine, near Port Hill, states the company will not put in the proposed concentrator till next year. At that time they expect to build a 100-ton plant. Work is progressing on the mine and ore is being taken out at rate of thirty tons per day. The road from Port Hill to the mine, 24 miles, has been repaired.

LEMHI COUNTY.

President St. V. Le Sieur of the Le Sieur Opal M. Co. says they have begun to operate the opal mines near Forney. S. L. Le Sieur is manager. The company expects to have its plant at the mine ready for turning out polished opals by Oct. 15.

G. W. Thompson and N. Hibbs of Lewiston have bought the Richardson Bros. & Pope group of claims in the Salmon river country for $200,000. It is intended to begin work this month and add such machinery as is needed.

W. L. Cook of Nephi, Utah, reports having men at work opening up the Royal Harlequin group of opal claims, adjoining the North American Opal Co., near Salmon City. The same section, says Mr. Cook, is rich in lode and placer gold. Ramey Bros. are working a flat on Silver creek with hydraulic power with good returns.

OWYHEE COUNTY.

At the Florida Mountain mill of the Trade Dollar M. Co., at Dewey, the battery of boilers and the Corliss engine have been displaced, and all the machinery will be run by electric motors. There will be three motors: A 75 H. P. motor on the upper floor and connected to a shaft which will run the batteries, rock breaker and vanners; a 100 H. P. motor to drive the pans and settlers, and a 10 H. P. motor in the machine shop on the ground floor. The power is brought from the Swan Falls plant, 27 miles distant on Snake river. Aside from the change from steam to electric power at Dewey, other improvements have been made. The machine shop, formerly at the Blaine mill, is in the Florida Mountain mill. A new ore house with bins of larger capacity has been built at the end of the tunnel track above the mill, and connected by covered tramway with the top of the mill. Heavier rails have been laid and the track in the tunnel made a broader gauge, with a view of substituting an electric motor for mule power.

SHOSHONE COUNTY.

Since the strike made on the O. K. mine last week it is the intention of the company to build a mill. When the ore shoot was struck on the 400-foot level drifting was started and has gone in 70 feet. The ledge is 4 feet wide. Of this there are 2 feet of milling ore. The O. K. mine adjoins the Silver King mine, near Wardner. B. F. O'Neill, A. Burch, O. H. Linn and J. W. Flink are interested.

A company is being organized at Orofino to exploit the coal prospects on Orofino creek. Considerable work has been done and the quality of coal is said to be improving.

MICHIGAN.

CANYON COUNTY.

The Magnolia group, on Miller mountain, near Nampa, will be equipped with a 20-stamp mill by the Nampa M. Co., which owns it. Ore bodies have been developed averaging $15 per ton in gold. Miller mountain is on the State wagon

road near the crossing of the Payette river.

KEWEENAW COUNTY.

Sinking is progressing in the Allouez shaft of the Allouez C. M. Co., at Allouez, on the Kearsarge amygdaloid, the overburden of 50 feet having been successfully gone through, and is in the ledge.

HOUGHTON COUNTY.

The jigs are in place at the Franklin mill at Hancock for the fourth head, and the other work incidental to installing the head is progressing, says the News.

The Elm River Co., since resuming work on the Winona lode, near Winona, last June, has sunk its No. 2 shaft to the 300-foot mark. Two drills are running and it is intended to carry this shaft to a depth of 1000 feet and then drift, to thoroughly test the lode at depth. The lowest drifts were at a depth of 250 feet from the surface.

The burning of A shafthouse of the Atlantic mine, near Houghton, has delayed development work. The erection of a temporary shaftbouse is under way. Eight drills have been used in the drifts tributary to A shaft, but these have been divided between B and D shafts. As A shaft produced not over 25% of the Atlantic rock, the management, by crowding B and D shafts, can maintain nearly the former output until A shaft is again in commission. The copper contents of the lode, which for the first six months of 1903 averaged in excess of seventeen pounds per ton of rock, have recently shown a falling off, present results being sixteen pounds per ton, says the News.

MONTANA.

DEER LODGE COUNTY.

Official announcement has been made that operations will be resumed at the concentrator at the Washoe smelter at Anaconda on Sept. 10th.

FERGUS COUNTY.

Superintendent T. Riser has men on development work on the Wright mine, between the Kendall and Barnes-King mines near Kendall. The main tunnel is being extended along the hanging wall of the ore body. It is intended to drive this tunnel 700 feet. It is said the ore can be worked by cyaniding.

GRANITE COUNTY.

The Willow Creek M. Co. has been organized at Philipsburg by J. H. Grant and D. Olson of Philipsburg, and W. H. Wahl and T. J. Haugeberg of Washburn, N. D. The company owns a group of seven claims on Willow creek, 16 miles west of Philipsburg, and has in addition a millsite, water rights, etc. The ore is a free-milling gold proposition.

JEFFERSON COUNTY.

Canol & Martin of Helena, who are working the Sure Thing mine, in the Ontario district, near Basin, will sink another 100 feet from the 200-foot level. They have started their mill on the Argo and Eclipse mines in Hellgate canyon and are producing 10 tons of concentrating ore per day, which averages 15% copper. They propose to double the capacity of the mill.

LEWIS AND CLARKE COUNTY.

The Piegan M. Co., near Marysville, has bonded three adjoining claims from the Kelly Bros. of Empire, on which is a vein 40 feet wide, and development work is under way.

Development work is progressing in the Liverpool mines in Lump gulch, 9 miles from Helena, and ore is being taken out. Shipments will begin next week. At the 500-foot level a drift is being driven east on the vein. While work is being done on the 500, 600 and 750-foot levels, no stoping has been done. Stoping will begin next week at the 600-foot and 750-foot levels. The ore has to be hauled 1½ mile down hill and the cost of taking to the smelter is expected not to be over $1 a ton. The ore runs well in silver.

SILVER BOW COUNTY.

Judge Clancy, in the District Court at Butte, on the 29th ult., in the so-called "Nipper case," rendered the decision for the United C. Co. (the plaintiff) as against the Washoe M. Co. and the Anaconda C. Co. The United C. Co. claimed the ore bodies on the theory that they were extralateral portions of the Nipper vein, which they alleged had an existence in the Nipper claim and crossed it east and west and dipped to the south through the south side line. This was denied by the defendants, who claimed the so-called Nipper apex and vein did not exist, and that the only vein in the Nipper claim was the Blue X fault or fissure. An appeal will be taken to the Supreme Court.

NEVADA.

ELKO COUNTY.

The slimes plant, with which the mills of the mines at Tuscarora of the Dexter M. Co are being equipped, will be ready for operation this week. It is designed to recover the auriferous contents from 30,000 tons of material that fill the slimes pond, averaging $5 per ton value.

ESMERALDA COUNTY.

At Gold Mountain, 4½ miles southwest of Tonopah (Nye county), the Gormy & Bjornerud group of seven claims, adjoining the Battleship group on the south, were sold last week to the Gold Mountain-Eagle M. Co. of California. H. J. Gormy is manager and has begun development work.

NYE COUNTY.

At Cloverdale, C. Sweeney of Spokane, Wash., is reported to have bought the King-Baldwin group of seven claims, 1 mile from the original Workman discovery, for $5000.

STOREY COUNTY.

The Butters Co. has bought the Imperial mine dump at Gold Hill, and will crush the material at the Best & Belcher mill and flume the tailings to their plant in Six-Mile canyon.

WASHOE COUNTY.

A. J. Pritchett, S. Porteous et al of Reno report finding a ledge of quartz carrying free gold, ¼ mile from the Southern Pacific railroad track, 27 miles east of Reno and about 8 miles west of Wadsworth.

WHITE PINE COUNTY.

Manager P. H. Cannon of the Old Imperial M. Co., near Cherry Creek, reports development work progressing on the drifts at the 250 foot level of the New Century mine. They are taking out good grade gold-silver ore the full width of both drifts. A blast and fan are now supplying fresh air in the drifts and eighteen men are at work. An assaying laboratory has been built.

Work on the Rising Sun group, near Ely, has opened up a vein of copper ore 4 feet in width, and assaying 20% copper, with some values in gold, says the White Pine Miner. M. McDonald of Tonopah has an option on the group.

NEW MEXICO.

GRANT COUNTY.

The Santa Rita M. Co.'s concentrating mill at Santa Rita has been enlarged and remodeled and four slime tables added to the equipment. The mill has capacity of 180 tons per day. Operations were resumed this week.

W. McAllister of Silver City reports making arrangements for a 60-ton concentrator to handle the low-grade ores of the Aztec group of mines at Pinos Altos. The Aztec mill, 1 mile north of the town, will be moved and set up with the new plant at the mines.——The Mogollon G. & C. Co. have added a boiler and engine to their plant.

LINCOLN COUNTY.

The Mescalero M. & M. Co. has been incorporated, with principal place of business at Roswell, by J. A. Ryan, C. R Young, A. L. Norfleet and J. E. Hurd, the last named being the general manager. The company owns ten claims on Rio Bonito.

SAN MIGUEL COUNTY.

S. Binns of Baxter Springs, Kan., manager, says he is arranging for a copper reduction plant at the Archibald & Pettis mines, near Mineral Hill.

OREGON.

BAKER COUNTY.

Machinery for the Alpine 20-stamp mill, near Sumpter, is on the ground, says J. Temple Grayson, manager of the Alpine M. Co. The sawmill will begin cutting lumber this week for the mill.

D. Grant and B. Rusk of Bourne last week bought, for $30,000, three claims in the Platts group, on the Rock creek side of the Elkhorn divide, and adjoining the Oregon Clipper of the South Pole group, near Sumpter, says the Miner. Development work will be started.

J. W. Larkin of the Cougar mine, near Sumpter, says work is progressing. The crosscut is being driven and arrangements are being made to resume work at the mill.

The Don Juan mine, near Sumpter, has been sold to J W. Davidson for Michigan men. Davidson is making arrangements for pumping out the shaft and opening up the lower workings.

DOUGLAS COUNTY.

Men have been put to work at the Riverside mine, near Bohemia. Work will hereafter be done by the day, instead of by contract. Another tunnel has been started on the vein, which will be used as a working tunnel for the entire group.

GRANT COUNTY.

E. S. Topping and W. E. Sanders have a bond on the Monitor claim, adjoining the Oriole mine, near Susanville. The Monitor is one full claim and a fraction, and will be worked in connection with the Oriole. Operations will be started next week, and it is expected plans for a mill will be considered.

The Stockton M. Co. at Galena is preparing to resume development. It is intended to sink a new shaft in the vertical and to build a mill.

Manager A H. Willett reports development work will begin next week on the Copperopolis mine, in Quartzburg district, near Granite.

SOUTH DAKOTA.

LAWRENCE COUNTY.

Operations on the Hercules mine and the Branch Mint M. Co. mine in the Bear Butte district near Deadwood are progressing; also at the Golden Crest, Gilt Edge-Maid, Ruby and Oro Fino properties. Work of change in the milling plants of the Branch Mint is under way. The water has been pumped out of the workings of the Hercules, and drifting on the body of porphyrite ore which exists at the 230-foot level of the mine has been started.

The Rex M. Co., operating a mile south of Lead, report the double-compartment shaft in ore, being a white quartz carrying values of about $7 a ton, and showing galena. Sinking continues and crosscutting will be started. It is expected a treatment plant will be built.

Alterations at the Hidden Fortune mill, below Deadwood, are progressing and the company expects to be ready for work by Sept. 1. A plate house is being built and amalgamating plates will be put in over which the ore will be run after it has been treated in the cyanide vats. This mill has a capacity of 300 tons daily. As soon as the first section is on a permanent working basis the company proposes to double its size.——The Capital G. M. & M. Co. has been incorporated by local Lincoln, Neb, men to operate a group of claims at Texana, along the Northwestern road, in Deadwood gulch, 3 miles above Central City. This group consists of sixty acres and the company also has under bond a number of other claims adjoining. J. Harrop of Lincoln, Neb., with C. H. Nelson and C. P. Ames of Deadwood are officers.

UTAH.

BEAVER COUNTY.

The Horn Silver mine at Frisco is maintaining daily shipments of fifty tons to the smelters. The ore averages 30% in lead. An increase in output is expected this fall.

F. O. Meakin of Salt Lake City of the Wasatch King M. Co. reports having men at work upon their group in the northern part of Beaver Lake district, near Milford. In the copper vein, which is 4 feet wide, there are 20 inches of ore that runs high grade. The gold vein opened on another claim is also showing values.

J. E. Meyer of Salt Lake City of the Federal G. & C. M. Co, operating near Milford, says two shafts are being sunk. The Federal group adjoins the Majestic on one side.

IRON COUNTY.

The Colorado Fuel & Iron Co. made an addition to its Utah holdings last week by buying for $90,000 of the Taylor estate six iron claims near Kanarraville, says the Tribune. The six claims are the Blowout, Excelsior, Black Magnetic, Chesapeake, Duncan and Desert Mound. The Duncan is said to contain a large body of soft hematite. The Desert Mound is also a hematite proposition and is favorably situated for working, being accessible to a railroad. The Blowout has the largest amount of iron in sight of the group. A few men are at work on experimental development. There is thought to be no intention of a local treatment plant, as the company already has a large plant at Pueblo, Colo. Another objection to a local iron smelter is the insufficiency of water and coal in the vicinity.

JUAB COUNTY.

Superintendent Legg says arrangements are being made for the 50-ton concentrator for the Uncle Sam mine, near Eureka, and he expects the mill to be in operation by Nov. 10. Water will be procured from the Bullion-Beck pipe line.

W. D. Sheppard has men at work on the Pioneer mine, south of Diamond, and is putting up a gasoline hoist. A mill will be in operation by Nov. 1.

The Centennial-Eureka mine shaft at Eureka has been completed to the sixteenth level—a depth of 1800 feet—and a station is being cut at that point.

At Mammoth, the management of the Victor Con. mine report taking out high-grade ore from the 500 foot level at a point under the winze where ore was struck at depth of 60 feet below the 400-foot level.

The Black Jack mine shaft, near Eureka, says Manager D. Evans, is down 1180 feet, being put down at rate of 4 feet per day. It will continue to the 1400-foot point.

Manager Joseph of the Carisa mine at Eureka says a number of lessees on their ground are shipping ore—both copper and silver-lead—and the company is taking out copper ore from the tunnel, the 100-foot level and the 700-foot level. The new ore body opened up by the company on the 1000-foot level is showing good values.

PIUTE COUNTY.

At the Sevier Con. M. Co.'s group, near Richfield, the mill is nearing completion, Acting Manager C. W. Foster says.—— Six miners are at work in the tunnel on the Annie Laurie Extension, and another shift will be added next week. The Annie Laurie vein is expected to be tapped by Sept. 10th.

L. Neilsen is driving a tunnel on the Outzen group, in Mount Baldy district, near Marysvale.

Needed repairs are being made at the Trapper's Pride mine, near Marysvale, says Superintendent A. D. McLain, after which more men will be put on and further development work done.

P. A. H. Franklin of Salt Lake City is reported to have bought the Deer Trail mine, near Richfield.——Shipments of ore have begun from the Aldebaran mine, says Superintendent B. T. Ashby. In the winze being sunk on the shoot values are showing.

SALT LAKE COUNTY.

The Michaelson M. & M. Co. has been incorporated at Salt Lake City by C. O. Michaelson, P. I. Dockendorf, D. Burlough and J. H. Hiller.

The equipment at the lime quarry of the American S & R. Co., north of Salt Lake City, which was destroyed by fire last week, is being replaced. The new crushers and other machinery are on the ground. The fire caused no cooling of furnaces at the smelters, as they have a reserve supply constantly on hand.

The Little Eddie G. & C. M. Co. has been incorporated at Salt Lake City by E. McCarrick, A. H Page and J. McCarrick, to operate in Bingham.

There are twenty-two teams and forty men employed on the Utah Copper Co. concentrator site at Bingham, doing grading work. Concrete work began this week.

The Continental Alta M. Co. is working 300 men on the Grizzly and Lavinia claims at Alta, says the Tribune. No ore is being shipped as yet, but is being blocked out.——Down at the Albion tunnel machine drills are being used.

At the Silver Shield mine, at Bingham, Manager H. S. Joseph says it seems that the Niagara tunnel at 5300 feet has broken into the vein that has been worked in the upper levels. The mineralized portion of the vein is 3 feet in thickness, and 1 foot carries 32% lead, seven ounces in silver and 6% copper.

SUMMIT COUNTY.

At the Keith-Dearns mine, near Park City, work is progressing on the mill which is expected to be ready for operation by October 1.

The management of the Daly-Judge M. Co., operating at Park City, has decided to use a gasoline locomotive for movement of ore cars in the tunnel between the mine and mill, in which new tracks are being laid It is expected the track laying will be finished next week. The mine is shut down, pending these improvements, says Manager O. J. Salisbury.

WASHINGTON.

FERRY COUNTY.

Near Danville, the Lucile Dreyfus mine has six men at work, and is sending out fifteen tons of ore per day to the smelter. ——The Mineral Hill Con. M. Co. has started work on a tunnel on the Copper Bullion claim, which will be driven 1100 feet. This is expected to open the extension of the Lucile Dreyfus vein, says Manager Humphreys of Spokane.

Superintendent H. Brooks has put men to work on the St. Crispen mine, on Sheep creek, near Northport. The mine carries gold and copper values.

At Republic, at a depth of 600 feet in the Quilp mine, a 20-inch streak of ore has been opened up, says E. L. Tate. The values average $200 in gold per ton. The ore was first struck in the 400-foot level, which is 525 feet deep, and drifted on for 90 feet. It proved 5 feet wide, with a high-grade streak of 20 inches. It carries seventy-five ounces silver per ton in addition to the gold. Development work continues, and fourteen cars of ore per week are shipped to the smelter.

Manager W. D. Church of the Tom Thumb mine, near Republic, says as soon as arrangements are made with the smelters to take sufficient ore to pay for pumping the water out of the mine it will be reopened.

W. Hoffstedter, J. O'Donnell and J. Meyer have taken a lease on the Copper

King mine, on Belcher mountain, near Republic, and will start work this week.

LINCOLN COUNTY.

Iowa men have bought the Evergreen mining claim, in Cedar canyon, near Davenport, of Davis Bros. for $3000, says the Spokesman-Review. The claim is a copper prospect and adjoins the Turk group of claims. The new owners have put four men to work, continuing the shaft.

OKANOGAN COUNTY.

J. Drumheller, of Spokane, and J. Wentworth, of Loomis, with New York men have incorporated the Copper World G. M. & S. Co., to operate the Copper World group of fifteen claims. Shafts and tunnels will be started and later it is expected to build a smelter.

W. G. Madison of Spokane, manager of the mines of the Bodie M Co., near Curlew, says he is putting in machinery for the milling plant, which consists of a 10-stamp amalgamation-cyanide mill, a sawmill and a power plant for both. The sawmill will have a capacity of 15,000 feet of lumber per day, and the power plant will furnish 60 H. P.

SNOHOMISH COUNTY.

It is reported the Amalgamated Copper Co. has bought the Monte Cristo mine and smelter at Monte Cristo.

WYOMING.

ALBANY COUNTY.

A body of covellite is reported struck in the Albany mine, 3 miles east of the Rambler mine at Holmes, in the Douglas district. It is owned by the American Copper Co.

UINTA COUNTY.

Superintendent Deming says the well of the Idaho-Wyoming Oil Co. at Spring valley is 1350 feet deep and the drill is in slate. The Spring valley field is an extension of the Fossil field and has several producing wells. It is expected that the Idaho-Wyoming well will have to penetrate 150 feet more of shale to reach the oil-bearing sandstone. The wells in Spring valley are from 1200 to 1700 feet deep. In the latter the oil has risen 1200 feet and a pump is being put in to raise it.

FOREIGN.

AFRICA.

NATAL.

It is reported an important find of cassiterite has been made near Ichanga Station, says the South African Mines.

TRANSVAAL.

The following table gives the gold yield of the Transvaal for the years indicated:

Year.	Value	
1884.....	£10,000	$48,665 00
1885.....	6,000	29 199 00
1886.....	35 000	170 327 50
1887	169 000	822,438 50
1888	967,000	4,705,905 50
1889	1,491.000	7.255,951 50
1890	1,870,000	9,100,355 00
1891.....	2,938,000	14 297,777.00
1892	4 698,000	22 862 817.00
1893.....	5,649,000	27,490,858 50
1894	7 809,000	38,002,498 50
1895	8,578,000	41,744 837 00
1896	8,598,000	41 842.167 00
1897.....	11,476,000	55,847.954 00
1898.....	16.044,135	78,078,683 17
1899.....	15,782,640	76 806,217 56
1900	1,457.684	7.093.819 00
1901.....	1,014 687	4,937 974 28
1902	7,269,888	35,378,909 95
1903 (June 30).....	5,579,730	27,153,756 04
Total	£101,442,764	$493,671,211 00

WEST AFRICA.

At the Himan concessions sinking is suspended pending installation of sinking and pumping machinery, which has arrived on the ground. The shaft is down 100 feet.

AUSTRALIA.

QUEENSLAND.

At the Lancelot Freehold Tin & Copper Co., at Newellton, during July the 5-stamp battery crushed 213 tons Lancelot tin ore for thirty tons of dressed, 65% tinhismuth ore.

The Mungana, at Chillagoe, report for July 1549 tons of ore handled containing 95¾ tons of copper, 7912 ounces of silver and 165 tons of lead.

WESTERN AUSTRALIA.

At Kalgoorlie, the need of thoroughly prospecting in depth the large area of abandoned ground lying south of the productive section of the Kalgoorlie Golden Mile is shown by the extraction of gold-bearing ore from a small lease, known as the Merriwee, in that part of the district, says the West Australian Journal. The rock is of hard quartz intermixed with ironstone, and the results obtained from two crushings show it to carry 8 dwt. gold over a width of 18 inches. With a view to further testing the reef the shaft will be deepened from 30 feet to 50 feet.

The Coamopolitan Proprietary at Kookynie, in North Coolgardie field, has sunk the main shaft 100 feet on the underlay.

The report issued by the government assistant geologist shows that the Princess Royal reef at Cue has yielded 6534 ounces for 6720 tons. Of this quantity 449 tons came from the Royal Secret, the yield from it being 364 ounces. The amount of cyaniding that was done on the Princess, and which was the means of helping to hold the ground so long, was 2370 tons, which yielded 399 ounces. Besides the addition of plant, which increased development necessitated at the new shaft, several buildings have been erected on the lease.

Hereafter the monthly yields from most of the Western Australia mines controlled by Bewick, Moreing & Co are to be given in fine gold, says the West Australian Journal. The Lake View Consols and Ivanhoe already declare their outputs in fine ounces, and the supplementary list of companies now to follow suit includes the Sons of Gwalia, the Great Fingall, the Golden Age Consolidated, the East Murchison, Waroonga South and the Vivian. ——A diamond drill borehole is being put down from the surface of the Kalgoorlie Amalgamated, south of the Golden Link's Eclipse mill at Kalgoorlie. This is to pick up the run of ore being worked in the Eclipse lease ——The Hannan's Reward Co, Mt Charlotte, is still negotiating with the Government for assistance in carrying out some development in deep ground with the diamond drill.

The Altona North mine at North Kalgoorlie is being worked by tributers, who are to sink a minimum depth of 100 feet in twelve months. There are nine men working.——Manager W. Bright of the Eagle-Hawk-Heather Co. has completed the purchase of the Missing Link, a 10-acre lease at Niagara, for £2500. The Link adjoins the leases operated by the Eagle-Hawk-Heather Co.

At Coolgardie 231 tons of ore drawn from the 900 and 1000-foot levels of Bayley's were cleaned up for 86 ozs. 16 dwts. of gold. Concentrates yielded an additional 70 ozs 7 dwts. The management, per instructions from London, has closed down the mine pending reconstruction. ——The last seam of ore intersected by the crosscut at the 400-foot level of Bayley's Consols shows a width of 5½ feet, but average assay value is low.

BRITISH COLUMBIA.

BOUNDARY DISTRICT.

Development has been started on the Gold Bug claim in Providence Camp —— Work has been resumed on the Ah There mine in Deadwood camp, and ore is being taken out——The Gold Finch claim in Skylark camp has been bonded to D W. McVicar and W. T Hunter, manager of the Hunter-Kendrick Co., Greenwood. The claim will be worked in connection with the E. P. U. claim adjoining it.

Foreman Holman of the Mother Lode mine, at Deadwood, with a force of fifty-five men, for ten days or more supplied sufficient ore to keep two furnaces at the smelter in operation—600 or 700 tons daily, says the Miner.

Work and shipments will be resumed at the Winnipeg mine, in Wellington camp, near Hartford Junction, 2 miles east of Phœnix, says R. Plewman, president and managing director of the company.

The British Columbia mine, at Eholt, has closed down again. During the past eighteen months considerable high-grade copper has been shipped.

The Goldfinch mine, in Skylark Camp, near Greenwood, has been bonded by D. W. McVicar, manager of the E Pluribus Unum, and W. T. Hunter of the Hunter-Kendrick Co. The Goldfinch adjoins the E Pluribus Unum and will be worked in connection with it.

EAST KOOTENAY DISTRICT.

The Alice mine, near Creston, will resume operations next week. This mine is owned by a Manchester, Eng., company. Development work will be increased and a concentrator will be built.

On Perry creek, near Fort Steele, work is progressing at the Badger and Red Mountain group of mines. A ditch 4000 feet in length is being built. Water power is obtained sufficient to run a battery of five stamps. A contract has been let to run a working tunnel ——The Kootenay Perry Creek Co. have sunk a shaft 20 feet, striking the rimrock, and are sinking another shaft in the old tunnel which is expected to reach bedrock.——The Perry Creek M. & H. Co. have completed the grade for a ditch and are putting in a flume 1½ mile in length. They have forty men at work.

The Morrissey coal mines are averaging over 1100 tons daily.

A group of nineteen coal licenses for claims up Elk creek, above Michel, were issued to as many Fernie citizens last week.

LILLOOET DISTRICT.

The judgments against the Toronto-Lillooet Gold Reefs Co. having been satisfied it is expected work on this company's properties, near Lillooet, will be resumed this month.

NANAIMO DISTRICT.

The Tacoma owners of the Marble Bay copper-gold mines, on Texada island, have resented the demand of the local branch of the Western Federation of Miners for an eight-hour shift for miners and a nine-hour shift for carpenters, teamsters and surface laborers at present wages by closing down the mines altogether.

ROSSLAND DISTRICT.

The Iron Horse mine has been added to the list of those operating in the Rossland camp, says the Rossland Miner. The mine has been opened up, and smelter test shipments are being extracted from the ore bodies blocked out. The Iron Horse adjoins the Kootenay on the east. The principal holders in the proprietary company are the Reddin-Jackson Co. of Rossland and A. E. Humphries of Denver, Colo.

SLOCAN DISTRICT.

A 1000 foot tunnel will be started this week on the Howard fraction, near Slocan City, to tap four ledges at vertical depth of 700 feet. The property is owned by Virginia men, with J. M M. Bennedum as superintendent. Ten men are at work and more will be taken on. The company also intends to build a wagon road and erect a mill to treat the second-class ore on the dump- —— Work at the American Boy is confined principally to driving an intermediate tunnel between Nos. 4 and 5 and raising on the vein connecting all three.

VANCOUVER ISLAND.

The Texada Miners' Union having withdrawn its demands for a nine-hour day for carpenters and blacksmiths, the Marble Bay mines will reopen this week, says the Rossland Miner. The company has for some time past recognized the union, in so far as the payment of the regular scale of wages for miners is concerned, but has reserved the right to employ non-union men. At the Van Anda mines the miners are still on strike, as Manager Vaughan-Rhys refuses to recognize the union in any form.

WEST KOOTENAY DISTRICT.

The Eva stamp mill, 2 miles from Camborne, in Lardeau district, is nearing completion, the crushers being in place and stamps ready to drop. The other machinery is being set up. It will run by water power. At the mine three shifts are at work. —— At the Ophir-Lade stamp mill and compressor plant work is progressing. The air pipe is being laid up the mountain side. At the mill the crusher and stamps are in place and the cable is being put in. Grading for the reservoir is finished and timbers are being framed.

KLONDIKE.

Low water in Klondike creeks nearly stopped mining operations previous to the rain of last week. Many claims shut down for the season, throwing 500 men out of work during ten days previous to August 25th. The North American T. & T. Co. entirely closed down operations on Bonanza and reduced its number of men on other creeks. Continued low water on the Upper Yukon is starting outward men from Dawson who intend coming out before navigation ends. Steamers are having difficulty in getting up and down the Yukon. The water is lower than ever known at this season and an early freeze is expected. Frost appeared last week along the Yukon.

MEXICO.

CHIHUAHUA.

A 12 H. P. gasoline hoist has been set up at the San Salvador mine at Terrazas camp and work is progressing well with forty men on the payroll, says the Enterprise.

D. W. Shanks of Los Angeles, Cal., is developing a mine in the Cerro Almaloya section near the Cigarrero, near Parral.

F. Collinson of Clarendon, Tex., has taken over the interests of A. D. Gatherings in the Kansas Boy mine at Santa Eulalia and is making arrangements to start development work.

The Columbia and Sierra Madre mines in Sierra Madre district have been sold for $50,000 to J. Arnold et al of London, England.

DURANGO.

At Bacis, the Gold & Silver M. & S. Co. has a 100-ton concentrating plant running steadily, water power being obtained from the river. W. Pearless, manager, says it is intended to put in a cyanide plant to treat the tailings from the mill. They have 3 miles of gravity tramway, by which the ores are brought from the mines to the mill. The proposed electric line from Durango to San Dimas would pass this camp.

OAXACA.

J. Felton of Ejutla reports high-grade gold-bearing ore found near Ejutla in a ledge showing 15 feet across on the surface.

SINALOA.

At Culiacan, the Palmerito mine, Wilkins & Flores owners, is said to be turning out 5000 ounces of silver per month with a 5-stamp mill. The ore is principally a chloride.

SONORA.

It is reported that the Greene Con. Co., operating at Cananea, proposes to double the capacity of its reduction works, now capable of handling 1500 tons of ore daily. The new equipment will consist of three furnaces.

The Promontorio mine, 20 miles west of Nogales, is making regular shipments. Last week 7000 ounces of silver bullion was sent out and another of 14,000 ounces this week.

At the Verde Grande C. Co.'s camp, 40 miles northwest from Hermosillo, the machinery is ready to start and the smelter will be blown in next week. The smelter is of 100 tons capacity daily. There are 120 men employed.

J. F. Bueslem, manager for the Boston & Mexican Placer M. Co. at Cumuripa, says they are making preparations for putting in a plant for operating the ground of the company.

The Moctezuma G. & S. M. Co. has been formed at Douglas, Ariz., to operate in Moctezuma district in the east extension of the San Jose mountains; A. R. Wormell, W. F. Hall, H. E. Sone and F. C Gilland.

Seventy miles south of Nogales, in the Magdalena district, a Chicago, Ill., company is working the Sierra del Oro mines. They are working a vein of ore 70 feet wide of $5 value and have a 200-stamp mill in operation, says the Cananea Herald.

PERU.

Berropasco advices report a gold-bearing vein 15 feet wide has been struck at Chuquitambo. An English company is working mines near this vein which are producing high-grade ore

Commercial Paragraphs.

G. W. MYERS, Pacific coast representative of the Masurite Explosive Co, reports the home office under date of Aug. 28th informed him they would ship to San Francisco, Cal, a carload of masurite from the factory at Sharon, Pa, on Sept. 1st.

J. A. YEATMAN & Co, hydraulic engineers, San Francisco, Cal, report shipping this week to Woloott, Eagle county, Colo., a complete hydraulic equipment, including a two-step series pressure centrifugal pump and an Adams hydraulic lift.

FAIRBANKS, MORSE & Co, Denver, Colo., state they have recently secured orders for three mills—one for Naco, Ariz, and the other two for Colorado. In each of the mills they are installing the Elspass mills, which they are agents for. They also have an order for a 40 H. P. gasoline hoist from the Josephine mine, Idaho Springs, Colo.

C. M. FUELLER, 1752 California street, Denver, Colo., has opened an ore testing plant He has installed an Overstrom concentrating table, but will make tests on all others. He writes that he is independent of machinery houses, not being tied down to any particular machine. During the past year he has designed some very large mills in the United States.

R. J. CORY, in charge of the Denver office of the Allis-Chalmers Co., says: "Three of the specialties of the Allis-Chalmers Co. in mining machinery are the Gates crusher, the Gates ball mill and Gates tube mill. Within recent years the company have sold over 90,000 tons of the three machines named. The one item of Corliss engines made by this company amounts in weight to over 500,000 tons of iron and steel."

THE Mine & Smelter Supply Co., Denver, Colo., has received orders for two 20-stamp mills, one for Hanna M. & M. Co., Lake City, Colo., and one for the Barstow mine, Ouray, Colo.; one 18-inch De Remer water wheel for Deadwood, S. D., and one each 18, 24 and 48-inch wheels for Idaho. They state their orders for De Remer water wheels are rapidly increasing and that their trade on the Wilfley table has been the best this season it has ever been. The Durkee electric drill is another one of their specialties which has had increasing sales.

PERSONAL.

E. A. WILTSEE has returned from the East to San Francisco, Cal.

J. H. MEALE of Sonora, Cal., is in San Francisco, Cal., on mining business.

W. D. CHURCH is manager of the Tom Thumb mine, near Republic, Wash.

W. R. BERMINGHAM of Fresno, Cal., is in San Francisco, Cal., on mining business.

G. ROSS, interested in Arizona mines, is in San Francisco, Cal., from Jerome, Ariz.

D. J. MCFALL, interested in mines near Nevada City, Cal., is in San Francisco, Cal.

E. C. LIMBACH, of Denver, Colo., is in Sonora, Mexico, examining mining property.

J. C. BAILER is instructor in chemistry at the Colorado School of Mines at Golden, Colo.

A. H. TARBET of Salt Lake City, Utah, interested in Utah mines, is in San Francisco, Cal.

T. COALE has resigned as superintendent of the Butler-Liberal mine at Bingham, Utah.

H. HUNSAKER, interested in Colorado mines, is in San Francisco, Cal., from Denver, Colo.

T. W. HAND succeeds A. Conard as general manager of the Hays Con. M. Co., Nogales, Ariz.

C. B. CULBERSON of Boulder, Colo., interested in Boulder county mines, is in San Francisco, Cal.

R. S. SANDOW of Grass Valley, Cal., is on a mining business trip through eastern Oregon and Idaho.

W. OCHS returned to Salt Lake City, Utah, last week from a trip to New York on mining business.

M. P. GILBERT, manager of the Leland group of mines near Kingman, Ariz., is in the East on business.

H. J. GORMY is manager of the Gold Mountain-Eagle M. Co., at Gold Mountain, near Tonopah, Nev.

H. E. ZERBE returned last week to Salt Lake City, Utah, from an examination of mines in Montana.

JEROME DRUMHELLER of Spokane, Wash., returned last week from a trip to New York on mining business.

J. E HURD of Capitan, N. M., is manager of the Mescalero M & M. Co., operating in Lincoln county, N. M.

G. M. BUTLER has been appointed instructor in mineralogy at the Colorado School of Mines at Golden, Colo.

J. EKMAN of Calumet, Mich., is superintendent of the H. M. H. group, near Telluride, San Miguel county, Colo.

C. D. ROOKLIDGE returned last week to Salt Lake City, Utah, from a trip to northern Montana, examining mines.

K. C. BABCOCK of the University of California, has been appointed president of the University of Arizona at Tucson.

J. E. MEYER of Salt Lake City, Utah, of the Federal G. & C. M. Co., Beaver county, Utah, is in the East on business.

J. W. CUNNINGHAM of Boise, Idaho, has resigned as assayer in charge of the United States Assay Office at that place.

J. H. BURKHART has resigned as superintendent of the Rawhide Extension mine, near Jamestown, Tuolumne county, Cal.

A. C. NAHL, superintendent of the San Francisco mines near Llano, Sonora, Mexico, is in San Francisco, Cal., on business.

J. E. SNELUS of London, England, is superintendent of operations in Egypt of the Mysore Reefs & General Exp. Co., Ltd.

C. A. BURCHAM, part owner of the Yellow Aster M. Co., is at their mines at Randsburg, Cal., from Los Angeles, Cal.

FRANK T. LELAND, of the Risdon Iron Works, San Francisco, Cal., has returned from a business visit to Magdalena, Mexico.

E. H. BARTON, superintendent of the Yellow Aster M. Co. at Randsburg, Cal., returned from San Francisco, Cal., last week.

C. J. NORTH, a director in the Blackbird M. Co., operating in Lemhi Co., Idaho, is in Salt Lake City, Utah, from Buffalo, N. Y.

H. S. WOOLLEY of Pocatello, Idaho, has been appointed as assayer in charge of the United States Assay Office at Boise, Idaho.

M. CLERE has succeeded M. Cololot as superintendent of the San Jose mine, southwest of Douglas, in Arizpe district, Sonora, Mex.

SUPERINTENDENT I. MCKAY of the Halifax mine, at Tonopah, Nev., has returned there from a business trip to San Francisco, Cal.

P. A. JOHNS of Prescott, Ariz., has resigned as manager of the Braganza G. M. Co., near Prescott, to devote his time to other interests.

W. I. SNYDER, of the California mine at Park City, Utah, has returned to Salt Lake City, Utah, from a visit to California and Nevada.

A. D. PARKER, owner of the Little Gem mine at Anchor, Taos county, N. M., returned last week to Florence, Colo., after visiting the property.

F. BARKER, manager of the London Venture Co., is in San Francisco, Cal., in connection with the purchase of the Esperanza, Mexico, mine.

W. S LEWIS, vice-president of the Jayhawk G. M. Co., returned to New York City last week after several weeks at Red River, Taos county, N. M.

A. R. MINNER, of the Utah Copper Co., is at Bingham, Utah, from Canon City, Colo., to superintend construction of the concentrator for the company.

J. A. FARWELL, for many years with the Crane Co., Chicago, has assumed an equally responsible position with the J. Geo. Leyner Co., Denver, Colo.

G. W. MYERS, Pacific coast representative of the Chrome Steel Works, Brooklyn, N. Y., returned this week to San Francisco, Cal., from a business trip to New York.

A. S. BIGELOW, superintendent of the Pelger and Capsilvar mines of the Franco-Russian Co. des Almaks in Mongolia, has returned to North Columbia, Nevada county, Cal.

SUPERINTENDENT WILLIAMS of the Belmont mine at Park City, Utah, has accepted a similar position at the Butler-Liberal mine at Bingham, Utah, vice T. Coale, resigned.

W. B. MUCKLOW of Hartford, Conn., of the Majestic Copper Co., operating in Beaver county, Utah, is in Salt Lake City, and expects to remain in Utah until the smelter is in full operation.

A. E. WHEELER, for two years assistant superintendent of the Boston & Montana C. & S. Co. smelters at Great Falls, Mont., has been appointed superintendent, vice J. C. Morrow, resigned.

W. J. WILLIAMS, manager of sales of the Mexico Mine & Smelter Supply Co., Mexico, D. F., was in Denver the past week on his way to Chicago on business connected with his company.

E. H. TEATS of Denver, Colo., consulting engineer for the Marowyne G. M. Co., in Dutch Guiana, is in Denver, Colo., from an examination of mines in Nevada, and will return this month to Guiana.

J. C. MORROW, having resigned as superintendent of the Great Falls smelters of the Boston & Montana C. & S. Co., Montana, is manager of the Green River C. Co. of Cananea, Sonora, Mexico.

MANAGER JACKLING of the Utah Copper Co., at Bingham, Utah, has resigned, to take effect Oct. 1st, and will be succeeded by J. McDonald, superintendent of the Commercial mine, at Bingham, Utah.

F. COLLINSON, of Clarendon, Texas, returned there last week from Santa Eulalia, Chihuahua, Mex., on mining business, after arranging for the commencement of work on the Kansas Boy mine at Santa Eulalia, Chih., about the first of the month.

PROF. R. D. SALISBURY, head of the Geological Department of Chicago University, is in charge of a party of fifteen making a survey of the Big Horn mountains in Wyoming for the U. S. Government, and has returned to Wyoming from a trip to Denver, Colo.

"JIM" WARDNER is reported dying in a Milwaukee, Wis., hospital. It is stated that in the early part of 1903, while traversing eastern Nevada, he drank from a roadside stream into which close above ran discharge from a cyanide plant, and that the poison therefrom has occasioned his fatal illness. "Jim" Wardner is known to thousands of mining men throughout this west half of America, who will read with regret of his sad condition.

SINCE the appearance of a little notice in this column some weeks ago concerning the connection of Senator E. W. Voorhels, ex-president of the California State Miners' Association, with a South American gold mining company, his mail has been filled with inquiries as to when he starts for the equator. It is to be said that he has no intention of moving from California and will act as resident agent for the Darien G. M. Co., with headquarters at San Francisco, Cal.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING AUGUST 25, 1903.

736,919.—WINDOW SCREEN—J. W. Adams, Santa Ana, Cal.
737,053.—RAILWAY SIGNAL—Ammann & Cambell, Spokane, Wash.
737,054.—PRESSING FRUIT INTO BOXES—Anderson & Fleming, San Jose, Cal.
737,216.—CAN HEADER—C. E. Forry, S. F.
736,951.—MARINE PROPULSIGN—H. H. Fowler Oakland, Cal.
737,384.—SNAP HOOK—J. A. Gavitt, Pendleton, Or.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PUMPS.—No. 737,274. Aug. 25, 1903. G. C. Richards, Berkeley, Cal. The object of this invention is to provide a pump of simple construction adapted for use particularly in oil wells, where great difficulty is experienced in lifting heavy oils and those containing considerable quantities of sand and like gritty foreign substances. It consists in the combination in a pump of a main discharge pipe, a plurality of pump barrels on the end thereof, cylinders reciprocal on the outside of said barrels, valves in said barrels and cylinders, means for giving said cylinders an alternating reciprocating movement, and guides supported from above and extending beneath the lower end of the cylinders and serving to suspend the latter should they become detached.

DEVICE FOR PRESSING FRUIT INTO BOXES.—No. 737,054. Aug. 25, 1903. W. C. Anderson and C. F. Fleming, San Jose, Cal. Assigned to Anderson Barngrover Mfg. Co., a corporation of San Jose, Cal. The object of this invention is to provide a machine capable of pressing several thousand boxes of fruit in a day, that is uniform in its results, that does not mar the fruit, and that is adjustable for variation in filling and for different sizes of boxes or packages. It consists of a horizontal endless carrier upon which the boxes or other receptacles containing the fruit are conveyed, a superposed adjustable pressure surface arranged and operating in relation to said carrier, and means for compressing the contents of the boxes as the latter are passed between sa'd carrier and surface.

CAN HEADER.—No. 737,216. Aug. 25, 1903. C. E. Forry, San Francisco, Cal. The object of this invention is to provide an automatic machine of simple construction capable of being operated rapidly and in which any danger of injury to the can bodies or tops is obviated. It consists of a can body carrier movable about horizontally disposed sprockets, said carrier comprising pivoted cylindrical jaw segments, means for delivering the bodies in upright position into said jaws, means for insuring the closing of said jaws upon the cans, a can head carrier rotatable intermittently, a yielding guide mechanism by which injury to the heads as they are fed from the conveyor trough into the rotatable carrier is obviated, means for effecting the movement of said last named carrier by and relative to the can body carrier, and means for delivering the can bodies from the machine.

Catalogues Received.

"Jessop's Steel and How They Make It," is an interesting story, finely illustrated and worth reading. I. Willard Beam, 29 Main St., San Francisco, Cal., is the Pacific coast agent for this well-known manufacture.

"Digging Machinery" is a handsome brochure issued by the Hayward Co., 97 Cedar St., New York, descriptive of several styles of dredges, derricks and excavating machinery.

Dividend Notice.

Bunker Hill & Sullivan Mining & Concentrating Co., Wardner, Idaho, $18,000, payable Sept. 4.

Obituary.

W. C. GIVEN, a pioneer miner of Trinity and El Dorado counties, Cal., died at Junction City, Aug. 25th, the result of an apoplectic stroke. Deceased was born at Brunswick, Maine, seventy-three years ago, and came to Placerville, Cal., in 1850, making the trip around Cape Horn. He is survived by a widow and two sons.

Latest Market Reports.

SAN FRANCISCO, September 4, 1903.

METALS.

SITUATIONS WANTED.

A THOROUGHLY COMPETENT ASSAYER and Analyst, 15 years' experience, with a good practical knowledge of mining, milling and smelting, is open for engagement, with chance for advancement. Excellent references. Address "Everett" care of this office.

MILL FOREMAN WANTS POSITION—Concentration, amalgamation, cyaniding and assaying; 20 years' experience. Best of references. Address "Millman," 1056 South Gaylord St., Denver, Colo.

MINE SUPERINTENDENT WANTS POSITION with a substantial company that has a mill on property. A qualified mining engineer who can run a mine or mill, cyanide plant, assaying and surveying. Address "Mining," this office.

MINING ENGINEER NOW IN CHARGE COPper proposition desires change of location. Management gold or copper proposition. State terms. Address Box 85, this office.

MINING ENGINEER AND METALLURGIST, at present general manager of a large mining concern in Mexico, desires to change his position. Would need four months' notice. Address F.B.A.S., care of this office.

POSITION BY PRACTICAL MINING ENGIneer; 20 years' experience in U. S., Alaska and Mexico. Reference A1. Specialty, commercial mining. Address W., care of this office.

POSITION DESIRED AS DRAUGHTSMAN, Surveyor, Assayer or Bookkeeper. Good references. Address H.W.K., Box 74, Long Beach, Wash.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WANTED.

WANTED—A First-Class Assayer and Chemist,

with extended cyanide experience, for position of Assayer and Chemist with large gold mining company, with cyanide plant. Must have best of references. State age, experience and salary wanted. Address "Chemist," care of Mining and Scientific Press.

WANTED TO SELL This Machinery, Cheap.

Six-Drill Compressor; Double Cylinder Hoist, good for 800 feet; Large Double Reel Geared Hoist, good for 1500 feet; 60 H. P. Fire-box Boiler. All in good condition. Address "Machinery," this office.

ASSESSMENT NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of August, 1903, an assessment (No. 37) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 30, fifth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 18th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 30, fifth floor, Mills Building, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Golden West Consolidated Mining Company will be held at the office of the company, at Iowa Hill, Placer County, California, on Saturday, the 26th day of September, 1903, at the hour of 9 o'clock A. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. E. M. ARMSTRONG, Secretary.

Office—Woodland, Cal.

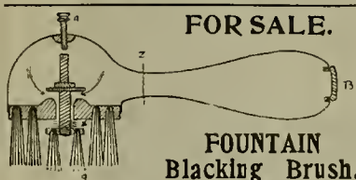
PICHER
Natural Blue Lead Paint.

Best protective paint for all iron and steel surfaces. Withstands the action of sulphuretted hydrogen gases. Send 25 cts. to cover express charges for one quart and illustrated booklet free. Address Dept. B.

PICHER LEAD CO.

Chicago, Ill. Joplin, Mo. New York, N. Y.

FOR SALE.



The Mines of Park City, Utah,

Have furnished 70% of the lead, 62% of the silver, 70% of the dividends of the State. Send 20 cents for 24-page illustrated edition of Park City Miner, with map. N. B. DRESSER, Park City, Utah.

MINING PROPERTY FOR SALE.

Consists of 13,000 tons of tailings, 25,000 tons of dump—both good values. Water for working same. Situated 3 miles from railroad. No crushing power required. Guarantee a saving of 80%. Partners cannot agree, so it will be sold cheap. Inquire of James McDermott, Brooklyn Hotel, San Francisco.

FOR SALE.

FOUNTAIN Blacking Brush.

A New and Cleanly Means of Applying Liquid Blacking.

With no pressure on bristles the small brush is kept in position shown by dotted lines *Y*, by the spring *X*. With pressure on bristles, as by rubbing, the small brush is raised to position shown in cut, opening the valve and allowing the blacking to flow onto the bristles as indicated by arrows. Thumb screw *A* securely locks valve, making brush absolutely tight. Bottle in which liquid blacking is sold can be made to fasten on brush at line *Z* and serve as a handle.

Pat. in U. S. and abroad. For sale separately or as a whole. For particulars, address E. R KING, Lafayette, Contra Costa Co., Cal.

NOTICE

of Receiver's Sale of the Electric Plant, Apparatus, and Other Property of the Cochiti Gold Mining Company.

Notice is hereby given that the Receiver, by appointment of the District Court of the Second Judicial District of the Territory of New Mexico, for the County of Bernalillo, in that certain cause pending therein wherein Raymond P. Ripley and others are defendants, will, under and by virtue of an order of said court made August 20, 1903, receive bids for the purchase and sale of all the property of the said Cochiti Gold Mining Company, now in his possession as such receiver. Said property consists of a complete cyanide mill of two hundred and fifty tons capacity, built of structural iron, various other buildings such as stores, boarding house, store house, hunk houses, etc., etc. The machinery consists of dry crushing apparatus, Davis and Allis finishing rolls, twenty steel leaching tanks of two hundred and one hundred and thirty tons capacity; also sixteen thousand dollars worth of mining and mill supplies; office furniture, etc. And also, situated at Madrid, N. M., an electric power plant and structural steel building, one eight hundred horse power engine, one 600 K. W. generator, complete switches, etc., etc., for a twenty-thousand-volt transmission, and other property such as is generally used in connection with such a mill run by electricity, including one hundred miles of copper transmission wire.

Also the Albemarle, Pamlico, Huron, Ontario patented mining properties, and the U. M. C. and three-fourths interest in the Red Cloud, containing in all almost one hundred acres and having five thousand feet on the strike of the vein. These mines and the mills are situated at Albemarle, Sandoval County, New Mexico, twenty-four miles from Thornton on the A. T. & S. F. Ry.—the other property at Madrid on said railway.

Bids will be received by the undersigned for the sale of said property, or any part thereof, for sixty days from the date of this notice. For the Madrid power plant property, and the electrical machinery, bids must be itemized, fixing the price to be paid upon each separate article; and, also, separate bids must be submitted for the wire, on account of conflicting interests in the property. The buildings and other property may be removed by purchasers from the premises on which they are located.

A reasonable deposit, certified check or cash, must accompany each bid as a guaranty of good faith and responsibility.

Lists of the property and all other information requested will be furnished upon application to the Receiver. WILLIAM SPENCER, Receiver.

P. O. Address: Alhuquerqus, New Mexico.

August 21, 1903.

HIGHEST PURITY--LOWEST COST.
Baker & Adamson Chemical Co, Easton, Pa.

It's THE BEST
(and WE make them.)

The above picture shows one of our Traction Engine outfits in use in Guatemala, C. A.; was used during late war by that Government for transportation of troops and supplies. Engine, 110 H. P.; car capacity, 16 tons each. Can be used on from 5 to 30 per cent grades, depending upon condition of roads. Over 150 in use on this coast alone, and every one a money maker. Let us know the kind of freight you are hauling, per cent of the grades, usual conditions of roads, and we will tell you how to save ½ to ⅓ of your present cost of hauling. You know we also make the best 2 to 75 H. P. Crude Oil Engine, with Improved Generator and Self-Starter, in the market.

Write for our new Catalogue No. 18, and we'll do the rest.

THE BEST MANUFACTURING COMPANY,
SAN LEANDRO, CALIFORNIA.

W. & P. ROOFING.

Best wool felt, thoroughly saturated and coated; elastic, and unaffected by heat or cold; will not rust or drip like metal; unaffected by acid fumes or gases; is not inflammable like shingles. Good for mining plants, mills, factories, warehouses — any place where steam or vapors abound; for roofing and lining dry kilns—will stand heat and insulate perfectly; for dwellings, stables, barns, stock sheds, poultry houses—anything needing protection from sun and rain. Lowest in price; best, irrespective of price. If interested let us send you sample. PACIFIC REFINING & ROOFING CO., 113 NEW MONTGOMERY ST., SAN FRANCISCO.

JOCELYN'S 20TH CENTURY PLACER MACHINE.

HAND POWER.

For use in Arizona, Alaska, etc., where heavy expensive machinery cannot be taken and where water is scarce. Weight about 100 lbs. Made in sections and can be packed on mule back.

Write for Booklet.

A. H. JOCELYN,
1138 Clarkson Street, DENVER, COLORADO.

MORE EFFICIENCY. LESS PRICE.

SAMSON TURBINE

We use a PATENTED NUT LOCK on the bolts which hold the gates in position on the SAMSON. This prevents the bolts from becoming unscrewed and allowing the gates to get out of alignment and wear unevenly, which causes leakage.

WRITE DEPT. "AA" FOR CATALOG.

JAMES LEFFEL & CO., SPRINGFIELD, OHIO, U.S.A.

Obituary.....178

A GOVERNMENT Inspector to protect mining investors is a good idea merely as an idea, but it wouldn't work to any one's satisfaction. There is nothing about a Government Inspector that makes him superior to any one else, and his judgment as to what was or wasn't a good investment or a deserving field, for mining development would be no better than that of another. No man's judgment on such matters is infallible. Nothing but actual development work can determine the value or lack of value in a mine or prospect. It is a notorious fact that the Cripple Creek country in Colorado was "turned down" as being no good by famous mining engineers; so also was Tonopah, Nevada. As to "protecting" the would-be mining investor, if the Government ever starts in that kind of business it will have a big contract on its hands. There are a hundred ways for the unwise investor to drop his money besides unworthy mining investments, and as a cold fact it is extremely probable that there is less lack of legitimate investment proportionately in mining matters than in any form of placing money in hopes of profit. Of course there never can be any law, State or Federal, against any one making a fool of himself and many are constantly abusing such privilege.

THERE is a difference in procedure in United States Land Offices, in different States, as to requirements. Ordinarily in the case of plats on mining locations the several Surveyor-Generals of the different States deem that the letter and spirit of the law is observed in simply requiring that but one plat be placed in the case of where there is more than one mining claim in a group, and that were there forty mining claims in one group one plat would suffice. In the case of the Surveyor-General of California precedent and custom seem to make it obligatory in his office to furnish the locator a separate plat for each location. This, of course, involves considerable extra office work, but in the early days of California it was deemed necessary and desirable, and the custom has been followed through the years. It is noticeable, also, that there is some latitude in the matter of fees. While in some States from $30 to $35 is charged for this plat, and even then but one plat furnished for the entire group of say ten or twenty locations, in the office of the Surveyor-General of California there is a charge of $25, but no extra charge for the additional plats furnished for use, though as stated, the requirements of that office are that there shall be a separate plat for each location in the group.

American Miners Abroad.

"You don't appreciate the United States till you've been away awhile," is the keynote of two letters received this week from two eminent mining engineers—one just returned from a South American mine management, the other from a still farther location. Both go into detail to the effect that nothing but unusually high wages should tempt an American mining engineer to go to foreign lands, and even then it is questionable if such self-ostracism pays in the long run. The returned South American declares that the high salary he was paid did not make up for the inefficiency of his assistants, the constant vexation and annoyance, the general lack of much that the American takes as a matter of course, and the enforced delay so galling to any one who wants to see quick results. Indeed, much of his plaint is a statement that the best things in this life are not paid for in money, and that there is a whole lot to a position besides the salary connected with it—all of which has been said and sung before. When a man exiles himself he is supposed to take all that into account beforehand. The most noticeable part of the statement is where he says: "A great lure to the young American mining engineer, and the professional man generally, is the great chance to make a fortune in these countries. I have found this to be a myth. I can do more with $10,000 in the United States than I could with $100,000 in any part of South America that I visited, and do it five times as quick. All our Western mining States hold just as good mining and milling propositions as can be found in Mexico or South America."

There are many good mines in both countries mentioned that have long been worked with profit, and there is abundance of virgin ground that awaits development there, as well as an abundance of abandoned mines that could be made to pay handsomely under modern mine management. The same remark will precisely apply to this country as well. One need not go out of the confines of his own county to call to mind several good mining prospects that need only capital and intelligence to make them pay. Manifestly, then, there is abundance of raw material, and what is needed is skill and money—two things that are always sure of reward the world over.

The chief inducement to an American mining engineer, manager or superintendent is the usually higher salary he gets abroad; but when the increased expense and annoyance is reckoned, and the deprivation often of much that goes to make life comfortable or endurable, it is sometimes questionable if one betters his condition by going outside the national confines. To the average unmarried man the chief attraction or incentive is the change, the opportunity to "get experience," and a little of that old romantic taste of adventure. The American, whether miner or anything else, is a good deal of a nomad; we are all wanderers; a touch of the Arab is in us all; but there comes a time when the love of travel gives way to a homelier feeling. Many times mining engineers have said to the writer: "I would rather take considerably less salary and stay, for I am tired of rambling the earth over; I have friends and acquaintances here, and I would much prefer to remain; but I have the skill, they want me bad enough to pay me more than I am getting, and so I go." A man with others dependent on him feels that he must sell his skill in the highest market, and many a man is self-exiled because of such devotion to duty.

The other, who writes from a land where in the heavens the Southern Cross takes the place of the North Star, says about the same in effect as the returned South American, emphasizing his experience that the versatility of the American miner is painfully absent where he has charge; that only one thing can be expected from one man, and not much of that. While a miner in the United States can, when required, do a variety of things—be equally clever at blasting, timbering, tunnel work, sinking, looking out for swelling ground, taking care of himself and those around him, at a pinch being somewhat of a carpenter, fairly well acquainted with country rock and its attendant conditions, quick to note and put into practice possibilities of development and profit, and ready to take advantage of existing conditions and new phases as they arise—a parallel is drawn to the disadvantage of those with whom that writer is at present associated; the assertion being made that the cheap man is often dearest, and that one alert, quick-witted man is worth a dozen of the kind that see only what is before them—and that but dimly—and whose horizon is bounded by their daily wage, without hope or care for the future, and with no ambition as to progress. He says that the only redeeming feature about them is that they don't strike, and implies that even an occasional display of desire in that direction would relieve the monotony. (If he were managing a Colorado or California property at present he would have little to complain of in this latter connection.)

The flattering reference to the American miner's adaptability is deserved. The miner who does his thinking and talking in English is usually equal to anything that calls for immediate attention. It is all in the day's work, and he will sharpen a drill, lay out a ditch, upraise on a stope, follow the vein, build an ore bin, charge a furnace, make an assay, or boss the boarding house with equal facility. If he can't do it he will tackle the job anyhow, and is at all times ready with advice and opinion. That is the distinctive difference, and, though he has the faults of his good qualities, it is no wonder that the mine manager in foreign climes sighs for the swift dexterity and readiness that he is familiar with in this country.

The most noticeable point that these two correspondents make is where they both say in almost exactly the same words that so far as their experience goes there are better chances for capital and skill, for profitable mine development and permanent dividend producing propositions right here in this country than anywhere else. This may or may not be so. It is too sweeping a statement to be accepted, but certain it is that the resources of this country offer at least as good a field for the investor or mine manager as any other section of the globe.

We would not be human to omit another statement that both of our correspondents make, viz., that they never fully realized what a help to the mining engineer and manager the MINING AND SCIENTIFIC PRESS was till they read it in foreign lands, and got others in their employ to read it, the South American saying particularly that the improvement in the quality and quantity of the work was noticeable among those who read this journal. That, however, is usual, and is one of the things that has often been told us before, but which, of course, is always pleasing to be told, not in a flattering way, but by reason of its truth. Many times through the years mine managers, owners and superintendents have been kind enough to say that they knew of no better investment than to put out half a dozen extra copies of this journal among those with whom they were in daily association, to the ultimate good of all concerned. It is a part of the province and purpose of this journal to lay before its readers modern methods, devices and machinery, to the end that economy of operation may result in greater profit, and that the work may be carried on with less trouble and more satisfaction all round.

There is nothing easy about mining, no matter what part one plays in the great industry, and in the operation and management of a metal mine so much depends upon intelligent co-operation that no wonder the mine managers whose correspondence is here cited lay stress upon the kind of assistance that they miss in those with whom they are associated.

It is, however, to be borne in mind that efficiency in mining methods is not wholly to be claimed by the miners of any country. Many a good miner has come here from across the sea, able to see and oversee to his and others advantage. "Everybody is wiser than anybody," and possession of exclusive knowledge is not the sole attribute of any race or nation.

CONCENTRATES.

VOLUME for volume, carbonic acid gas is 2¾ times as heavy as marsh gas.

THERE is a total of nineteen coal mines operating in South Africa, producing nearly a quarter of a million tons of coal monthly.

THE Tamarack shaft in the Lake Superior copper district is nearly one mile in vertical depth, and the ore therein grows leaner with depth.

IN the case of a heavy sphere, 8 inches in diameter, being put into a conical vessel filled with water, the vessel being 10 inches diameter and of 12 inches altitude, there would be a displacement of 210 2 cubic inches of water.

WATER can be heated to any temperature that is possible to be produced by the sufficient pressure requisite for the stated temperature, but cannot be heated to a higher temperature than 212° F. under atmospheric pressure.

THERE are several long flumes in California. One at Madera is 53 miles in length, and has besides 18 miles of feeders. It is V-shaped, is 46 inches across the top; 36 inch sides, has a daily capacity of floating 400,000 feet B. M., and cost $270,000.

SCRAP PLATINUM will dissolve only in aqua regia, which is a mixture of three parts strong hydrochloric acid and one part strong nitric acid. After dissolving, the excess of acid is evaporated and the resultant platinum chloride crystallized out.

MISTAKES in our contemporaries are rarely noticed: we are too busy trying to keep mistakes out of our own columns to have time or space to devote to the errors of others. Every one is supposed to do the best he can and as near right as he knows how.

THE finding of gold and tin together in place is a rare occurrence. It is said that such a combination has been noted at the Royal Tasmanian mine, in the northeastern part of Tasmania. A similar occurrence is reported from Nigger Hill, South Dakota.

A QUARTZ MILL handling free-milling gold ore is not a "reduction works," according to the decision of the District Court at Reno, Nev., in the case of the Miners' Union vs. J. W. Phillips, in testing the Nevada eight-hour law passed by the last Legislature.

FIGURING a profit of $1 per ton on $6 ore where the cost of freight and treatment is $5, is only theoretical. In practice not over 90% metallic extraction could be counted on, and if the costs and receipts made even, it would, in the case specified, be good work.

IN the Moebius process of refining silver, the metal is deposited from a solution of its nitrate by a heavy electrical current, coming down in the form of loose crystals, which are brushed off the cathode and caught on muslin trays. The process is a commercial success.

THE Panama fee for taking up a mining claim is $10; the tax title costs $150. To "denounce" three pertenencias costs $500 for each pertenencia. The annual tax on each pertenencia is $40, whether it is worked or not. A "pertenencia" is a rectangle 1968 feet long and 797 feet wide.

A MAN can not be made a stockholder in a concern against his will, and the fact that his name was put upon the books of the company, either by mistake or otherwise, against his knowledge or consent, would go far toward exonerating him from any liability as a stockholder in that concern.

OZOCERITE (ozokerite) is a mineral wax having the appearance and consistency of wax or spermaceti. It is essentially a paraffine, being mainly of a higher member of the series; is colorless to white when pure, but often leek-green, yellowish to brown; occurs in beds of coal or associated bituminous deposits.

COBALT OXIDE is produced in the United States to the annual amount of about 14,000 pounds; five times that amount is annually imported. Most of the American cobalt comes from Mine la Motte, Missouri. It is prepared for commercial use at the American Nickel Works, Camden, N. J. It is used by makers of enamels and paints; there is scarcely any general demand for it.

THE melting point of silver is 954° C. It is the best conductor of heat and electricity of any of the metals. Taking silver at 100 the conductivity of gold would be, for heat, 53.2; of copper, 73.6. Silver is readily dissolved by nitric acid. Sulphuric acid attacks it only when concentrated and boiling. The surface only is attacked by hydrochloric acid, covering it with an impervious coating of chloride.

A TRIPLEX PUMP, cylinders 4 inches by 6 inches and making 74 revolutions per minute, will discharge 19.3584 cubic feet, 144 36 gallons of water per minute. For a 32-mile electric transmission for the delivery of mechanical power the constant current transmission would require dynamos and motors of two kilowatts total capacity, and for the delivery of low-voltage current dynamos and motors of three kilowatts capacity for each kilowatt of working capacity.

THERE is no legal limit to the number of mining claims one may file on public mineral land in the United States, nor to the number that may be so held provided the requisite annual assessment work is kept up. In Mexico the owners of a mining property may ask for an increase of the number of their claims, and for this purpose must subject themselves to the proceedings laid down for application for a concession.

IN every field of engineering the fundamental principle that limits progress in promoting efficiency is: Improvement may be carried to that point at which further advance will cost more than the gain, and at which a lesser efficiency would mean a sacrifice of economy more than equal to the saving in cost. A particular improvement will thus find its limit in application under given conditions at the financial critical point, however successful, practically, it may prove to be.

STEAM may exist in three forms; it may be wet saturated steam, or dry saturated steam, or superheated steam. The steam consumption of the engine will manifest influence by the nature of the steam supplied. If the boilers furnish very wet steam a large amount of entrained water is necessarily carried through the engine. Excessive condensation in the steam drum and feed-water heater can be remedied by having an exhaust steam separator fitted to the exhaust pipe after it leaves the feed-water heater.

THE California State Miners' Association is intact, and not wholly inert. It does the most of its work through committees, and on the activity of those committees depends largely its power. The work of the committees is assumed to be continuous, and but little is done at the annual conventions beyond hearing the reports of those committees and electing officers, though the convention voices its sentiments and outlines its policy for the ensuing year by the kind of resolutions passed. The Association has been of great benefit and the days of its usefulness are by no means ended.

SILVER SULPHIDE may be completely reduced by fusion with niter, but it is not acted on by sodium sulphate or lime. With potassium chlorate one-third of the silver is reduced to metal, the remaining two-thirds being converted into chloride. Sulphide of silver when roasted with common salt is partly converted by the joint action of sodium chloride and oxygen into silver chloride. Sodium sulphate is formed at the same time. At a red heat chlorine will quickly attack silver sulphide; in the cold chlorine water acts upon it slowly, with formation of silver chloride and sulphuric acid.

IT IS possible that the difficulty mentioned in the chlorination method may be because of impure chlorine. The chlorine so used should contain no hydrochloric acid, which dissolves the oxides, and tends to spoil the gold solution. In the case of sulphides it will form hydrogen sulphide and tend to precipitate gold from the solution. Then, too, if there be any substance in the ore likely to be attacked by free chlorine the best results of the method cannot be secured. The question hence involves not only the chlorine used, but the suitability of the ore itself to the chlorination process.

CONDENSED FOOD has been advertised for prospectors and others who have to pack their own "grub," but dessicated eggs and concentrated beefsteaks do not satisfactorily take the place of beans, bacon and coffee. These faddish foods are all well enough where one can discard them at will, but on a prospecting trip, while they may be taken as an experiment, it were not well to trust wholly to them. Nothing has thus far been found to fill the place in the prospector's outfit so long and usefully occupied by the sack of flour, the can of baking powder, the side of bacon and paper of coffee, which are good old standbys, coupled with what can be got along the way.

IN the sense that one speaks of a "current" of water there is no such thing as an electric "current," yet that term is used in want of a better one in talking or writing of electrical power or transmission. The word "current" embodies the idea of flowing velocity—weight, momentum. And when applied to the consideration of electrical phenomena one can hardly divest the word sufficiently of its accepted meaning to correctly indicate the action or function of dynamic electricity. Used in its electrical sense, then, the word "current" may be considered as expressing generally a condition or relation of electrical forces supposed to be in progression; an axis of power in every part of which both electric forces are present in equal amount.

A SINGLE LEATHER BELT, 1 inch wide and running at the rate of 800 feet per minute, will transmit 1 H. P. A double leather belt will transmit at this speed 1⅔ H. P. per inch width of belt, both pulleys of the same diameter going 180° contact. All belts over 12 inches wide should be made double. The old theory that atmospheric pressure caused a belt to adhere to the smooth surface of a pulley has been partially discarded, although the pressure of the atmosphere certainly does increase the coefficient of friction. The grain side of the belt should be next to the pulley. To determine the horse power a single belt will transmit when the arc of contact on the smaller pulley is 158°, divide the speed of the belt in feet per minute by 800, and multiply the quotient by the width of the belt in inches; then multiply the product by .92; the result will be the approximate horse power the belt will transmit.

THE maximum amount of water a pump can deliver per day is understood to be its "capacity." A pump of 3,000,000 gallons capacity is one that could raise 3,000,000 gallons of water in twenty-four hours. The work done by the pump is further determined by the height of lift or the pressure that it maintains. A pump of 3,000,000 gallons capacity lifting water a height of 100 feet would be of 1,500,000 gallons capacity if the height of lift were 200 feet. The power of a pump is the number of H. P. it can deliver; 1 H. P. is the performance of 550 foot-pounds of work in one second. If 1,200,000 gallons of water were to be raised through a height of 230 feet in twenty-four hours, the weight to be lifted in one second would be 116⅔ pounds and the power required 48.6 H. P. The effective power of the pump would have to be much higher, for work is lost in overcoming frictional resistances due to the flow in the pipe as well as the pump cylinders.

TO DETERMINE "the right price" for a gasoline engine is a difficult matter. The price of a gasoline engine, like that of any machine, depends primarily on the material used, and the amount and quality of work put on it. "Cheapness" is a relative term. The question for the purchaser to consider is: what he wants. One good way to get the right kind of an engine is to write to a reliable manufacturer, giving in detail just what the engine is expected to do; the kind of work planned, explaining at length the use to which the engine is to be put. It is necessary for the manufacturer to have this information, that he can recommend the kind of engine best suited to the stated requirements. And, as in everything else, if one wants a good article he must pay a good price for it. A high-grade, well-built machine will prove the cheapest in the long run, if special work be required.

SILVER CHLORIDE in nature is the mineral cerargyrite. It may be produced artificially by adding chlorine water or a solution of a soluble chloride to a solution of silver nitrate or sulphate, and washing and drying the precipitate. In this way it appears as a snow-white anhydrous powder, which blackens when exposed to light. It will fuse at about 360° C., forming first a yellow liquid and then a thin red one which will quickly permeate an ordinary clay crucible. It will volatilize slowly. When it solidifies it is of a pale yellow color, waxy or horn-like, and partially transparent. Silver chloride is almost insoluble in pure water; it will dissolve unchanged in ammonia water, will not dissolve in cold nitric and sulphuric acids, but is decomposed by both acids in the concentrated condition. Among metals zinc is considered the best reducing agent for silver chloride, and that method is often employed in establishments using the nitric acid process.

A DRAWBACK to the use of fine ore in the blast furnace is the large escape of dust from the furnace mouth, due to the strong air blast, the pressure of which must be increased in proportion to the size of the furnace, if the latter is to be driven to its full capacity. This loss, which in a 600-ton furnace will rise to forty or fifty tons per day, can be considerably reduced by using briquetted ore instead of the loose. In this regard it must, however, be remembered that any substance that can be used to make the particles of a mass adhere, when compressed at ordinary temperature, or at a comparatively low heat, loses its binding force at or even below red heat. Hence, some briquettes, instead of remaining whole until they melt down, have a tendency to crumble and spread while passing through that zone of the furnace where the formation of gas pockets might occasion unsatisfactory results. If the fine ore be fritted into hard lumps before being charged into the blast furnace, such lumps might become sufficiently tough to hold out until melted down.

CONCERNING the condition of copper mill plates, evidently too much cyanide of potassium has been and is still being used on the plates. Cyanide hardens the plates and renders them unfit for amalgamating gold. Plates may be annealed by applying moderate heat—enough to cause dry wood or sawdust to smoke. This softens the plates and they are then in better condition to amalgamate than before. A very good remedy for plates which continually become discolored with copper salts is to keep brushing them frequently and allowing the plate to accumulate a quantity of gold amalgam, which forms the best possible surface for collecting more gold. They should then not be scraped with chisels or steel scrapers, but with rubber only. In some cases where copper plates tarnished badly, a remedy has been found in placing strips of iron or zinc on the plates (heavy enough not to be moved by the current of water and pulp); this forms an electro, or galvanic couple, and has the effect of stopping discoloration of the plate in some cases.

Lifting Water by Compressed Air.*

The complete apparatus necessary for the successful raising of water hy the air lift system consists of an air compressor and the necessary air regulators; an air tank or receiver large enough to furnish a steady flow of air to the well, and to hreak up the pulsations of the compressor; a pressure gauge and valves suitahle for regulating the pressure and flow of air, and the necessary length of pipe of the proper sizes. In order to enahle the well to work successfully and economically the pipe should he properly proportioned. When the pipe is too large the water is apt to blow out in a spray and with great force, which is ohviously very wasteful hoth of air and water. When the pipe is too small the air is apt to rise to the surface of the water in small hubbles, and without producing the desired results. When the air pipe is outside of the water pipe, I have found the proper relation hetween the diameters of the air and water pipes to he as 1½ to 4, which gives a ratio of actual cross-sectional area of 6.24. When the air pipe is situated inside the water pipe the same ratio of actual cross-sectional areas should ohtain, and in this case the diameter of the water pipe is

$$D = \sqrt{\frac{a \times 6.24 + A}{.7854}}$$, in which a and A represent

the actual internal and external areas of the air pipe. The proper areas of the air and water pipes, together with the required depth of suhmersion and the introduction of the air into the water pipe at the proper point, are the principal factors which determine the success of the air lift.

The water pipe should he suhmerged to a depth of 18 inches for each foot lift above the lowest water level in the well; in other words, the hest results are obtained when suhmersion = .5, the lift heing measured from the lowest or the working water level, as it is called. It will be seen that the depth of suhmersion for the hest results should not he less than 1½ times the total lift measured from the working water level.

When the well is heing worked the water level falls helow the level reached before water is pumped out. To illustrate the foregoing rule, suppose we wish to elevate water 25 feet above the surface of the ground, and that when drilling the well, water is ohtained at a depth of 40 feet helow the surface. The lift is now 40 + 25 = 65 feet. Applying the foregoing rule for depth of submersion we have 65 × 1.5 = 97.5 feet, or practically 100 feet, thus giving a total height of 165 feet from the point where the air enters the water pipe to the point of discharge. After drilling to a depth of 165 — 25 = 140 feet, we are ready to find the working water level in the well. First put the water and air pipes into the well; then drop a float attached to a string into the well. Pass the string over a pulley and attach a weight to the free end. The weight should he just heavy enough to take up the slack in the string and at the same time allow the float to descend with the water level as the latter is lowered by pumping. The distance the weight rises will indicate the depth of the working level below the level first ohtained in the well, and the latter level should he employed when making calculations involving lift and depth of suhmersion.

A simple and convenient arrangement for measuring the fall of the water level in the well can be made as follows: Take a pulley whose circumference is twelve times the circumference of the shaft upon which the pulley is mounted; then wind the float string around the pulley and fasten another string to the shaft, so that it will he wound on the shaft as the float string unwinds from the pulley. It will be seen that this arrangement reduces the travel of the string on the shaft to a convenient distance and one that can easily he measured. Suppose the water level in the well falls 10 feet. The corresponding additional depth of submersion will he 10 × 1.5 = 15 feet, and if the well is not deep enough it should be drilled to a sufficient depth to permit the increased depth of submersion to be obtained, and this is done in order to make the total depth of suhmersion equal to 1½ times the lift, which proportion, as has been pointed out, is necessary for the hest results. If it is not practicahle to increase the depth of submersion after finding the working level, the height of the lift may he decreased a corresponding amount; otherwise the efficiency of the lift will be to some extent affected. If the well had been drilled deeper than necessary at the outstart, the increased depth of submersion could readily he ohtained hy simply lowering the pipes to the required depth. It will he seen that the lower water level in the well also determines the necessary change in the point at which the air should enter the water pipe. With a fall of 10 feet when pumping, the air should enter the water pipe at from 38 to 40 inches from the lower end of the pipe; with a fall of 5 feet the air should enter at from 24 to 26 inches from the lower end of the water pipe, and with a fall of from 1 to 3 feet it should enter at a point of 18 to 20 inches from the lower end of the pipe. For other distances the same ratio may be used. A well put down to the depth previously determined and fitted with pipes of the sizes indicated by the rule can be cemented over and huildings erected over it without fear of trouhle, because the well will need no further attention, and all that is required is simply to supply it with air as long as the pipes last. A numher of wells can, of course, he operated from the same compressor. The necessary machinery can be located in the engine room or in any convenient place, and the air pipes run to tLe different points of distrihution.

Coming now to the question of air required for raising water, it is estimated that 1 cubic foot of air will raise one gallon of water, hut in wells that are properly proportioned there will he a saving over the amount of from 40% to 47%; that is to say, the air used will be 60% of the ahove estimate as the maximum and 52% as the minimum. This serves to illustrate the fact that wells vary, as, for instance, along rivers, where the water rises and falls, causing the water level in the well to fluctuate. To illustrate the application of the rule for volume of air required, if we wish to raise 100 gallons of water we shall need 60 cubic feet of air as the maximum and 52 cubic feet of air as the minimum, the required volume carrying from the maximum to the minimum according to the conditions in each individual case. The average air pressure is sixty pounds per square inch. When starting to raise water it requires a somewhat higher pressure because there is a solid hody of water from the surface in the well to the point at which the air enters the water pipe, and this column of water has to he moved hy the first discharge of air. When the well has reached its normal working condition the water pipe will contain a numher of short columns of air and short columns of water. These short columns of air and water are discharged alternately, and in the pipe they form a continuous chain, the intermittent discharge continuing as long as the proper amount of air is supplied and as long as there remains water to he pumped.

The principle upon which the operation of the air lift depends may he explained as follows: The pressure of the atmosphere heing 14.7/10 pounds, in a perfect vacuum water can he lifted to a height of 34 feet. We know that as the water piston is drawn forward in the cylinder a partial vacuum is created hehind it and the pressure of the atmosphere on the outside of the suction pipe causes the water to rush into the latter. The suction valve then closes and on the return stroke the discharge valve opens the piston, forcing the water to a higher level.

In the air lift pump the pressure of the atmosphere is not removed from the surface of the water in the pipe, as it is in the suction pipe of an ordinary pump. We have the atmospheric pressure on the surface of the water outside of the well and also in the pipe. The short columns of air previously mentioned act as pistons in the air lift pump, the propelling force being that due to the difference in specific gravity between air and water. The specific gravity of a solid is the difference hetween its weight and the weight of a like volume of distilled water at 39.2° F., the weight of the water generally heing represented by unity, or 1. Taking the weight of water as 1, the specific gravity of air is .0012. Air being elastic and compressed to 3, 4 or 5 atmospheres, as the case may be, when liherated under the water is found to be very huoyant, and, as expansion is confined to the limits of the pipe, it forms a large hubble and carries the water above it to the surface, the air column hecoming longer as it ascends on account of the removal of the weight of water ahove it, thus allowing the air to continue to expand, until finally it flows from the pipe a little above atmospheric pressure. It will be seen that the water which is removed by the air lessens the weight of water in the pipe, or, in other words, the weight of the column in the pipe is less than that of a similar column outside of it. This in turn causes the water to rush in at the bottom, because of the greater weight of the column on the outside. Other buhbles are formed, thus causing a continuous chain of short columns of air and water as long as air is supplied. One important advantage to be derived from the use of the air lift pump where water is to be used for condensing purposes or domestic use is that the air during expansion absorhs heat, and this tends to lower the temperature from 2° to 4° F.; that is, water having a normal temperature of 50° in the well will have a temperature of from 48° to 46° when discharged.

There is no particular advantage to he gained by employing special arrangements for introducing the air into the water pipe. The air may enter from the side or at the center with equally good results. The economy of this system can be figured out by any engineer without much trouhle, because ahout all that is necessary is to find out how much steam will he required to compress 1 cubic foot of air to the required pressure, which may be taken at sixty pounds when making calculations.

*Condensed from a paper read by G. C. H. Freidrich before the Ohio Society of Mecbanical, Electrical and Steam Engineers.

THE volcanic ash deposits in Nebraska were partially worked last year to obtain pumice, the product, about 100 tons, heing used largely in the manufacture of soaps and scouring powders.

Some Structural Features of the California Gold Belt.

NUMBER IV.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Ahout 6000 feet east of the system of fissures at Sutter Creek, which were described in the last paper, is situated the Baliol mine. This property has developed structural features of unusual character and interest. The rocks occupying the country intermediate of the Baliol and the Mother Lode consist of schistose and massive greenstones, slates and quartzites and grano-diorite. The metamorphic rocks (slates and quartzites) helong to the Calaveras formation. The rocks in which the Baliol ore deposits and veins occur are wholly amphibolite schist, which are the result of alteration of an ancient tuff, as shown hy microscopic slides made of this rock. The schist strikes ahout N. 20° W. The ore hodies occur as a series of quartz veins, mostly less than 4 feet in width—usually less than 1 foot—the intervening schist being impregnated with silica and containing from ½% to 3% iron sulphide. In some places the percentage is much larger, hut it will average ahout 1½%. These sulphides are auriferous, running from $25 to over $200 per ton, and averaging in the pay zone ahout $30. There are, however, some mineralized shoots where the values are much lower. Free gold accompanies these sulphides in greatly varying proportion. The ore hodies occur as a series of rudely lenticular impregnations, and do not conform ahsolutely with the strike of the schists, hut have a more westerly trend going northward, cutting the formation at an angle of 10° to 15°. Generally speaking, there are three distinct zones of mineralization, though in some places there are more—a hroad zone sometimes splitting up into two or more separate ones. In places the zone of mineralization is over 40 feet wide.

In dip the ore hodies appear to conform closely with that of the inclosing schists. The vein quartz is white, crystallized, with many vugs, and often a comb structure. The intermediate silicified schist is grayish and granular, resembling the texture and general appearance of grindstone, which has led to the rock heing called "grindstone" hy the miners. This is a condition common in the Utica and other mines at Angels, in Calaveras county, Cal. The "grindstone" forms the hest ore found in the mine. The Baliol has been developed to a depth of 700 feet (the lowest level), though the shaft is down 800 feet. The condition on the several levels is essentially the same, though no large hodies have yet been found below the 500-foot level. However, the highest grade rock has been discovered in the lowest level, though work was discontinued hefore a large ore hody, which prohably does exist, was found. There are numerous later fissures (crossheads) cutting the formation and the ore deposits and displacing them. The most peculiar and interesting geological feature, however, is the sudden disappearance of mineralization in certain portions of the mine, upon the floors forming the jointing planes of the rock. These floors lie nearly horizontal, and a large ore hody—20 to over 40 feet in width—will be found "cut off," as if hy a fault, though no displacement has occurred. At a higher or a lower level, in the same zone, the mineralization reappears, similar in character and value to that above or helow. This is known to he the case in at least four separate instances. An occurrence of this kind is somewhat discouraging to the owners of a mine, but it cannot be said that such geological phenomena render a mine more difficult to develop or to operate than those ore bodies of erratic distribution in limestone. Indeed, it is actually less so, as the ore bodies occur with more or less regularity, and within the same zones, repeatedly.

There are no gouges connected with the ore hodies excepting those resulting from movement subsequent to the mineralization of the several zones, and these, in some places, occurring on the walls, may suddenly swerve from their course and cut across an ore hody or leave it entirely. The mine makes comparatively little water considering the development, though varying considerably with the seasons, heing most abundant in the winter and spring months.

The minerals occurring in the Baliol mine are quartz, calcite and pyrite, with small amounts of chalcopyrite, galena and gold. In one vein a quantity of molyhdenite occurs with coarsely crystallized pyrite, but the ore body contained very little gold. Silver also is present with the gold, the hullion heing worth from $17 to $18 per ounce. The gold is generally very finely distributed, hut bright and easy to amalgamate on good plates. Ahout 160 tons can he crushed daily in a 40-stamp mill. Large amounts of ore were cheaply mined by open cut system in the early history of the mine, but the expense is considerably increased in the deeper levels which require in most stopes heavy timbering, though swelling ground, such as is found in the Mother Lode slates, is unknown.

An Arizona Gold Mill and Cyanide Plant.*

Written for the MINING AND SCIENTIFIC PRESS by ARTHUR H. HALLORAN.

The recognition of Arizona's importance as a gold producer is evidenced by the constant building of so many plants for the treatment of gold ore throughout the Territory. A noticeable recent installation is that of the Golden Link M. Co. at the Sultan mine, 18 miles west of Hillside, Yavapai county, Arizona.

This mine is about a mile from the Santa Maria river, and all water for the recently completed 20-stamp mill and cyanide plant is pumped from a tunnel run under the river bed to tanks 500 feet above.

The question as to the site of the mill was an interesting one. The tunnel levels of the mine are on the canyon side, 600 feet above the river. The mill could be located either at the river, involving the construction of 5000 feet of aerial tramway, or it could be located at the mine, involving a pumping plant and pipe line from river to mine. After some figuring, including cost of construction of road and hauling of all materials of construction, the latter plan was adopted, and the ore is now trammed either first into a 200-ton ore bin or directly to the grizzlies and rock crusher.

The mill was constructed under the supervision of C. E. Bunker and is designed to represent an advanced type of mill construction based upon California experience. The main driving shaft is located behind and below the mortars and is belted to the two driving wheels of the cam shaft, each capable of running independently of the other. Noticeable features due to construction are economy of ore handling by gravity, ample light and particularly the massive concrete retaining walls and concrete floors.

The engine room, boiler room and a machine shop are placed to the side and about 3 feet lower than the table floor. Oil for fuel is hauled 18 miles from the S. F. P. & P. R. R. and stored in iron tanks above the mill whence it is piped by a fuel oil circulating system to the boilers. A tandem Corliss engine is direct connected by gearing to a three-phase alternating current generator of 2300 volts full load with 12 5 amperes. This supplies current for incandescent lighting and for running a 20 H. P. induction motor, 220 volts, 50 amperes, direct connected to a 6x10 pump, the latter pumping 200 gallons per minute from the 60-foot shaft and 300-foot tunnel run out under the Santa Maria river to the plant.

As originally planned the cyanide plant was to be placed immediately below and parallel to the mill. But owing to the nature of the ground it was placed about 200 feet lower down the hill, and the pulp from the tables is run through pipes to the leaching tanks.

The equipment of the cyanide plant consists of two 14 feet diameter by 10 feet deep solution tanks shown in the general view, five 24 feet diameter by 5 feet deep leaching tanks, two 10 feet diameter by 6 feet deep gold tanks, two 10 feet diameter by 4 feet sump tanks, two double zinc boxes, cleanup tanks, air compressor and filter presses. An assay office and retort room are under same roof as the cyanide plant.

In constructing this plant, excavations being made and concrete retaining walls and bases being in place, the battery frames and mortar blocks were first placed, then the mill and cyanide plant buildings were framed, after which all equipment was placed as it was received from the railroad. The plates of the leaching tanks were put in place and riveted on the spot. The smaller tanks were made up where convenient and afterwards moved into place. Much inconvenience and loss of time resulted from lack of room for storing materials as they arrived and the subsequent handling of some material in moving to make room for other, and the fact that it could not be stored, where needed, pointed out the necessity for adequate ground for handling supplies.

Following are some details of the construction of the ore bin illustrated in the accompanying photograph. In its construction three beams 12 inches by 14 inches by 30 feet were placed parallel to each other about 7 feet apart, the rearmost one resting on short 12x14-inch blocks, the middle one on short 12x14-inch uprights and the one in the foreground on uprights tall enough to place it on the same level with the other two, the uprights being supported by 12x14-inch timbers imbedded in the ground. A temporary support was then made to the right and the posts of the first of the six upright members were laid so that their lower ends rested on the bin foundations and their upper ends on the supports. The cap and cross piece were then laid in place. In the same manner each of the remaining members were laid on the one to its right. As all are framed from 10x12 inch timbers with templet, before being moved each drops into its place.

A gin pole and windlass were then put up and each member, after its parts had been bolted together, was raised to a vertical position and tied to the next, as is shown in the picture. The whole is then boarded up with 2x6-inch plank.

In constructing such plants the chief difficulties to be overcome are those of transportation, water supply and labor. The climate is rather hard on the men and care as to water and food has to be constantly exercised in order to keep efficient labor.

*See illustrations front page.

Engineering as a Profession.

Engineering is a profession, not an art, or a trade. It is a profession to exactly the same extent as medicine, or the sciences, or law, based upon principles universally true. The knowledge of these principles cannot be acquired by individual experience, or by lucky discoveries. The experience of thousands of generations, the discoveries of ages and ages, logically arranged by the master minds of the past, constitute to-day these very principles. In order to become proficient these principles must be studied, their knowledge theoretically acquired. A trade can only be learned by actual practice. Skill in blacksmithing, or molding can only be acquired by repeatedly performing the various operations of these trades. Add to this skill the individual conception of the work, the imprint of the worker's personality, and the trade becomes an art. In each case the experience of the individual is essential for the success of the work.

But engineering principles are universally true; you must be conversant with the laws of statics before you can build a bridge or a smokestack; the rules on heat must be studied before you do blast furnace or steam engine work. The most skillful application of these principles is a question of experience and talent, as it is also in other professions. An eye specialist will meet with but little success in treating general diseases, a criminal lawyer cannot draw a modern charter, and an electrical engineer will build a poor rolling mill. A further requirement is a mind trained in logic, a mind which is taught to think, to grasp and weigh stipulations, build up mentally a problem in its entirety, all its details, and conceive all conditions governing it and all which are governed by it. We have a number of men, proficient in their respective fields, who have never visited an engineering school, who substitute, as they proudly claim, practice for theory, who have graduated from the shop. These men ought to be proud for having mastered by individual study, perhaps unconsciously, these very principles which are taught in concise and lucid form in our neighboring schools. Such men are the exception—they rank far above the average, both in energy and in mental outfit. And for this same reason I do not like these schools, where they make you an engineer while you wait. We are overrun to-day by such men. We want honest schools, where the average scholar, not the genius, and not the chump, may acquire honest knowledge by honest work, and I, for my part, will have none of these institutions where they spoil good mechanics to make poor draughtsmen, whether they be called evening schools or correspondence schools, or founded for the purpose of advertising so-called philanthropy.

Anybody who does not master these broad theoretical principles is not an engineer. Such a man might be able to copy, to reproduce what he has done before, but he cannot accomplish anything higher. Engineering teaches us as the highest goal to apply known principles to new problems, to do creative work. This ability to do creative work we offer to the world as the reason for our existence. As you see this world to-day, it is the work of the engineer. Where is the progress in the trades, where in art? Greek statues are still the choicest gems of art. Stone masonry and wood carving date back 4000 years. The early middle ages produced masterpieces in wrought iron and bronze, which are far beyond the limit of our modern metal butchers. Slow and conservative has been the progress of medicine, law, and even the sciences have made their progress felt more in a physical than a material way. But humanity was awakened, this old earth all at once swung into a new orbit, when some fifty years ago engineering was recognized as a profession and studied as such. And it is not the man who invents photographs, or talks to the inhabitants of Mars, but the solid rank and file of well-trained, well-balanced engineers, who have wrought in the last hundred years such miraculous, dumbfounding changes, that the whole development of mankind up to that time seems incomparably slow.

The evolutionist has taught us that the rapid advancement of man began with the substitution of artificial tools for the natural implements. If this is true we stand on the threshold of an equally momentous step in the development of the world, dating from the day when the engineer taught man to substitute the vast powers of nature for his own limited little strength.

Engineering is a profession, the youngest one, and in one respect has to learn much from her older sisters. Both the law and medical fraternities watch with jealous eyes over the professional conduct of their members, and while they cannot prevent the existence of shysters or quacks, they take prompt and proper measures to demonstrate the characters of such men to the public. This ethical aspect of his station in the world the engineer seems to have overlooked in his mile-a-minute development. His work, whether as an employe or as counselor of his clients, is a confidential one, requiring not only a mastering of his profession, not only skill in the handling of difficult problems, but a high degree of integrity, which alone can inspire confidence and will lend him that dignity which his profession deserves. The public might be dumfounded by the gigantic, or the daring of your work, but hearing that you are an engineer they will look for the overalls and the oil can. Let us pledge ourselves to guard our standing, to guard our dignity.—W. RIDDLE.

The American Mining Congress.

On Monday, Sept. 5th, the American Mining Congress held its sixth annual session at Deadwood and Lead, South Dakota, the congress continuing throughout the week. The aims of the congress are to advance the mining and metallurgical industries in all their various branches within the United States; to assist in bringing about a more perfect co-operation between the Government of the United States and the development of mining and metallurgy; to encourage education in practical and scientific mining and metallurgy and the dissemination of scientific information in relation to mining and metallurgy and their allied industries; to acquire and disseminate trustworthy information bearing upon the development of the metallic and non-metallic mining resources of the United States; to promote a more co-operative tendency in the evolution of agriculture, mining, manufacturing, transportation and commerce; and for the particular purpose of bringing the mining men of the United States into closer relation with one another and of promoting a friendly feeling for one another through social intercourse and the discussion of mutual interests.

The annual address was delivered by the president of the congress, J. H. Richards, and the usual speeches were made by others, followed by the reading of technical papers by their authors, several of which are reproduced herein.

Ore Deposits of the Northern Black Hills.*

Written by J. D. IRVING.

The Black Hills have been from the earliest time a region of singular economic interest. From the dates when Indian hunting parties visited them to obtain provisions for future use they have gradually increased in importance as a source of wealth, until their production has seen its culmination in the thriving mining industries of to day.

The gradual inroads of the hardy prospector to this Indian hunting ground first attracted attention to the region as a source of a different type of wealth.

In the several steps of its growth, mining in the Black Hills has followed quite closely the lines of its development in other regions. First, the attention of the early prospectors and those who followed them there was given to the more easily accessible deposits—the placers. As the value of these became evident, search was made for the source from which the gold in the placers was derived. The old gravel deposits which lie at the base of the Cambrian formation were then found, and for a number of years yielded almost fabulous sums to those who had located upon them. The impregnated lodes in the schistose rocks were discovered, and the mines which have now become the famous Homestake belt were gradually opened up. The lead-silver ores of Carbonate then became productive, and still further search revealed the beds of refractory siliceous ore, which have of late years become of such very great importance; then the Ragged Top ores were found, and finally a variety of smaller deposits was discovered. Regions where ore bodies were easily accessible at the surface were those first prospected; then those more remote and more deeply buried beneath the covering of barren rocks in turn yielded their contents to the efforts of the miners.

GEOLOGY.—As a problem in geology the Black Hills differ in some respects from almost any other to be found in this country. Surrounded on all sides by a flat and rather barren country whose general character is monotonous and without special interest, the Black Hills rise as an island, presenting within their borders geologic problems of great variety and interest, diverse types of ore deposits, and studies in land drainage, which, from their very isolation and circumscribed character, are easily grasped and understood, and are without the usual complicated connections with the surrounding country that make most geological questions so difficult to comprehend.

In his classic work upon this region, Henry New-

*Trans. Amer. Min. Congress, Deadwood, S. D., Sept. 7, 1903; (condensed).

ton has described the general geological character of the Black Hills as an elevated area, roughly elliptical in outline, comprising a central core of metamorphic crystalline rocks, which are grouped in rudely concentric helts, strata of later geologic age, dipping away in all directions from what is termed hy Newton the elevatory axis or region of the Hills.

Were the strata which originally covered the core of schists which forms the center of the hills still present, we would have an elevated dome of very great height, rising far ahove the level of the surrounding country. The gradual erosion or wearing away, however, of these uplifted rocks has gone on together with their upheaval, so that we have now remaining a country only slightly higher than the surrounding plains. In the center is the uncovered area of the schists, and at the sides the stratified rocks dipping outward heneath the flat prairie land beyond. The general trend of this central core of old crystalline rocks is in a due north and south direction, hut at its northern extremity it turns abruptly towards the northwest, forming a sort of geological cul-de-sac shut in on three sides hy upturned strata, hut separated from the main portion of the core to the south hy a narrow helt of Cambrian rocks and their included masses of porphyry.

Throughout this northern area erosion has not cut so deeply into the crystalline schists as farther south, so that, hesides the helt of enclosing strata, isolated patches of the old covering lie upon the higher hills within the area of schists.

If we examine the rocks which compose the different geological formations which are found in the northern hills, we find there are four groups of importance which can be readily distinguished from one another. The first is the lowest, or series of metamorphic schists. It consists of a series of crystalline mica schists, mica slates, or phyllites, and laminated quartzites. Together with these are found, in the southern portion of the Black Hills, and in the region known as Nigger Hill, large intruded masses of granite, very coarse in its texture, and sometimes containing deposits of tin. In the northern portion of the hills there is no granite present in the series, but its place is taken hy numerous dikes and great irregular patches of a dark, greenish hornhlende rock, termed amphibolite. Bodies of this rock are particularly noticeahle in the vicinity of Lead City, and extend as far south as Custer Peak. It is possihle that they may have had some connection with the occurrence of gold in the Homestake mines, but there is no definite evidence in favor of this theory. The rocks of this series are strongly laminated and everywhere tilted at a high angle. The lamination crosses the planes of original sedimentary hedding, as can he still seen in many places. Numerous closely spaced folds are also seen to exist in the series; hut the high degree of alteration that the rocks have undergone has now almost completely ohliterated their original structure.

The next series of rocks is that belonging to the Cambrian period, and comprises those rocks which lie upon the eroded surface of the underlying schists. These rocks are a heavy hasal conglomerate, or coarse hed of hardened gravel, a thick layer of quartzite, and a series of alternating limestones and shales, with some quartzite—in all a thickness of ahout 300 feet. Ahove these, and still farther out from the center of the hills, there is a yellowish limestone showing purple spots, and helonging to the Silurian age. This is ahout 80 feet thick. Ahove it comes a series of heavily hedded gray limestones, pinkish at the hase and averaging about 600 feet in thickness. It covers the other rocks throughout the entire western portion of the uplift.

(TO BE CONTINUED.)

Pyritic Smelting.*

Written by FRANKLIN R. CARPENTER, Ph.D.

This is a process of smelting applicahle to any raw ores not carrying lead, hut more especially to sulphide ores carrying copper.

From time immemorial man has roasted off the sulphur in pyrite ores and burned his iron to oxide in the open air, thus wasting what pyritic smelters consider good fuel. If it is admitted that a heat unit derived from the oxidation of iron or sulphur will do as much work as one derived from the oxidation of coke, the folly of this proceeding becomes apparent, provided this heat can be utilized. If it can, one might just as well waste his coke in a similar manner.

American engineers derived from Europe two raw smelting processes, which, unfortunately, are often confused. One was the Kongsberg process of pyritic smelting, where raw pyrite was added to the charge simply to produce a carrier, or matte, for the precious metals. This was all I had in view when I advocated pyritic smelting for the siliceous ores of South Dakota. By its means the small amounts of gold and silver in many tons of rock were concentrated into a few tons of matte. This process, broadly, is very ancient—so ancient that we know not when it was first employed. It will be observed later that it is the very opposite of the other class of pyritic smelting, in that the ores treated are siliceous, and pyrite is added for a carrier only.

The other sort of pyritic smelting is the outgrowth of principles discovered by Sir Henry Bessemer in steel making, who found that cast iron might be purified hy the oxidation, or burning, of its own contained impurities. The principles of Bessemer, much modified, are now everywhere applied to the refining of copper matte, where again the oxidation of the iron and sulphur furnish the heat to hurn and slag off impurities, giving us a very pure blister copper at one direct cheap operation, and without additional fuel. This is the heautiful operation of Mahnes, first employed in America by our Butte friends.

After the establishment of Bessemer's process in England, Hollway sought to smelt the Rio Tinto copper sulphide ores hy means of heat generated in the oxidation of their sulphur and iron. A short calculation will show that his conclusions were well founded. Without going into the investigation very fully, we may admit that 1 pound of iron pyrite hurned in the furnace is equal to 2,026 British thermal units, and that this, roughly, is equal to 40% of the value of a pound of carhon burned to CO; hut as our furnaces prohahly hurn perhaps a third of the carhon to CO_2, we may conclude that this value is too high, hence figure it as equal to only 26%, or one-fourth the value of 1 pound of coke, which is certainly a safe deduction.

Those who are interested in the suhject are referred to the forthcoming volume of the Mineral Industry, where E. C. Reybold, Jr., a young man employed at our Golden, Colo., works and formerly with me at Deadwood, has fully investigated the suhject.

For every 4 pounds of pyrite, therefore, hurned in the open air, we have lost the equivalent of 1 pound of good coke. Stated in another way, 4 pounds of pyrite will do as much smelting as 1 pound of coke, and, in so doing, it is smelted and has fluxed itself.

Our hlast furnaces, in ordinary matte smelting, are running with 16% coke, hut a charge containing 64% of raw pyrite should smelt itself; and if this is assisted with a hot air stove, which can he fired with a cheap low-grade fuel, even this percentage of pyrite may he much reduced. The fullest application of these principles has heen made hy Rohert Steicht at Mount Lyell, in Tasmania, where the first smelting is done absolutely without carhonaceous fuel of any sort. Let us now consider for a moment what they do. Their ores are pyritic, and of two classes. The Mount Lyell pyrite is so mined as to maintain a general average as follows:

Fe	40.30%
SiO_2	4.42%
$BaSO_4$	1.48%
Cu	2.36%
Al_2O_3	2.04%
S	46.01%
Ag	2 oz. per ton.
Au	0.0725 oz. per ton.

The second class is a siliceous hornite ore purchased from other mines, and quartz is employed as a flux. This is the direct opposite of the case first considered, calling for additions of silica in the place of additions of pyrite.

The Mount Lyell Co. operates eleven blast furnaces, which are arranged in two smelting plants. Those employed in the first smelter are five in number and are 42x210 inches at the tuyeres. The height of the ore column ahove the tuyeres is maintained at 9 feet and 6 inches. The other plant consists of six furnaces, five of which are 40x168 inches at the tuyeres. The tuyeres are all 3 inches in diameter, and the larger furnaces have thirty-two each, the smaller ones twenty-four each. In the first set of furnaces all the ore delivered at the plant is smelted, without roasting and without fuel, to a first matte carrying 15% copper. Formerly a hot hlast (528°) and 3% coke were used. But for a year past the coke has heen ahandoned and the hlast only warmed. No difference was noticed in this change save a greatly increased capacity; three furnaces now doing the work of four under the old method.

The matte from this first smelting is resmelted in the second set of furnaces to a 45% to 50% copper matte, which goes directly to the converters.

The process is, therefore, divided into three stages, all of which are oxidizing, and which may he said to he almost continuous Bessemerizing from beginning to end. Disregarding the time for cooling and transportation from one department to another, the time consumed from ore to copper is only six hours, and this is accomplished almost without extraneous fuel.

In the first smelting no limestone or coke is used, and but a slightly warmed blast. In the second smelting a small percentage of coke and limestone is used and a cold blast. The third stage is simple Bessemerizing or converter work.

These results having been attained at Mount Lyell by the application of principles long advocated hy pyrite smelters, there is no longer any reason, in my opinion, why the same or similar results cannot he had at Sudhury, Ontario; Ducktown, Tenn.; Keswick, California; and in Arizona and New Mexico, in fact, at any place where the ores carry sufficient pyrite, or pyrite can be had from outside sources.

The Potsdam Formation of Bald Mountain District.*

Written by JOHN BLATCHFORD.

In describing a portion of this formation I shall only touch on the geological part of it, describing the occurrences of the ore hodies in this formation. These ores were first discovered in 1877, hut there was very little done on them until 1890 and 1891, hecause up to that time all of the ore had to he hauled by teams and shipped out of the country to be treated. In the latter part of the summer of 1891 the Burlington and the Elkhorn Railroad Companies placed a numher of spurs into different mines, after which the work hegan in earnest. At that time it was not known how extensive those ore hodies would prove to be, hut, after continuous work for twelve years, we find that they are almost unlimited. Ores that we could not look at years ago, on account of their low grade, can he handled to-day, with our new reducing or cyanide processes, at a profit.

In some places in our mines the flat ore hody is known to lie and to he intermixed with a vertical ore hody, not showing any division hy quartzites. It is one of the occurrences which causes me to helieve that there are a numher of these vertical ore hodies, or quartz ledges, that are covered up hy this sedimentary formation. For instance, quite a portion of the Homestake ore hodies have heen more or less covered by this flat formation; hut in other places the flat portion, heing more or less eroded, left the vertical portion to he more easily prospected than it is in Bald mountain district. The eastern houndary of the flat formation hegins at the original Golden Reward and Buxton, and almost at the base of Bald mountain on the north, and to the west of Sugar Loaf mountain on the south. It starts with a thin layer of quartzite, lying on the schist, covered with sandstone and shales. It gradually thickens toward the west, not so much because the hill rises, but because the quartzite and schist drop. It drops variahle distances at various places until it is several hundred feet helow the surface, making a number of layers of different material. Ahove it, on and between some of these layers is where we find what is called "top contacts."

As we get nearer Terry's peak, the flat formation thickens more by the rise of the surface than by the fall of the quartzite, and, west of the peak, it keeps this increased thickness for a numher of miles. Towards this rise or thickening of the formation is where the top layers of ore hecome more numerous. How many layers, or so-called contacts, there are has not yet heen determined. There is continually something new cropping out.

In these upper layers we usually find a vertical, or crack, filled with ore, extending downwards for hundreds of feet, with a numher of lense-like hodies of ore hranching out at different intervals, in some places connecting with hodies from nearhy verticals. At present most of the work west of Terry's peak is on the upper contacts. In the Ragged Top district the ore hodies are in the lime, and are proving to he extensive and profitable.

Around Portland the workings are all in the shales, scarcely any work in that neighhorhood being done on the quartzite as yet. There is no douht in my mind that when they commence to look for lower ore hodies west of the peak they will find them large and valuahle on the quartzite.

The original dikes all have a north and south course, while a few of the later dikes, near the base of Bald mountain, have an east and west course, and the ore hodies mostly have a north and south course.

These ore hodies vary in width and thickness; we find some of them over 400 feet in width and of variahle thicknesses—from 6 to 20 feet—and of various values, ranging from $5 to $50 per ton, and a general average for cyanide ores in the neighhorhood of $8 to $10 per ton. To describe the condition of the quartzite we may compare them to the rolling waves of the ocean.

We find these ore hodies at the hase, on the steps and slopes of the folds, and most times on the top of these large uplifts, hut seldom find ore hodies in the "channel" proper. The most of the level places in the quartzite seem to he capped with large sheets of porphyry, but at every fault and in close proximity with it the capping is composed of shales and sand rocks. No douht this has much to do with the occurrence of the ore along the breaks; those heing in themselves an altered condition of these shales and sand rocks.

The Galena district has an extensive area of this formation.

The present developments there are very encouraging, although there has not been enough done to determine how large the ore hodies are, but they are numerous and the prospects obtained from them are good. There is still a very large area undeveloped.

There is room for a good many mines such as the Golden Reward Co.'s property, consisting of over 50 miles of underground workings, about two-thirds of this being on ore, while the other third is crosscutting. After following some of these ore hodies close onto 3 miles we find them still continuing.

Notes on the Metallurgy of Copper of Montana.*

NUMBER VII.

Written by H. O. HOFMAN.

DETAILS OF PRACTICE.—The coal is crushed through a ¾-inch ring and passed through a 5-mm. screen; the oversize goes to the producers, the fines, forming about 30%, are burnt under the boilers. Owing to the high percentage of ash in the coal, the amount of fixed carbon retained by it is exceedingly high. The flue from the six producers serving one matting furnace has to be fired once in eight days to remove soot, tar, etc., and washed out once in six weeks to free it from ashes. An average analysis of producer gas, taken from a large number of determinations, gave CO_2, 9.4; CO, 16 8; CH_4, 2.9; H, 13 3; N, 57.6. The high percentage of carbon-dioxide is probably due to the excessive use of steam. Bunte has shown that the larger amount of steam that is admitted to a producer the larger is the volume of carbon-dioxide formed. The gases, however, pass off from the producers with a temperature of 700° C., which would seem to counteract the cooling effect of the steam and cause the carbon to burn rather to carbon-monoxide than to dioxide.

The hearth of the regenerative matting furnace, 42 feet 6 inches by 15 feet 9 inches, has the same width at the ends as at the middle. While this arrangement gives a larger hearth area than in the furnace tapering at the ends, it has the disadvantage that the sides tend to bulge inwardly instead of outwardly as is ordinarily the case. The furnace is built in five sections in order to allow for expansion. This amounts to 14 inches over all. The sections are separate in the roof; in the 18-inch side walls the necessary spaces are left between the bricks. The upper tie-rods run over 1 foot above the roof (9 to 12 inches thick), as this may rise as much as 9 inches; the lower tie-rods, placed 4 feet below the brick hearth supporting the quartz bottom, were passed at first through 4-inch wrought-iron tubes; when these burnt out, the new tie-rods were provided with a small central opening for water cooling. At present, the rods are solid, 1½ inches in diameter, and pass through a flue 2 feet 6 inches by 3 feet 8 inches, which is ample for air cooling. The checker work has a peculiar construction to permit cleaning and thus reduce the slagging of the brick through dust. The flues are horizontal, 18 inches high by 7 inches wide by 11 to 21 feet long, according to position, and are constructed of firebrick. The 9-inch brick forming the tops and bottoms are laid 4½ inches apart, leaving open spaces to allow the dust to fall and collect in a pit at the bottom, 4 to 5 feet deep. The heating surface is not very much diminished by this arrangement, as the sides of the horizontal bricks are exposed to the hot gases; this would not be the case if the bottoms and tops did not have the open spaces. The dimensions of the air chambers are: Width 8 feet 6 inches, by length 14 feet 7½ inches, by height 13 feet 9 inches; of the gas chambers, width 7 feet, by length 14 feet 7½ inches, by height 13 feet 9 inches. The heating surfaces, including exposed walls, are 4900 and 4200 square feet, respectively. While long-checkers save fuel, they tend to shorten campaigns; the reverse is the case with the short-checkers. Air enters the hearth through a single port. 15 feet 9 inches by 2 feet, the gas through four ports, 20½x30 inches. The products of combustion from the furnace descend in a chamber at one end of the checkers, and, after passing through these, ascend in the other at the opposite end. The life of the checkers is about three months. In order to lengthen it, experiments are under way to have the gases go during the charging period through a by-pass direct into the main flue, and thus prevent the inevitable dust from settling in the checker flues.

The working bottoms of the furnaces have a thickness ranging from 19 to 28 inches at the lowest point, the taphole. Both single and double bottoms are found. The single bottom is more common with ore smelting, as here the furnace had to carry a relatively light material in comparison with the refining furnace with which the double bottom is more prevalent. The bottom sand is a sugar-like quartzite, with 95% silica, the rest being alumina and ferric oxide. It is crushed between rolls to bean size, say, through a ½-inch ring; 80% of it will pass through a 5-mm. screen. Two examples of putting in a bottom will show how great are the differences in practice. One furnace has a hearth 20x50 feet, is direct-fired, and takes seventy-three tons of crushed sandstone. Supposing the furnace to be dry and warm, from six to seven tons of sand are charged and heated for six hours, being rabbled at intervals. These operations are continued until one-half of the total sand required has been introduced, when the whole is heated to the fritting of the surface. The other half of the sand is now charged in the same manner as was the first and brought to fritting. Converter slag is now poured in to cement the particles of sand more firmly together; from three to four charges of calcines are worked and the furnace tapped dry after the fourth charge. The furnace is allowed to cool for three to four hours and is ready for regular work. The time required for putting in the bottom is four days. The bottom under consideration was put in in February, 1900.

The other extreme is offered by a gas-fired furnace with regenerative chambers; the rectangular hearth is 42 feet 6 inches by 15 feet 9 inches. It is presupposed that the furnace is new and requires drying and warming. A light wood fire is started on the hearth in half a dozen places; the valves are reversed every half hour. In ten days the furnace will be at a dull red, in two days more it will be hot enough to ignite producer gas. The gas is turned on in small amount at first; after three days the wood ashes are taken out, and on the fourth or fifth day (the sixteenth or seventeenth after starting) the furnace will be a bright cherry red. Five tons of sand are charged through the hoppers in the roof and, when spread, cover the hearth to a thickness of 2 inches. The sand is calcined, turned over, and the furnace brought to a normal heat; charging of sand and heating it are continued in five to six hour intervals until about 60 tons have been introduced, care being taken to have the sand thoroughly calcined. The furnace is now brought in thirty-six to forty-eight hours to the highest heat that can be obtained without endangering the brickwork, and the sand brought to set, which amounts to about 3 inches in thickness. The high heat is maintained for sixteen hours, and the furnace then cooled down to a dull cherry red. Enough calcines (giving 45% copper matte) are dropped through the roof to cover the hearth to a depth of 3 inches. They are melted down and are absorbed by the sand bottom. The furnace is cooled as before, and a second charge of calcines given and smelted. Part only of the charge will be taken up by the hearth, the rest is tapped out. The furnace is again cooled, 12 to 15 tons ore charge are given, melted down, and the furnace is tapped dry and cooled to a dark red, but more slowly than before. It is again fired up, worked for three days as under normal conditions, and then tapped dry and allowed to cool to a cherry red. It is now safe for any kind of work. The time required to bring a new cold furnace to this point is three weeks. The object of the repeated coolings of the furnace is to harden the bottom. A bottom put down without cooling is liable to be mushy when it is hot, even though it be hard when relatively cool.

The ore charges consist mainly of roasted concentrates, with fines from first class ore; sometimes small additions of limestones are made. In converter plants, low-grade blast-furnace matte is often poured into the reverberatory matting furnace in order to raise the percentage of copper.

In regular work, the charge is collected above the furnace in from five to seven hoppers, having discharge pipes with gates, and dropped onto the hearth. With non-regenerative furnaces, the bulk of the charge is collected near the fire bridge; thus with five hoppers, e. g., seven and one-half volumes of the charge will be dropped through hopper No. 1 near the fire bridge, then six and one-half through hopper No. 2, five through No. 3, three through No. 4, and one through No. 5 near the flue bridge. With a regenerative furnace, having, for example, seven hoppers, charge will be dropped through the end hoppers that it may flow toward the center, then through the central hopper and its two neighbors, and lastly through the two remaining ones, the flow being regulated by the gates that there may be an even distribution. The charge is now melted down and stirred at intervals, in order to break up lumps. With a furnace that has been tapped dry, the bottom has to be rabbled in order to bring adhering melted parts to the surface. When melted and thoroughly liquefied, the slag is skimmed into a settling box or settling pot, that particles of the matte carried out by the slag may be collected and saved. With zinc-ose ore it is important to give a good fire before tapping, that there may be a good separation of the mushy, zincky matte (which being light floats on the surface of the heavy matte), and the slag. The overflow slag is collected either in waste slag pots of 5 to 6 tons capacity, hauled to the dump electrically and poured, or it is granulated and carried off by a stream of water. Granulated slag from the reverberatory matting furnace was first introduced in 1888 at the Anaconda Lower Works. In order to reduce the copper contents of this slag, fine pyrites has been sprinkled into it before the final firing-up, with the hope that slagged copper may be sulphurized and carried into the matte. The matte is removed from the furnace wholly or in part, depending on whether it is to be collected and shipped or transferred to the converters. When the furnace is to be tapped dry, which occurs only after several charges (with high concentrations as many as twelve charges) have been treated, and the hearth holds 18 to 20 inches of matte, this is run into sand moulds or cast iron moulds of similar form, or it is first collected in a steel ladle, and then poured into the form of flat cakes. With a converter plant, only part of the matte is removed after every charge, the aim being to keep the level as nearly constant as possible. With furnaces that are tapped dry, the sides are patched or fettled after every tap. With converter plants, fettling of the matting reverberatories is resorted to once every four or five weeks. As fettling material, siliceous gold ore has, in some instances, replaced the usual sand. A furnace runs about ninety days before it needs sufficient repairs to require shutting down.

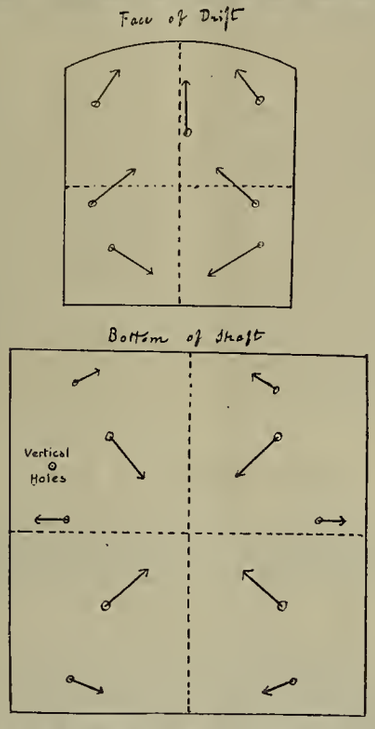
Good in Peace or War.

The traction engines made by the Best Mfg. Co., San Francisco, Cal., have found their way around the world, and are highly valued for purposes of peace, but it appears that they are also of value in times of war. The accompanying engraving shows one of those engines that was recently used in a Central American military campaign.

A Best Traction Engine Used for Military Purposes in Central America.



The Cia de Transportes de Matagalta Ltda. Co. of Nicaragua, C. A., purchased the traction engine and cars shown in the engraving for use in some Nicaragua concessions granted to the company by the Nicaraguan government in consideration of having free use of the outfit in case of war. The machine was used in a late war in that republic to carry 200 soldiers, six cannons, with carriages and ammunition, and also ammunition and guns for 1000 additional troops. The distance covered was 90 miles, through a very heavily timbered country and a rough mountain range; the stumps left on the ground in some places were from 8 to 16 inches high, over and through which the outfit had to climb. Under these hard conditions the distance was covered in less than forty-eight hours without a break, greatly to the satisfaction of the Nicaraguan purchasers and the

government authorities, the rough trip being a good testimonial to the enduring qualities of the Best traction engine.

There have been two similar outfits sold to the Russian-Chinese Bank at St. Petersburg, Russia, and are now being used in Siberia, after a 500-mile trip through an unbroken country by their own power. The engine shown in the illustration is 110 H. P. The carrying capacity of each car is sixteen tons.

A Practical Suggestion.

TO THE EDITOR:—Referring to your article of June 27th, "Danger in the Cut-off Holes," and the finding of some means, outside of the blasting by batteries and the placing of the primer near the bottom of the hole, to protect the following shift of miners from drilling in cut-off holes, I would suggest that a trial be made of providing miners with large printed cards representing, first, the face of the drift or bottom of the shaft; second, the left side of same;

third, the right side of same; fourth, the top of drift or the different walls of shaft, designated north, south, east and west, such cards to be of uniform printing and differing only in the mention of such indications. The crew which has just drilled should fill in on these cards before blasting the position and direction of holes drilled, as per the inclosed diagram.

These indications may not provide fully for the safety of the following shift, but would contribute in a certain measure to the location of the cut-off holes, and even if not sufficient to locate the same, would anyhow help the miners to keep from drilling near or by the previous holes. Some one may suggest something better for the protection of the life of the miners. N. E. T.

Baker City, Or.

MINING is manifestly more strenuous than formerly. In no department of the industry is this more noticeable than in the absence of so many reports formerly evolved from the inner consciousness of the imaginative. Time was when the week was a dull one that did not furnish something unusual in the way of gold or other metallic finds. Yet in this thirty-seventh week of 1903 not a solitary freak story has appeared. The bark from the hemlock tree near Olympia, Wash., which when burned gave ashes that assayed $77.84 gold to the ton; the goose at Grant's Pass, Or., which when butchered disgorged $4.75 gold from its crop; the mysterious stranger who visited Picacho, Cal., and who had 23 ounces "white gold" for which he was to be paid $24.10 per ounce at the San Francisco Mint; the discovery at Telluride, Colo., of an ore "half telluride and half platinum;" the petrified stumps near St. George, Utah, that assayed throughout $14,376 silver per ton; the chalcopyrite so abundant at Patapsco, Md., that yielded 49% copper; the man from Lecompton, Kan., who produced 22-carat gold from equal portions of antimony and fried carrots; the Providence, R. I., genius who "generated" gold by the bucketful from sea water; the Denver, Colo., man who produced "oil of gold," and the Washington D. C., genius who rearranged the "ions" of silver on a 32 to 1 basis to make 2 ounces of gold grow where but 1 ounce of silver grew before —all lack appearance this season. They no longer furnish momentary mirth to the miner, and probably the places that knew them once will know them no more forever.

Leaching Low-Grade Copper Ore.

Written for the MINING AND SCIENTIFIC PRESS.

Wet processes for successful treatment of low-grade copper ore long since emerged from the laboratory stage to be commercially profitable. Without being severely technical the following is designed as general answer to a multitude of questions thereon:

Not all copper ores are susceptible of leaching by any method. The first thing is to determine by careful and detailed experiment whether the particular ore in question can be so treated at all. Into this question enters a number of other factors, location, cost of mining, amount of available ore, transportation, cost of sulphuric acid, and other points that require consideration. For instance, some of the cases cited might present a situation where copper is present in the ore as metallic copper, yet not soluble (as a commercially successful proposition) in any ordinary solvent; in such a case, if there were so existent a large percentage of the copper in the form of metallics it would have to be saved in some different way, as, say, by concentration of the tailings after leaching. While oxides, carbonates, silicates (including roasted ores), dissolve in sulphurous acid, and from the solution obtained copper may be precipitated by boiling the filtered solutions, yet lime, magnesia, and to a certain degree alumina and iron, are objectionable, for they adulterate the copper precipitate and consume sulphur. Then, again, in considering the commercial possibilities of leaching a copper ore the contents of the ore in copper and the cost of sulphur must be taken into account. If the body of copper ore were close to a deposit of pyrites, from which could be cheaply furnished all needed sulphur, the existence of lime in the ore would not be an insuperable objection. But if the ore body were a long ways from sulphide ores, and the sulphur had to be freighted in the form of brimstone, the matter would not be so simple.

It is customary in many cases to manufacture the necessary sulphuric acid on the premises. The Black Warrior Copper Co., 7 miles from Globe, Gila county, Arizona, has such a plant with a stated daily capacity of twenty-five tons sulphuric acid. Much of their ore roasted runs 35% sulphur, though the ore mainly consists of copper oxides and carbonates, running about 60% silica. Their leaching plant contains fifteen lead-lined leaching tanks, made of redwood, boiled in asphaltum. Each tank has ten tons capacity and is hung on trunnions, provided with gearing so as to turn or dump it. Above the leaching tanks is a row of lead-lined acid solution tanks, reaching the ore in the latter from the bottom. On a level below the leaching tanks are a number of steel, lead-lined receptacles into which the exhaust solution is drained. By compressed air it is pumped up to the solution tanks, where it is standardized for use again. The solution is about 10% sulphuric acid, and it is stated that the requirements are four to five pounds of acid to recover one pound of copper. The copper in solution is precipitated by means of scrap iron within two "copper barrels," each 10 feet long by 8 feet in diameter. The resultant precipitate is about 85% copper, the balance iron.

In the Black Warrior plant sulphide ores are fed from a central hopper above into the several furnaces at the top. The center shaft in each furnace is turned by gearing, and attached to it are rakes that circle around on each shell, stirring the ore and dropping it through the apertures to the shelf below. When the fires are once started in these furnaces the sulphur in the ore is supposed to supply the fuel for continuous roasting. The sulphurous fumes and dust pass from the furnaces to an adjoining dust chamber, thence into ovens in which nitrate of soda is boiled with sulphuric acid to convert the nitrate to a sulphate of soda, and by this the nitrous fumes are liberated and used in condensing the sulphur fumes into the sulphuric acid. The gases from the niter oven pass up through a quantity of quartz within a lead-lined Glover tower, thence through a flue into the main acid chamber.

The Central Black Hills Copper Co., 12 miles from Custer and 6 miles from Redfern, South Dakota, owns large deposits of copper carbonates and has erected a leaching plant for the extraction of copper at what is claimed to be a much lower cost than has heretofore been attained. With the new plant 100 tons of ore per day can be treated. This plant consists of a four-story building, the ores going through by gravity. The ore is mined as stone is quarried—in benches. When mined the ore passes from the open cut to the ore bins in a chute and is taken from the ore bins to the mill over a trestle, so that it enters the mill at the extreme top, the mill being about 150 feet below the mine. The ore is first crushed, then it passes through a set of roughing rolls, a set of finishing rolls, and then to the leaching tank, where it is treated and put into solution. This solution is run into the precipitating vats, where it is precipitated and then gathered. The copper, after being precipitated, is recovered in small granules, and is then melted and run into bars. This process is asserted to in no way interfere with the gold and silver contained in the ores. As this ore is siliceous in character, it is considered a good cyanide ore. The tailings are being saved.

The wet process for treating copper ore in small quantities, known as Henderson's, is reported to be successfully used in the extraction of the 2% or 3% of copper contained in pyrites roasted at vitriol works for the sake of the sulphur therein. These residues contain a very small quantity of silver and a small proportion of residual sulphur. They are mixed with a sufficient quantity of common salt and heated in a muffle furnace to a moderate red heat. A muffle furnace is heated externally so that the products of combustion from the fuel can not gain admission. Air is allowed free access to the mixture, and any fumes evolved are withdrawn by flues. The copper sulphide present becomes copper sulphate, and this reacts with the common salt, forming copper chloride and sodium sulphate, while the silver is simultaneously converted into silver chloride. On withdrawing the charge it is transferred to large vats fitted with false bottoms covered with brushwood to serve as a filter, and there treated with water, which dissolves the chloride of copper and the common salt, the brine thus produced dissolving the silver chloride also. The solution is then filtered off into a separate tank and treated by Claudet's process, which consists in mixing it with a solution of iodide of zinc containing just enough iodine to combine with all the silver present. Silver iodide is thus produced, containing small quantities of gold and some lead, and, as it is insoluble in brine, it separates out into the solid state and sinks to the bottom. On filtering the liquid again, a solution of chloride of copper free from silver is obtained, and the solid iodide of silver, being carefully collected, is treated with metallic zinc, which decomposes it, reforming an iodide of zinc that may be dissolved in water and used to separate the silver from a fresh batch of ore, while the silver, now in the metallic state, is melted and refined. The working loss of iodine is made up by adding iodide of potassium. The solution of chloride of copper obtained in this way, or that of sulphate of copper recovered from ores that have undergone a sulphating wash, may be made to yield up the copper therein in a powdery but metallic form by the well-known process of placing fragments of scrap iron in the liquid in large tanks, or as it flows through long channels. The iron exchanges places with the copper, because its combining power for sulphuric or hydrochloric acid is greater than that of copper. It gradually dissolves into the solution, and a precipitate of copper separates in the form of cement copper, which is seldom sufficiently pure to be used direct, and is, therefore, subsequently refined in furnaces or electrolytically.

The Neill leaching process is a treatment based on the use of sulphurous acid for the recovery of copper from the oxide and carbonate ores. These minerals are reacted upon by sulphurous acid with the formation of cuprous sulphite (Cu_2SO_3). This salt is not soluble in water, but is soluble in water containing sulphurous acid—that is, the leaching solution must have an excess of the acid in it over that required to make the reaction. The copper is precipitated by driving off the excess of acid by heat. The precipitate is cupro-cuprous sulphite ($CuSO_3Cu_2SO_3 + 2H_2O$) and contains 49.1% of copper. It is a heavy, crystalline compound, of dark-red color, which settles readily from the solution and can be washed by decantation, dried and reduced to metallic copper by fusion on the hearth of a reverberatory furnace. Very small amounts of other metals are dissolved and the product is pure copper. In practice the ore is crushed to pass a 20-mesh, put in covered tanks and kept in a state of agitation while a current of sulphurous acid from the generators is forced through it. The copper will pass into solution in from one to four hours. The solution is drawn off through a filter press to separate the slimes. The latter and the sands are washed once with water, which is used over with the next charge. The solution in the precipitating tanks is heated with exhaust steam, precipitating the copper salt. The plant can be arranged to save nearly all the sulphurous acid except that combining with the copper. One pound of sulphur is required to convert four pounds of copper into sulphite, or, with the loss from the excess, one pound converts three pounds. The sulphurous gas can be obtained either by burning pyrite or sulphur. Roasting a copper sulphide ore to an oxide should provide ample acid for its own treatment. The recovery of the copper by fire alone effects a great saving over leaching, where iron is required to precipitate the copper.

The Conconino Copper Co. plant at Ryan, Arizona, was some time ago reported by Manager Jennings to have successfully solved some of the difficulties attendant upon leaching low-grade copper ores at a commercial profit.

In connection with this whole matter, it is as said to be constantly borne in mind that the cost of leaching works in actual operation is often as much as a smelting plant of the same capacity, and some of them may cost more. A leaching plant is of no value unless put up right. No one appreciates this more than those actually engaged in leaching. The wear and tear on a well constructed leaching plant is, however, less than on a smelter. Whether a leaching plant or smelting works is needed on a certain mine depends entirely on local conditions, and on the qual-

ity of the ores, etc., which must he studied carefully in each case. Most of copper ores can he leached, so also can they be smelted; the deciding point must therefore he the cost of the treatment. For instance: A mine with plenty of good sulphide ores at a place where fluxes and fuel are cheap would hardly consider the erection of a leaching plant; or if fluxes and fuel are expensive and distance from a railroad is great, a smelter is often out of the question, and it is then in order to investigate the different methods of leaching and select the one which will give commercial results.

It has been prominently asserted that the end result when copper sulphide ores are subjected to an oxidizing roasting will he copper sulphate exclusively, and that this can he leached out hy water, only provided the required skill is used and proper care is taken.

The process is about as old as the metallurgy of copper, and metallurgists in general would he pleased to learn of one place on the globe where such results are obtained in practice.

Authorities who record results of practice from wherever copper ores are treated do not record an instance, and most of them state that such results are not obtained, and that speaking from a practical standpoint they are an impossibility.

As to the results from a chloridizing roasting, it has been stated that the end results are cupric-chloride exclusively, provided the required skill and attention are used, hut where such results are obtained is not stated. This is not a new French process, which is manifest to any familiar with the so-called Henderson process, which has been in operation in England, Germany and other countries for several years.

Experienced metallurgists who have roasted thousands of tons of copper ore and matte, wish that these theories were correct, hut their experience denies it.

It has been further claimed that ores containing silicate of copper must of necessity he roasted before they can be leached; yet some of those leaching them on a large scale do not roast them, and claim that there is no absolute necessity for roasting them; indeed, they obtain a very good extraction hy leaching the raw silicate ores.

The salt cake and nitre cake method for leaching copper ores is not devoid of theoretical merit. The patent covering this process is valid, and it is of use at places where salt or nitre cake is of no value. But to produce salt cake or nitre cake for the purpose of using it as a solvent for copper is not economy. These compounds carry between 15% and 16% free sulphuric acid, which is the only ingredient in them that will dissolve copper. The glauber salt in them does not dissolve copper and is useless and cumbersome. Salt and nitre cake are never pure where made and thrown away as by-products, or used to make glauber salts, and as it would appear that eight pounds of it is required to contain one pound of free sulphuric acid, or, in other words, one pound of sulphuric acid will dissolve as much copper as eight pounds of salt or nitre cake, then where these compounds cost only half as much as sulphuric acid their use would still entail a cost four times as great per pound of copper as would the use of sulphuric acid straight. To any one hunting for new solvents for copper to get up some secret process might he suggested alum solution; this will dissolve copper out of oxidized ores, or if a mixture is needed to make the process still more mysterious, one might mix the alum solution with a common salt solution, and heat the mixture with the copper ore, and copper will he dissolved. Or if a plain everyday article will answer as well use vinegar.

Except under the conditions named, where salt or nitre cake are of no value at all, the cost of using these, or alum, or alum and salt, or vinegar, would not vary much; hut, of course, for the secret process man costs would he of slight importance.

As to the alleged reactions consequent upon the use of the following formulæ:

$$Cu_2S + 4O_2 + H_2SO_4 = 2CuSO_4 + H_2SO_4.$$

$$CuFe_2 + 4O_2 + H_2SO_4 = CuSO_4 + FeSO_4 + H_2SO_4.$$

The sulphuric acid (H_2SO_4) does not appear to he active in this reaction, hence might he replaced hy any other liquid which is not a solvent for copper sulphides, say water (H_2O) and the equation would look as follows:

$$CuFeS_2 + 4O_2 + H_2O = CuSO_4 + FeSO_4 + H_2O.$$

It has been stated that it will take from six to twelve hours for the reaction to take place when using sulphuric acid, and air is blown into the charge to provide the $4O_2$.

It would he of value if it would occur in as many days! The matter is of such importance that even a few months blowing would he in order, hut it is feared that the blower's patience would wear out if not his machinery, and the result would leave the $CuFeS_2$ undecomposed as before.

The well-known Ellsner's reactions, which occur when gold and silver are extracted from the ore hy potassium cyanide, does not warrant the conclusion that if these can occur the reactions pertaining to copper must also occur, as this overlooking of the fact that potassium cyanide is a solvent for gold and silver and its action is merely hastened hy an extra amount of oxygen present, and also hy the agitation of the blowing operation. Sulphuric acid is not a solvent for copper sulphides, and blowing air into the mixture for a century will not make it one!

In writing the equation, to make it of value it were well to use the one usually given to represent the treatment in vogue at Rio Tinto, viz:

$$x\text{-}H_2\text{-}SO_4 + Cu_2\text{-}S + 2Fe_2\text{-}(SO_4)3 = 2Cu\text{-}S\text{-}O_4 + 4Fe\text{-}S\text{-}O_4 + xH_2\text{-}S\text{-}O_4$$

Writers who give this formula and reaction add that in most cases it is impossible to extract in this way the copper as sulphate during a number of years, and this only from suitable ores. Now, if with a solvent present ($Fe(SO_4)3$) it requires many years to complete the reaction, how many years would the reaction require in which there is no solvent for copper present?

Still, in all such discussions it must he borne in mind that the subject is, like many others, two-sided and involves considerable experiment and research. Many of the theoretically perfect reactions do not prove successful when tried practically. Circumstances must determine when smelting or leaching processes should be employed. Experiments made at the Rio Tinto mine, in Spain, show that with ore carrying as high as 2% of copper, 75% of the copper was oxidized to sulphate and washed out; hut 25% remained behind. It is practically impossible to carry on the operation so that all the copper will become sulphate. This is shown hy the two following reactions which may take place between the sulphate and the sulphide not yet oxidized:

$$Cu_2S + CuSO_4 = \underline{3\,Cu} + 2\,SO_2$$

And

$$Cu_2S + 4\,CuSO_4 = 6\,\underline{CuO} + 5\,SO_2.$$

Oxides are the ultimate result of the roasting process, the sulphate being only the intermediate product, and, we must know that, as is always the case with intermediate products, is never obtained pure.

All furnace operations are extremely complex, and as a dozen chemical processes are in progress at the same time, it would not he possible to say that any one pure result was going to he obtained. While the hulk of the copper becomes chloride, yet some remains as oxide, some is sulphide and perhaps some remains as sulphate.

In all these various reactions the sulphuric acid, existing at the end just as at the beginning, seems a useless ingredient; but chemical reactions are frequently more complex than they seem, and the changes indicated may he the result of half a dozen intermediate reactions. The claim that in the presence of sulphuric acid oxygen from the air will unite with copper sulphide to form copper sulphate is faintly possible. Copper sulphide will unite with this amount of oxygen under other circumstances; it does so in the process of weathering, where it is left exposed in heaps to the action of the air.

It is, lastly, a mistake to assume the possibility of converting sulphurous acid into sulphuric acid hy the action of light and air. The sulphur from the ore could he converted into sulphuric acid—in fact, is so converted in many places—hut it must he done in the same way as if sulphuric acid were the object to he attained, and the method adopted must be the ordinary method of making sulphuric acid.

The subject is an important one to metallurgists, and is here discussed with a view to eliciting further light, for the last word hy no means has been spoken regarding the matter.

MANUFACTURERS of heavy machinery are reported commencing to use silicate of soda in foundations for engines, hammers, and various other lines of heavy machinery. The formula recommended hy large users is: three harrels crushed stone, one harrel gravel, one harrel cement, two quarts water glass. This material gives a homogeneous mixture and smooth surface, and prevents oils and greases from disintegrating the foundations.

Mines of Summit County, Colorado.

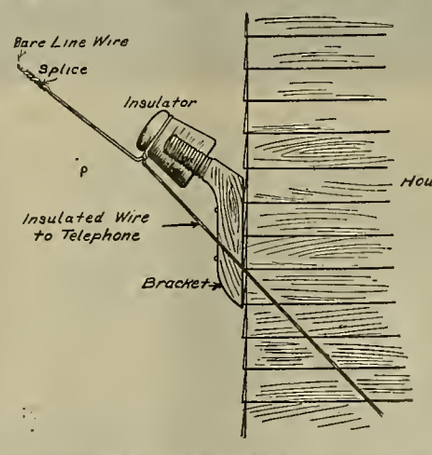
(FROM AN OCCASIONAL CORRESPONDENT.)

I send you herewith a photo of the mouth of the tunnel of the Rothchild G. & S. M. Co. of Argentine. This property is located on the western slope of the Continental divide, 13 miles from the railroad. The shipping point is Keystone. J. J. Reilley, superintendent of the property, is installing a 7-drill compressor, 100 H. P. boiler, 12 inch ventilating pipe and 4-inch air line. The tunnel is 2500 feet in length and has cut several veins of ore. Some of these run from $35 to $70 per ton. He expects to drive the tunnel 1500 feet farther during the year, a total distance of 4000 feet.

Rothchild Gold and Silver Mining Company's Property, Argentine, Colo.

Across the gulch from the Rothchild property is the Pennsylvania Co., operating the Pennsylvania and Ohio mines, also concentrating mill. This company will install a steam plant at the mill to enable them to run through the winter months. R. T. Williams has charge of the plant.

At Montezuma, 4 miles from Argentine, the Mine Developing Co. of Cleveland, Ohio, is operating the California and Sunhurst. This company owns five claims on Glacier mountain on Snake river. They have a tunnel 1000 feet in length and are sinking a shaft on ruby silver and silver glance ore. A. M. Campbell, manager of the company, states they are doing development work at present, hut expect to be shipping again soon.

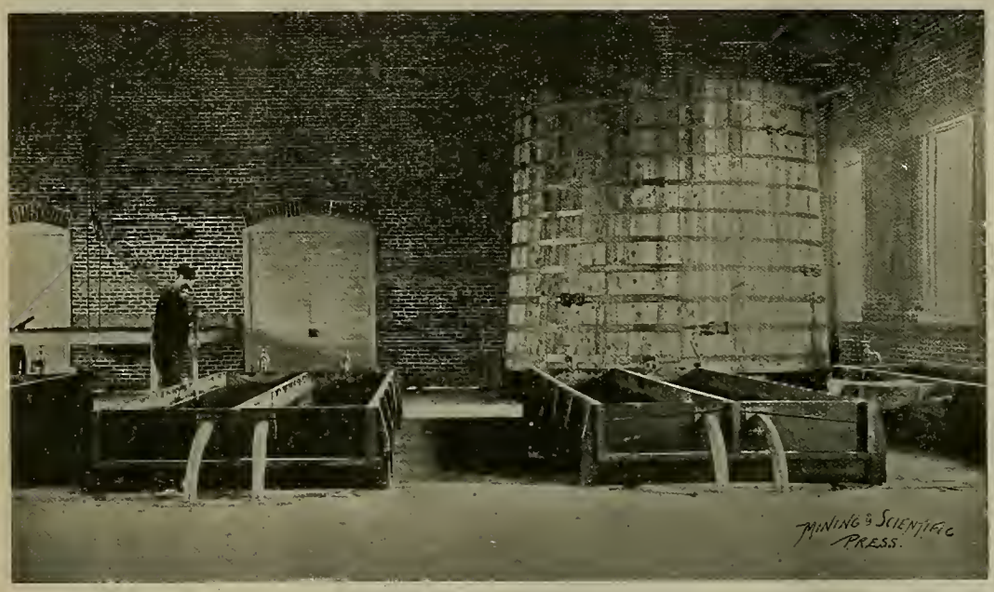


Graham & Miller, owners of the Harrison group, consisting of thirteen claims, have been doing development work the past year. The ore is heavy lead without zinc, and occasionally they strike some pockets of high-grade ore, running 4000 ounces in silver. The property is on Glacier mountain.

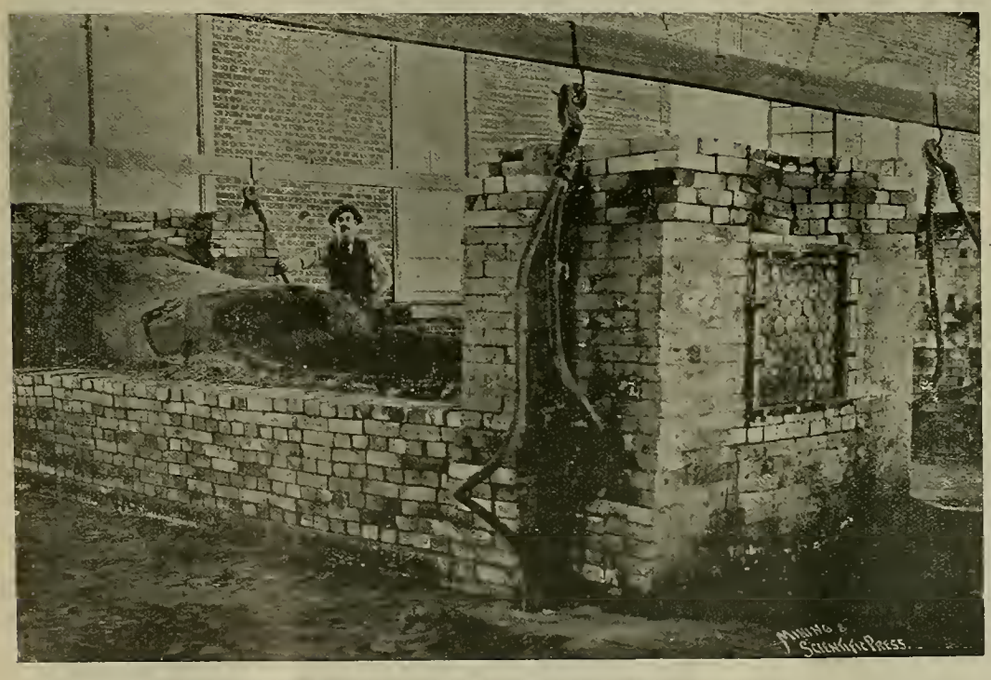
The ore around Montezuma has carried more or less zinc, which was at one time a drawback to the camp, hut if the present demand for zinc keeps up it will be a benefit.

Montezuma, August 30.

Simple Device to Stop Humming.



The American Telephone Journal recommends the device indicated in the drawing to stop the disagreeable humming sound in a house to which a bracket, having on it a vibrating telephone wire, was attached. To secure this result a piece of heavily insulated No. 14 copper wire is spliced to the bare line wire, as



shown in the drawing, and the covered wire made up around the insulator. The loose end of the copper wire is then run to the telephone, care being taken to leave it quite slack. This scheme is stated to have proven entirely successful wherever used.

Manufacture of Carborundum.

The manufacture of carhorundum, as now carried out at Niagara Falls, N. Y., is as follows: The materials used are coke, sand (rich in silicon), salt and sawdust, the two latter to facilitate the operation of the furnace. These are mixed in proper proportions and introduced into the furnaces, which are of hrick, built up into four walls, so as to form a kind of rough hrick hox, no mortar or cement of any kind being employed. In the center of each end wall of the furnace is a large hronze plate, to which are connected the cables carrying the current. When complete the internal dimensions of a furnace are about 15 feet long, 6 feet wide and 5 feet high. Connecting with the inner surface of each plate are sixty carhon rods, each of which is about 30 inches long and 3 inches in diameter. The rods project through the walls of the furnace and form the terminals. When the furnace has been huilt up in this way the mixture is introduced, about ten tons making the charge. Through the center of the mixture a core formed of small grains of coke is huilt, and this serves to form a continuous electrical connection hetween the terminals. When the current is turned on, the core is soon raised to a high temperature. About an hour after the application of the current, carbon monoxide gas is given off freely, and, when a lighted match is applied, this hurns with a lamhent hlue flame and envelops the whole furnace. The current is kept on for ahout twenty-four hours and then the furnace is allowed to cool down, after which it is opened, when the core is found surrounded hy a cylinder of carborundum crystals varying in color from yellow to violet. The crystals in immediate contact with the core are in one solid mass; as the distance from the core is increased, the size of the crystals rapidly diminishes, until at about 15 inches all crystallization ceases and an amorphous material is found, of a whitish gray color, for a distance of 2 inches, when suddenly a hlack mass, composed of the original mixture, now held together in a cemented state by the fusion of the salt, is met. The crystalline and amorphous material, lying hetween the core and the outer hlack mass, is carbide of silicon. About two tons of carborundum are produced in one run. It is at once noticed that the core is changed in appearance; it now has a somewhat metallic luster, all impurities have heen driven off and a pure form of graphite re-

Tanks Used in the Manufacture of Carborundum

Furnace at the Niagara Falls Carborundum Factory.

mains. This may be an important hy-product of these furnaces. The presence of graphite denotes that the temperature, when the current was on, must have been nearly 7000°, which is the point of graphite formation. The makers of carborundum, however, take pains to keep the temperature of their furnaces under 7000°, care being taken that it does not run too high, as carhorundum is at its best when the furnace work is done hetween 6000° and 7000°.

The industry has increased rapidly; in 1893 6¾ tons were manufactured, in 1901 1690 tons were produced, and the power in use has been increased from 2000 H. P. to 3000 H. P., thus raising the output to 2700 tons. Carhorundum has found large use as an abrasive; of still more interest is its recent application in the steel industry, replacing to a considerable extent ferrosilicon. The present consumption of carhorundum for this purpose is seventy-five tons per month. Still more promise is shown hy the proposed use of this substance for making highly refractory materials. In this connection the discovery of Fitzgerald of "recrystallized" carborundum, which is prepared hy agglomerating the finely divided material and reheating in the electric furnace, is to he noted, as also that of Tone. for using for similar purposes the "amorphous" variety, which always forms a considerahle portion of the product. Each of the carborundum furnaces in use at Niagara employs 1000 H. P., the voltage starting at 200, and falling to 80 as the furnace heats up; the units are kept working at full power, the voltage being varied according to the progress of the reaction.

The power is distributed hy the Niagara Falls Power Company on the constant-pressure system, and it is therefore necessary to have some means hy which this variation in the resistance of the furnace can be coped with. The two principal ways in which this can be accomplished are to change the ratio of the transformer, or to add in another small transformer which can be used as a booster; in either case it is necessary to deal with the primary, as the secondary connection for such large currents can not easily be manipulated.

The American production of carhorundum in 1902 was 3,741,500 pounds.

How to Determine if You Have a Concentrating Ore.

Written for the MINING AND SCIENTIFIC PRESS by WM. H. KRITZER.

Obtain samples of the ore from all parts of the mine, using care. Then have complete and reliable assays made, and if the ore has a gross value of several times what the expense is to mine it, proceed as follows to determine the size of particles to which the ore should he crushed for treatment:

Crush an average sample to pass through a No. 4 mesh screen onto a No. 8. If the product remaining on the latter screen separates readily by hand panning, there will he no necessity of crushing it finer. If the product does not separate freely, then crush it so it will pass through a No. 10 and remain on a No. 16, and repeat the panning process.

This operation of crushing, panning and screening is to be continued through a No. 16, 24, 30, 40, and 60 mesh, respectively, or until the mineral readily separates from the gangue in the pan, weighing carefully each part which is left remaining on each screen, also the part that finally passes the No. 60 mesh screen. This procedure will give you a fair approximation of how the ore will crush, and if it will have many fines or slimes. Note how each lot separates; examine the tailings or waste under a magnifying glass to see if the mineral is released from the rock, for among the different samples one should he found that is clean or free from inclosed mineral. This will he about the size to which the ore should he crushed. Observe if the material that passes through the No. 60 mesh has much float mineral, also if it contains an unusual amount of mineral, for if so it will slime. From the weights you can ascertain about what can he expected in crushing, and if a large amount is secured from the fine screens it is an indication that the ore will slime more or less. If the material left on a coarse screen is free from mineral and comparatively large, no fine crushing will be required for concentration or separation, and the ore should be easy to work.

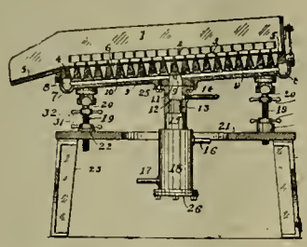
The percentage of concentrates in ore can he estimated by taking 20 83 ounces of ore (10,000 grains) crushed to pass through a 40 mesh screen and washing it very carefully in a batea or pan, as long as concentrates appear. Dry and weigh. Each grain will represent one-hundredth of 1%. If the concentrates weigh 300 grains, the quartz contains 3% of values, or, if 60 grains, six-tenths of 1%. If the concentrates are worth $150 per ton, the value of each tons of ore is $4 50, or, if six-tenths of 1%, 90 cents per ton.

To find the loss in tailings, take a sample every half hour (if you have no self-sampler) for twelve hours by passing dipper under the discharge, being careful not to allow it to overflow. Settle the material collected by sifting several teaspoonfuls of powdered alum over the surface of the water, allow it to remain quiet until the water becomes clear, then siphon it off and evaporate the residue remaining.

Mix thoroughly when dry and take three samples of 300 grams, or 5000 grains, each. Place one of these samples in a two-quart vessel and add about a quart of water. Stir thoroughly, and after having allowed it to stand for several minutes pour the wash water into a larger vessel. Continue doing this until the water from the sample is comparatively clear. To this wash water collected add powdered alum, and after settling remove the clear water and evaporate the material left at the bottom. Then weigh to ascertain the percentage of slimes, and assay.

After the sands have heen removed from the slimes separate into three sizes hy passing them through a 40 and a 60 mesh screen. Weigh each to ascertain the percentage of sands, and assay. If the assay shows that the greatest loss occurs in the slimes, then you are crushing too fine; hut if the assay of the coarse sands contains the most values, then you are not crushing fine enough. Mills, as a rule, crush too fine. This can he ascertained only by making tests

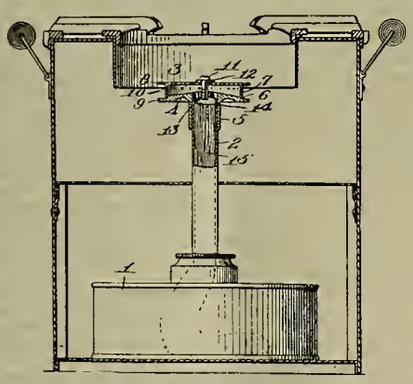
as above, changing the mesh of screens until the loss in the coarse sands and slimes is about equal, remembering that with the coarser screens you increase your crushing capacity.



To test tailings, dry and weigh out 17.35 pounds (10,000 grains) and wash as described above. Dry and weigh the concentrates. Each grain will represent one-hundredth of 1%, and a loss of 2 cents, if the concentrates are worth $200 per ton. If the 10,000 grains in sample contain 4 grains of concentrates, the loss will be 8 cents per ton. If the concentrates are worth $50 per ton, multiply fifty by four, and 2 cents is the value of the concentrates in one ton of tailings.

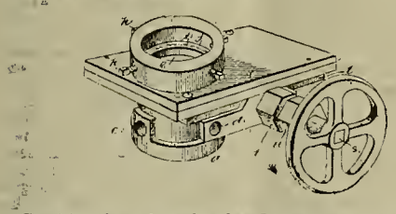
Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 1, 1903.



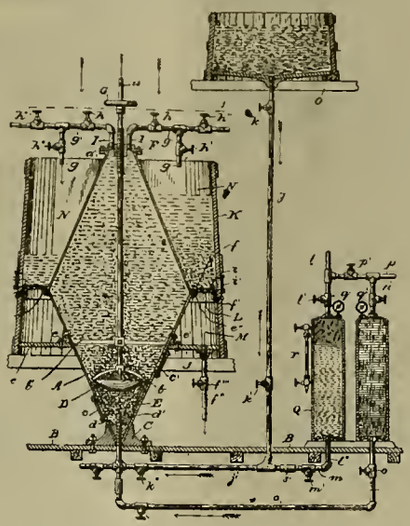
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE CONCENTRATOR.—No. 737,326; C. A. Bonner & E. E. Euchenhofer, Dayton, Ohio.



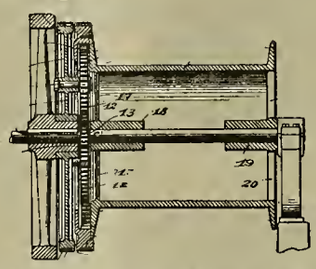
In ore concentrator operated by means of motive fluid pressure bed having diagonally arranged strips placed over flexible section supported by ribbed frame resting upon corrugated bottom having air passages diverging from opening in center, cylinder arrangement placed under opening of corrugated bottom, cylinder consisting of enlarged part in which is operated large piston to upper part of which is attached smaller piston which acts as valve opening, closing intake pipe for fluid pressure, means for holding and regulating position of machine.

HYDROCARBON BURNER.—No. 737,999; C. Cannom, London, Canada.



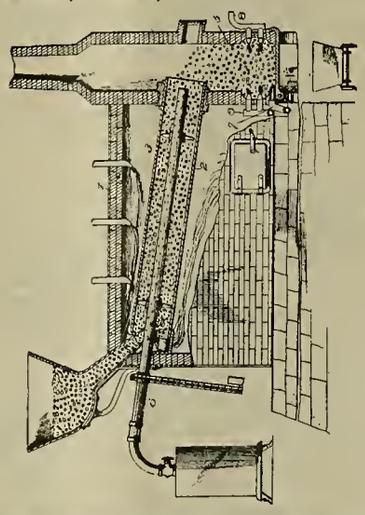
Burner comprising head provided with plurality of gas-inlet openings and with cone-shaped upper face and cap provided with plurality of gas-escape openings, combined areas of gas-inlet openings being in excess of combined areas of gas-outlet openings, thereby to maintain pressure within head.

CASING HEAD FOR OIL WELLS.—No. 738,001; J. Cochran, Bealls Mills, W. Va.



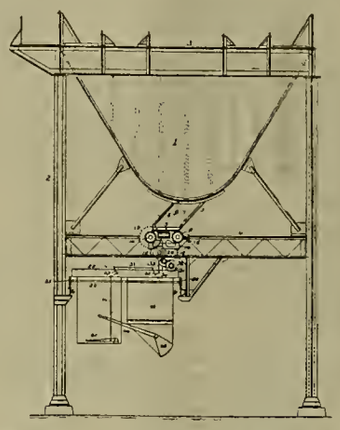
Combination of casing head composed of two separate parts, one fitting above other, parts being fastened together, both parts provided with vertically arranged perforation, and lower part being cut away for passage of rack, upper part fitting over lower part to leave recess into which rack may slide, with perforated tube ring secured in upper part of casing head, screws securing tube ring in place, packing between tube ring and upper part of casing head, rack mounted between parts of casing head, rack being provided with downwardly extending teeth, toothed pinion mounted in recess in lower part of casing head and engaging with rack, hand wheel for operating pinion and means for preventing oil from leaking out around shaft of pinion.

APPARATUS FOR EXTRACTING GOLD AND OTHER METALS FROM ORES.—No. 737,533; E. L. Van der Naillen, San Francisco, Cal.



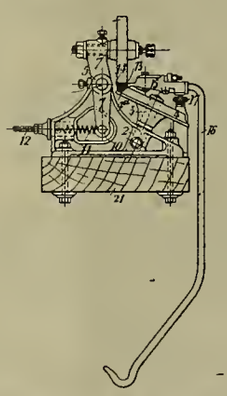
In apparatus for extracting metals from ores, combination of concentrating tank consisting of two cone-shaped sections secured together at their largest diameter by means of suitable flanges and provided with intermediate strip secured between flanges and projecting outwardly, settling tank disposed around concentrating tank, perforated diaphragm placed between concentrating and settling tanks supported upon intermediate strip, and suitable bracket bolted to settling tank and adapted to form two horizontal sections within settling tank.

HOIST.—No. 737,830; O. C. Duryea and M. C. White, Los Angeles, Cal.



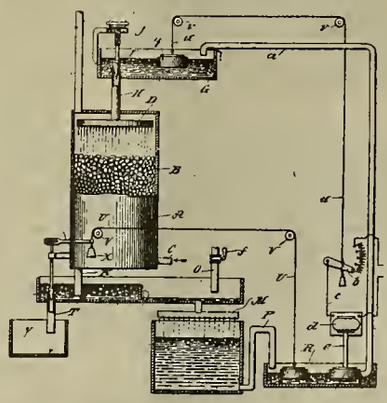
Base, webbed drum mounted on base, band wheel on drum, intermediate webbed hand wheel, gearing connecting two hand wheels, gearing being between web of drum and web of intermediate band wheel, friction hand on each hand wheel, means for tightening one friction band, means independent of first means for tightening other friction hand and means for driving gearing.

PROCESS OF REDUCING MINERALS.—No. 738,007; O. B. Dawson, Caldwell, N. J.



Process for effecting direct decomposition of minerals, and conversion of same into globular shot-like masses or nuggets consisting in subjecting ores without addition of flux, and, while atmospheric air is excluded therefrom, to continuously applied external heat for heating ores to about degree of beginning of incandescence in presence of hydrogen gas supplied in quantity in excess of that required for hydrogenizing elements naturally and previously combined with and extracted from metals, such excess gas serving to maintain metal in metallic, spongy condition and preventing formation of oxides, carbonates, etc., and, while still in metallic, spongy condition and in presence of hydrogen gas, concentrating metals in gangue to globular, shot-like masses or nuggets by subjecting them to higher degree of heat in air-tight chamber.

DELIVERY MECHANISM FOR ORE BINS.—No. 738,076; J. W. Seaver, Cleveland, Ohio.



Combination of storage bin with inclined delivery spout having perforated transverse bar therein, and series of pins passing through perforations of bar and constituting grated valve for governing flow through spout.

AERIAL ROPEWAY.—No. 737,871; J. P. Roe, London, England.

Sheave mounting for aerial ropeway comprising guiding sheave mounted to rotate at angle to horizontal, and depression sheave that has periphery arranged above and forced toward periphery of guiding sheave with yielding pressure that will allow of its being moved away from guiding sheave, but will act to automatically return depression sheave to normal position when displacing force is removed.

PROCESS OF MAKING SULPHURIC ACID.—No. 737,625; J. B. F. Herreshoff, New York, N. Y.

Method of making sulphuric acid by causing liquid sulphuric acid and gaseous sulphuric anhydrid to travel in opposite directions in contact with each other, reserving portion of strong acid thus produced as final product of process, diluting and cooling remainder of strong acid, and returning such diluted and cooled acid to first stage of process to again absorb anhydrid.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

At Sunnyside, on the north side of Sum Dum bay, 55 miles from Juneau, the Oceanic M Co. reports development work progressing. The shaft is down 25 feet and hoisting machinery is being put in. The shaft will be sunk to 120 feet and the ledge crosscut.

ARIZONA.

COCHISE COUNTY.

At the Wolverine & Arizona mine, near Bisbee, Superintendent S Hunt says additional machinery, including a compressor and power drills, will be put in.

J. G. Pritchard reports work progressing on the Gold Nugget mine, at Fort Bowie, near Bisbee. The ore platforms on the Golden Fleece claim and on the Nugget claims have been completed, and a hoist will be put in for sinking on the Nugget.

The Benton M Co. is putting in hoisting machinery on the Little Devil mine, near the Stonewall, near Tombstone. There are ten men at work, and as soon as the hoist is running the number will be increased.

GRAHAM COUNTY.

The Irish Syndicate has been organized by Clifton men to develop the Irish group of claims on Chase creek, near Clifton, with N. L. Lewis as manager.

Work is under way on the aerial tramway for the Standard copper mines, near Clifton. The distance from the ore bins at the mines to the railroad is 3200 feet, with a drop of 800 feet. The tramway will be operated by gravity and is expected to convey the ore to the railroad for 5 cents a ton. The Standard mines continue their usual output.

The Arizona C. Co. is to work the Humboldt mine at Morenci and the Coronado mine at Metcalf to greater depths, says Manager J. Colquboun.

MOHAVE COUNTY.

Tuck & Co. of Needles, Cal., have started work on the J. H. More properties, east of Boundary Cone, near Chloride, which they have bonded.

Sinking continues on the Vivian mine, in Snowball camp, near Chloride, owned by J. Ewing.

The Cedar Valley M. Co., in Cedar valley, near Kingman, will develop a water supply at a spring in the mountain above the mines and carry it to the mill. Several other springs will also be developed and as as soon as this is done the mill will be started up again, says the Mohave Miner.

The German - American mines, near Kingman, will be started up Oct. 1st. Later a milling plant will be built at the mines and the ores treated by cyanide and amalgamation.

Preparations are being made to put in a cyanide plant at the Great West mine, near Chloride, says Resident Manager S. W. Toby.

The Cedar Forest G. & C. Co. has been organized by J. Rice and F. N. Rust of Los Angeles, Cal., with G. C. and A. E Davis and F. W. Morrison of Kingman, to take over the Davis gold and copper mines, near the Windmill, at the head of the Big Sandy. Development work will begin next week.

Work has been started on the Tyro group of mines, near Kingman, by Manager S. Dorsey of Los Angeles, Cal., who holds an option. He will run a tunnel for 100 feet to open up the vein at 100 feet below the apex. The group is 7 miles from the Colorado river.

YAVAPAI COUNTY.

The United Verde Copper Co. has men at work on the two new 500-ton water-jacket furnaces they are building, and it is expected to have them finished this month.

The smelter at the United Verde mine in Jerome was blown in last week, after being closed down for several weeks on account of not being able to get a sufficient supply of coke, says the Journal-Miner. The coke shipments now are coming in at the rate of fifteen cars a day.

G. E Moe and C. C. Farwell have bought the Wright interests in the group of four claims near Kirkland, operated by the Farwell M. Co.

J. H. Robeson of Georgetown, Colo., says he will reopen a gold-copper mine which he owns in the Bradshaw mountains on Castle creek, southeast of Prescott. Machinery will be put in.

L. Pfau of Cincinnati, Ohio, president of the Pfau G. M. Co., operating the B. B. mines at Cherry creek, says they are preparing to put in additional machinery for the mine, including two 60 H. P. boilers, a 50 H. P. friction gear hoist, capable of sinking to depth of 1000 feet, a six-drill air compressor, track, ore cars, a pump, etc. The two-compartment vertical shaft is down 172 feet, and they expect to strike the ledge at depth of 230 feet.

CALIFORNIA.

AMADOR COUNTY.

At the Defender mine, at Defender, in Pioneer district, F. B Joyce, owner, reports shipping a $4000 bar of gold bullion, the result of the cleanup of August's run of the 10-stamp mill.

BUTTE COUNTY.

The construction of a tunnel from Butte creek, near Oroville, to drain the ridge between Big and Little Butte creeks, is proposed. On this ridge was the Perschbaker (later known as the Magalia) gold mine. Owing to the flow of water, the mine had to be given up. Then a shaft was sunk at heavy expense and the mine worked by pumping the water, but this was abandoned. On and along this ridge are ancient channels covered by lava, and the object of the tunnel projected is to drain these channels. H. H. Yard of San Francisco, of the Butte & Plumas Railway, is said to be back of the proposition.

CALAVERAS COUNTY.

The Stockton Hill mine, near Mokelumne Hill, has been unwatered, and operations will be under way next week.

Sinking is in progress at the Union copper mine at Copperopolis, and at the 900-foot level a vein of ore 9 feet wide is reported found, assaying 6% in copper. There are twenty men working at the mine.

EL DORADO COUNTY.

Machinery is on the ground for development work at the Ancient Channel M. Co. mine at Latrobe.

Preparations are being made to reopen the Rosecrans mine, at Garden Valley, says the Nugget.

FRESNO COUNTY.

The Twenty-eight Oil Co., near Coalinga, has finished its No. 9 well at 1200 feet, which shows well ——Section Seven Oil Co.'s well was perforated last week and is flowing intermittently, often throwing a stream of oil over the derrick. This well has depth of 1200 feet, with 60 feet of oil sand, says the Reporter. It is estimated it will produce 300 barrels of oil per day.

During the month of August eleven new wells were brought in in Coalinga oil district and all of them produce at least 100 barrels daily, while one of them is said to reach 1000 barrels daily. How long these wells will continue to flow at this rate is not known, but wells in this field have been flowing one year without lessening production. Ten new wells were started during the month.

KERN COUNTY.

The Continental Oil Co. of Los Angeles has secured forty acres from the Bunker Hill Co. in Kern River field, near Bakersfield, and has let the contract for its first well.

The Merced mine, near Randsburg, under management of R. W. Cloud, began operations last week.

The Hope Spring and Star Hope 1, 2, 3 and 4 mines, in Goler district, near Randsburg, have been sold to the Bland G. M. Co

R. W. Jameson, of Pennsylvania, vice-president and manager of the Lockhaven Oil Co., says he is arranging for starting operations on their ground in Midway district, near Sunset. Fourteen wells will be sunk, and work will begin in October. There are two pipe lines on the property. The company is made up of Altoona, Pennsylvania men.

Twelve thousand barrels of heavy Kern river oil, mixed with one-fourth water, were pumped through the Standard Oil Co.'s Bakersfield-Point Richmond pipe line from the Kern river field to Pond in twenty four hours one day last week, says the Californian. The use of water with the oil is proving successful. The maximum capacity for water is 20,000 barrels daily.

The Associated Oil Co. reports work progressing on their San Josquin lease, near Bakersfield, where the boiler plant has been completed. New sump holes are being dug to conserve the oil with the least evaporation, steam pipes extended from the boiler houses to each well, and arrangements being made to pipe the oil from the sump holes direct to tanks, instead of conveying it in open ditches as heretofore. The company is producing 2000 barrels per day in excess of shipments, which are being run into storage tanks. The management expects the new wells coming in will enable them to store at least 1,000,000 barrels of oil before Jan. 1st next, which they desire to carry as a reserve. The boiler plant consists of six 70 H. P boilers. Another plant with four smaller boilers is being put in on the Central Point lease, where fifteen more wells are to be drilled before Oct. 1st, says the Californian.

NEVADA COUNTY.

Operations are suspended at the Malakoff mine at North Bloomfield, says Superintendent L. L. Myers. It is thought the shut down will be temporary.

The 6 inch pump at the Murchie mine, near Nevada City, used to raise water from the 600-foot to the 400-foot level, cannot handle the water coming in, and an 8-inch pump is replacing it. From the 400-foot level to the drain tunnel a 10-inch pump is used.

Superintendent Brockington of the New Orleans M. Co., on Houston Hill, near Nevada City, says the tunnel has broken into and is unwatering the old workings, for which they have been driving.

The Nevada City mine, one of the Champion group, near Nevada City, has ceased operations for the present.

G. Bonney has bonded the L C. A. mine at Selby Flat, near Nevada City, and will increase development work.

PLACER COUNTY.

A company, with E. Mallows of Keswick as president, is reported organized to operate on the gravel channels which pass under the town of Dutch Flat.

PLUMAS COUNTY.

J. M. Engle has bought the Tom Johnson placer claim, on Mill creek, above Rich bar, near Quincy.

SACRAMENTO COUNTY.

The Gray-Wing mine, near Folsom, is closed down temporarily while moving the plant to a new shaft, a few hundred yards from the old one. It will resume full operations in December.

SHASTA COUNTY.

The Bennington group of mines, adjoining the Iron Mountain mine on the north and east, near Keswick, has been bought by the Pittsburg & Mt. Shasta G. M. & M. Co. of Pittsburg, Pa., B. N. Scott president. They will begin development work next week. The group consists of nine claims, including the Dorset, Yorktown, Bennington and King. The Little Nellie is not included in the sale. The ore carries copper, gold and silver, and will be shipped to the smelter at Keswick. The Iron Mountain Railroad passes over the property. There is an abundance of water and timber.

SIERRA COUNTY.

Superintendent J. Connachie of the Kenton mine, on Kanaka creek, near Alleghany, has suspended operations temporarily.

SISKIYOU COUNTY.

(Special Correspondence).—The Yuba M. & M. Co. have shut down indefinitely, pending conclusion of lawsuits against the property. The merchants of Sawyer's Bar and the townspeople, also, will feel the effects of this shut-down. The company had a successful season last year and made a good mill run, covering all expenses and the cost of the improvements put in, the principal one being the tramway for conveying ore from the Alda, Flora, Blanche and Ohio claims to the mill. Patents are under way for all the company's claims. When all is settled regarding the patents and pending suits, the company will resume.

A. J. Ball & Co. are putting up a 2-stamp mill on the Ida May mine, adjoining the Yreka M. & M. Co.'s property. The Ida May has a good shoot of ore and enough already on the dump to pay for the mill and improvements.

The Hibernia ledge, in Eddy's gulch, is being developed by A. Ford, who reports promising results.——The Salmon River Hydraulic M. Co. have suspended operations on the Meyers claim, below Sawyer's Bar, and are moving their plant to Summerville, where they have a large area of ground to work.——At the Dannebrink mine at Gilta ten stamps are dropping on ore.——The King Solomon mine has changed hands.

Rollin, Sept. 5.

C. Saunders, of Sacramento, last week bought a group of claims owned by Tacoma men, at Oro Fino, 16 miles from Yreka. The property comprises seven claims and shows free gold ore.

Manager Draper, owner of the McKinley mine, on Humbug creek, near Hawkinsville, will increase development work, says Superintendent Jamison.

Superintendent D. B. Jackson has men at work on the Oregon G. M. & M. Co. ground (formerly the China Ock mine), near Fort Jones. He will put in a sawmill also.

The Classic Hill mine on Indian creek, 12 miles from Happy Camp, near Fort Jones, will be operated this winter, says Superintendent Head.

TUOLUMNE COUNTY.

The Grizzly mine, near Carters, has shut down, and only the pumps are running.

The Starr King mine, near Carters, is closed down temporarily pending repairs to the plant.

Preparations are being made to start the mill at the Longfellow mine, at Big Oak Flat, and more miners have been put on.

The line for a tramway from the Georgiana mine, near Carters, to the Grizzly mill has been surveyed and work begun.

C. A. Gillis of Sonora is reported having bought a half interest in the Santissima quartz mine for $10,000 and will start developments this month.

Owing to the bonding parties operating the Los Angeles mine, on the river below the Mohican, near Groveland, failing to meet their obligations, work on the mill and mine has been discontinued, says the Prospector.

YUBA COUNTY.

The California Debris Commission, composed of D. P. Heap, Major Heuer and Captain Harts, U. S A. engineers, having adjusted the differences between the land owners and the dredging people concerning the proposed improvement of the Yuba river at Daguerre Point, 12 miles east of Marysville, work will resume It is proposed to build two barriers above Daguerre Point to hold back the coarse mining tailings and to make a cut at the Point so as to carry the Yuba river out to one side and away from the tailings lying in the stream, which are now being washed down into the Sacramento and Feather rivers to the detriment of navigation. After the Government had agreed to purchase title to the land involved it was discovered that part of the land was valuable for gold dredging, and the owners refused to deal with the Government agents sent out to acquire the titles to the land necessary for the undertaking. The contract for building the barriers has been awarded to S. Montgomery and the work of making the cut at Daguerre Point to E. Malley. In the performance of the latter contract W. P. Hammon & Co., operating the dredgers, agree to build at their own expense certain training walls to cost $5000, with the agreement that they will be permitted to carry on their gold dredging without interruption.

COLORADO.

BOULDER COUNTY.

An automatic roaster and a cyanide plant will be put in at the Inter-Ocean mine, near Sunshine. The ore is said to run $5 per ton.

There are 100 men at work at the Nancy G. M. & T. Co. properties, near Wall Street. The crusher in the mill is running steadily. Ore is being hauled from the mine at the rate of forty tons a day, and men are stoping in the Last Chance, Gray Copper and Gillard drifts of the Nancy tunnel.

The Wood Mountain M. & M. Co., near Wall Street, has decided to build a cyanide mill to treat sixty tons of ore a day. G. M. Gray, president of the company, says in a basin 300 feet below the mill, the tailings are deposited which contain 50% of the original value of the ore, and this will be cyanided. The company expects to have the mill ready for operations in the spring. In the meantime development continues in the mine. The crosscut tunnel will be driven 500 feet farther into the mountain. It is in 1700 feet. The Wood Mountain group adjoins the Concord.

The Great Western M. & M. Co., working the Miser's Hoard group of mines in Gordon gulch, near Sugar Loaf, has twenty-five men at work and is shipping fifteen tons of ore a day. The ore is being treated at the Boyd mill in Boulder. The shaft is 175 feet deep, the lowest level in 400 feet. The company is putting in a 40 H. P. engine and 50 H. P. boiler, and has bought the stamp mill at Sunny Side, which is being removed to the mine. W. Rowen is manager and M. Jones superintendent.

CLEAR CREEK COUNTY.

The Capital Prize M. Co., operating at Georgetown, will put in a compressor plant for development work.

The compressor plant going up at the Sidney tunnel, near Silver Plume, is expected to be finished by Oct. 1st.

Regular weekly shipments have been resumed from the Anglo-Saxon Extension. Stoping is carried on in 14 inches of ore, which averages $35 per ton in gold.

The Red Elephant M. Co. has been organized in Denver to develop two groups on Red Elephant mountain, near Lawson. They expect to start operations this month. They will develop the larger group by an adit tunnel on one of the veins and a crosscut from the adit will cut the entire group of veins. The company will also continue sinking the shaft on one of the lodes on the flat, says Manager G. B. Sinclair.

The Cassatt-Homestake G. M. & M. Co. has been incorporated at Idaho Springs to develop a group of six claims on Santa Fe mountain. The ore shows values of $6 a ton in gold, and it has been found susceptible to cyanide treatment. Included in the sale are water rights. W. A.

Hamilton of Terre Haute, Ind., is president, with F G. Watrous, L. W. Herrin, R Wier. L. E. Cassatt, A. Norton and F. G. Shaffer as directors. L. E. Cassatt is superintendent.

The New Era G. M. Co. has resumed work on the Lone Tree tunnel, near Idaho Springs, and will develop the Lone Tree group. The Lone Tree tunnel has been driven 800 feet on the Great Western vein of the New Era Co. Within 600 feet they expect to enter the Lone Tree lode and will drive 4500 feet through the Lone Tree and Lone Tree Extension.

Besides the 200 H. P. hoist being placed on the Gem shaft, the Con. Gem M. Co., near Idaho Springs, is also putting in a compound air compressor of 1000 cubic feet capacity. The Silver Age mill has been dismantled and is being used as a compressor plant. The company has two other compressors there, one of 800 cubic feet capacity and the other 400. The hoist on the Gem shaft will be operated by a 150 H. P. electric motor. The shaft is down 950 feet, but when the raise connects with the shaft it will have a depth of 2000 feet.

CUSTER COUNTY.

Near Silver Cliff, Preston, Ray & Condell report opening up a body of ore in the Bismuth mine assaying 200 ounces of silver, $15 gold, with a percentage of lead. The ore was exposed in a shaft 20 feet in depth. They will put in a hoist.

A lead prospect on Lead hill, near Querida, carrying cerusite, has been bought by the Bogue Lead Co. of Denver. Improvements are under way, both in the mine and on the surface.

DENVER COUNTY.

The Grant smelter of the American S. & R Co. at Denver is closed, without any immediate prospect of resuming, and three furnaces only are working in the Globe plant. The intention seems to be to transfer the bulk of the business to their plant at Pueblo.

GILPIN COUNTY.

Christopher & Co., lessees on the Wood uranium property in Leavenworth gulch, near Central City, have overhauled their machinery and resumed development. The water has been taken out and after prospecting the levels they may deepen the shaft.

Sinking operations have been suspended at the Straub mine on Gunnell hill, near Central City, and the shaft is down 430 feet. The Ingalls G. M. & L. Co. will drive levels and open up additional ground. The shaft shows a vein with 18 inches of milling grade ore, reported to carry $15 per ton. The smelting ore shoot averages 4 inches wide and carries $100 to the ton. Superintendent Ballantyne says drifts will be run east and west and a crosscut also started.

The Elizabeth M. Co., operating in Lake and Illinois Central districts, near Central City, will put in a hoisting plant at the Skelly mine, in Illinois Central district.

The Wautauga mine, in Russell district, near Russell Gulch, is being operated by Bush & Co. of Idaho Springs under lease and bond from the Old Town Con. M. Co. with N. Pike as superintendent. He has thirteen men at work and has cleaned out the fifth and sixth levels, and is taking out some concentrating ores, which are being shipped to Idaho Springs by wagon.

B G. Granville and J. L. Hoefler of Central City have bought the Eagle mill, at the mouth of Chase gulch, on North Clear creek, at Black Hawk, and will treat custom ores. The mill is equipped with thirty-five rapid-drop stamps.

GUNNISON COUNTY.

At the Tin Cup mine, near Pitkin, Manager A. Lejune reports striking ore assaying well in gold, silver and lead. The mine is owned by J. J. Mastin & Co. of Kansas City, Mo. The strike was made north of the deepest workings at a depth of 300 feet, and is thought to be the shoot lost trace of through a fault encountered in 1880.

The C. G. Davis group of placer claims in the Box Canyon district, near Pitkin, has been leased to Moore & Hoff.

LAKE COUNTY.

The Yak tunnel at Leadville is shipping on an average 2500 to 3000 tons per month, in addition to 1000 tons handled by lessees.——The No. 4 Ibex shaft is completed to the tunnel level. The company has started a new level—the twelfth—100 feet below the old one.

Work has resumed at the Bug Gold mine, near Leadville, says Manager Dewey. The pumps are unwatering the workings and the shaft will be put down deeper. Additional territory has been secured.

It is reported operations will be resumed on the Pilot M. Co.'s group, near Leadville. The intention is to put down several diamond drill holes to test the formation. It is thought that conditions below the parting quartzite will be the same as those found in the downtown area

A. Hahnewald is carrying on prospect work in the Grayton shaft on Poverty Flat, near Leadville, and opening up manganese iron.

OURAY COUNTY.

It is reported that the Barston M. Co., owning the Bobtail mine in Commodore gulch, has decided to build their mill at Ironton, the plant to be completed this season.

SAN JUAN COUNTY.

Electric rock drills will be put in at the mines of the Sultan Mountain M. & M. Co., near Silverton, as soon as the buildings are completed. The company intends to complete the 600-foot tunnel to cut the Molas and Junior Warden veins and to drift 2000 feet on the Molas vein, says the Silverton Standard. The electric generator for the drills will be run by a 10 H. P. gasoline engine.

Reilly Bros. are preparing to develop a group of claims in Mill gulch, near Chattanooga, including the Red Buck, Crown Point and the Two Macks.

The pipe line at the Highland Mary mine, near Silverton, is expected to be finished and the mill in operation next week.

The Ransom vein, owned by the Freeport & Cripple Creek Co., having been exploited by the crosscut tunnel in Eureka mountain at Eureka, all work will be confined to Tower mountain properties—the Acme group—on the opposite side of the gulch from the Ransom mine, says the Silverton Standard. The development of the Ransom vein showed 20 feet of milling ore at a depth on the vein of 300 feet. The Acme tunnel on Acme vein No. 1 is expected to cut Acme No. 2 vein at 500 feet, the same being in 460 feet.

SAN MIGUEL COUNTY.

The Japan-Flora M & T. Co. was incorporated last week by D. Swickheimer, A. J. Clark, W. E. Humphreys, J. Wilkinson and T. W. Beam of Denver, to operate mines and reduction plants in San Miguel county. This is the reorganization of the Japan M. Co. and it is expected work will be started on a mill at Pandora and a tramway from the mouth of the lower Japan tunnel to the reduction plant.

Work has been started on the retaining dam which is to be built by the Tomboy, Liberty Bell and Smuggler-Union mining companies across the San Miguel river below the Liberty Bell mill, ½ mile east of Telluride. It will be 80 feet in length, 12 feet in width and 7 feet high. Heavy lumber will be used in the construction and stone will be thrown in between the sides. Valves will be set at equal distances and the tailings that accumulate during the winter can be flushed out when there is high water in the spring and summer months. It is expected the work will be completed by Oct 1st. This dam is being built as the result of a threatened lawsuit being brought against the above mentioned companies by the Keystone Hydraulic M. Co. to recover damages caused by the reduction plants of the quartz mining companies operating above the placer mines owned by the latter company. It was alleged that during the summer and fall months the sand and mineral contained in the tailings damaged the flumes and pipe lines of the placer company.

J. Ekman of Calumet, Mich., manager of the H. M. H. group in Bear creek basin, near Telluride, says development is opening up ore bodies carrying values in gold. More men are being put on and stoping ground will be opened up. It is not probable, however, that ore will be extracted for milling this year, but next spring a tramway will be built from the mine to the 10-stamp mill, a distance of 9000 feet. Last week Ekman secured an option on a group of claims in Bridal Veil basin, consisting of seven claims and a reservoir and millsite. Besides these he located four other claims adjoining the group, and has men working assessments. W. Hutchinson is mine superintendent.

J. D. Gale of Boston, Mass., says he will increase development work on the Mary group of claims in Swamp canyon, near Ophir. J. Manifold and J. W. O'Brien are also interested, and have had men working on the group since last spring. The ore carries gold, silver, lead and some copper. The veins are 10 feet in width, with a pay shoot of 2 feet. A crosscut tunnel, 200 feet in length, was run, which cut the veins at depth, and 200 feet of drifting has been done. Ore has been piled on the dump, which will be shipped to the smelters. The group consists of seven full claims and millsite. Gale says as soon as the organization of the company is effected arrangements will be made for putting in a milling plant.

At Telluride, H. Buckley, manager of the Silver Bell mine, has agreed to treat with the union and grant the men an eight-hour day, provided the union will not attempt to dictate to him the number of men he must employ, and will continue to agree to a fair cut in their scale of wages proportionate to the reduction in hours. The management of the Butterfly-Terrible mine refused to have any dealings with the union. The number of men at the Tomboy mine has been increased and seventy-five men are at work. About sixty union men left Telluride on the 9th inst. for points in Utah and farther west.

SUMMIT COUNTY.

(Special Correspondence) — About 1½ mile from Breckenridge, on Nigger hill, is the Washington mill. The property consists of 201 acres of patented ground, 20-stamp mill and placer ground. They are now handling fifty tons of ore through the mill. This output will be increased this fall by the erection of a new mill. The tunnel through which they are working is 1450 feet in length. The ore is taken down through a 280-foot shaft to the 240 level, and there taken through a mill hole 115 feet and trammed to the mill through an 800-foot tunnel. The mill contains crusher, stamps, plates and tables. C. S. Newsom is manager.

Breckenridge, Sept 5.

The Clark-Reithmann (Goldrick) property, consisting of placer and lode claims and improvements, and covering 1000 acres of mining ground in French gulch and near Lincoln, near Breckenridge, was sold last week at sheriff's sale to W. Lennox of Colorado Springs for $17,050.

Manager Whitehead of the Providence-Colorado group, on Gibson hill, at Kokomo, has ceased drifting and resumed sinking. The 300 feet of drifting on the vein at the 100 foot level shows a body of milling grade ore.

The Monte Cristo group, on Mount Quandary, near the head of the Blue, near Breckenridge, has been sold to the Quandary Mountain M. & M. Co. for cash. T. J. Cooper is president of the new company and has put men to work building roads, bunk and boarding houses, after which the quarry will be opened and a concentrating mill will be built. In the meantime, if a mill is necessary, it is thought either the Jack or the Eldorado mill will be used, says the Summit Journal.

It is reported the Union mine on Gold Hill, near Kokomo, will resume. The ores carry gold and lead.

The Robert Emmett group, at the head of Mayflower gulch, near Kokomo, has been sold to M. Miller et al. of Cripple Creek. The Emmett group embraces three full claims and is near the Gold Belt mine, the M. K. C. and Bird's Nest groups. The Emmett ore shows gold, silver and copper values. Work will begin next week.

TELLER COUNTY.

The Cripple Creek drainage tunnel, which has been in process of construction since January, 1903, was completed and put in operation Sept. 6 Under Superintendent Bainbridge, the valves in the bulkheads were opened. The flow was 2500 gallons a minute. Later in the day work was begun on the northern heading, a connecting branch, and when this is completed it is estimated the flow will reach 4000 gallons.——With military protection, the Findley, Strong and C. K. & N. mines were reopened on the 8th inst., giving employment to eighty men. The managers of those properties say they can obtain all the men they need, and will increase the number.——The Mine Owners' Association has announced that no members of the Western Federation of Miners will be employed in any of the properties owned by members of the Association. The Federation influence on the prosperity of the district has been pernicious, according to the mine owners, who openly declare that they will no longer tolerate its alleged dictation. The union officials are still confidently aggressive. It is reported the mine owners have arranged with railroads for reduced rates for laborers from southwestern Missouri, and it is expected that miners will be brought from the Joplin lead district to take the places of strikers. A small force of men began breaking ore in Stratton's Independence mine on the 9th inst., and the military guard line was extended to embrace this property. Operations were also resumed on leases in the Vindicator and Hull City placer ground. A petition is said to be in circulation among the miners of the district asking the American Federation of Labor for a charter for a miners' union, the purpose being to enable the miners, as union men, to return to work, under union conditions, for employers against whom they have no grievance.

Air drills were put at work last week in the tunnel on Grouse mountain, near Cripple Creek, by the Big Turkey M. Co., operating a group of claims there. The tunnel will be driven 1000 feet before any lateral work is done.

The Cripple Creek Enterprise Co., operating the Deadwood mine at Cripple Creek under lease, working through No. 1 shaft, is taking out three carloads of ore per week which averages two ounces gold per ton. The ore is being mined 300 feet from the shaft on the 415-foot level, where a vein 3 feet wide has been uncovered. Some sylvanite is found. The Enterprise Co. holds a lease on the Deadwood from the 400 foot level down and on the Trachyte claim, which adjoins the Deadwood, from the 400-foot level to the surface, and both claims are being operated from No. 1 shaft on the Deadwood. The same company is operating under the streets and alleys of Cripple Creek.

The output of Cripple Creek district for August is given below. The large amount of ore handled is explained by the fact that all the mills carry a reserve, and all of it is Cripple Creek ore, says the Cripple Creek Times. This reserve tonnage was handled during the month, and will be counted as having been sent out from the camp during August. The mines produced and shipped out ore until the 10th of August, and since then only intermittent shipments have gone out, and these were for the most part sent out by lessees. The output would have reached $2,000,000 had not the strike been declared. During July the gross output amounted to $1,866,900, with a tonnage of 56,300. The following table shows the output figures:

Plant.	Tons.	Total Value.
Smelters	4,665	$303,225
United States R & R. Co.	7,000	216,000
Telluride	5,000	150,000
Economic	3,400	88 400
Portland	4,075	122 250
Dorcas (estimated)	2,500	87 500
Globe	1,800	9,000
Gillett	450	1,800
Ingham	600	2,880
Other cyanide plants	300	1,500
Totals	29,790	$982,555

At Cripple Creek the shaft of the Molly Kathleen mine, adjoining the Gold King, on Womack hill, is to be deepened to the 1000-foot point.

The Eclipse shaft house, owned by the Sunset-Eclipse Con. M. Co., on the north slope of Battle mountain, near Cripple Creek, was destroyed by fire last week. Loss $15,000. The property was under lease to G. Keener. The fire is supposed to have started from live coals from the boilers, as the lessees banked their fires

IDAHO.

BANNOCK COUNTY.

At Pocatello, the Fort Hall M. & M. Co., L. A. West, has decided to put in an air compressor and machine drills. In a tunnel 825 feet long, two veins have been cut, one 19 feet and the other 35 feet wide, the ore being copper-bearing and showing some silver and gold.

On the Moonlight mine, east of Pocatello, copper ore is being saved for shipment to the smelter at Mackay. A 10-mile wagon haul is necessary. The Moonlight has opened a copper deposit 5 feet in thickness, with a tunnel into an extension of Mount Putnam.

The Fort Hall M. Co., 12 miles east of Pocatello, have a tunnel driven in 1200 feet. At the West mine, 5 miles to the north, silver values are being obtained.

BLAINE COUNTY.

The Cambridge M. Co. has been incorporated at Hailey to operate a group of seven placer claims and a water right near the head of Little Smoky and Smoky-Bullion creeks, above the Revis placer claims near Hailey, says the Wood River Times. H. A Walter, C. C. Ruthrauff, C Hernsheim, I. J. Wadley and W. A. Brodhead are directors. Superintendent Wadley has begun the work of making ditches, flumes, etc., and to get ready for hydraulicking in the spring.

BOISE COUNTY.

The Checkmate mine at Pearl has been sold to E H. Dewey, who says he will consolidate the Checkmate and Levan claims under one management. A greater depth can be attained from the bottom of the Checkmate shaft than from any of the other workings at Pearl. This shaft is down 270 feet, which gives a depth on the vein of 400 feet from the surface. He will sink the shaft another 100 feet, then drift on the vein both east and west and the shaft will continue down. Cross cutting south to explore the parallel ledges known to exist in adjoining claims belonging to the Checkmate will also be done.

C. F. Dill of Greenville, S. C, and his associates propose to develop a series of coal deposits which they have located near Garden Valley. An electric road will be built from Boise to Pearl and up the Payette river to Garden Valley. The coal is a lignite.

The Gold Coin M. Co. will build a road 2 miles long, from Lager Beer gulch, on the Forest King road, to their mines on the east side of Washington gulch, near

Idaho City, says Superintendent Emery. The company will put up a sawmill and quartz mill this fall, the latter to have a capacity of 60 tons daily. A hoisting plant will also be put in. Besides sinking on the Blue Bell, they will start work this fall on a tunnel to tap the ledges at depth and they propose next summer to build an electric plant on More creek, says the Idaho World.

The Big Ledge group, in Deer Creek mining district, has been bonded to J. H. Richards, of Boise, for $150,000. The water right on More's creek is also included in the transfer.

IDAHO COUNTY.

Near Warren the Silver King and Keystone mines are being operated under one management. On the latter there are sixteen men opening up the mine and a small mill will be placed this month. At the Silver King the mill is running steadily and table concentrators are used. The concentrates are being saved until next year, when they will put in a plant for extracting their values, which average $100 per ton. There are ten stamps in the mill and next season they will increase the number. They are crushing forty tons per stamp per day. There are twenty men on the Silver King.

Manager Hathaway reports at the Golden Rule placers on Grouse creek, near Warren, they have in the course of their placer work cut through a body of bituminous coal 25 feet thick which is 300 feet wide at that point.

In the Marshal Lake district, near Grangeville, D. Strong of Denver, Colo., has a working bond on the Irwin group of four claims for $25,000. He will develop the claims, on which is said to be a 2 foot vein, free milling and assaying $30.

OWYHEE COUNTY.

The shaft in the Afterthought mine on Mahogany flat, on War Eagle mountain, near Silver City, is down 430 feet, having cut the ledge at that point. A station was cut at the 400-foot level and a crosscut showed the vein 2 feet wide. Drifting south on it will be started. The water flowing into the shaft is handled by bailing skip.

SHOSHONE COUNTY.

Manager Steen of the Granite & Allie G. M. Co., near Murray, says he has the cyanide plant in operation. The reduction plant consists of a 10-stamp battery, from which the pulp (not fine crushed), passes to a 5-foot Huntington mill. No amalgamation is done. The pulp from the Huntington is conveyed in an iron pipe to the two cyaniding vats. At the mine the shaft is down 100 feet and showing a 6-foot ledge.

The Elk Star group of claims on French gulch, near Elk City, and near the American Eagle, Boyer Mill and Blue Ribbon mines, has been sold to Spokane men, who have incorporated the Elk Star G. M. Co. The price paid is said to be $20,000. The incorporators are H. W. Greenberg, G. C. Beck, R. E. Hutchinson, J. Harris and G. M. Davis. They will start development work next week.

MICHIGAN.

HOUGHTON COUNTY.

The annual report of the Lake Superior Smelting Co., near Calumet, shows that last year's product of the Tamarack amounted to 7125 gross tons of copper, while the product of the Osceola was 5989 gross tons.

It is reported negotiations are under way for a consolidation of the Copper Range Con. C. Co. and the Trimountain properties, south of Houghton.

The August output of the Atlantic mine, at Painesdale, is given at 299 tons of copper.

The August production of the Franklin mine, at Hancock, amounted to 367 tons of copper, as compared with 376 tons during July.

That the Arcadian mine, near Hancock, is to explore for the conglomerate on which the Franklin Junior is working is erroneous, says the News. The lode has already been cut in two places from the St. Mary's shafts at depth of 300 feet and was found barren. The Franklin's values are at greater depth, the seventeenth level being the best. The Arcadian shafts are dismantled, the tracks pulled up, and are being allowed to fill with water. The compressor, etc., still on the property, are sufficient for exploratory work. There is a tract, aggregating 1 square mile, still unexplored.

The Copper Range Con. C. Co. report labor is so scarce that a carload of men were brought from Chicago last week to work on the new South Range smelting plant at Houghton. At present 225 men are employed and foundations are going in.——The August output of their Champion mine at Painesdale amounted to 738 tons of copper, and the Baltic mine 667 tons.

The output for month of August of the Wolverine mine, at Kearsarge, was 517 tons, 935 pounds of refined copper.

Two miners report the discovery of workable iron ore outcrops near Covington. The district lies in a direct line between the westernmost limits of the Marquette range and the easternmost mines of the Gogebic range, says the News.

During the past two years the Wolverine mine at Kearsarge has increased its output of ingot copper by 41%, the last annual report covering the year ended June 30 showing a product for the twelve months of 8,260,386 pounds of refined copper, as compared with 4,907,646 pounds for the year ended June 30, 1901, says the News. During the last fiscal year the mill turned out 11,330,370 pounds of mineral, as compared with 5,852,646 in 1900–01. The present rock supply is being entirely drawn from the Kearsarge lode. As a reserve there are the Osceola amygdaloid and Kearsarge conglomerate lodes, these on the Wolverine property traversing 1250 feet in width. The output of refined copper for the present year is expected to reach 10,000,000 pounds.

KEWEENAW COUNTY.

The Phœnix mine rock bins at Phœnix are full and the mill will start next week.

The August production of the Mohawk mine, near Allouez, amounted to 333 tons 420 pounds copper.

ONTONAGON COUNTY.

At the Adventure mine, at Greenland, No. 3 shaft is nearing the ninth level and showing richer at the bottom. It is said the lode in the Adventure bluff is practically worthless, because the formation is so badly broken. The mill is running steadily.

MISSOURI.

JASPER COUNTY.

The powder shortage has been relieved and properties which were shut down have resumed.

The Oliver Lease Prospecting Co.'s 65-acre tract, adjoining the Lincoln mine, northwest of Zincite, has been sold for $34,000 to E. G. Rankin and J. L. Boogher of St. Louis. Besides the lease the sale includes two mines producing $1000 net per week, says the News. They have started work and will build a mill and increase the output. J. F. Boyd of Carthage is superintendent.

At Carterville the Minnie R. M. Co., composed of W. E. McCuley and W. A. Rhea, is building a mill on the Plutocrat lease. They have a run of 12 feet of soft ground at the 190-foot level, from which they expect to make six tons of ore per shift, and another in sheet ground at 198 feet. There is one vein of jack 14 inches in thickness. They expect to have the mill in operation by Oct. 1.

The Barrister M. Co. of Joplin and the John Durby M. Co. of Carterville have been incorporated.

The Lyon M. & Dev. Co. of Joplin was incorporated last week by B. W. Lyon, E. D. Nix and C. W. Bartlett of Joplin.

The S. H. & H. mine at Badger is developing ore. A pump has been put in. They have a face of ore measuring 50 feet. The drift is 30 feet wide.

STONE COUNTY.

At Galena, J. C. Moore, S. Cooper, G. W. Webb and J. W. Tate, who are prospecting on the city market square, report opening up a prospect at depth of 34 feet. They are drifting on an 18-foot face of jack.

MONTANA.

BEAVERHEAD COUNTY.

A. J. Noyes, manager of the Ajax G. M. Co., near Dillon, says he will increase the capacity of the mill to ten stamps and will also build a 4000-foot wire tramway this fall. The mill is expected to be completed by Nov. 1st.

FERGUS COUNTY.

C. Little has bought the Hazelton and Maricbette mining claims, in Cone Butte district, near Lewiston.

LEWIS AND CLARKE COUNTY.

The Red Bird M. Co, operating the Punches mines, 12 miles west of Helena, reports a strike of high-grade copper ore. This mine was originally operated as an iron proposition, the product being used as a flux at the smelter; but with depth copper values are said to be increasing.

Work on the mill for the Farmer group in Scratch Gravel district, 5 miles from Helena, has begun. The shaft is down 200 feet and the lead at that point is 7 feet wide, the ore averaging $6 per ton.

Work will be resumed on the iron claim in the Scratch Gravel district, near Helena, owned by M. H. Gerry of Helena.

MADISON COUNTY.

C. E. Damours, manager of the Damours G. M. Co. at Summit, near Virginia City, says he has increased the number of men at work in their mines.

MISSOULA COUNTY.

W. B. Tilden, manager of a Baltimore company, has bought the Copper Cliff mine, near Bonita, for $50,000. They are said to be also negotiating for the purchase of adjoining claims.

It is reported that the Copper Cliff group of claims, near Bonita, has been sold to Manager Tilden of Baltimore, Md., of an Eastern company. There are several thousand tons of ore on the dump which is said to run 7% copper.

SWEET GRASS COUNTY.

A deposit of marble is reported found in the Dear Creek section, near Big Timber, by R. F. Beal. The stone in the rough is translucent and workable. Considerable gypsum is said to accompany the marble.

NEVADA.

LINCOLN COUNTY.

G. L. Hardison of Los Angeles, Cal., has thrown up his bond on the Campbell property, in Crescent mountain, near Searchlight, and has a bond on the Edna mine, says the Searchlight.——G. Simmons is working his turquoise mine and also a gold mine, near Crossman's Springs.

The Searchlight M & M. Co. has been incorporated under Arizona laws to develop the Peerless group, owned by Day & Landon, with G. I. Myers of Leadville, Colo., as president.

Acting under orders from headquarters in Los Angeles, Cal., the Big Bug and Little Bug mines, near Searchlight, closed down last week, says the Searchlight.

The mill at the Homestake mine, in Deer Lodge district, near Stateline, is expected to be in operation this month.

STOREY COUNTY.

The work of reopening the Ward mine at Virginia City began last week and men are overhauling the machinery, etc.

WASHOE COUNTY.

The Jumper mine at Olinghouse, near Wadsworth, is to be worked by Jelinek & Jackson.——Golding & Fraser will put men on at the Hutchinson mine.

The No. 2 mine, in Olinghouse canyon, near Wadsworth, has been bonded for $35,000 to Manager Onn, who will begin operations next week.

NEW MEXICO.

GRANT COUNTY.

Work is reported progressing at the Casino group, near Silver City, by the owners, T. N. Stebbins & Co. Grading for the mill is finished, and it is expected the cyanide process will be used.—— T. Carter, lessee of the St. Louis mine in the Burros mountains, is taking out ore, and regular shipments will begin next week.——Portwood & Moses have a lease on two claims lying on either side of the Pactolus mine, and one of them they have subleased to Albert Owen of Santa Rita.

TAOS COUNTY.

The Cashier M. & M. Co. is operating a group of claims in Anchor district, near Red River. The ore is low-grade and free milling, and the company proposes to build a mill this fall, says the New Mexican. M. A. Bralden of La Jara, Colo., is president.

In Rio Hondo district the San Cristobal Copper Co. of West Virginia is developing a group of twenty claims. An experimental cyanide mill is in operation, and it is expected later on to build a plant with capacity of 200 tons per day.

OREGON.

BAKER COUNTY.

Manager L. G. Lilley of the Baby McKee M. Co., near Sumpter, says the Last Chance hoist building is finished and the machinery is being set up.

A 4-foot ore body on the Cleveland drift from the Standard tunnel is reported opened up at the Standard mine, near Sumpter. The shoot gives values in gold and cobalt, especially the latter, says the Sumpter Miner. E. W. Mueller, manager of the Standard Con. M. Co., says crystals of remingtonite, a rare cobalt mineral, have also been found.

W. Cable, superintendent of the Adelene mine in the Cracker Creek district, near Sumpter, says development work is progressing, and preparations will be made to put in a mill.

Manager T. F. Barbee, of the Crown Point mine, Cable Cove district, near Sumpter, says operations will be resumed. The lower tunnel will be driven another 200 feet, which, according to survey, will cut the main vein of the group. This tunnel is in 750 feet and will reach the ledge at a depth of 650 feet. Next season a reduction plant will be built.

DOUGLAS COUNTY.

The North Fairview M. Co., W. Faber, of Albany, president, report striking a body of ore carrying values in free gold. On the Maine, one of the 14 claims owned by the company near Bohemia, a ledge 4 feet wide has been opened. H. Leigh is manager.

GRANT COUNTY.

At Susanville, Sorenson & Sons of Greenhorn, who have a bond on the Big Snort mine, have work under way.

The Crane Flat placer mines are under option to F. Burbridge and A. Burch, who are developing the Independence mine. These placers are 5 miles northwest of Granite, on Crane Flat, and cover several hundred acres. Burbridge & Burch are arranging for thoroughly prospecting the ground, and it is intended to work the gravel with a dredger, should the tests prove satisfactory.

T. P. Carson, who is working the Milwaukee placers, near Granite, this season, reports operations progressing. He had to clean out 5 miles of ditch, as there had been no water through it for several years.

The Western M. & Dev. Co. has been incorporated by A. B. Campbell and A. Burch of Spokane, Wash., and F. I. Dutton, E. F. Whittum and M. J. Berry of Augusta, Me., to operate holdings in Granite Creek district, near Granite.

JOSEPHINE COUNTY.

A strike is reported made last week at the Granite Hill mines of Louise Creek district, near Grant's Pass, owned and being developed by the American G. Fields Co., of Chicago, Ill., W. J. Morphy, manager. In running a drift on the 125-foot level to connect the bottom of the vertical shaft with the drift an 11-foot vein has been opened, carrying values in free gold and sulphurets. The boiler and other machinery has been set up, and the air compressor and drills will be at work this week. The shaft will be continued down to 600 feet. The 5-stamp mill is crushing rock from the stope on the 135-foot level. A 10 stamp mill of 1000-pound stamps is going up.

The Eureka mine, on Soldier Creek, near Grant's Pass, has reverted to its former owner and A. F. Nelson is manager, and will increase development work. The mine is equipped with a 10-stamp mill.

SOUTH DAKOTA.

CUSTER COUNTY.

Superintendent Wright of the Extreme M. Co., owner of the Minnie May mine, says he will increase development and reduction work. The company owns 200 acres of ground 3 miles northwest of Custer. A few men are at work pending completion of a sawmill, with which the company will saw lumber to be used in building a 10-stamp mill. There is a large tonnage of free-milling concentrating ore on the dump which assays $6.

LAWRENCE COUNTY.

J. C. Sberman & Co. are getting the Amma Queen mill ready for operations at the Amma Queen mine, near Custer Peak. This mine has shown a ledge of free-milling ore.

Superintendent R. Fitzgerald of the Reliance M. Co has men at work grading for a millsite on Annie creek, near Deadwood. The site is 200 feet north of the main working tunnel on the property of the former University Co. The plant will contain three Chilian mills, each having capacity of seventy-five tons daily. The Burlington Railway Co. will build in to the site from the Juno spur, a distance of about 1500 feet, to deliver coal and freight. F. W. Medbury is manager.

Manager M. R. Maloney, of the Phœnix M. Co., operating on Blacktail gulch near Deadwood, says they expect to begin construction on their mill this week. Grading has been done. It is intended to give the mill at first a capacity of 200 tons daily, but it will be so arranged that this can be increased to 500 tons without suspending. At present but a few men are at work in the mine, timbering, running the pumps, etc. The pumps are operated by air, as will be the hoist when completed. Machine drills, also electric lights, will be used in the underground workings. The company has made arrangements to sink an incline shaft of two compartments through which the ore will be raised to the surface. This incline will be 800 feet in length. This shaft will be completed before the mill is ready to drop its stamps and the hoist will land the ore on the millsite. The shaft will tap the old workings of the mine, and with the tunnel should give a sufficient ore supply, says the Lead Call.

T. Goodman, superintendent of the Gold Hill M. Co., will put men at work on their holding, near Spearfish, next week. As soon as the shaft is unwatered, sinking will be resumed and continued until the quartzite is reached. The shaft is down 300 feet. Drifting on the quartzite will be done. The property is on the silliceous ore belt of the Ragged Top and Iron Creek districts.

TEXAS.

BREWSTER COUNTY.

At Terlingua three companies are operating quicksilver mines, and the district

is producing 500 flasks per month. Other companies are doing development work. Terlingua is in a bend of the Rio Grande river and near the Mexican line. The place is reached by wagon from Marfa, Tex. The camp contains 3000 people, mostly Mexicans, the labor being mainly done by Mexicans at present, who receive from $1.25 to $1.50 per day. The Kansas City & Orient Railroad, which it is expected will reach the line of Mexico in two years, will pass within 50 miles of Terlingua, and it is thought a branch will run out of it. Coal fields exist near the camp, the coal land being owned by the State. There is also good timber in the same section and spring water. There is no water at Terlingua. It is hauled from the Rio Grande, 7 miles.

UTAH.

Exclusive of the shipments of copper bullion from the independent smelters, which were 2,573 580 pounds, the ore and bullion settlements for products of Utah mines amounted to $1,771,550 for month of August. During July the settlements totaled up $1,829,250. Production was retarded by the large amount of development work which became necessary after the close of the first half of the year, says the Salt Lake Tribune. About 61,000 pounds more of copper bullion was produced than in July, distributed as follows:

	Pounds.
Bingham Con	693,440
Highland Boy	1,100,000
United States	780,140
American S. & R. Co.	1,200,000
Total	3,773,000

The American is expected to handle a larger tonnage by 4% or 5% this month and the United States will be able to treat more by reason of blowing in of an extra furnace.

BEAVER COUNTY.

Manager Botkin says operations will be resumed on the Old Catawba group, in Beaver Lake district, near Milford. He is also preparing to incorporate the Anchor group, which has a showing of copper ore.

Work was resumed on the Orphan Boy mine near Milford last week.

The Gold Crown group of twenty-one claims near the head of Indian creek, in the Newton district, near Milford, has been sold for $50,000 to the American Exploration Co., represented by W. Thompson, of Salt Lake City. No development work has been done on the property, but it is said to show a ledge of low-grade gold ore.

Contractor J. Dedrich, putting in the waterworks system for the Newhouse M. & S. Co. for the Cactus group of mines near Frisco, says the development of the Wah Wah springs has been completed and the reservoirs for storage purposes are about finished. In the vicinity of the springs and reservoirs 14,000 feet of piping will be required. Work is going ahead on the trenches for the main pipe line across the Wah Wah valley.

The Majestic Co. has awarded a contract for hauling a maximum of 500 tons of ore daily from the Harrington-Hickory, Old Hickory and O. K. mines, near Milford, to their smelter. It will require sixty teams to handle the contract when in full operation, but at the outset the hauling will be confined to the Harrington-Hickory, 100 tons per day, says the Milford Times.

The Royal Co. has started operations near Milton says Superintendent J. Forgie. Two hoists are being put in at the Montreal mine. Equipment will be put in for the Atlas-Monitor for sending the incline deeper, and work will be continued on the Beacon and other properties. It has been decided to sink a deep shaft at a point near the intersection of the two main veins. A prospecting shaft has already been sunk at this point to depth of 50 feet. A 40 H. P. gasoline hoist will be placed at this shaft, which will be enlarged, timbered and sent down to 500 feet.

JUAB COUNTY.

The shaft at the Dagmar - Northwest mine, northeast of Eureka, is at depth of 350 feet where a station is being cut. Sinking will be continued to the 500-foot level.——Now that the Mammoth M. Co. has closed a contract with the American S. & R. Co., an additional force of 150 men are being put on at the mine; but the mill will be kept closed. The ore bins at the mill will be emptied and the contents shipped. There is a large body of low-grade ore at the mine which averages $3.50 per ton, containing copper, gold and silver, says the Deseret News.

Work in the lower levels of the La Clede copper mine, near Diamond, has been suspended and the pumps were pulled last week. Manager Weir says no further effort will be made to rescue the diamond drill which was lost at depth of 300 feet, but the development of the property had not been permanently dropped. A new diamond drill with greater capacity will be put in, when a prospect hole will be put down from the surface, thus avoiding the expense of maintaining a pumping plant.

Shipments for the month of August from Tintic district were:

Mine.	Cars of Ore.
Bullion-Beck	28
Carisa	10
Centennial-Eureka	87
Eureka Hill	11
Gemini	35
Grand Central	108
Mammoth	56
Victor	18
Yankee Con	12
Ten others, a total of	42
Total	407
Iron Ores:	
Black Jack	37
Dragon Iron Mine	98
Noon Iron Mine	16
Total	151
Concentrates:	
May Day	7

PIUTE COUNTY.

Operations will be resumed by the Boston & Gold Mountain M. Co. at the foot of Mount Baldy, south of the Annie Laurie mine near Marysvale.

The Annie Laurie mine at Kimberly, which has been shut down for several weeks on account of an agitation started by the Western Federation of Miners, has resumed with a number of non-union miners, says the Times.

SALT LAKE COUNTY.

Superintendent Thornton of the Vallejo mine, at Alta, says the International Leasing Co. will increase operations on the property this week. Men will begin breaking down rock in the Burgess tunnel, and shipments will be made as soon as transportation facilities can be obtained. The Vallejo workings carry low-grade silver ores, with occasional pockets of high grade. The main trouble with the Vallejo, as well as with other properties, is transportation. An aerial tram is being considered, which would be serviceable the year around.

SUMMIT COUNTY.

Negotiations are under way by the directors of the California & Comstock Co., operating at Park City, for consolidation of the two properties. Underground surveys are said to show that the California and Comstock veins divide in the latter property, and the one that has been worked is almost entirely in California territory. As they go down, the ore bodies apparently converge.

The J. I. C. mine, at Park City, is temporarily closed down on account of a flow of water caused by cutting the water bearing fissure in sinking. Superintendent Turner reports a pump being put in.

Superintendent C. T. Mixer of the Creole mine, near Park City, says he expects to put in a compressor plant at the mine this month. The shaft is down to the 600-foot point. Crosscutting will begin for the contact on this level. The leasers at the upper workings are shipping ore.

TOOELE COUNTY.

Superintendent B. F. Fleiner, of the Blaine mine, near the Juab county line, says he is preparing to make ore shipments. The ore carries values in lead, gold and silver, and is hauled to Jericho on the San Pedro railroad. The Blaine is owned by the Blaine G. & S. M. Co., of Salt Lake City, W. D. Mathis, secretary.

UTAH COUNTY.

The mining of ozokerite (mineral wax) is reported improving. A New York company is taking out fifty tons per week near Soldier Summit, and several other deposits are being explored. This product is said to be worth $250 per ton, refined.

WASHINGTON.

FERRY COUNTY.

A diamond drill plant is at work on the Little Gem mine, near Orient.

R. L. Boyle of Indianapolis, Ind., says a company has been formed to build a smelter at Keller, on the south half of the Colville reservation. A sawmill is being set up to cut timber for the smelter. Surveyors are at work for a ditch 1 mile in length to furnish the water power to run the plant. The San Poil river runs through Keller. The incorporators are R. L. Boyle, H. Hildebrandt, J. F. Reed, J. S. Badger and H. A. Denton. It is expected the smelter will be in operation this winter. Keller is 9 miles north of the Columbia river. The ores of the camp carry copper, gold and silver.

OKANOGAN COUNTY.

Superintendent J. M. Hagerty says he sent last week to the smelter at Nelson, B. C., a car of ore from the Ruby mine, on Mount Chapaca, in Similkameen district, which was hauled to Curlew for transportation by railroad. It was assorted to run $125 per ton, principally in silver. The Ruby mine is 3 miles west from the Night Hawk and Six Eagles mines. It has been opened by two tunnels, which have developed a vein at 150 and 250 feet deep. The lower tunnel strikes the vein at 226 feet in from the portal, and drifts have been extended on it 300 feet. He will start another tunnel to strike the vein 600 feet deeper than the present workings, which will give a total depth of 850 feet below the apex. September 15th he will start up a concentrating plant, crush the ore from the Ruby mine with two mills and use two tables and a belt machine for concentrating. Hagerty is also manager for the Similkameen Falls Power Co., which is putting in a hydro-electric plant for supplying power to the Six Eagles, Ruby and other mines. A power line with poles and wirage 25 miles, from the Golden Zone mine to the Ruby, and thence to the Six Eagles, Night Hawk, Similkameen Falls and Oroville, is being built.

PIERCE COUNTY.

Coal deposits are reported located 60 miles south of Tacoma, near the line of the Northern Pacific Railroad, being only 6 miles from the main track, says the Telegram. It is of a semi-lignite character. The seam opened up is 12 feet thick and was struck at a depth of 100 feet.

STEVENS COUNTY.

High-grade silver ore is reported found in Rattlesnake Butte mining district, on the south half of the Colville reservation, says H. L. McIntyre of Spokane. The district is 35 miles southwest of Myers' Falls and 30 miles west of Colville and near Rattlesnake Butte.

WYOMING.

CARBON COUNTY.

The Southern Wyoming Aerial Tramway, which connects the Boston-Wyoming smelter at Grand Encampment with the Ferris-Haggarty copper mine at Battle lake, 16 miles away, is in steady operation, and the smelter is expected to be blown this week. Delay in blowing in was caused by the roaster, which had not turned out enough roasted ore to begin operations.

LARAMIE COUNTY.

The Omaha Co., operating a mine in Slate Creek district, west of Wheatland, is arranging to put in a mill. Ore from this mine shows values in gold, silver and copper.——Nickel ore has been found in the Three Cripples property in Laramie Peak district, northwest of Wheatland.

UINTA COUNTY.

J. Acocks of Evanston reports finding a body of coal 10 feet in thickness and extending northeast to southwest. Eight entries have been made on the streak, which dips at an angle of 20°. It is 4 miles southwest of Cumberland, from which point a spur of the railroad can be laid without heavy grades, and a good water supply is close at hand.

BIGHORN COUNTY.

J. Hilliard, E. Mann and B. Dunshee report finding gold-bearing quartz near Basin City and on the north end of Bald mountain.

FOREIGN.

AFRICA.

RHODESIA.

At the Ayrshire mine, in Mashonaland, 75 miles from Salisbury, and connected with the main line of railway by a 2-foot gauge line, work is about completed on the mill. The surface equipment of the mine will consist of a 60-stamp back-to-back mill with 1300-pound stamps, and driven by steam. This engine is one of three, so arranged as to drive either electric generators or the mill. A jet condensing plant is being provided, capable of handling 15,000 pounds of steam per hour, the circulating water being cooled by means of an open type, natural draught cooling tower. Steam will be supplied to the engines from four 155 H. P. boilers, arranged to burn either wood or coal. Electricity is to be largely used, the current being taken from a 200 kilowatt 3-phase generator and distributed to various parts of the mine. Among others it will drive a 50,000-gallon per hour pump, supplying water to the mill from the Maquassi river, workshops, cyanide plant, fuel haulage and the whole of the surface and underground workings will be lighted by electricity. At the main shaft the rock-breakers will double-crush the ore, which will be sent to the mill reduced to ¾-inch size. This will be driven by two 3-phase 50 H. P. induction motors. A 16-drill cross-compound compressor will be used, the steam being supplied from three 155 H. P. boilers. Special arrangements have been made for filtering and heating the feed water. The sands from the mill will be run by gravity to a cyanide plant, consisting of a series of steel tanks.

TRANSVAAL.

In the Witwatersrand district the "Deep Deeps," or third row propositions, are being brought into the producing stage, says South African Mines. The Village Deep is ready for production. A tailings wheel has been put in. South Nourse is also being developed, while the Knight's Deep of the Con. Gold Fields group around Germiston is already a gold producer.

At the Great Eastern colliery at Springs the shaft which caved has been repaired and operations resumed. Fully two weeks were lost in waiting for timber. A small air shaft, 230 feet from the old shaft, has been enlarged and timbered, and a new head gear erected. The hauling engine has been removed and fitted up near the new shaft, and a platform put up which connects with the screening plant formerly in use.

BRITISH COLUMBIA.

BOUNDARY DISTRICT.

R. Plewman of Rossland, managing director of the Winnipeg mine, near Boundary Falls, says work will be resumed. A 10-drill compressor and a 150 H. P. hoist will be put in. About 3000 tons have been mined and shipped, of average value of $12.

Operations and shipments will be resumed at the Winnipeg mine in Wellington camp, near Hartford Junction, 2 miles east of Phœnix, says R. Plewman, president and managing director of the company owning the mine. On May 30, 1902, fire destroyed the shaft-house, the seven drill air compressor pumps, boilers and other machinery, and since then nothing has been done at the Winnipeg except to keep the water out of the workings for a few weeks.

A strike is reported on the Onondaga mines in Waterloo camp, showing a quartz lead of free-milling gold carrying values of $10 across the vein. The principal owners are L. & A. Will, of New York City. They have a 10-stamp mill up.

CASSIAR DISTRICT.

Manager J. W. Haskins, of the Rosella M. Co., has put men to work on the Dease River claims of the company, near McDame, in Liard mining division. They went in by way of Wrangel and Telegraph Creek, and are making preparations to put in machinery.

EAST KOOTENAY DISTRICT.

It is reported oil has been struck in a well being sunk in Flathead valley near Atlyn, near Fort Steele, by a Montana company at depth of 300 feet.

B. Layton, manager of the Sullivan mine near Fort Steele, says the mine will be reopened this fall.

NELSON DISTRICT.

E. M. Wilson has bought a half interest in the Emerald claim, near Ymir, for $4000. The claim is on Lost creek and shows a 3-foot ledge carrying galena. On this a shaft has been sunk 30 feet, besides several open cuts. Assays run 30% lead, 12 ounces silver and $5 gold. Wilson will open up the mine.

SLOCAN DISTRICT.

The freight and treatment rate on dry ore from Slocan has been raised from $9 to $11 a ton in Nelson, and from $11 to $12 at Trail, says the Rossland Miner.——The Reco mine has opened a body of good ore and more men will be put on and shipping resumed, says Manager Harris.

Surface stripping on the Legal claim, on Lemon creek, near Slocan City, has exposed 2 feet of gold-bearing quartz.——On the Howard Fraction, on Lemon creek, a crosscut tunnel will be driven to tap the ledges at depth. It will be 1000 feet in length, and in that distance is expected to open four ledges at vertical depths approaching 700 feet, which have been located on the surface.

WEST KOOTENAY DISTRICT.

The Kootenay Con. M. Co., with headquarters at Minneapolis, Minn., has been organized as a merger of the following mines in Lardeau section: Old Gold, Primrose, Mountain Lion, Treadwell, Black Warrior, Lardeau Duncan, Guinea Gold Extension, Spring group, Silver Moon, Comstock, Rio Grande, Baltimore and Amazon.

A free gold group of prospects, consisting of the Nelson, Goldflake and Gold Medal, at the head of Ten Mile creek, near Sable creek divide, near Camborne, was bought last week by C. Menhinick, G. Sandham and G. Young. On the Nelson claim there is said to be a lead 10 feet wide of quartz which carries free gold.

A find of quartz carrying free gold is reported in Lardeau section, near the north end of Trout lake, near Trout Lake City. It is 30 miles from the Poplar Creek discoveries.

CHINA.

MANCHURIA.

Manager Yugovitch, chief engineer in construction of the Chinese Eastern Railway, has completed an agreement with the Chinese Governor of Hylomtsian Province for exploitation of two coal mines in that Province, by which the Chinese Eastern Railway is granted the right to exploit the coal mines on a strip of land 30 Chinese versts (about 20 miles) on both sides of the railway line, besides preferential rights to exploit coal mines beyond these limits. The railway company agrees to indemnify all private parties whose lands may be taken for any damage done to buildings, graves or crops, and to pay the Chinese Government a royalty for every 1000 Chinese pounds of the output of coal. To the company is also conceded the right to cut timber in the Province, both in Government and private forests, for a remuneration to be hereafter fixed, says R. T. Greener, U. S. Commercial Agent at Vladivostok.

MONGOLIA.

A. S Bigelow of North Columbia, Cal., superintendent of the Peiger and Capsilvar mines, owned by the Franco-Russian Co. des Aimaks in northern Mongolia, says the company has a concession from the Chinese government covering 600 square miles of territory for placer mining. American methods and implements are being introduced there. The main difficulty in mining operation in that section is the lack of grade; canals are run on light grades, and 6 to 7 miles of pipe are necessary in order to obtain an hydraulic head of 200 feet. Formerly the "long Tom" was used, and horses hauled the gravel to the place of washing and afterwards removed the tailings. Russian peasants are employed, working ten hours a day for 1 ruble (50 cents). They go on at 6 A. M. and come off shift at 6 P. M., taking out an hour at noon and a half hour at 9 and 3 o'clock to eat and smoke. They require to be immediately instructed in all the details of their work. The Mongols are not miners. During the last two seasons there has been a lack of rainfall and snow, causing a scarcity of water for mining. Victor von Grot is manager.

CANADA.

ALBERTA.

The International Coal & Coke Co., controlled by the Granby mining interests of Grand Forks, B. C., are planning for a plant capable of producing an output of 2000 tons daily of coal from their mines at Blairmore.

ONTARIO.

To operate the McRae mine at Minnehaha lake, near Wabigoon, owned by B. J. Morningstar, of Buffalo, N. Y., the Fechter M. Co. has been incorporated, with L. Fechter, of Buffalo, N. Y., as president. Development has shown a vein 6 feet wide, carrying free gold.——At the Jubilee mine, the machinery is in place and operations resumed. The shaft will be sunk.——The Big Master stamp mill is running steadily. The hoist which is being set up will be effective to depth of 1000 feet. Concentrates are being shipped to the smelter.——At the Twentieth Century mine twenty stamps are dropping steadily on quartz from the raise between the third and second levels, where the vein is 10 feet wide. Owing to the water supply from the creek proving insufficient, other arrangements are being made.

The Sultana gold mine, near Rat Portage has been unwatered, using a 3-ton bailing skip, making fifty trips per hour.

On HW 43, near Wabigoon, being operated by the Escanaba Co., considerable preliminary work has been done. A working shaft will be sunk.

A prospecting drill has been put to work on the Twentieth Century M. Co. ground, in Manitou district, near Beaudro's Landing.

GERMANY.

The annual report of the Oppeln Chamber of Commerce says the average wages of coal miners over sixteen years of age in Silesia fell from 1029 7 marks ($245 14) in 1902 to 972 1 marks ($231 33) in 1903. This includes all classes from the apprentice to the skilled laborer. There was a reduction of wages in the years 1892 and 1893. Comparisons will show an increase, however, of 66% in the last fifteen years. While in 1899 the average of $218.25 was set over against each workman above sixteen years of age, the actual amount paid to miners in a certain section of Silesia was $278 22. The helpers of various kind were paid as follows: Drivers, $173 50; carpenters, etc., $236.57; general help in the mines, $166 32; top men, $172 55. The wages paid to the miners who pick out the coal is in many cases more than 1200 marks ($285.60); and in a few, 1500 and 1600 marks ($357 and $380.80).

MEXICO.

AGUAS CALIENTES

The smelters at Aguas Calientes are treating 1500 tons of ore per day. Five of the furnaces are devoted to treatment of copper ore and three to lead.

CHIHUAHUA.

G. B Jacobs of Chihuahua reports having secured options on a group of silver and gold properties in Los Otates section in western Chihuahua and southwest of Ocampo.

Work is progressing on the Encinillas M. Co.'s smelter at Santa Rosalia and is expected to be ready this month. The company is planning to put up additional furnaces as a customs plant in connection with the 80-ton plant, which will be used for the treatment of the Encinillas ores.

COAHUILA.

The Mexican Coal & Coke Co., E. Ludlow manager, reports making a contract to furnish 22,000 tons of coke to Smelter No. 3 at Monterey from the Las Esperanzas coal mines in northern Coahuila. The vein is 8 feet thick and they are producing 2000 tons per day.

DURANGO.

Operations have resumed on the Trinidad mine at Cuensame. The principal values are in silver, with some gold.

At Tacitita, a free-milling gold camp, Manager Rawlings says they have a 10-stamp mill and a small cyanide plant in operation. The principal part of the ore comes from the Socavon group. There are 5000 feet of tunneling. The ores are brought to the mill by gravity tramway, the mill being operated by water power. The company has denounced a number of old dumps on mines at one time operated by the Spaniards and will build a 75-stamp mill to treat them, which will also be operated by water power.

GUANAJUATO.

Arrangements are made for driving a drainage tunnel in Guanajuato mining district. The La Luz Drainage and Transportation Co. has been organized at Guanajuato to carry out the enterprise, which involves the construction of tunnels several miles long at a depth of 400 feet below the lowest workings of the flooded mines.

GUERRERO.

J. G. Tucker is reported to have bought the quicksilver mines of Huitzuco, being La Cruz y Annexas group, covering 568 pertenencias and thirteen mines, three of them producers. The main shaft is down 800 feet, with five drifts to distance of 150 feet. He claims the value of the property lies in the large low-grade deposits, although occasional pockets of rich ore are found. The mines are equipped with a smelting plant of six furnaces, together with condensers. A gravity tramway connects the mine with the smelter. Water is plentiful. The mines are 20 miles from the railroad station of Iguala.

JALISCO.

A St. Paul, Minn., company has bought a three-fourths interest in the Altamira group of seven properties of 64 pertenencias, near Etzatlan, and will begin work as soon as air drills and other machinery arrive at the mine.—— Douglas, Lacey & Co. are reported to have started work last week on the Buena Ventura, Veta Grande, Fenix, San Salvador and Iguana mines adjoining the Santa Domingo mine, near Etzatlan. The mines are of silver and gold.

A Fort Worth, Texas, company has started work on the gold, silver and copper mines of La Cruz, Dos Amigos, El Cobre and Texas mines, 15 miles west of Etzatlan, which they have under option.

MEXICO.

The Mexican Light & Power Co., Ltd. (the Canadian Co), putting in an 80,000 H. P. electric plant at Necaxa, Puebla, to furnish power for the City of Mexico, has announced its intention to put power into El Oro mining camp for use in the mines, says the Chihuahua Enterprise. Work for the first installation of 40,000 H. P. is being rushed. For this three tunnels have to be constructed. Three towns located in the reservoir site are being bought up so as to remove them.

The Victoria mine at El Oro is preparing to increase its development equipment, including heavier hoist and pumps. The shaft is down 360 feet, with the first crosscut run from the 300-foot point. Drifts are being run both north and south.

MICHOACAN.

A. E. Abbott, interested in the Agostitlan coal fields, says the Southwestern Michoacan Exp. Coal Co. has been organized to exploit the coal measures. His company has a 5-foot body of lignite coal. A railroad 44 kilometers long from Irembo on the Michoacan Pacific road to Agostitlan is to be built and the work started this fall.

OAXACA.

The Esmeralda M. Co. has been organized in Delaware to exploit a group of gold mines in Oaxaca, with principal offices at Wilmington, Del., with W. R. and J. T. Wallace, O. G. Noble and C. T. Downham as officers.

A strike of high-grade gold ore is reported made near Ejutla. A number of prospectors have gone in there.

SAN LUIS POTOSI.

R. Ipina, having bought the hacienda of San Miguel, near San Pedro camp, proposes to establish a smelter there. San Pedro is 15 miles from San Luis Potosi, and the ores carry gold and silver. The camp is producing 4000 tons of ore monthly.

One of the features of San Luis Potosi camp is the cyanide plants which are working over the old dumps which were left as waste by the Spaniards, says the Mexican Investor. Ardilla & Co. own a number of tailings dumps, amounting to about 250,000 tons, and they are working them in two separate plants, treating fifty tons daily in one and thirty in the other. F. Eschauzier & Bros. are also cyaniding dumps. They have a large tonnage and two plants with a capacity of fifteen and eleven tons per day, respectively.

SONORA.

The Ventana mine has been bought by H. Smith, manager of the Palimentas mine, for Philadelphia, Pa., men. The property is 4 miles from the Palimentas mine, on the Bato river, in Pilares de Terres district. It has a vein averaging 6 feet wide, containing gold, silver and copper values. The vein is defined between porphyry and lime.

The Anglo-American G. & C. M. Co. will increase development work on the Enriquita mine, and ore shipments will be started from their Garciala. The Enriquita is 4 miles south of Cananea, and the Garciala 25 miles south.

The Ures Con. M. Co. within the past two years has been developing its mines, 1½ miles from El Gavilan on the Sonora river. On the Eureka & Ramona development has opened ore with average value of $10 per ton. The equipment consists of a 10-stamp mill, friction hoist, three water tanks of 5000 gallons capacity each, etc. The mill will be started Sept. 1st.

The Santa Ana M., M. & S. Co. has been incorporated to work in Sahuaripa district, near the Bufa mines. Their holdings include four groups which aggregate 50 pertenencias of ground—Las Verdes Bufa, La Plomosa de Santa Ana, La Plomosa de Guadalupe and Las Gatitas. E. Kingae is president and manager, Z. T. Rawson, vice-president and superintendent. Developments will be started.

The Yaqui River C Co. has closed down work in its mines at Campo Santo Nino.

The Sierra Madre M. Co. has been incorporated at Douglas, Ariz., by A. J. King, manager, with O. C. Kennedy and D. S. Smith. Their holdings are 7 miles from the El Tigre mine and 5 miles from Pilares de Teras, in Moctezuma district.

ZACATECAS.

The Mazaprel Copper Co. at Conception del Oro continues regular operations. The mine has a deposit of lead and copper ore. The reduction plant consists of copper furnaces, four lead furnaces, and a Bessemer plant for refining the copper. In addition the company owns a railroad 150 kilometers long, running from Saltillo to Conception del Oro. From the mine to the plant are 20 kilometers of overhead tramway. W. Purcell is president and J. Lynch is manager. The company has 4000 men at work.

PERSONAL.

M. J. BRIDE of Nome, Alaska, is in San Francisco, Cal.

W. B. PITTMAN of Tonopah, Nev., is in San Francisco, Cal.

R. R. SWAIN has returned to El Paso, Tex., from Denver, Colo.

F. KLEPETKO has returned to New York from Parral, Mexico.

B. LAYTON is manager of the Sullivan mines near Fort Steele, B. C.

PHILLIP ARGALL has returned to Denver, Colo., from New York City.

L. HERFOOT of Chihuahua, Mexico, is in New York on mining business.

R. W. CLOUD is superintendent of the Merced mine, near Randsburg, Cal.

F. W. MEDBURY is manager of the Reliance M. Co., near Deadwood, S. D.

J. B. FARISH, E. M., has returned to Denver, Colo., from San Francisco, Cal.

A. MORRISON is superintendent of the Noonday copper mine, near El Dorado, Cal.

G. MAINHART of Grass Valley, Cal., is in San Francisco, Cal., on mining business.

G. SALMON is superintendent of the North Star mine and mill, near Custer, S. D.

H. W. NELSON has resigned as superintendent of the Alpine mine, near Sumpter, Or.

H. BRATNOBER, interested in Alaska mines, returned to San Francisco, Cal., last week.

B. F. GRAHAM, of Bisbee, Ariz., of the Copper Queen M. Co., is in the East on business.

F. A. JONES will have charge of the New Mexican mining exhibit at St. Louis, Mo.

W. MAGUIRE of Dutch Flat, Cal., interested in Placer county mines, is in San Francisco, Cal.

JAMES A. MCCLURG has returned to Denver, Colo., from an extended trip through Europe.

W. L. CRAWFORD, interested in Mexican mines, is in San Francisco, Cal., from Tuxpan, Mexico.

W. T. MCGREGOR is mine manager for the Premier Special Claim at Waiorongomai, New Zealand.

B. F. FLEINER, superintendent of the Blaine mine in Tooele county, Utah, is in Leavenworth, Kansas.

H. KEY has resigned as superintendent of the Adventure mill at Edgemere, Houghton county, Mich.

GEORGE ROSS, master mechanic of the United Verde Copper Co. of Jerome, Ariz., is in San Francisco, Cal.

J. PROSSER is superintendent of the Paparoa coal mine at Coromandel, in Hauraki district, New Zealand.

A. J. NOYES, manager of the Ajax G. M. Co., returned to Dillon, Mont., last week from a business trip East.

HENRY STEWART, manager of the S. S. Machinery Co., Denver, Colo., is in San Francisco, Cal., on business.

MANAGER D J. JACKLING of the Utah C. Co. is in Colorado Springs, Colo., on business, from Salt Lake City, Utah.

N. PIKE is superintendent of the Wautauga mine of the Old Town Con M. Co., near Russell Gulch, Gilpin county, Colo.

J. F. BOYD of Carthage, Mo., is superintendent of the Oliver Lease Prospecting Co. mines, near Zinclte, Jasper county, Mo.

G. J. MCCARTY of the Crestone-Colorado mines in Sonora, Mexico, has returned there from a trip to San Francisco, Cal.

J. PIPER, of Ishpeming, Mich., of the Negaunee mine, is superintendent of the mines of the Mitchell Dev. Co., near Bisbee, Ariz.

E P. LAW of Honolulu, and having mining interests in Nevada, will represent Hawaii at the Mining Congress at Deadwood, S. D.

J. H. ROBESON, of Georgetown, Colo., is visiting mines in which he is interested, in Bradshaw mountains, southeast of Prescott, Ariz.

R. C. DUNSTAN is superintendent of the mill of the Adventure Con. C. Co. at Edgmere, Houghton county, Mich., vice H. Key, resigned.

E. S. TOPPING, formerly of British Columbia, interested in Baker county, Or., mines, has established his headquarters at Sumpter, Or.

T. H OXNAM, manager of the Palmarejo & Mexican Gold Fields, Ltd., is at their mines at Chinipas, Chihuahua, Mexico, from Los Angeles, Cal.

C. A. CUNNINGHAM of Guthrie, Oklaboma Territory, secretary of the Endless Chain M. Co., is at their mines near Patagonia, Santa Cruz county, Ariz.

E. C. BANKS, chief chemist of the Waihi G. M. Co. of Waihi, New Zealand, is at Deadwood, S. D, investigating the cyanide practice of the Black Hills.

F. W. OLDFIELD, recently of the Palmarejo and Mexican Gold Fields Co., has gone to Ecuador, as assistant manager of the South American Dev. Co. at Zaruma.

J. F. HYDE has been appointed Professor of Economic Geology and Mining at the State University at Eugene, Or., as it is intended to build up a department of mining there.

W. HUTCHINSON, formerly superintendent of the Tomboy mine, near Telluride, Colo., has been appointed superin-

tendent of the H. M. H. group, in the same district.

A. E. WELBY returned last week to San Francisco, Cal., from a year's stay in Peru, where he superintended construction of a railroad for the J. B. Haggin mining interests.

P. REARDEN, formerly superintendent of the Kurtz Chatterton mine at Grand Encampment, Wyo, is superintendent of the Alpine mine, near Sumpter, Or., vice H. W. Nelson, resigned.

New Patents.

DEWEY, STRONG & CO.'s SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING SEPT 1, 1903.

737,812.—EVAPORATING APPARATUS—W. C. Anderson, San Jose, Cal.
737,893.—NUT LOCK—A. D. Asdell, Lakeview, Or.
737,896.—POWER TRANSMITTER—P. W. Bettinger, San Jose, Cal.
737,822.—PRINTING ATTACHMENT FOR ROLL PAPER HOLDERS—R. E. Brunacci, S. F.
737,822.—TROLLEY WHEEL—E. S. Cobb, Los Angeles, Cal
737,709.—CAR BUMPER—T. Collins, San Jose, Cal.
738,002.—PINE NEEDLE MATTRESS—Mathilde R. Corda, S. F.
737,823.—CLOTHES HANGER—Carrie F. Cox, Los Angeles, Cal
737,830.—HOIST—Duryea & White, Los Angeles, Cal.
737,897.—BUCKLE—H. S. Englebright, North Ysmbill, Or.
737,725.—BICYCLE MUD GUARD—H. Fesenfeld, Hoquiam, Wash.
737,832.—BEVELING MACHINE—C. Finnegan, Fairhaven, Wash.
737,607.—FRUIT TRAY—J. H. Gunby, Chico, Cal.
737,924.—WINDOW CLEANING CHAIR—J. H. Hanavan S. F.
737,736.—MATCH SAFE—W. A. Harmon, Skagway, Alaska.
737,515.—FRUIT CUTTER—O. Harpold, Santa Paula, Cal.
737,833.—MOWING MACHINE—A. T. Haynes, Wheatland, Cal.
737,622.—VEHICLE BRACE—P. Hebert, Hazeldell, Or.
737,928.—PUMP—N. A. Heyman, Los Angeles, Cal.
737,737.—GAS ENGINE—C F Hitchcock, S. F.
737,738.—VAPOR GENERATOR—C. F. Hitchcock, S. F.
738,038.—STOVEPIPE FASTENER—R. H. Hodge, Centrapoint, Or.
737,841.—TILE MACHINE—W. A. Houts, S. F.
737,842.—BRICK MACHINE—W. A. Houts, S. F.
737,843.—TILE MACHINE—W. A. Houts, S. F.
737,743.—BED AND SOFA—L Kragen, S. F.
737,747.—GAS GENERATOR—J. Kuijis, Portland, Or.
738,115.—ENGINE VALVE—C. E. H. Lincoln, Douglas, Ariz.
737,756.—STILL—W. Maybury, Los Angeles, Cal.
737,757.—TOY—S. E. Miller, Crockett, Cal.
737,760.—OIL BURNER—A. Moorefield, Stockton, Cal.
737,765.—GRUBBING MACHINE—G. Olsen, Port Blakeley, Wash.
737,769.—FASTENER—L C. Preston, Weaton, Or.
737,966.—CANDLE HOLDER—Pauline Rummelin, Portland, Or.
738,129.—PACKING—E. W. Tucker, S F.
737 886.—CIRCULATOR—J. P Urbanek, York, Wash.
738,130.—COMBINATION TOOL—A. A. Waymire, Woods, Or.
737,8 5.—TABLE—C E. Wehn, Los Angeles, Cal.
737,981.—BELT SHIFTER—J Welchhart, S. F.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

TILE MAKING MACHINE.—No. 737,841. Sept. 1, 1903. W. A. Houts, Oakland, Cal. The object of this invention is to provide a suitable machine for the manufacture of pipe or tiling from compositions containing asphaltum or such materials as are rendered plastic by heat and have the quality of setting into a hard resistant mass when cooled. The invention comprises a mold, means for feeding material to the mold, means, including a plunger core, for compressing the material therein, and rings engaging the core to free the tile from the mold and core.

BRICK MAKING MACHINE.—No. 737,842. Sept. 1, 1903. W. A. Houts, Oakland, Cal. This invention relates to improvements in machines for pressing and molding bricks and the like. The object is to provide a continuously operating means for forming bricks from compositions which have the quality of becoming plastic on the application of heat and of setting into a hard cohesive mass when cooled.

TILE MAKING MACHINE.—No. 737,843. Sept. 1, 1903. W. A. Houts, Oakland, Cal. This invention relates to improvements in machines for manufacturing drain tiles, conduit sections and the like. Its object is particularly to provide an apparatus suitable for the manufacture of pipe or tiling from compositions containing asphaltum, sand and the like.

EVAPORATING APPARATUS.—No. 737,812. Sept. 1, 1903. W. C. Anderson, San Jose, Cal. Assigned to Anderson-Barngrover Mfg. Co., of San Jose, Cal., a corporation, of California. This invention is especially applicable to the evaporation of fruits of all kinds. It consists in the construction of a furnace and drying tunnels disposed in independent longitudinal channels, each adapted to receive a line of drying trays, and in a means for regulating the application of heat, so that an approximately even division of the heat may be made and constantly directed through each of the drying tunnels.

PRINTING ATTACHMENTS FOR ROLL PAPER HOLDERS.—No. 737,822. Sept. 1, 1903. R. E. Brunacci, San Francisco, Cal. Half assigned to Barone Carlo Sobrero, of same place. This invention relates to improvements in devices that are intended to be attached to a wrapping paper roll support or rack and which devices are adapted to print the name or an advertisement or other matter upon the wrapping sheet as it is unwound. Its object is to provide a simple compact printing and advertising machine adapted to receive printing and inking rollers of different diameters and lengths and having various tension devices for adjusting it to to the several rolls and to the paper roll as the latter is diminished.

Commercial Paragraphs.

THE Redfield Drill Co., Denver, Colo., report the sale of two of their hand drills for Australia; also one to W. L. Murphy, Keller, Wash., and one to W. D. Wilcox, Glendale, Or.

THE following orders are reported received by the Mine and Smelter Supply Co. of Denver, Colo: One eight-drill Cincinnati duplex air compressor for Boulder, Colo.; one 350 H. P. Babcock & Wilcox boiler for Cripple Creek, Colo.; four Wilfley tables and two Wilfley slime tables for the Beaver Creek M. Co. of Oregon; nineteen Wilfley tables for the Federal Lead Co. of Missouri.

IN the case brought by the Wilfley Ore Concentrator Syndicate, Ltd., against the Central Cookman's G. M. Co., the Victoria, Aust., Chief Justice has granted an order restraining the defendants from making or using any concentrating table constructed in accordance with the Wilfley specifications or in colorable imitation thereof during the continuance of the patent. The concentrator to which exception was taken by the plaintiff company is reported to have been manufactured for the defendants by a South Australian firm.

THE American Concentrator Co., of Joplin, Mo, state that among recent shipments made by them are the following: New Century jigs, rolls and ore feeders to the Missouri Copper Mt M. Co, Sullivan, Mo., and to the Holston Zinc Co., Mascot, Tenn.; New Century jigs to the Tybo M. & Reduction Co, Tyho, Nev.; Whitepine M. Co., Sargents, Colo., and to the Holthoff Machinery Co., for the Old Dominion C. M. & S. Co, of Globe, Ariz. Eight coal washing jigs for jigging anthracite coal were sent to the Delaware & Hudson Co., to be used in their Plymouth No. 2, Carbondale and Wilkesbarre breakers, they having decided to adopt these machines after trial of one of them at their Plymouth No. 2 breaker where a high grade of chestnut coal is being removed from the material formerly rejected to the culmbank.

Obituary.

W. B. WINN, editor and proprietor of the Pacific Oil Reporter, of San Francisco, Cal., died on the 9th inst, at Berkeley, Cal, the cause of death being inflammation of the ear drum, which affected the brain. Deceased was 45 years old and a graduate of Brown University. He is survived by a widow and four children.

Latest Market Reports.

SAN FRANCISCO, September 11, 1903.

METALS.

SILVER.—Per oz., Troy: London, 26⅝d (standard ounce, 925 fine); New York, bar silver, 57¼c, refined (1000 fine); San Francisco, 57¼c; Mexican dollars, 45¼c San Francisco, 45½c New York.

Silver is still at a fair price, and, according to the statement of Geo. E. Roberts, director of the U. S. Mint at Washington, D. C, made in his address before the American Mining Congress at Deadwood, S. D., it has seen its worst days, and in his opinion it will soon reach and maintain a stable standard of value.

COPPER.—New York: Standard, $13.75; Lake, 1 to 3 casks, $13.75@13 87½; Electrolytic, 1 to 3 casks, $13.62½@13.75; Casting, 1 to 3 casks, $13.37½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £57 7s 6d spot per ton.

LEAD.—New York, $4.35; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.75. London: £11 3s 6d per long ton.

SPELTER.—New York, $6.00; St. Louis, $5.00; London, £21 2s 6d per ton; San Francisco, ton lots, 6¼c; 100-lb lots, 7c

TIN.—New York, pig, $26.85; San Francisco, ton lots, 28½c; 500 lbs., 29c; 200 lbs., 29½c; less, 30c; bar tin, ℔ lb, 30c @32c. London, £122 spot.

PLATINUM.—San Francisco, crude, $18.00 ℔ oz.; New York, ingot, $19.00 per Troy oz Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, $47.00@47.50; large lots; London, £8 12s; San Francisco, local, $44.50 ℔ flask of 76½ lbs.; Denver, $49.50. Export, $43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER.—Half-and-half, 100-lb. lots 18.75c; San Francisco, Plumbers', 100-lb. lots, 15 50c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 45@48c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17 85 @18 85; gray forge, $15 60; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27 00@29.00; open hearth billets, $28.00 @30 00; San Francisco, bar, 7c to 12c per lb.

LIME.—Santa Cruz, $2.35; Roche Harbor, $2.35 per bbl.

CEMENT.—Imported, $2 50@2 75 ℔ bbl; California carload lots, $2 25 f. o. b. at works; small lots, $2.50 ℔ bbl. in sacks, 4 sacks to bbl.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No 1. 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ℔ set: 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $1.95 ℔ 100 lbs.; hyposulphite of soda, 2½@2½c ℔ lb.; caustic soda, in drums, 3@3¼c ℔ lb; Cal. s. soda, hhls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb tins; roll sulphur, 4@5c; powdered sulphur, 2@3c; flour sulphur, French, 2@3c; alum, $2.00@2.25; California refined, 2@2½c; sulphide of iron, 8c ℔ lb; copper sulphate, 5@6c; chloride of lime, spot, $2 50@2.75; sulphuric acid, in carboys, 66% B, 2½o ℔ lb.; nitric acid, in carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 44c; cs., 49c; raw, bbl., 42c; cs., 47c; Lucol oil, boiled, bbl., 41c; cs, 46c; raw, bbl., 39c; cs, 44c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 23½c; Elaine, 26½c; Water White, in bulk, 14½c; Mineral Seal, iron bhls., 18½c; wooden bhls., 21c; cs, 24c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 16c; do., in cs., 22½ c; Lard Oil, E. W. S., bbl., $1.00; cs., $1.05; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 70@60c; Natural White, 65c; Bleached do, 50c; Whale Oil, cs, 50@55c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymho, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $13; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13 in sacks; Sunnyside, $8.50, long ton.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin palls, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BORAX.—Concentrated, 6@7c per lb powdered, 8@10c; fused, 20@25c.

BORAX.—Crystal, 7c; calcined, 25o.

MANGANESE.—Pure, ℔ lb., 60o.

SODIUM.—Metal, ℔ lb., $1.00.

MOLYBDENUM.—$2 per lb.

CHROMIUM.—(90% and over) per lb., $1.00.

BISMUTH.—Subnitrate, per lb., $1.75.

MERCURY.—Bichloride, ℔ lb., 90c.

PHOSPHORUS.—(American) ℔ lb., 75c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate. 55c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

SITUATIONS WANTED.

A THOROUGHLY COMPETENT ASSAYER and Analyst, 15 years' experience, with a good practical knowledge of mining, milling and smelting, is open for engagement, with chance for advancement. Excellent references. Address "Everett" care of this office.

MILL FOREMAN WANTS POSITION—Concentration, amalgamation, cyaniding and assaying; 20 years' experience. Best of references. Address "Millman," 1055 South Gaylord St., Denver, Colo.

MINE SUPERINTENDENT WANTS POSITION with a substantial company that has a mill on property. A qualified mining engineer who can run a mine or mill, cyanide plant, assaying and surveying. Address "Mining," this office.

POSITION BY PRACTICAL MINING ENGINEER; 20 years' experience in U. S., Alaska and Mexico. Reference Al. Specialty, commercial mining. Address W., care of this office.

POSITION DESIRED AS DRAUGHTSMAN, Surveyor, Assayer or Bookkeeper. Good references. Address H.W.K., Box 74, Long Beach, Wash.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U S and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expect d not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WANTED—POSITION WITH SOME MINING and milling company desiring an electrical and mechanic familiar with all leading electrical machinery and having experience with hydraulic plants, engines, boilers, compressors and milling plants. Will be pleased to correspond with interested parties. Address "Mechanic," care of Mining and Scientific Press.

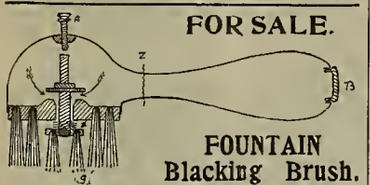
WANTED—POSITION BY A MINE SUPT. OR manager of 30 years' experience in practical mining and milling; past 17 years spent in superintending, managing and examining mines. Profitable handling of low grade ores a specialty. Climate no object. Reference from first-class companies. Address "Utility," this office.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by hydraulic process from C A Posge, in Phelps Hill Mine, near Washington, Nevada County, Cal., draining into Jefferson Creek which reaches South Yuba River; from Plumas Minea Co, in Plumas Mines, near Quincy, Plumas County, Cal., draining into Squirrel Creek which reaches North Fork of Feather River; from Excelsior Hydraulic Mining Co., in Excelsior Mine, near Lowell Hill, Nevada County, Cal, draining into North Fork Steep Hollow Creek which reaches Feather River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., Sept. 28, 1903, at 1:30 P. M.

FOR SALE.

EXCEPTIONAL BARGAIN!

ONE FOUR-FOOT FRUE VANNER, fitted with Brownell Patent Lip Flange Belt Vanner and Belt absolutely new. Address Fricot & Miller, Latrobe, El Dorado Co., Cal.



The Mines of Park City, Utah.

Have furnished 70% of the lead, 62% of the silver, 70% of the dividends of the State. Send 20 cents for 24-page illustrated edition of Park City Miner, with map. N. B. DRESSER, Park City, Utah.

MINING PROPERTY FOR SALE.

Consists of 13,000 tons of tailings, 25,000 tons of dump—both good values. Water for working same. Situated 3 miles from railroad. No crushing power required. Guarantee a saving of 80%. Partners cannot agree, so it will be sold cheap. Inquire of James McDermott, Brooklyn Hotel, San Francisco.

FOR SALE.

FOUNTAIN Blacking Brush.

A New and Clean'y Means of Applying Liquid Blacking.

With no pressure on bristles the small brush is kept in position shown by dotted lines F, by the spring X. With pressure on bristles, as by rubbing, the small brush is raised to position shown in cut, opening the valve and allowing the blacking to flow onto the bristles as indicated by arrows. Thumb screw J securely locks valve, making brush absolutely tight. Bottle in which liquid blacking is sold can be made to fasten on brush at line Z and serve as a handle.

Pat. in U. S. and abroad. For sale separately or as a whole. For particulars, address E. R KING, Lafayette, Contra Costa Co., Cal.

NOTICE

of Receiver's Sale of the Electric Plant, Apparatus, and Other Property of the Cochiti Gold Mining Company.

Notice is hereby given that the Receiver, by appointment of the District Court of the Second Judicial District of the Territory of New Mexico, for the County of Bernalillo, in that certain cause pending therein wherein Raymond P. Ripley and others are defendants, will, under and by virtue of an order of said court made August 20, 1903, receive bids for the purchase and sale of all the property of the said Cochiti Gold Mining Company, now in his possession as such receiver. Said property consists of a complete cyanide mill of two hundred and fifty tons capacity, built of structural iron, various other buildings such as stores, boarding house, store house, hunk houses, etc., etc. The machinery consists of dry crushing apparatus, Davis and Allis finishing rolls, twenty steel leaching tanks of two hundred and one hundred and thirty tons capacity; also sixteen thousand dollars worth of mining and mill supplies; office furniture, etc. And also, situated at Madrid, N. M., an electric power plant and structural steel building, one eight hundred horse power engine, one 600 K. W. generator, complete switches, etc., etc., for a twenty-thousand-volt transmission, and other property such as is generally used in connection with such a mill run by electricity, including one hundred miles of copper transmission wire.

Also the Albemarle, Pamlico, Huron, Ontario patented mining properties, and the U. M. C. and three-fourths interest in the Red Cloud, containing in all almost one hundred acres and having five thousand feet on the strike of the vein. These mines and the mills are situated at Albemarle, Sandoval County, New Mexico, twenty-four miles from Thornton on the A. T. & S. F. Ry.—the other property at Madrid on said railway.

Bids will be received by the undersigned for the sale of said property, or any part thereof, for sixty days from the date of this notice. For the Madrid power plant property, and the electrical machinery, bids must be itemized, fixing the price to be paid upon each separate article; and, also, separate bids must be submitted for the wire, on account of conflicting interests in the property. The buildings and other property may be removed by purchasers from the premises on which they are located.

A reasonable deposit, certified check or cash, must accompany each bid as a guaranty of good faith and responsibility.

Lists of the property and all other information requested will be furnished upon application to the Receiver. WILLIAM SPENCER, Receiver.

P. O. Address: Albuquerque, New Mexico.
August 21, 1903.

PICHER Natural Blue Lead Paint.

PICHER NATURAL BLUE LEAD PICHER PASTE FORM PICHER LEAD CO. JOPLIN, MO. U.S.A.

Best protective paint for all iron and steel surfaces. Withstands the action of sulphuretted hydrogen gases. Send 25 cts. to cover express charges for one quart and illustrated booklet free. Address Dept. B.

PICHER LEAD CO.

Chicago, Ill. Joplin, Mo. New York, N. Y.

RELIABLE MINING MAN

having charge of property in Mariposa county, temporarily closed down, would examine, assay and report on mines in this vicinity. Correspondence solicited. P. O. Box 65, Coulterville, Mariposa County, Cal.

WANTED.

WANTED—A First-Class Assayer and Chemist,

with extended cyanide experience, for position of Assayer and Chemist with large gold mining company, with cyanide plant. Must have best of references. State age, experience and salary wanted. Address "Chemist," care of Mining and Scientific Press.

WANTED.

A Double Drum First Motion Hoist Engine, not less than 16x32 or greater than 20x40; capable of sinking 1500 feet or more Round rope preferred. Capping stone and all connections required, including sheaves. All must be in first-class condition. Name lowest price f. o. b. cars. Address PITTSBURGH & MONTANA COPPER CO., Lock Box No. 1098, Butte, Montana.

Florence and Cripple Creek RAILROAD

And Associated Companies.

The Connecting Link between the Gold Mines of the Cripple Creek District and the mills and smelters in the valley below.

40=Miles=40

Of the grandest mountain scenery on earth. Connecting at Canon City and Florence with all Denver & Rio Grande Railroad trains from east and west.

For rates, routes and literature descriptive of the Cripple Creek District, call on or address

ASSESSMENT NOTICE.

INYO MARBLE COMPANY OF CALIFORNIA.—Location of principal place of business, San Francisco, California; location of works, Inyo, Inyo County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 18th day of August, 1903, an assessment (No. 37) of five (5) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, room 30, fifth floor, Mills Building, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 15th day of October, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on WEDNESDAY, the 18th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHARLES E. ANDERSON, Secretary.

Office—Room 30, fifth floor, Mills Building, San Francisco, California.

ANNUAL MEETING.

The Regular Annual Meeting of the Stockholders of the Golden West Consolidated Mining Company will be held at the office of the company, at Iowa Hill, Placer County, California, on Saturday, the 26th day of September, 1903, at the hour of 9 o'clock A. M., for the purpose of electing a Board of Directors to serve for the ensuing year, and the transaction of such other business as may come before the meeting. E. M. ARMSTRONG, Secretary.
Office—Woodland, Cal.

Working Costs.

It has been said "anybody can run a mine," and this is true, but there is a very important factor in the manner in which a mine is run—the personal equation is a very large and extremely variable one. There are scores of instances where business men—by which is meant men who have made a success of business along commercial lines, usually merchandising, and professional men (not mining engineers) and others with neither college nor business training who with perfect confidence in themselves—a confidence born of success in other lines—have undertaken the management of mines, probably having heard that "anybody can run a mine." Of the large number who represent this class very few of them have recorded success during the first years of their mining experience, and where an exception has been found, the mine and not the manager, was responsible, for truly almost any one could have made it pay—such mines are more rare than the individuals who essay to conduct mining operations without experience in the business.

In the direction of mines the question of cost is paramount, whether the mine be large or small, rich or low grade. If the mine pays handsomely the conscientious and capable manager will strive to make it pay more; if it pays a small profit he will endeavor to increase this small gain, if only by a few cents per ton. If the mine fails to pay by a small margin then the manager must work and plan and direct affairs in such a manner as to reduce all costs to the lowest possible figure. He endeavors to increase capacity without greater expense. If the ore requires much handling he schemes to avoid this, and to make the rock travel by gravity as far as possible, from stope to stamp. It may be necessary to make many changes under ground, on the surface and in the mill to accomplish this, but if the tonnage justifies it the changes should be made.

There are many instances of record where a mine in operation returns about the cost of working it, but the management was either inexperienced or too parsimonious to make the needed changes. A new man appointed to the management saw at once where money was being wasted. Needed reforms in the working force were made, necessary changes in the method of mining introduced, the transportation problem was revised and changed for the better, and the mine entered at once upon a career of prosperity which attracted the attention of the mining world to the mine and to the manager.

Forty-Stamp Mill, Baliol Mine, Near Sutter Creek, Cal. (See Page 183)

In one instance a mine was operated through an inclined shaft. The ore was delivered from the skips into a bin in the head frame at the collar of the shaft. From there it was trammed several hundred feet to a chute and dumped. From this chute it was drawn into cars on a lower tramway trammed and dumped a second time into a vertical shaft connecting with a tunnel. Here the ore was reloaded and trammed to the mill, where it was distributed to two rock breakers, requiring the services of two men per shift. The disposition of the breakers and grizzlies was such that when the ore bins were not nearly full it was necessary to put men into the bins to shovel the ore to the doors leading to the feeders—and this was often the case. A new manager was appointed who made many much-needed changes in the arrangement as described. He first put in competent foremen, and in a short time had a far better working force. The rock breakers were removed from the mill and a larger single breaker placed near the shaft to receive the ore from the bin in the head frame. It was then trammed to the vertical chute by an extension of the tramway along the hillside so as to dispense with the trammers on the intermediate section of the tramway. The track leading to the mill was changed from the center of the building at the back to the end so that the cars could enter at that place that the ore might be dumped in the bin wherever desired. These changes cost about $3000. The mill was hung up meantime, but this permitted an opportunity to do development work and to put in much needed raises in order that mining might be more economically conducted. By the changes made four trammers and two breaker men were dispensed with, making a direct saving of nearly $500 per month, beside which shoveling in the mill bins was no longer necessary, and the mill was constantly supplied with ore by reason of new development. The extension of the tunnel on the mill level to the shaft furnished a means of drainage more than 100 feet lower than the collar of the shaft, and also greatly improved the ventilation of the mine. Had this tunnel been properly planned in the first place it could have been made the main adit from the shaft and the rock breaker set below the bins that might have been built near its portal which would have still further improved matters, but the tunnel had been drived in several hundred feet prior to the advent of the new manager.

The above is a bona fide instance where a mine emerged from a non-paying to a profitable enterprise. The accomplishment was not through any secret means, but by the exercise of good judgment—the result of experience and technical training. Any other mining engineer with experience and good sense would probably have made similar changes and have scored a like success.

WITH some inexperienced managers their "hobby" is to keep every man busy, but if this manager does not know what a man is capable of doing or what he should do in a shift's work the men quickly find it out and impose upon him, even in his presence. Under such a man the pay roll usually carries from 10% to 40% too many names, though all are "busy."

AN untimely dividend is often forced from a company's directors in opposition to their judgment and wishes by impatient stockholders, who can not understand why money in the treasury could be better used in insuring or creating conditions that would enable the company to pay bigger and more permanent dividends later on. The best way to prevent dissatisfaction or suspicion is to be frank. Few stockholders will want to adopt a suicidal policy if they can be shown that the best interests of the corporation can be better served by betterment of the company's property than skinning the treasury in an effort to satisfy the unthinking by declaring a dividend out of money that could be well employed in development and improvement.

FLOTATION of bonds on a mining proposition does not eliminate the risk, nor does the new guaranty plan of trust companies "guaranteeing" the mining stock change the speculative feature of any embryo mine development. The value of a prospect is just what its very name implies—prospective—and no amount of cuttle-fish "guarantys" can extract the speculative feature. Fortunately this is almost invariably manifest and constitutes one of the attractions of the game, though in the sometimes sinister effacement of values, the grim reflection forces itself on one's attention that the principal mistake was in not requiring a guaranty for the company that "guaranteed" the prospect. Nothing will ever wholly eliminate the element of risk from development of a prospect, and nothing will so tend to minimize that risk as the exercise of the same common sense and judgment, the same intelligent stick-to-itiveness that makes a success of the development of any business, whether mining, professional, mercantile or manufacturing.

Two Important Meetings.

The American Mining Congress concluded its sixth annual meeting at Deadwood, S. D., on Saturday, the 12th inst. The mining men of the Black Hills did all possible to render the stay of their visitors pleasant and profitable. The meetings were well attended, notwithstanding the stormy weather (there being an early snowfall throughout the Hills during the congress), and the numerous papers will form a valuable feature of the transactions of the Association. Those of a technical or practical character are reproduced in the MINING AND SCIENTIFIC PRESS for the benefit of those who were unable to attend the congress in person.

During the present week the Irrigation Congress is in session at Ogden, Utah. It is one of the most important gatherings of men ever held in the West to discuss the problems of irrigation. It is the more noticeable that a mining man—W. A. Clark of Butte, Mont.—has been chosen president of the congress. The primary object of the congress is to secure a proper disposition and expenditure of the money devoted by the Government to irrigation in the West. There are millions of acres of semi-arid land in the West, a large portion of which would become fertile if supplied with proper irrigation facilities. For several years past the Government has been making investigations along these lines under the auspices of the United States Geological Survey, and a large amount of money has been expended in furtherance of the plans and suggestions of the Government engineers. The irrigation papers and special volumes devoted to hydrography and irrigation form some of the most interesting publications of the Geological Survey. Much has already been accomplished by the Government in the way of conservation of water, and elaborate plans have been prepared for further work in this direction.

The subjects for discussion coming before the congress will be of an important character, and great good can only result. Miners as well as agriculturists are interested in the great water problems—how to perpetuate the average annual rainfall and by what means to care for it. Under existing, though already greatly improved, conditions, there is a tremendous waste of storm waters throughout the West, where the water is most needed, as the more humid climate of States from the Mississippi valley eastward render irrigation unnecessary.

Plans have been, and are still, being devised by the Government engineers looking to the utilization of this wasted water. In the high uplands of the West farms without water are almost worthless, while with it they become valuable property. Mines can not operate without water, excepting in a few instances where the ore is high grade, and even then water can not be dispensed with entirely, and it is often necessary to haul it many miles in tank wagons. This is particularly the case on the deserts of California and Arizona and in the Great Basin region, and often, too, within plain sight of mountain ranges covered with snow, where there is abundance of water, all of which is lost shortly after it flows out on the desert plain. It is to impound this wasted water that the Government has undertaken the task of searching out suitable reservoir sites, and, by making careful stream measurements, to estimate the probable amount of water that may be depended upon in any particular locality.

The conservation of water also contemplates the preservation of the forests, as far as possible, for the general opinion is that if the mountains be denuded of the forests the average of annual rainfall will decrease, and in some sections dwindle to almost nothing. Good authority is responsible for the statement that the removal of large areas of forest trees in some regions has been followed by a marked decrease of rainfall.

AN interesting complication has arisen in Nevada over the whereabouts of Tonopah. For the past three years, it has been generally believed to be in Nye county, though there were those who contended otherwise. About a year ago an engineer was employed by the county of Esmeralda to determine the disputed question and he stated, after a survey, that Tonopah was situated over a mile east of the Esmeralda county line in Nye county. The County Commissioners of Esmeralda county, being still dissatisfied, appealed to the Interior Department at Washington. An engineering corps was sent to Nevada and, after a three months' campaign in the field, it was determined that Tonopah is almost wholly in Esmeralda county, and the business and greater part of the residence section, as well as many of the mines, are in Esmeralda.

The Present Labor Situation.

Throughout the greater part of last summer and up to the present time, from almost every mining State of the West has come weekly the news of strikes, shutdowns, lockouts, and the other features resulting from the attempts of organized labor to enforce its demands for shorter hours, higher wages, "recognition of the union," etc. The situation at this date shows but slight improvement on the whole, though winter is approaching with its rigors, and it will find thousands of miners in the West unprepared, but apparently little thought is given this phase of the situation.

In the Cripple Creek, Colo., district, a few men are at work in several of the mines under military protection, and at the same time the municipal and county officers seem to be endeavoring to handicap the military authorities in every way possible. On the 15th inst., a consignment of Krag-Jorgensen rifles and 60,000 rounds of ammunition were sent into the district by the Government for use of the militia. As the presence of State troops appears obnoxious to some of the citizens, steps are to be taken by some of them to test the power of the militia, getting the case before the Supreme Court as soon as possible. Under the constitution of the State of Colorado, the militia has scant authority, there being very little latitude given the commanding officers, and the power of declaring martial law is denied the Governor of the State. An attempt is being made to secure a large number of miners in the southwest Missouri lead and zinc mines, for the purpose of breaking the strike in the Cripple Creek district. This plan was successfully adopted in 1894 in Leadville. Undoubtedly the advent of Missouri miners into the troublous district about Cripple Creek will be the signal for immediate trouble, unless the militia is sufficiently strong to prevent it; although Missouri miners have heretofore demonstrated their ability to take care of themselves, pretty well.

In the San Juan country, in southwest Colorado, the mining industry is practically at a standstill, on account of labor troubles. All the large mines of Marshall and Savage basins are closed, except the Tomboy, where twenty-five men are at work. The Smuggler-Union is closed, the electric machinery removed from the mine and the hoists painted and covered as for a long period of idleness. A few of the smaller mines are working, the unions for some reason not extending their demands beyond the larger concerns.

In Yavapai county, Arizona, little headway is being made in resuming work in the idle mines. In a few instances small crews of men have been put to work, but the strike is practically still on throughout that country. The mines of southeast Arizona are in operation. In the Clifton and Morenci section the troubles of early summer have been adjusted or new men have taken the place of the strikers.

In the Searchlight, Nevada, district the mines still remain closed, the owners showing no disposition to recede from their position. The mine owners and operators of the district, as in many other sections, organized an association, announced their intentions as to hours, wages and their attitude toward union labor, and this appears to be the only mine owners' association that has held rigidly to its expressed determination.

In the Randsburg district of California about seventy miners were brought in from the Missouri zinc mines in Joplin district and the Yellow Aster mine and mill are again in operation. The saloons of the district are reported closed by the local authorities, and thus far no trouble has resulted.

The Dunsmuir coal mines on Vancouver island, at Ladysmith and Cumberland, are again working to their full capacity and there is no lack of miners. The local union decided to renounce the Western Federation of Miners and withdrew from that body, since which time they have worked steadily.

CONCENTRATES.

THE coefficient of linear expansion of concrete is 0.0000099 per 1° C.

THE Pittsburg Reduction Co. is almost solely the producer of aluminum in this country. The price varies from 32 cents to 36 cents per pound.

ABOUT 75% of the yield of Mexican mines is silver. In former years the proportion was much greater, but of late gold and copper have been mined in larger quantities.

IT is the practical experience of many successful mining superintendents that for every ton of ore extracted there ought to be enough men at work to open up another ton.

PERPENDICULAR does not always mean at right angles to the horizon. Geometrically it means a line drawn at right angles to some other line. Vertical always means at right angles to the horizon. A plumbline hangs vertically.

THERE is no present competition to any great extent on the Pacific coast between foreign and domestic coal, but there is the keenest kind of competition between coal of any kind and fuel oil, with the odds very much in favor of the latter, as an economical factor in the cost problem.

A "BUSHEL" of charcoal is understood to be a heaped bushel, which would equal 2688 cubic inches. The "struck," or ordinary bushel of dry measure, contains 2150.42 cubic inches. The legal bushel measure is a cylinder 18½ inches diameter and 8 inches depth, inside measurement.

PORCELAIN ENAMEL COATING has been recommended for cast iron pipe. It would add about 20% to the cost of the pipe, but would insure the full carrying capacity of the pipe during its life, besides being proof against electrolysis. The sand blast method of cleaning before coating is also recommended.

MEXICAN mining law does not recognize "extralateral rights." On that subject it says: "The unit of concession or mining claim shall be a solid of indefinite depth, limited as to its exterior boundaries by a section of the surface embraced within horizontal planes measuring 100 meters on all four sides, and in depth by vertical planes passing through the same."

STEAM TURBINE tests show a very low steam consumption, in one case less than eleven pounds per indicated horse power. Even higher efficiencies are claimed under unusually favorable conditions. One of its strongest claims to practical use is its adaptability to the use of superheated steam at temperatures entirely beyond the range of the reciprocating engine.

IN roasting galena the sulphide of lead goes largely into the form of sulphate, which can be completely decomposed only by means of silica; but this involves a high temperature, and the loss of lead is so large that the practice of slag roasting has now been generally abandoned in the United States. The temperature required for the desulphurization of zincblende is also high, and, when ore contains lead, the loss of that metal by volatilization is also high.

BUT one asphalt mine is now being worked in the State of California, the augmented increase in that State's oil yield occasioning such an increase in the production of asphalt as a residual product of oil refining as to make that the most economic source of supply. Asphalt is a compound substance, its principal constituents being petrolene and asphaltene. Asphaltene is a solid and extremely brittle. Petrolene is a thick, black, viscous fluid, volatilizing at a temperature of 450° F., and remaining stable at ordinary atmospheric conditions.

KUNZITE, the new gem recently discovered at Pala, San Diego county, Cal., is a lilac colored spodumene. Spodumene is usually white, grayish white, greenish, yellowish green to emerald green and rarely amethystine purple. The lilac color is still more rare. The crystals are prismatic, often flattened and striated in the direction of their principal axis. The new variety occurs with lepidolite and pink tourmaline (rubellite) in a large pegmatite dike. Hiddenite is a yellowish green variety of spodumene. The mineral is a composition of lithia, alumina, silica and oxygen.

ASBESTOS, felt, magnesia and other packing is usually secured to the iron pipes, boilers or other metallic surfaces around which they are placed, by wrapping with drilling, canvas or other strong fabric, and then fastened by metal bands made for the purpose. In the case of boilers wooden strips may be substituted for the canvas. No paste or glue would give satisfaction where heat is to be applied, for the reason that the packing, being very porous, would absorb a large quantity of any mucilaginous substance that might be employed, and even if it did form a satisfactory paste while cold, its properties would be destroyed by heating. In lining small vessels, good results are sometimes obtained by placing a cylinder of iron within another of greater diameter and filling the annular space between them with the packing.

ONE good way to keep draftings and drawings clean is not to wash the triangles in soap and water; just wipe them off with a clean, dry rag, and instead of sliding them over the paper pick them up, or, at least, slide them only on their corner, so as to have as little of them as possible in contact with the paper. Never, if possible, slide anything over the paper; keep the elbows and the points of the fingers off the paper. Nor should a pad ever be put on a drawing When it is necessary to figure, put a piece of clean paper on the drawing, and then put the pad on it.

THE maximum permissible temperature of dynamo and motor coils is 150° to 160° F; watts equal volts multiplied by amperes; 1 watt equals 44½ foot-pounds per minute; 746 watts equal 1 H. P.; 1000 watts equal 1 K. W.; 1 H. P. equals 0.746 K. W.; 1 K. W. equals 1.34 H. P.; nine to ten 16-candle power lamps require 1 H. P.; one 16 candle power lamp at 100 volts takes .048 to .06 ampere; the efficiency of small dynamos is about 84%; efficiency of large dynamos is about 91%; 1 K. W. requires from 1¾ to 2 indicated H. P. to generate it. Keep damp, dust and oil off wiring and insulation.

THERE is no more of a gamble in mining than in any other business pursuit, certainly not near as much chance, uncertainty and likelihood of disaster as in farming, which is held up as the safest of all occupations and the surest as to results. In mining the result is unaffected by the drought of the desert, the deluge of destroying waters, the burning heat of the sun, the depredations of the locust or caterpillar, and the hundred other destroying influences that burden the life of the farmer but have no effect on the miner, or upon the great natural storehouses of wealth that he uncovers.

IT IS a part of a modern mining outfit to have a good photographic appliance. A series of pictures for present use or permanent reference would be of value, often increasing with the years. The matter could be made to constitute a complete history of surface and underground development. It is the experience of "Concentrates" that solio is much cheaper and easier handled than velox. It is also better where it is intended that the photographs shall be engraved. Velox is no good for the use of the engraver or illustrative artist. Velox costs a little more than solio, is a little harder to manipulate, but is more permanent than the solio paper.

NO LIST of names in any department of mining, engineering or metallurgy can be compiled that is of other than the most transitory value. Most of such "lists" are made for show and are worthless. Care and judgment, with some knowledge of existing facts and requirements, can at considerable expense compile a list that is of some immediate value, but they soon rapidly deteriorate and soon become comparatively worthless. The best lists are found in the subscription lists of journals that have a good many subscribers who think enough of the publication to have it sent to them, no matter how many changes of postoffice address they may make during the year.

GASOLINE alone is not considered to be an explosive; to secure an explosion with gasoline it is necessary to have present a certain proportion of air. Gasoline is a product of petroleum midway between benzine and kerosene; that is, it consists of a series which in the selective distillation of petroleum is obtained after the benzine has been evaporated, and before kerosene begins to be distilled. In the oil trade it is known as naphtha, and is divided into three grades, A, B and C, A naphtha being that last given off, and hence having the greatest specific gravity. By the retail trade it is generally known as gasoline, and is sold according to its specific gravity, which is designated by so many degrees, on an arbitrary scale known as Baume's scale. Stove gasoline having a specific gravity of 72° Baume is that generally employed for gasoline engines, although gasolines from 66° to 76° may be used with success when employed with a vaporizer.

THE increasing number of questions received make it necessary to greatly condense the answers, and in this regard inquirers are requested to make their inquiries as brief as possible, consistent with clearness. This sometimes requires that the exact word necessary be used, to prevent confusion and to insure clearness of meaning and accuracy in the desired answer. "Concentrates" also respectfully states that it is manifestly much easier to ask a question than to correctly answer it; that many of the questions answered in this column take considerable time (a question asked last March is answered in this column, the question being from Montana, and the answer only obtained last week from South Africa), and that it is not always possible to obtain answers of any value to every question asked. To those who suggest that the question should be published, as well as the answer, it can only be repeated that to publish the questions would take up nearly all the space in the paper. Even as it is, and omitting the questions, the answers have to be boiled down to the bone, and every possible word omitted to get room enough. The page of "concentrates" used to be copyrighted for a while, but there came so many remonstrances from other mining journals and exchanges desirous of copying the matter that the copyright restriction was withdrawn some years ago, and any publication has the privilege of republishing those little paragraphs, subject, of course, to the usual courtesy of crediting them to their original source.

IN the lead smelting of zinc slimes, as practiced at Johannesburg, South Africa, instead of treating the slimes with acid, in some instances they are taken direct from the filter press to the lead furnace. The slimes are mixed with litharge and a flux of assay slag and put into a furnace of the same type as is used in the Siemens & Halske process. A slow fire is made, to drive out all moisture, and then it is made more intense, until the mass is in a molten state. Sawdust is likewise used as a reducing agent The molten mass is continually mixed, to prevent the formation of lumps, etc., and when the slag shows the proper consistency—that is, a glassy, viscous black—it is drawn off at the slag door. The lead is run into moulds from another opening. The bullion from the lead furnace is purposely kept low, 7% to 8% being considered a good grade of bullion. The lead pigs are then taken to a cupellation furnace. Across the surface of the molten lead an air blast is played, the litharge being driven across the test in quiet riffles to a hole in the bone ash, where the molten litharge runs out into a special pot. The gold and silver from the cupel are run down into a plumbago crucible, and cast into bricks.

IF alloys of silver and copper be roasted with a free access of air both metals will be oxidized, the copper in much the larger proportion; silver when roasted with salt is converted into chloride; copper into black oxide. If the silver-copper alloy be alternately treated with dilute sulphuric acid and exposed to the air the copper will go into solution as sulphate, but the silver will remain as metal. If a silver-lead alloy be melted at a red heat with free access of air the lead will be oxidized to litharge and the silver will remain unaltered. A silver-mercury alloy is an amalgam, as all such compounds of mercury are called. The proportion of such composition is 43.7 parts of silver to 100 parts of mercury. Should silver be plunged into mercury there will be produced at the surface of the metal a very thin layer of amalgam, which will prevent any further action of the mercury. This is why grinding is of such universal necessity in the amalgamation of silver ores, for the resultant film of amalgam is removed by the friction, and fresh surfaces of silver are constantly exposed to the action of the mercury. In a similar way clean siliceous sand helps amalgamation, while clay or any similar substance which would increase the viscosity of the mixture will hinder the amalgamation.

CEMENTED gravels, containing fine gold should be easily treated in a stamp mill of ordinary type, if, as stated, the gravel can be pulverized in a hand mortar and the gold amalgamated with mercury. There is, however, a noticeable difference in crushing rock under stamps and crushing and grinding it in a hand mortar. Gold which might be readily saved by amalgamation after grinding in a mortar, might prove difficult to save on plates after stamping in a mill, for the possible reason that the gold may be coated with a thin film of iron oxide, silica or some other substance which prevents direct contact of the mercury and the gold. The grinding in the iron mortar removes this coating, rendering the gold bright and easily subject to amalgamation. The remedy is suggested by the experiment. A grinding mill would probably prove more satisfactory in such a case than a stamp mill. An arrastra should answer admirably, because of the grinding performed by the mullers, but the capacity of an arrastra is too limited for low-grade ore. If the gold cannot be saved by a grinding mill, the cyanide process should be tried and it might be found a valuable accessory to amalgamation, and often to concentration. Experiments must be made to determine the details of cyanide treatment, if the gravel is found amenable to that process at all.

THE fouling action of copper upon the extracting efficiency of cyanide solution is very marked with 0.3% present, even alone, and would be more so in practice where the accumulation of such an amount would be accompanied by the accumulation of other metals. On the other hand, copper salts in the absence of free cyanide to some extent act as solvents for gold and silver, but cupro-potassium cyanide is not so active in this respect as the corresponding zinc salt. In practice it is found that copper is precipitated from weak solutions of cyanide, such as 0.05% to 0.08%, upon the zinc shavings, which then become less active in precipitating gold and silver. This can be remedied by making the solution stronger with cyanide before entering the zinc boxes, wherehy the precipitation of the copper is prevented. But, then, the copper accumulates in the solution, and the increase renders the solution less effective in extracting gold from the ore. The difficulty has been met in some cases by precipitating the copper with a lead-zinc couple after the precipitation of the bulk of the gold. At the plant at Minas Prietas, Mexico, the solution from the zinc launders, containing from 3 to 4 pounds of copper per ton, is run over zinc shavings which have been steeped in lead-acetate solution, hy which the quantity is reduced to about 1.25 pound per ton, and any gold which has escaped previous precipitation also recovered. The product so obtained runs about $2 per pound in gold and silver and 25% of copper.

Raw Copper Plates.

Written for the MINING AND SCIENTIFIC PRESS.

There are those who still believe that raw copper plates, without the electro-silver plating, are superior to the silver-covered plates for amalgamation of gold ores. The bane of the mill man, whether he uses raw or plated plates, is the formation of discolored spots on the plates. These are caused by the collection of oxides and insoluble salts. The remedies for the removal and prevention of this discoloration are numerous, some of which are good, others are bad. It has long since been proven that the long continued use of a solution of cyanide of potassium—one of the principal remedies—is injurious to the plate. Still, in some cases its use is almost unavoidable.

Undoubtedly silvered-copper plates are much easier to keep in good condition than raw plates; but, as previously stated, some mill men cling to the idea that raw plates are superior, for the reason that they can select better sheets of metal, and that, when once having been gotten into good condition, the raw plate will do more satisfactory work than silvered plates. In selecting copper sheets for mill plates, care must be taken to get suitable metal. The purest, softest metal is by far the best for the purpose. It may appear discolored in spots and be of undulating surface, etc.; but a soft plate of pure copper showing these inequalities of surface, due to handling and transportation, will be found better adapted to the purposes of amalgamation than a fine-appearing, shining hard plate that has been rolled until it has a polished surface. Such a plate as the latter will be found too dense and will not readily absorb either mercury or gold. The plate selected should be free from rough spots or holes; the dents caused by handling may be readily removed by use of a block of soft wood laid on the plate and pounded with a wooden mallet. The plate should not be pounded with the mallet, as it will injure the plate; but the intervening block will serve to make the sheet of copper flat and smooth.

An alloy of copper and zinc has been tried for mill plates; but, although a plate made of this alloy is found an excellent amalgamator, it is not enduring, for the reason that the mercury combines with the zinc, forming an amalgam, and the plate disintegrates and breaks up. They are also expensive in first cost.

Raw copper plates should weigh no less than three pounds per square foot, and a heavier plate is still better. For inside battery plates, copper of double this weight is not too heavy, for, if made of light metal, the plates will be quickly worn through and torn from their fastenings.

All raw plates should be annealed after the last rolling at the mills, as the rolling process has a tendency to render the plates hard and impervious to quicksilver. If the plates have not been annealed, they may be softened by placing them over a slow fire of coals, heating them until dry sawdust sprinkled on the upper side of the plate will ignite. A higher heat is useless and may even do damage by causing the plate to "buckle up." The annealing should be done as evenly as possible. This process renders the plate porous and it will readily absorb a surprisingly large amount of mercury. Plates which have become hard in the mill by use of too much cyanide solution may be softened in this manner, when they will again be in good condition to amalgamate ores.

When the plate has been carefully and evenly annealed, it should be placed on the table in front of the mortar where it is to be used, smoothed out and then made as nearly flat as possible by means of the wooden block and mallet, as previously suggested. The plate is then fastened to the table by means of iron screws or copper nails, the latter long enough to be clinched on the under side of the table. Some mill men prefer to turn up the upper end and the side edges of the plate to prevent the escape of any amalgam in those directions; but if a strip of carefully planed wood be nailed along the edges of the plate, having a strip of cloth between the plate and the wood, very little gold will escape at the sides of the plate.

Having secured the plate in position, the mill man now proceeds to get his plate in shape for amalgamating. To do this every square inch of its surface must be carefully scoured, so that the bright metal shows. No spots or discolorations of any sort can be permitted.

Next scour the plate with wood ashes and fine sand or tailings, using a scrubbing brush or coarse rag. Bad spots may be scoured with the ashes and sand and the end of a small block of wood. Continue the scouring until the coating of oxide is entirely removed and the bright, metallic copper exposed. Caustic soda, the concentrated lye of the shops, or sal soda, may be used instead of ashes, the object being to remove all traces of oil or grease by action of alkalies. After washing with clean water, apply with a soft brush, or swab, a solution of cyanide of potassium, say one-half ounce of cyanide to a pint of water. The plate may be readily amalgamated by the use of the following mixture: Fine sand or tailings, powdered sal ammoniac, equal parts, and containing a small quantity of quicksilver sprinkled therein. With the scrubbing brush and this mixture continue the scrubbing until all parts of the plate are amalgamated. During the operation sprinkle on the plate as much quicksilver as the plate will absorb, and water enough to make a thick mud of the mixture. Lime may be used with this mixture, but it cannot be said that the addition is of any special benefit. It is unpleasant, to say the least, as ammonia is set free in great quantity. Allow this mixture to remain on the plate for an hour or so, and then wash it off with clean water and the brush. Follow with the soft brush and cyanide solution, adding quicksilver, if the plate will hold it. By continuing this treatment for three or four rounds the plate will be found to have taken up or absorbed as much quicksilver as ordinarily after many weeks' running. If fine gold amalgam can be spared, it is well at this stage to rub some upon the plate, using a cloth rubber wetted with a solution of sal ammoniac, in the proportion of four ounces to the pint of water. If the amalgam be heated and rubbed in a wedgewood mortar, so as to insure the solution or minute diffusion of the gold, it will be the more readily attached to the plate. Silver amalgam in the place of gold amalgam gives excellent results. Silver amalgam can be made as follows: Dissolve a piece of silver—coin will answer—in the smallest possible quantity of dilute nitric acid. Heat will hasten the solution. Dissolve the resulting crystals of nitrate of silver in water, and pour into the vessel enough quicksilver to reduce and amalgamate the silver in the solution. This reaction will be completed in a few hours. Wash the amalgam with clean water, to remove all traces of nitrate of mercury, and strain to remove the surplus quicksilver, leaving in the cloth a pasty amalgam of very pure and finely divided silver. Use this as directed for the gold amalgam.

The first scouring removes oxides and grease, and exposes the pure, bright metal, which by the annealing has been rendered capable of holding a comparatively large quantity of quicksilver and amalgam, by virtue of its porosity. The sal ammoniac, by reason of its property of dissolving oxides, assists the amalgamation by keeping a bright metallic surface, allowing the quicksilver and amalgam to penetrate the copper, filling the minute interstices, and combine in atomic proportions, so as to form an alloy of copper, gold and quicksilver. Thus air, water and various salts are kept from acting directly upon the copper, preventing the formation of oxide and carbonate of copper to coat the plate. This is accomplished in a longer or shorter period, depending upon the mode of preparation and upon the richness of the ore and the ease with which the gold in the ore may be amalgamated. It is probable that the galvanic current due to the contact of two dissimilar metals plays an important part in influencing the chemical reactions and assisting the amalgamation of gold; but as its exact action is not defined, it is needless to discuss the point in this article.

The point aimed at in this plan of preparation is to hasten the union of a sufficient amount of gold and quicksilver with the copper. If allowed to take place slowly, the unavoidable loss of gold makes the expense much greater than if forwarded by the use of the needful amount of amalgam, before running any ore over the plate. If an old, well-used plate be cut or broken the amalgam will be found to have penetrated perhaps half, and in some cases completely, through the copper.

Corrosive sublimate, nitrate of mercury, sulphuric acid, and common salt, muriatic acid, sodium amalgam, cyanide of potassium and other acids and salts, have been used in amalgamating copper; but though the amalgamation may be accomplished in some cases quite easily, the plate cannot be brought to a good working condition so soon, if at all, as in the way described.

The subsequent treatment of plates, amalgamated as described, should be varied to suit the circumstances of kind and quality of ore and purity of water. Water containing carbonic acid discolors plates readily, forming an insoluble coating of carbonate of copper. Though an infinitely thin film, it is sufficient to prevent the contact and adhesion of gold and amalgam, unless in particles sufficiently large to break the coating. The worst form of discoloration of plates proceeds from the action of sulphates of iron and copper present in many ores from the natural decomposition of the pyrites. The addition of lime to the water introduced to the battery, as much as will dissolve therein, will neutralize the carbonic acid and decompose the sulphates. It may be necessary to add lime to the ore to furnish enough to react on all the sulphates.

When the mill is in operation the plates should be "dressed" every six hours, or oftener, should they become discolored. After stopping the mill and washing the plates with a stream of clear water, apply with a soft brush (a whitewash brush is handy) some of the solution of sal ammoniac. Allow the sal ammoniac to remain on the plate a few minutes, wash with clear water and apply with the brush enough of the solution of cyanide of potassium to brighten the plate. The plate should have upon it as much quicksilver as it will hold without gathering in drops or running off. Experience in this matter will teach the niceties of manipulation to the mill man.

It is essential to use quicksilver entirely free from "base metals," such as lead, zinc, tin, copper, etc. The presence of gold and silver is, of course, desirable. The base metals, when combined with quicksilver, oxidize very readily, especially when the amalgam is finely divided, exposing a large surface to the action of water, air and other oxidizing agents. Thus, with impure quicksilver the coating on plates may arise from the amalgam instead of the copper itself.

To test the purity of quicksilver, put a small quantity on a sheet of paper while dry; if, when moved upon the paper, by inclining it in various directions, a film adhering to the paper is left on the track, the quicksilver is impure. Another test: Put half an ounce or so in an ordinary iron "gold pan," and by a quick up and down jerk separate the mercury into small globules; if, on inclining the pan, they do not readily run together, the sample is impure. To purify, first retort the quicksilver, and add to it after retorting a few ounces of dilute nitric acid (acid one part, water three parts). An ordinary acid bottle is a handy vessel to hold mercury and acid, as it may occasionally be agitated to hasten the purification by bringing the acid in contact with the impurities. The acid, by reason of its greater affinity or the base metals, removes them by forming nitrates. Some days may elapse before the quicksilver becomes purified. Samples may be tested from time to time by the plans here mentioned. Before using the quicksilver it should be repeatedly washed with water to remove all traces of nitrates. It is a good plan to keep a supply of quicksilver under treatment, putting all which has been used into the bottle, and drawing from it such an amount of purified metal as may be required.

A stock of needful chemicals should be kept at the mill. The following list comprises those necessary for the preparation and treatment of plates and quicksilver: Cyanide of potassium (fused), sal ammoniac (powdered), caustic or unslacked lime, caustic soda or "concentrated lye," and nitric acid (commercial acid is sufficiently pure). Cyanide of sodium may be substituted for cyanide of potassium; common salt for sal ammoniac; wood ashes, or the lye therefrom, or sal soda, for the lime and soda, and sulphuric acid and saltpeter for nitric acid. These substitutes are but "makeshifts" at best, and consequently should not be used when the others are at hand or can be procured. It is well to keep ready prepared the solutions of sal ammoniac and cyanide of potassium in well-stoppered bottles. The cyanide solution, being especially liable to decomposition, should not be prepared in large quantities at a time. It should also be carefully kept and labeled as poison, to avoid accidents.

In the almagamating of gold ores in the stamp batteries there is always a greater or less loss of mercury, and this feature of amalgamation will be treated of in a following paper.

The American Mining Congress.

The session of the American Mining Congress which was held last week at Deadwood and Lead City, S. Dak., was successful. The attendance was large and the papers read were of interest. Those in attendance had an opportunity to inspect the great mines and mills of the Homestake Co., a privilege for many years denied the general public, and this was taken advantage of by a large number of members. The Golden Reward and other mines and mills were visited, and the greatly diversified character of mines and metallurgical works of the Black Hills made these excursions particularly interesting and instructive to non-resident members. On Saturday, the 12th inst., the general election was held, at which the following were elected for the ensuing year:

Directors, J. H. Richardson, Boise, Idaho; T. Ewing, Los Angeles; R. C Patterson, Omaha; J. T. Grayson, Portland, Or.; E. F. Brown, Aspen, Colo.; J. Dern, Salt Lake; J. Holmes, Raleigh, N. C.; J. Lynch, Butte, Mont.; J. Gray, Terraville, S. D.; president, J. H. Richards, Boise; first vice-president, T. Ewing, Los Angeles; second vice-president, R. C. Patterson, Omaha; third vice-president, J. T. Grayson, Portland, Or.; treasurer, T. K. Mair, Portland, Or.; secretary, I. Mahon, Carlisle, Pa.

Among resolutions adopted was one to recommend to the legislatures of the several States and Territories the enactment of laws to afford better protection to life and limb of persons employed in and about mines.

It was decided that President Richards should appoint a committee of fifteen members of the Congress whose duty it should be to induce as many members of the Mining Congress as possible to visit the St. Louis Exposition in a body. The committee, with T. Ewing of Los Angeles, Cal., as chairman, was selected.

Before adjournment E. W. Martin, on behalf of the Black Hills Mining Association, presented to President Richards a badge of membership in the American Mining Congress, made of Black Hills gold, as a token of appreciation for the manner in which he had given his services during the past year in the

furtherance of the interests of the American mining industry.

Portland, Or., was selected as the place of holding the next meeting in 1904.

The close of the sixth annual session showed 548 accredited and appointed delegates to the Congress and 241 permanent members, making a total of 789 legally entitled to participate in the proceedings.

Some Structural Features of the California Gold Belt.

NUMBER V.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

The ore deposits of the Baliol mine may be referred to as a series of fahlbands accompanying a fissured zone. These fissures were evidently first filled with quartz, and the mineralization, extending outward from these small fissures, gradually impregnated the intermediate masses of schist. That this mineralization was not contemporaneous with the formation of the tuffs is plainly evident. It is also a fact that the small quartz fissures are generally payable along their edges only, it being rare to find good values in the center of a quartz vein in this mine. In this particular quartz veins must not he mistaken for silicified schist, the latter being generally gold-hearing when containing pyrite. The quartz veins were undoubtedly formed first, and afforded channels for the passage of gold-hearing siliceous solutions, which subsequently penetrated and enriched the masses of schist lying between the several veins; hut the writer can offer no explanation for the sudden stoppage of this impregnation of the schist on certain jointing planes, unless it he that a thin selvage of clay or other impervious material formed in the space forming the jointing crack, and this, acting as a dam, brought about a discontinuance of the mineralization at that place. It is noticed, however, that the occurrence of one of these floors did not result in entirely stopping mineralization, for at higher and lower levels in the same zone mineralization again occurs, and the several ore shoots are essentially similar throughout the mine in the several zones of mineralization.

Lying to the eastward of the Baliol ore shoots, the rocks are amphiholite schist and black slate, with numerous quartz veins; hut gold values in these, as far as known, are low, with the exception of a fissure which cuts the formation. In this pyrite and mispickle occur, and also good values in gold; but, as the vein was small, little development has been done on it.

In the vicinity of some of the aforementioned crossheads the ground is heavy and treacherous, hut can he easily held, if promptly and properly timbered.

The probability, as determined in the development of the mine, is that there are still large ore bodies as yet undiscovered in this property.

Lying somewhat to the westward of what has been considered the main zone of mineralization, is a zone of somewhat different character, consisting of a siliceous chloritic schist (distinguished from the "grindstone" of the main ore bodies), and this also contains payahle ore, though the gold is mostly in the iron sulphide, there being comparatively little free gold. In this schistose zone occurs a series of lenses of extremely hard, dense quartz, in which the laminations of the original schist are still preserved, though all the magnesian minerals have been displaced by the quartz. The gold values in the lenses of schist, which are 10 to 20 feet long and 4 to 6 feet wide, are greatly variable, some of the ore being high grade and some of it worthless. All that containing 1½% to 2% sulphide is pay rock; that poor in iron sulphide is also poor in gold.

In the main ore zone at one place on the 500 level was found a quartz vein, about 6 inches in thickness, dipping eastward at 15°. This vein contained a little gold and some pyrite, but was low grade; but for several feet above and below this vein the greenstone was partly silicified and impregnated with pyrite, and, although physically a most unpromising looking material, it was found to contain $8 to $10 gold per ton.

There are many structural peculiarities in this mine of local character; hut a complete description of the Baliol mine, like many other mines, would fill a good-sized volume. Sufficient has been said to indicate the peculiar character of the vein structure and its relation to the surrounding rocks. The mineralization is always pronounced, and when it stops the line of demarkation is usually plain, though in some instances it is not so, the pyrite scattering and finally disappearing almost entirely. The silicification of the schist acts in much the same manner. The small quartz veins which occur throughout the larger ore bodies are generally persistent for long distances in strike and in depth and are numerous, forming a series of essentially parallel quartz veins, with many small ramifying and often connecting branches.

(TO BE CONTINUED.)

Gold Fields of the Atlantic Slope.*

Written by C. L. DIGNOWITY.

Gold was discovered in Virginia in 1782 and in North Carolina in 1793. Prior to 1848 the gold production of this country all came from the East, principally from North Carolina, that State alone producing all our gold up to 1827.

The rush for the newly discovered gold fields of California and the West in 1848–49 shows us that human nature has not changed, as the distant fields still seem greener and more enchanting. Miners and mining talent flocked from the Eastern fields. Investors and money followed. Some succeeded, others failed and were unable to get back. History repeats itself. We know to-day how good fields are abandoned to follow a rumor and to begin the mad chase of the will-o'-the-wisp. So the South became a neglected field by the restless miner, and was soon absorbed by the planter. Slave labor and a virgin soil made tobacco, cotton and other products yield such handsome profits to the planter that the gold treasury vaults were soon plowed over and neglected. The South offered no inducement to the prospector.

We know the prospector and his shyness of ready cash. Unless "grubstaked" by the more prosperous investor, his vocation is a hard one. The Southern fields now passed into rich plantations—it took too much money to acquire land.

Quite different was it in the West. The public domain was opened to those seeking to civilize and develop it, and also gave most liberal inducements to the prospector. Surveyors, geologists and scientific men were put to work; maps and other data were compiled at government expense and all given to the gold seeker free of cost, and soon the West was ablaze with prosperity.

To-day money is flowing southward as never before and is building up every kind of industry. So it now behooves the mining man to follow the van and bring forth the hidden gold from those mineral zones and reefs.

THE GEOLOGICAL BELT.—The eastern formation of the Appalachian range of mountains exhibit one continual belt, from Virginia to Alabama, of red, brown and yellow slates and schists—argillaceous, talcose and micaceous.

This belt consists of low, rolling hills, quite soft and decomposed above the water lines.

The oxidized ores in that country can be worked to-day under our advanced methods at a good profit, with gold values as low as $3 per ton.

If the same character of ores and values can be made to yield large profits at the Homestake mine, and kindred institutions, why not in those Eastern fields, under far more favorable conditions? I find upon inspection of these Black Hills slates that they are almost identical with those of the Appalachian range, as well as similar in their gold deposition.

The old mint records from the South show that gold in abundance was produced under the most primitive methods by the old Spanish drag mills, or arrastra, hand rocker, Chilean mills (round rock rollers), succeeded by the stamp mill and placer washing.

No shaft mine could be profitably worked in those days that did not produce a gold value above $15 per ton, and this ore had to be oxidized or of a loose and free nature. Nothing but shallow workings were undertaken.

Deep mining for the sulphurets of a much higher gold value per ton could not be undertaken, owing to the refractory nature of the metals and expensive and at that time unobtainable machinery for pumping and hoisting.

Now it is different. No mining is too deep, or ores too refractory, to profitably manage under up-to-date methods.

THE GOLD MINERALIZATION.—The mineralized veins within this vast slate belt consist principally of stringers and lenses of quartz, from ¼ inch to 1 foot in thickness, following the cleavage of the slates and schists, as well as across the formation of the ore zones, that are from 20 to 500 feet in width, all of which is easily mined above the water level.

The gold of these veins occurs in finely disseminated or leaf gold.

Taking this formation as a whole, it will in many instances average from $3 to $6 per ton in gold, and as this formation makes but little slimes the precious values are readily recovered by the cyanide process.

These mineral slates are from 10 to 50 miles wide, with an easterly-westerly course, dipping southwestwardly.

There are evidences of much mining having been done in early days along this mineral zone, hut not to any great depth. The miners confined their work to the veins containing free gold, which they saved by their hand rockers and drag mills, and these primitive mill methods are still found in numerous localities, gone to decay.

Placer mining was popular, and much gold is still obtained by the farmers after rains or during the flood period.

I saw a quart of medium-sized gold nuggets, purchased in one locality last May, that were picked up by farmers during the spring rain, as well as many beautiful crystallized gold specimens which had their source in the granite formation west of these slates.

The oxidized portion of this gold belt is from 100 to 200 feet in depth, to water line. Below the water line are found the sulphurets and bluish quartz, with grains of gold. The veins are more concentrated and often very rich.

Recent geological researches tell us that the Southern slate and schist formation is not less than 2000 feet deep, and within this mass of rock must exist precious metals, which cannot be exhausted for ages, and it is one of the most important gold-hearing regions on this continent.

Could one-half of the idle mills of the West be transported to the Southern field, along that broad gold belt, there would be a transformation in gold productions of the South.

There are no custom mills or samplers to treat or purchase these Southern ores, which naturally retards the mining industry in that country. There is abundance of capital in the Eastern and Middle States waiting and willing to go into active mining propositions.

The low-grade ores of the Southern mineral zone, especially in North Carolina, have an area of over 20,000 square miles, and there the cyanide method has already made its advent, and is to-day producing the yellow metal with large profits to the investor.

Take, for example, the Colossus mill, located near Waxhaw, N. C. According to the mint records of North Carolina, this mine produced over $700,000 up to the beginning of the civil war. (Bulletin No. 10 of the North Carolina Geological Survey, as compiled by the United States Mint, shows no less than $21,830,528 in gold and silver bullion credited to North Carolina alone.) This is conclusive testimony that gold in abundance exists in that State.

The Colossus mill has a capacity of 100 tons per day and is constructed for straight cyaniding by percolation.

The gold solution is forced upwards from the bottom of steel tanks of 50 tons capacity. One and one-fourth pounds of cyanide per ton of ore is used and from seventy to seventy-two hours is required for leaching tailings before the gold solution is passed over the zinc shavings, upon which it precipitates, and from 90% to 92% of their gold values are recovered.

This mill was built to treat a deposit of tailings containing 40,000 tons, which came from this property prior to the war.

These tailings receive a slight roasting in order to free them from organic matter. They average about $6 per ton in gold, and after treatment leave but 40 cents of their values to the ton in the residue.

The gold product, or auro-cyanide, after two weeks' run, showed close to $30,000 per ton in gold. The mill had been in commission about one month when these results were attained, and it had not got down to its best work, as is the case with all new plants. This property consists of 1700 acres of highly improved farm land, through which passes northeast–southwest a gold reef, or zone, for 5000 feet, which averages about 400 feet wide, and 60 feet above the level plain.

This reef consists of a gray and reddish micaceous schist, which is decomposed and easy to mine, and dips westerly about 55°, which, when sampled by crosscuts from end to end, gave a value of $4.86 in gold and two ounces silver per ton, and is adapted to cyanide treatment. Mill tests gave 88% extraction with a seventy-hour leaching with 1¾ pound of cyanide per ton of ore.

The Colossus G. M. & M. Co., a Philadelphia concern, is arranging to erect at an early date a 500-ton plant to treat this ore, and will use the present 100-ton mill to work up the tailings deposits.

During my various investigations of this Eastern gold field many similar propositions presented themselves, principally in Virginia and North Carolina, any of which can be secured at a reasonable price and upon favorable terms.

The Southern lands can be bought at $10 to $30 per acre. The titles in most instances are perfect, conveying in fee simple all minerals and everything they contain. The timber and agricultural values alone are worth the price, not taking into consideration the minerals.

Choice pine lumber, cut to dimensions, is delivered at $7 to $12 per 1000 feet, hardwoods at $1 to $1.50 per cord, coal $2 to $3 per ton, delivered. The climate is delightful; seasons are open the year round; temperature ranges from 80° to 90° in summer and 45° to 60° in winter.

Commodities of every kind are raised here, making living very cheap. Being in the center of civilization, near the sea and railroad transportation, reasonable rates are obtained, and the markets are convenient.

Water for milling and domestic uses is plentiful and pure. Competent labor, white or black, is obtainable at $1 and $1.25 per day of ten hours, without board. The laborers are farmers, with fixed homes, who do not drift and are not organized into labor unions.

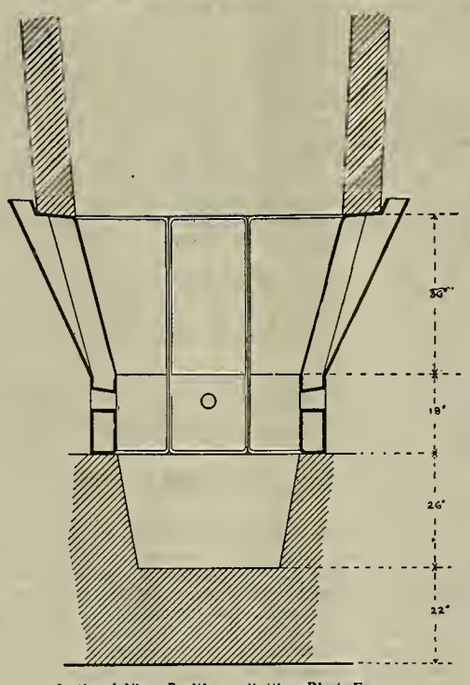
Copper Matting Pyritic Smelting.*

A blast furnace best adapted for copper matting of sulphide ores is precisely adapted for pyritic smelting, which latter is a copper matting process, no more and no less, and the difference between the two methods lies in the quantity and character of fuel employed, the manner of employing it and the variations in reactions involved by reason of its character.

If blast pressure is comparatively high through tuyeres relatively small, carrying no air in excess of that used for combustion at the tuyere zone, then there occurs a localization of combustion and consequent heat, and all material within that zone is quickly melted down with little change in grouping of constituents, while such carbon monoxide evolved as may escape oxidation there absorbs oxygen from the oxides in the hot zone above and thus reducing to metal results. With large volume of air blast at lower pressure, the oxidation of fuel is more gradual; the action at the tuyere zone is less intense, and, while a melting temperature must be maintained at that point, a surplus of heated air must pass on to the next layer or cross-section above, where, by thorough exposure for sufficient length of time and in the presence of adequate heat, oxidation takes place more or less rapidly, depending on character of material operated upon, and the equable proportioning of the conditions named above. Copper matting is essentially an oxidizing process as to the ores being treated, and every pound of carbonaceous fuel that it is necessary to use in the process for the purpose of producing heat whereby the necessary reactions may take place, is a direct obstacle to the realization of best results in tenor of matte, because in burning such fuel much carbon is produced which burns at once in the presence of the necessary heat, robbing FeO or SO_2 of air, or all of them of oxygen, sending the iron of the first to the matte to encumber that, instead of allowing it to combine with silica to form slag, forming sulphur from the second and sending the sulphur to the matte again to encumber that, reducing its tenor instead of allowing the sulphur to go off as sulphurous acid gas, and the third, the air, robbing that of oxygen that is needed to combine with the iron and the sulphur of the ore to dispose of them, the one for the slag as a necessary constituent, the other to the chimney and out of the way. There are none of the reactions involved in copper matting of pyriteous ores in which carbon is necessary or a desirable factor. Its sole office in that class of smelting is the production of heat necessary to the operation. It follows that the loss of carbonaceous fuel that can be burned in the furnace for the production of heat necessary, and the more the sulphur of the ore that can be utilized for heat production, the higher grade the matte product will be, other conditions being parallel. The utilization of sulphur as fuel involves furnace conditions not vitally necessary to smelting with carbonaceous fuel, in that the caloric value in heat units in the former is much lower than in the latter. The ultimate value in heat units is as equivalents of oxygen involved in the reaction of burning. Therefore, using the British thermal unit (B. T. U.) as the unit of measurement, and carbon equivalents as a basis of comparison, its value being 14,500 B. T. U., the thermal value of sulphur becomes 5437 B. T. U., or 37.5% that of carbon, pound for pound, to-wit: One equivalent of C = 12, 2 equivalents of O = 32 and 32 ÷ 12 = 2.667, the number of pounds of O involved in the oxidation of one pound of carbon to CO_2 producing 14,500 B. T. U., while the sulphur being 32 ÷ 2 of oxygen, or 32, = 1; that is, a pound of oxygen combines with a pound of sulphur to produce SO_2. Then 2.667 pounds of oxygen combining with one pound of carbon and producing 14,500 B. T. U., one pound of O combining with one pound of S producing 14,500 ÷ 2.667 = 5437 B. T. U. Again, by like comparisons, one pound of FeS evolves 3107 B. T. U. in the burning to FeO. Iron pyrites consist of about 53% of S and 47% Fe. When charged raw into a furnace, one equivalent of sulphur is expelled at a comparatively low temperature, and is therefore not available as a producer of heat, for it never reaches the smelting zones of the furnace. There is left, then, for heat production of one pound of pyrites .47 pound of Fe, having a caloric value of 1460 B. T. U. and .265 of a pound of S, value = 1441 B. T. U., or a total 2901 B. T. U. is the available heat producing value of one pound of iron pyrites, equal to 20% that of carbon. As the specific heat of air is about .24, this pound of iron pyrites would, in burning, develop sufficient heat to raise the temperature of about 12,100 pounds of air 1° F., or its equivalent, one pound of air 12,100°, or, say, six pounds of air, 2017°. As one pound of iron sulphide combines in burning with, approximately, one pound of oxygen, and as air is composed of, approximately, four parts nitrogen to one of oxygen, it follows that about five pounds of air is involved in burning one pound of iron sulphide.



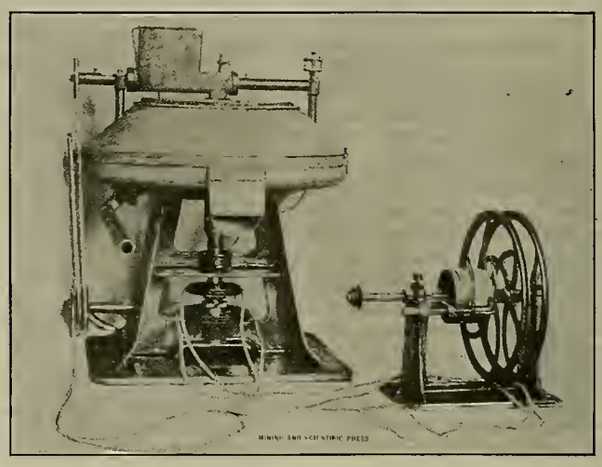
Assuming the ultimate smelting temperature to be 2000° above normal atmosphere, which is its lowest possible limit, then to raise the five pounds of air involved in the combustion of a pound of iron sulphide to the necessary smelting temperature involves the absorbtion of 1681 B. T. U., or $\frac{5}{6}$ of the heat developed, thus leaving but $\frac{1}{6}$ of such developed heat—an amount totally inadequate—for raising the silica and other necessary constituents for forming a fluid slag, to the necessary fusing temperature. The calculations above are approximately correct and fully demonstrate that pyritic smelting with cold air blast is not possible. In the above calculation the heat developed in the upper zones of the furnace by the combustion of the free atom of sulphur in the pyrites has been neglected, because at the comparatively low temperature at which the free atom burns, its effect in heating the stock there is of little value where so great a volume from below is constantly passing. In fact, the tendency of this added heat in the upper zones of the furnace is rather adverse than otherwise, as it contributes to overfiring, or hot-top, so called—a condition always to be avoided.

Carbonaceous fuel is an absolute necessity where cold air is employed, and the method thus becomes copper matting in the common acceptance of the term.

The low relative calorific value of sulphur renders it, when used in the form of pyrites, the more sensitive to disturbing conditions in the furnace, in proportion probably as its lower ultimate caloric value, especially so to that of the cold air blast, introducing as that does an unmanageable retarding and depressing factor into the vital part of the furnace. In direct proportion as the air blast is heated, reducing proportionately the amount of carbonaceous fuel necessary to be used in the furnace for heat production, and reducing the amount of air to be treated at the tuyere zone, and heating to some degree on the outside whatever air is required, the conditions for regular and efficient working are improved, the extreme expansibility of air heat rendering possible a most thorough distribution of the air, without the disturbing factor—cold.

For reasons given above, pyritic smelting—that is to say, that class of smelting requiring no carbonaceous fuel—has not been, nor can it ever be, accomplished with cold blast. There appears to be no doubt that all copper matting may be more efficiently and more economically done with the use of heated air blast than without it.

The accompanying diagram shows the construction of a pyritic or matting blast furnace. It is the water jacketed furnace now in general use. It is rectangular in form, but variable in proportions in the several furnaces, to suit the particular conditions involved.



Sectional View Pyritic or Matting Blast Furnace.

*Abstract from pamphlet issued by the Colorado Iron Works Co., Denver, Colo., entitled "Some Details as to Smelting Practice and Equipment."

THE first of the forty-five new mogul engines ordered by the Santa Fe Co. for the Pacific Coast division has arrived. By January 1 the entire forty-five will have been delivered. The new engines are all oil burners. Some of them will be used on the division between Seligman and Winslow, Arizona, and this will mark the installation of oil burners in that Territory. When this division is equipped the Santa Fe will be using oil on its lines for a distance of over 600 miles.

Berrigan Centrifugal Separator.

Experiments are being made at the Homestake mill with the Berrigan centrifugal separator on the slimes as they come from the mill and which have been allowed to waste. The separator, which is herewith illustrated, is intended to recover floating values, and also to force the cyanide out of slimes and other pulp. The machine gives promise of doing a great deal in that direction. It weighs about 700 pounds. The separator has a centrifugal bowl; there is an inside bowl thrown on an eccentric; the liquid forms in the inner bowl in a crescent and the slime is turned in through the center to the rim where it accumulates. This accumulation is removed from the rim by scrapers, conveyed up the incline, the water being forced out below. The dry pulp is thrown out by centrifugal force. It is a continuous operating device, throwing out pulp as fast as it accumulates. It is set just below the concentrators; concentrates and slimes are dried out with 3% of moisture but can be adjusted to leave in more moisture. The device is now operating on the slimes from the Homestake mill which have been sent down the gulch. One of the machines is in the mill of the Colorado Zinc Co., Denver, Colo. The De Laval Separator Co. of New York are manufacturing the machines. J. J. Berrigan, inventor of the separator, has been conducting all of the experiments for the De Laval Co., both at the Homestake and in Denver.

The Berrigan Separator.

Topographic Map of Part of Southern California.

A topographic map of the Tejon quadrangle, in southern California, has just been issued by the United States Geological Survey, the southern part of which lies in the Pine Mountain and Zaca Lake forest reserve and the northern part in Los Angeles and Kern counties. This map, drawn to the scale of 2 miles to 1 inch, covers about 944 square miles of territory, the most of which is extremely mountainous, ranging from 3000 to 6000 feet above sea level. The northern part of the map shows the Tehachapi mountains, the southern end of San Joaquin valley and Antelope valley, a part of the western end of the Mojave desert. The southern half of the map, embracing parts of Los Angeles and Ventura counties, shows a perfect maze of narrow canyons and mountain peaks.

Some fine timber of merchantable value is found on the Tehachapi mountains and in the northern part of the forest reserve, but the southern part of the quadrangle contains little except a dense growth of manzanita and chaparral. At Gold Hill, in Ventura county, are some mining claims, but the larger part of the area is without inhabitants.

Between Antelope valley and San Joaquin valley is shown Tejon pass, with old Fort Tejon, famous in the early history of California.

The map can be obtained for the nominal price of 5 cents by applying to the Director of the United States Geological Survey, Washington, D. C.

IN the case of a severe electric shock, the best immediate assistance would be to produce artificial respiration, enforcing the heart action and diminishing the pressure of blood, the latter being obtained by injecting one to three drops of amyl nitrate. The dangers of electric current will, moreover, vary to a high degree, according to personal predisposition, persons subject to alcoholism, as well as those easily frightened, suffering much more from the effect of electric shock than normal people. The limit of danger is considered as coinciding with 0.1 ampere.

A METRIC KILOGRAM equals 2.2046 avoirdupois pounds. The legal kilogram in the United States is 15,432 grains. In Mexico all weights of gold and silver in ores, mattes, bullion, etc., are expressed in metric terms.

Notes on the Metallurgy of Copper of Montana.*

NUMBER VIII.

Written by H. O. HOFMAN.

CONVERTING COPPER MATTE. — The converting of copper matte has undergone many changes in the form of apparatus and the mode of working since 1884, when the first converter was put into operation.

The original Parrot converter, swinging in a vertical plane, was 8½ feet high and 5 feet in diameter, outside dimensions. The matte was melted down in a cupola and tapped into the converter through a launder. In 1896, the original method of working in separate stages was changed, and 50% matte was brought forward to coarse copper in one operation. As the initial charge was 2500 pounds of matte, increasing to a maximum of 9000 pounds, the siliceous lining being eaten and worn away, the amount of coarse copper produced in a blow was relatively small. The largest upright converter in Montana is 14 feet 2½ inches in height and 7 feet in diameter, outside dimensions. It works with an average charge of five tons and a final charge of eleven tons of 50% copper matte, receiving it as direct matte from the forehearth of the blast furnace or from the reverberatory furnace. Working direct matte was planned in 1890–91 by the late C. O. Parsons, and carried out by F. Klepetko in 1892; matte was transferred from reverberatory and blast furnaces by means of ladle and electric crane to the converter. At two plants a medium-sized converter was lifted by means of an overhead traveling crane from its trunnion supports and brought to the blast or reverberatory matting furnace to receive its liquid charge; this method has become obsolete, but it has its advantages.

At present, the Parsons-Klepetko method is generally employed. A converter charge is tapped from the blast furnace forehearth, or the reverberatory matting furnace, into a steel ladle managed by an electric traveling crane and poured into the converter. Ladles vary in size; a common form has a diameter of 5 feet and a height of 3 feet 10 inches. The lining, ordinary loam, is plastered on by hand, dried by an air current and then by a fire (wood, coke); converter slag, to the thickness of 3 inches, is then poured in. Matte ladles are used, also, as slag ladles. A lining is good for nine and one-half tons of copper.

When the 50% matte has been blown to white metal, the slag is skimmed and the converter very often recharged with 50% matte and blown through the slagging stage, but, more commonly, the original charge of matte is blown to coarse copper after skimming, without addition of fresh matte. Doubling charges is a common procedure on matte running less than 50% copper. After skimming the slag, the white metal is brought forward to coarse copper. By these double charges considerable amount of copper is produced in one blow, to be poured into the form of shipping ingots, 200 to 250 pounds, or anodes, or into a refining furnace, to be refined before casting into anodes.

The upright converter has been replaced in the new plants by the David-Manhes, or barrel or trough converter swinging in a horizontal plane. Here we find two sizes; the smaller, in more general use, is 7 feet in diameter and 10 feet 6 inches long; it receives an initial double charge of five tons and a final double charge of twelve tons 50% matte; the larger one is 8 feet in diameter and 12 feet 5 inches long, the initial double charge is ten tons, and the final double charge is twenty tons. The main reason for replacing the upright by the horizontal converter is the low blast pressure required by the latter type, ten versus fifteen pounds, although this advantage suffers greatly by the difficulty of making the lining firm—a thing relatively easily accomplished in the vertical converter. Converting matte in a bottom-blown upright vessel has been tried. This was 13 feet high and 7 feet in diameter, had sixteen ¾-inch tuyeres placed in a manner similar to that which obtains in making steel by the Bessemer process. The experiments were successful so far as the process proper was concerned, i. e., 50% matte was satisfactorily brought forward to coarse copper, which remained sufficiently fluid to be poured satisfactorily. They appear to show that the failure of Manhes to use a bottom-blast converter in his first experiments was probably due to his operating with too small a vessel from which matte and slag were blown out, and with too little matte, which furnished only a small amount of copper quickly chilled by the blast. The Montana experiments have not been followed up for the present, as the life of the bottom was too short, parts of it floating up during a blow. The experience gained so far tends to show that the bottom-blown converter works more quickly than the side-blown, that the wear of the lining is more even, and that the critical points are less easily discovered and have to be watched with great care. When the question of lining the bottom will have been settled satisfactorily, it is believed that blowing from the side will be given up, at least with a large converter having an initial charge of five tons 50% matte. A gyratory motion of the charge, obtained by placing the bottom tuyeres inclined, may lengthen the life of a converter lining.

*Trans. Am. Inst. Min. Engs. (Condensed).

MONTANA CONVERTERS.

Converter.	Grade of Matte.	Hor. Section at Tuyeres.	*Lining Material per Converter.	Lining per Ton Copper Resulting.	Copper per Converter.	Tuyeres.		Maximum Pressure.
	p.c Cu.	Sq. Ft.	Tons.	Tons	Tons.	No.	Diam	Lbs.
Upright vessel, 7 feet x 14 feet 7 inches	51.1	7.07	7.63	.53	14.8	8	¾	18
Medium barrel, 7 feet x 10 feet 6 inches	51.7	6.66	8.40	.32	26.2	14	¾	12
Large barrel, 8 feet x 12 feet 6 inches	45	17.79	16.60	.80	20	18	1¼	15

* These data do not show the amount of lining material required to line a new converter, but only the average weight put in after a lining is worn down to the point where further charges would endanger the iron shell.

In all plants the converters are placed in a single row, forming a straight line. Back of them is the main flue (vacuum 0.1 inch water), with projecting hoods, into which the converters discharge their gases, vapors and finely divided particles of charge (called flue dust). The main flue ends in a dust chamber (temperature, 370° C.), connected with a stack. At some works the matte is poured into a converter at the front from a suspended ladle, at others it arrives at the back (above the main flue) in a ladle, and is poured into a launder, which delivers it at the front. One stall is served by two to two and one-half converters and one and one-half to two ladles. The lining of converters, both of body and of caps, is still causing trouble, as in the most favorable case the body has to be removed after twenty-eight tons of matte have been treated; the cap has a longer life. The material is, of course, siliceous. A greenish granular sandstone (SiO_2, 64.4; FeO, 7.6; Al_2O_3, 16.5; CaO, 1.1; MgO, 1.8; ignition loss, 4.7), which readily crumbles when exposed to the air, is used without any admixture of a bond. A crushed quartzite, pugged with 5% clay, gives a satisfactory mixture (SiO_2, 88.6; Fe_2O_3, 3.1; Al_2O_3, 4.0; CaO, 1.6); lining sand has been mixed with slimes from the ore-dressing works (insoluble, 75.3; SiO_2, 60.0; Fe, 2.2; Al_2O_3, 19.9; S, 6 8; As and Sb, 0.75; Cu, 6 05) and with second-class ore (insoluble, 68 9; SiO_2, 57.0; Fe, 9.6; Al_2O_3, 10.4; S, 15.95; Cu, 5.95; Ag, 2 oz.), giving the following material:

Insoluble, 82 2, SiO_2, 63.0; Fe, 5.9; Al_2O_3, 17.3; CaO, 1.5; MgO, 1.3; S, 2.1; Cu, 1.0; H_2O, 11.0; ignition loss, 4.1.

Another mixture for the body of the converters consists of quartzite (SiO_2, 90 to 91; Al_2O_3, 2.0; FeO, 3.0; Ag, 10 to 20 oz.) and slimes (SiO_2, 60; Fe, 4 to 5; Al_2O_3, 15; S, 9; Cu, 5 to 7), to form a lining (SiO_2, 85; Fe, 3.3; Al_2O_3, 4; S, 3; Cu, 4; Ag, 12 oz.).

In some instances siliceous gold ores have been worked in as a lining material. The material for the cap has to be more plastic than is necessary for that of the body. The lining usually consists of body lining material, and 5% to 10% of clay, and is mixed with more water than the body material. If the lining of the body were eaten away solely by the scorifying action of the iron, its life would be much longer than it is. The chemical action in some instances plays even a subordinate part to the mechanical wear, by the swash of the liquid charge which causes part of the lining to break off. This is especially observable in the barrel converter. The chemical wear takes place mainly near the tuyeres, the mechanical wear at the opposite side near the top of the body. In an upright converter, 14 feet 2 inches high and 7 feet in diameter, the bottom lining will be 22 inches thick, the side lining at the tuyeres will be 30 inches thick, and on the opposite only 18 inches, while at the top of the body the lining on the tuyere side will be 17¾ and opposite 27¾ inches thick.

In a horizontal converter, 10 feet 6 inches long and 7 feet in diameter, the bottom will be 18 inches thick, consisting of a 4-inch segmental layer of mixture tamped onto the steel shell, followed by a slightly curved 4½-inch course of brick and by a 10-inch layer of mixture. The sides are lined with a course of 4½-inch firebrick, special brick 6½ by 6½ by 4 inches being used at the tuyere level. A cross-section through the tuyere level will show the sand lining to be 30 inches at the tuyeres and 16 inches opposite; at the top of the body, the corresponding dimensions will be 20 and 20 inches. The longitudinal section will show the side lining to be 16 inches at top of the bottom lining and 34 inches at the top of the body. The ends are not lined with brick. Sometimes the lining is still rammed in by hand, an air drill adapted for the purpose or the flask tamper of the foundryman is more common.

The ramming is done by contract, a premium being paid if the converter makes more than the standard amount of copper on a lining and deductions made if it falls below it. If the lining is to be patched, the vessel is first emptied and then cooled with water from the outside, then lining material is rammed in or a few scoopfuls of infusible odds-and-ends are thrown in, tamped down and slag thrown over the patch. Occasionally, matte is run into the empty converter and allowed to solidify. Experiments in lengthening the life of the converter, by pouring siliceous blast furnace slag into the converters with the hope that the excess of silica over that of the normal converter slag would combine with the oxidized iron from the matte, have been only partially successful.

The difficulty and expense of handling converter slag has been overcome in one plant by the use of slag casting machines.

The average time to complete a charge with a five-ton upright converter is two hours fifty-five minutes; this figure is reduced to two hours twenty minutes if the time taken up by pouring and waiting is excluded. The blowing of a single charge takes forty-seven minutes, a double charge takes eighty-two minutes. In pouring the slag a rabble is pushed in and out of the stream of slag. The appearance of bright sizzling specks is a sign that white metal is coming over. A few partial analyses of the products obtained in converting are subjoined:

	Cu	SiO_2.	FeO	Al_2O_3.	CaO.	Ag. Au. Ozs.	S.	As. and Sb.
Slag	2.0	30.0	55.2	9.5	1.0	....	....	....
"	1.6	29.8	57.8	10.0	1.0	0.8	....	....
"	5–6	31–32	54	....	.....	....	....	....
Dust	37.8	1.5	7.4	1.9	None	....	14.3	4.8
"	63.4	3.8	12.8	....	.....	53.8	16.0	....
"	65	.....	....	....	.....	....	....	....
Pig copper	99.0	.....	....	....	.....	9–40	....	....

The labor required per shift for a single converter is made up of one skimmer, one puncher, one helper and one sampler.

With three large horizontal converters running as steadily as possible the number is one skimmer, two punchers, two helpers and two samplers.

In the following table part of the data given previously have been summarized, and some additional facts have been added.

It will be seen that the medium barrel uses much less lining per ton of resulting copper than the upright vessel, although the grade of the matte differs only slightly. This may be explained by the more siliceous character of the lining used, as, except for the mechanical effect of making the material plastic, alumina would be of no service in scorifying; furthermore, the lining of the upright vessel runs higher in iron.

The lining of the large barrel is of about the same quality as that used with the medium barrel, but as the matte of the former is of a lower grade, the quantity of lining used per ton of resulting copper is naturally higher.

Converter Lining.	SiO_2.	Fe_2O_3.	Al_2O_3.	CaO.	MgO.
Medium barrel	91.	3.	3.8	1.6	...
Upright vessel	64.4	8.4	16.5	1.1	1.8

In the upright vessel, the amount of free air used

per ton of copper converted is about 200,000 cubic feet, not allowing for "leakage" in the blowing engines.

YIELD OF METAL.—The general yield of metal in roasting, smelting and converting, in treating an ore assaying 10% to 12% copper and about four ounces silver per ton, is copper 92+% and silver 95+%.

(TO BE CONTINUED.)

Cyanide Treatment of Sands on the Rand.*

Written by H. S. DENNY.

As a general statement, it may be said that the cyanide process upon the Witwatersrand is principally confined to the treatment of what is designated as "sands," after classification always from "slimes," and in a few isolated cases from sulphurets. The average percentage of sands so classified is in the neighborhood of 70%, the balance consisting of slimes and, where concentration is employed, of slimes and sulphurets.

Leaving the question of concentration out of consideration for the moment, the general practice is to pass the ore, after being crushed to about a 600 mesh (per square inch), over amalgamated copper plates. The pulp is then lifted, ordinarily by means of a tailings wheel, to a point where it is introduced into one or a series of spitzkasten, the overflow from which carries off the bulk of the water and 30% of the crushed ore, consisting of slimes. This overflow is then either passed through a slimes plant, or, as in the majority of cases, simply led into settling pits, where the slime is allowed to accumulate and the overflow water is returned to the mill reservoir.

The bottom discharge from the spitzkasten is so arranged that its product may be conveyed into one of several vats, where it is settled either by means of an automatic distributor or a hand hose arrangement. In some cases fresh water is supplied at the point of discharge at the bottom of the spitzkasten, in order to avoid the possibility of slimes going through with the sands, but this is not generally considered necessary.

One form of automatic distributor, well known as the "Butters" distributor, is used. Most mining men, however, prefer the hand-hose distributor, which is generally operated by a native, who carries the hose to different points in the vat, and regulates the overflow discharge in each vat, so that it leaves at the furthest possible point from where he has deposited the sands. With the Butters distributor the vat is in some cases first filled with water, and a series of pipes automatically rotated by the force of the incoming pulp divides the stream into several channels and deposits it at various annular distances from the center. One objection to this latter method is that if for any reason the incoming flow is stopped, there is a settlement of slime with the sands, which prejudicially affects the subsequent leaching operations. Where a side discharge is adopted it is claimed that this objection is overcome. A good settlement is one which leaves a deposit of clean sand entirely free of slime, and which loses no sand in the operation. The settling tanks are supplied with filter beds, by means of which the sands are thoroughly drained.

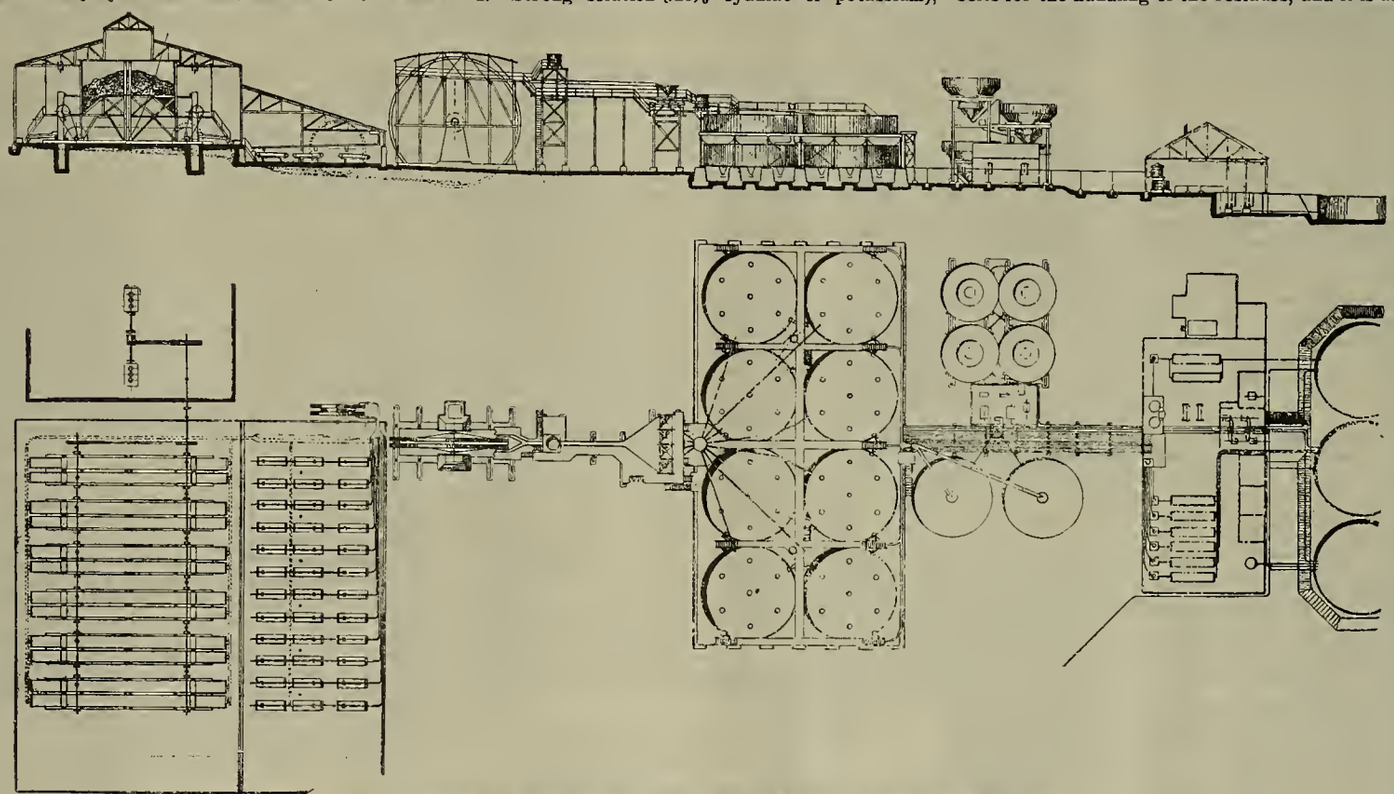
From the settling vats—which in some cases are superimposed above the treatment vats, whilst in others they are placed on the same level—the sands are removed through the discharge doors by hand labor and put into the treatment tanks. The treatment vats are supplied with filter beds, beneath which are two or three outlets connecting with mains running to the extractor boxes. Through these mains the strong, medium and weak solutions, or strong and weak solutions if only two mains are used, are conducted to the zinc separator boxes, where there is provision for conducting the solution coming from any one main to any extractor box desired. The connections between the outlets from the vats and the mains are so arranged that the flow of solution from any one vat may be regulated to the various boxes at will. The solution mains are provided with meters by which the amount of solution passing through any main may be estimated, and drip samples are taken from the top of each extractor box, in order to check the amount of gold entering any one box.

The usual practice on the Witwatersrand is to give each charge of sands a six days treatment, and the washes used are somewhat as follows:

1. Strong solution (.25% cyanide of potassium), regulated to drain in twenty-four hours, the weight of solution being about 20% of that of the ore. The charge is then allowed to stand for twelve hours.
2. This operation is repeated.
3. Washes of .1% solution, drained dry each time and occupying two days, the proportion of solution to ore being in the ratio of 4—5.
4. Washes of 0.2 solution in the ratio of 1—10.
5. Water wash in the ratio of 1—10.

It has come before my notice in the past few years that after the installation of new filter beds the value of the residues after treatment reaches its minimum point, and as the filter beds become older the residues increase in value. Careful attention to the condition of the beds and proper cleaning will obviate any material loss in this direction, but there is no doubt that a limit is reached when it pays far better to incur the expenditure entailed in putting in new filter beds rather than continue with the old ones.

The strength of the solution used and the time of treatment given will vary slightly with different ore, but the general practice is the same in all cases. The clean-up of the gold slimes from the extractor boxes is on some mines conducted monthly, whilst in others a light clean-up is made in the first half of the month, and, personally, I favor the latter procedure, as it increases the efficiency of the boxes and enables one to estimate more accurately what the output is likely to be.



The treatment of zinc slimes is simple, the first operation being to treat it with sulphuric acid and get rid of the bulk of the zinc, the second to calcine it, and, finally, to melt it with suitable fluxes in clay-lined plumbago furnaces of the reverberatory type.

A new process has been introduced lately by Mr. Taverner, cyanide manager of the Bonanza mine, by which the acid treatment may or may not be used, but the subsequent operation consists of smelting with lead and final cupellation, and it is claimed that a considerable saving is effected by it. There is no doubt that the presence of zinc in smelting gold always brings with it a tendency to carry off a portion of the gold, and whatever the subsequent operations may be, i. e., whether cupellation or direct smelting, I think the operation is benefited by a preliminary acid treatment if it can be done economically.

The main points to be observed in cyanide practice are, firstly, to study the consumption of cyanide, and by neutralizing any free acid that may be contained, to keep that consumption at its lowest point; secondly, to have a leachable product free from slimes, and, thirdly, to secure a high extraction and a low residue.

The details of handling both the slimes and sands depend entirely upon the arrangement of the plant, and it is generally agreed that the superimposed settling tanks enable the operator to work more economically than in any other design.

The attached diagram shows the general arrangement of reduction plant New Goch, shortly to be erected on the New Goch mine. There are many little improvements introduced, all of which will tend to facilitate the various operations comprising the treatment of sands. The most conspicuous feature of the cyanide plant is the installation of conveyor belts for the handling of the residues, and it is anticipated that in this section of work a considerable saving will be effected as against the methods of trucking in vogue to-day. It is more than probable that conveyor belts will play a very important part in all of our handling work in the near future, and even to-day there is plenty of evidence to show that their utility will not be confined to dealing with residues or even the handling of rock on surface.

General Arrangement of Reduction Plant at New Goch Gold Mines, Witwatersrand, South Africa.

I confidently look forward to the time when the huge plants, necessitated by the prolonged percolation methods in vogue to-day, will give way to something very much more simple and effective both in design and operation, and although, as elsewhere shown, our experiments on the short treatment of sands have not thus far resulted in a success that would justify too much optimism, I cannot but feel that on an ore offering to the metallurgist so few difficulties as that of the Witwatersrand, that the time is not far distant when the present difficulties will be overcome.

SLIMES TREATMENT.—Following up the experiments in the rapid treatment of slimes which show such highly satisfactory results, it may not be out of place to describe a plant which is now erected and being experimented with at the Van Ryn gold mines estate. The plant is designed to take the whole of the slimes overflowing from the spitzkasten, where the separation of sands and slimes is effected, and its arrangement is such that the flow is taken continuously at the top of the plant, and the treated slimes discharged continuously at the bottom, the whole process between these two points being continuous and regulated by the adjustment of a few valves. I admit that no authoritative statement as to the results the working of the plant can be made till it has be

*Abstract from Jour. Chem. Metal. & Min. Soc., S. A.

in operation for some months, and I prefer in these notes to simply describe the operations without going into details as to the figures of cost and extraction being obtained from it.

The first duty of the plant is to separate almost the whole of the water from the slimes in one continuous operation, and in such a manner that the water may be immediately returned to the mill reservoirs available for use again.

On the majority of our mines to-day the overflow from the spitzkasten above the cyanide vats is allowed to flow either through launders or open cuttings to the slime setting pits, and in many cases the length of such conduit is very considerable, and consequently the loss of water, firstly, by absorption, and, secondly, by evaporation, is correspondingly heavy.

Then, again, it is the custom to provide a series of pits in which the slime is settled, and the maintenance charges for the upkeep of banks and for cleaning out these pits represents a very appreciable figure per month.

Finally, there is further loss of water by absorption and evaporation in the pits themselves, and when the whole of these items are combined they constitute quite a heavy charge on the working costs per ton treated.

On this score alone, therefore, it may be fairly claimed that the plant fulfills an important function, and one that from a financial point of view is quite sufficient to justify the expenditure which its erection has entailed. This statement would not apply to the same degree on a mine possessing a supply of water so liberal that the loss of a fairly large quantity per day could be permitted without danger, but it is a notorious fact that most of the mines on the Witwatersrand have only their bare requirement, whilst many pay something like 2s 6d per 1000 gallons for the commodity, and in each case the saving of water becomes an exceedingly important consideration.

It is generally estimated that with every ton of ore crushed on the Witwatersrand we use from seven to ten tons of water, and although the latter figure is probably above the average, in the absence of more accurate data I have adopted it wherever this question has been touched upon.

The average loss of water is estimated at 20% of the total used per day.

On a basis of 100 stamps crushing 500 tons of ore and using 5000 tons of water, we thus have a loss of 1000 tons of water, or 200,000 gallons per day, which at say only 1s per 1000 gallons amounts to £10 per day, or £300 per month, whilst for companies paying 2s 6d per 1000 gallons it represents £750 per month.

In the plant under consideration the overflow water from the first three tanks flows continuously to the return water tanks, situated near at hand, and from this point is pumped either direct to the mill reservoir or to the service tanks.

Even supposing, therefore, that the loss of water is reduced by only 50% as compared with the slime pit settlement, the advantages gained are obviously important quite apart from the upkeep of conduits and slime pits involved in the latter system.

Another feature that may be mentioned is that to-day our slime settling pits are in many cases considerably removed from the mill water reservoir, and the whole of the return water has to be pumped over long distances, and often through a comparatively high lift, necessitating large pumping equipment and heavy cost.

The results of our work thus far indicate that on the score of water separation we may be quite satisfied that the plant will realize all our expectations.

In order to more clearly follow the operation of slime separation, gold solution and residue washing performed by the plant under consideration, the following description has been based upon a day's treatment of the current slimes produced by 160 stamps.

Assume that five tons of ore are crushed per stamp per day, and that ten tons of water are required for every ton of ore crushed, thus:

160x5 = 800 tons of ore crushed per day by 160 stamps.

800x10 = 8000 tons of water required per day.

800 + 8000 = 8800 tons of pulp discharged by battery per day.

Slimes average, say, 25% of total rock crushed.

Then: $\frac{800x25}{100}$ = 200 tons of slimes produced per day.

$\frac{800x75}{100}$ = 600 tons of tailings produced per day.

The tailings retain 10% of water, equal to sixty tons, therefore the tailings and retained water account for 660 tons out of the original 8800 tons of pulp discharged.

8800 — 660 = 8140 tons, which is the quantity sent to the slimes plant per day.

The launder is so arranged that the flow of incoming slimes is divided in such a manner that each vat receives an equal proportion of it. That is to say, on the proportion upon which we are figuring each vat receives $\frac{8140}{2}$ = 4070 tons of slime pulp per day. In these vats a separation of the whole of the slimes is automatically effected, the separated slimes continuously falling to the bottom of the vat, and continuously discharging through a suitable pipe to a second separator vat. The proportion of dry slimes in the discharge is one of slimes and four of water. The separated water overflows from the tops of the vats and returns direct to the mill reservoir.

We have seen that the total slimes produced per day is 200 tons, equivalent to, approximately, 0.14 tons per minute.

The flow of water into the slimes plant—less amount received by the tailings—is 1103 gallons per minute; 0.14 tons of slime—calculating it to be 1½ times as heavy as water—would therefore amount to 18 5 gallons per minute. The total quantity of slimes and water is, therefore, say, 1120 gallons per minute.

The vat B receives the whole of the separated slimes from the vat A, together with four times the quantity of water. It receives, therefore, per minute the equivalent of 19 gallons of dry slime and 111 gallons of water, or 130 gallons per minute in all. The quantity of water clarified and returned to the mill reservoirs from the vat A is; therefore, 1103 — 130 = 973 gallons per minute.

A similar separation to that effected in A takes place in B; that is to say, the slimes settle at the bottom and the water constantly rises and discharges over the top of the vat. As the rate of intake into B is only 130 gallons per minute, as compared with 450 gallons per minute in vat A, the one vat is sufficient to handle the whole of the incoming pulp from the vat A. The separated slimes in the vat B are discharged as a thick pulp in the proportion of one part by weight of dry slime to one part by weight of water to the solution chamber. Here the pulp is brought into contact with cyanide solution, and the whole is brought into a state of agitation by means of compressed air introduced through pipes lining the chamber and by arms revolving in the chamber. The quantity of water and slimes discharged per minute into the solution chamber is, therefore, 19 gallons of dry slimes and 28 gallons of water, equal to 47 gallons of pulp.

The quantity of clarified water overflowing from top of vat B is, therefore, 130 — 47 = 83 gallons of clear water per minute returned to the mill reservoir. The total quantity of water returned to the mill reservoir is, therefore, 973 gallons per minute from the vat A, plus 83 gallons per minute returned from vat B, a total of 1056 gallons out of the total 1103 supplied with the slimes.

In the solution chamber a quantity of cyanide solution—proportioned as 3 of solution to 1 of pulp—is added. At the rate of flow of pulp, shown above, into this chamber, viz.: 47 gallons per minute, the quantity of cyanide solution to be added is 141 gallons per minute. The inflow and outflow to and from the solution chamber may be regulated according to the will of the operator. The thoroughly mixed and aerated pulp and cyanide solution now discharges into the separator vat C, the flow being at the rate of 188 gallons per minute. Here a similar separation to that effected in B takes place, the slime sinking to the bottom of the vat and the solution rising to the top and overflowing. The important difference in the overflow from vats A and B, in contradistinction to vat C, is that, whereas in the first case the overflow was water, in the case of C the liquid is cyanide solution, in which is contained the gold dissolved from the pulp in solution chamber. The overflow passes directly to the precipitating boxes, the rate of flow being the total quantity less the proportion discharged from the bottom of the vat C. This quantity is precisely the same as that flowing from the vat B, therefore the rate of flow of the cyanide solution to the precipitating boxes is 141 gallons per minute. (This quantity, it will be observed, is that required for admixture with the pulp in each solution chamber, so that there can be no accumulation of cyanide solution.) The discharging pulp from C, at the rate of 47 gallons per minute, passes into the solution chamber, where it meets an incoming stream of cyanide solution, flowing at the rate of 141 gallons per minute. In this chamber the mixture is again thoroughly agitated by air, finally discharging into a slimes sump, in which is placed a pump, which latter raises the slimes to vat D. Here, similarly to C, a separation of slimes and solution is effected, the settled slimes discharging to the solution chamber, and the overflowing cyanide solution passing to the making-up tank, where, after being raised to the standard strength, it passes to the solution chamber, beginning the cycle de novo.

The pulp passing into the solution chamber meets a stream of solution which has passed through the precipitating boxes to the sump, and is continually pumped from thence to this chamber at the same rate as it flows through the precipitating boxes, viz., 168 gallons per minute. In this chamber the pulp is agitated by air similarly to the process in b and c, discharging into the separator vat E. Here a separation of slimes is effected from the cyanide solution in every way similar to that described in connection with the other separator vats, A, B, C and D, the overflow of the cyanide solution passing into the solution chamber, and the slimes discharging at the bottom of the vat, being depleted of their gold to the greatest possible degree, are pumped to a slimes residue dump. The quantity of solution lost in the whole process is the weak washing solution which is discharged from the vat E. This loss is less than that from the ordinary slimes plant, inasmuch as it is difficult to settle slimes by the ordinary process to a constituency of more than 40% dry slimes in the pulp, whereas in the case under review the discharge is from 50% to 60%.

In Western Australia to-day several authorities state that they obtain a product carrying 60% dry slimes from a series of ordinary spitzkasten.

Ore Deposits of the Northern Black Hills.*

NUMBER II.

Written by J. D. IRVING.

There are at present, besides these sedimentary rocks, eruptive rocks of several varieties. The most abundant of these are rhyolite, either fine-grained and white, as in the vicinity of the Homestake mine, or coarse-grained and darker-colored, as in other localities; syenite porphyries, which occur chiefly in the vicinity of Deadwood and Two Bit gulch, and phonolite. The latter is generally of a dark greenish or bluish rock, sometimes quite coarse, but usually exceedingly dense and fine-grained. Other intermediate varieties of eruptive rock are also present in different places. The eruptive rocks, when found in the schist series, are usually either in dikes which are parallel to the lamination of the schists, or in large and more irregular masses which have no definite form. When in the Cambrian rocks, they are generally sills or sheets which have spread out laterally to great distances along the planes of sedimentation; when found in the Carboniferous, are of more irregular form, sometimes occurring in short, thick sheets, again in dikes, and still more frequently in very irregular masses.

THE ORE DEPOSITS.—If the placer workings, which are distributed widely over the entire hills, be excluded, the productive mining region of the northern Black Hills comprises a limited area of about 100 square miles. It extends from the town of Perry, on Elk creek, where the Clover Leaf mine is situated, northwestward to the town of Carbonate, east of Spearfish canyon, while its widest, as well as most productive portion, lies between Terry Peak on the southwest and Garden City on the northeast.

Within this rather restricted region are closely grouped together as many as nine distinct types of ore deposits. They occur in each case in a particular geological series, and are, with one exception, not found in the rocks belonging to any other formation. Considering them in accordance with the rocks in which they are found, we may distinguish the following five divisions:

(1) Ore deposits in Algonkian rocks; (2) ore deposits in Cambrian rocks; (3) ore deposits in Carboniferous rocks; (4) ore deposits in eruptive rocks; (5) ore deposits in rocks of recent formation.

In the crystalline schists and metamorphic rocks of the Algonkian age are found the free-milling gold ores, some small deposits of tin and a few prospects of copper which have not yet assumed great importance. In addition to these, there are certain deposits of graphite which have lately attracted some interest.

In the Cambrian rocks there are gold-bearing gravels which lie at the base of the formation; the refractory siliceous ores which have of late years become of great importance, the lead-silver ores of Galena and vicinity, and some deposits of wolframite, which have from time to time produced considerable quantities of this mineral.

In the heavy, gray limestones of the Carboniferous there have been found in the vicinity of Ragged Top mountain high-grade siliceous ores, and at the town of Carbonate the same rocks have yielded lead-silver ores closely resembling those of Leadville, Colo. A few deposits also occur in eruptive rocks. In the latest rocks of all—the gravels which fill the beds of modern streams—have been found the placer deposits, and while they are chiefly of historic interest as representing the earlier development of mining in the hills, they have in past years produced heavily.

ORE DEPOSITS IN METAMORPHIC ALGONKIAN SCHISTS.—Since the attention of miners has been transferred from the gold-bearing gravels, which are always the first producers of a mining region, the free-milling lodes which occur in the Algonkian schists have assumed a greater and greater importance in the production of this region, until now they are the heaviest producers and constitute by far the most prominent factor in the gold production of the region.

There are in general two areas where ores of this character have been discovered. The first is the Homestake belt; the second, the Clover Leaf, or Uncle Sam mine, at some distance to the southeast.

The Homestake belt is a term which has been applied to a series of mines operated on a great gold-bearing zone in the metamorphic schists, which is located in the vicinity of Lead City. It comprises a

*Trans. Amer. Min. Congress, Deadwood, S. D., Sept. 9, 1903; (condensed).

group of mines which are known severally as the Homestake, Deadwood-Terra, Father De Smet and Caledonia; but as the Homestake Co. has exercised an increasingly important influence in the management, the name has become gradually applied to the entire belt. The surface workings or open cuts from which the ore was first extracted in the early days of the history of this belt, indicate in a broad, general way the location and trend of the ore body. The Caledonia ore body is distinct from that operated in the other mines and lies to the east of it. The Homestake ore body is not a true fissure vein, but is a broad impregnated zone in the schists, which strikes approximately north 34° west, and is slightly at variance with the general direction of the lamination of the schists. There seems to be a rough dip to the east, but the ore is so irregularly related to the rocks in which it occurs that the general inclination can not be given with any degree of accuracy. The ore body pitches noticeably towards the south, so that at the southernmost portion yet opened up it is much more deeply buried than in a northerly direction. Alternating with the lenses of ore, and almost to the eastern side of them, are many dikes of white, fine-grained rhyolite, which have passed upward between the lamination planes of the schists and spread out in broad flat masses in the remnants of flat-lying Cambrian strata which can the hills to the west, north and east of the ore zone. In places most of the stratified rock in which these porphyry masses have intruded is now eroded, and on the summits of the divides which separates the open cuts little is left but the thick sheets of rhyolite. As these porphyry bodies were followed downward, they became gradually smaller and fewer in number, the eruptive rock having apparently spread out as it came nearer to the surface and formed branching masses of a lenticular form. The first ore which was mined in the early days formed irregular lenticular masses, included almost wholly within these dikes of porphyry; but, as it was followed downward, it seemed to diverge from the porphyry bodies, and in the deeper levels of the mine is seemingly independent of them. It is, however, an interesting fact that in the lower levels a mass of phonolite of a dark greenish color has been found closely associated with the wider portions of the ore zone. No exact foot wall or hanging wall to the ore can be detected, because it is in many cases difficult to distinguish the mineralized material from the barren country rock.

It seems probable that the Homestake lode was a harder and more resistant ledge than the surrounding schists of the Algonkian, and that for this reason it constituted a reef in the old Cambrian seas before the sedimentary rocks above were deposited. That it was then mineralized and gold-bearing is proved by the presence of gold in the lowest rocks of the sedimentary series which lie in the isolated patches about the outcrop of the ore body.

The ores of the Homestake belt can not be said to present any constant features which serve to distinguish them from the characteristic but barren rocks of the Algonkian series. Pyrite is by far the most invariable indication of mineralization; but it is notably absent from much of the ore. Quartz also occurs in a great number of cases. Perhaps the most usual type of ore would be that consisting largely of quartz and pyrite. Other minerals are dolomite, calcite and arsenopyrite; these are also of very frequent occurrence, but no decrease in the values of the ore can be noted when they are absent. Again, garnet and tremolite appear in some portions of the ore in such abundance as to constitute the larger part of the gangue minerals; but the ore here found shows no variation in value from that having a wholly different appearance. When the ordinary type of schist is mineralized, the ore closely resembles a schist; but when the amphibolite is mineralized it more closely resembles an amphibolite. Thus it will appear that, although we find pyrite, quartz, dolomite, calcite, arsenopyrite, tremolite and garnet frequently constituting, either separately or in combination, the gangue of the ore, no one of these minerals can be considered as indication of the presence of gold. In general, however, it may be said that the ores occupy a zone in the Algonkian rocks which present a greater number of secondary minerals, a more constant occurrence of sulphides, quartz, dolomite, calcite and arsenopyrite, and finally a more advanced degree of distortion and irregularity of structure than do the barren areas of the same formation.

From a careful study of the ores and general structure of the Homestake belt, it appears that, first, there have been several different periods of mineralization, one at least of which has preceded the deposition of the Cambrian rocks. This is distinctly shown by the presence of placer gold in the lowermost gravel beds of the Cambrian. Second, there have been periods of mineralization which followed the entire deposition of the sedimentary rocks later than the intrusion of the dikes and bodies of rhyolite. It is probable that this belt has been the seat of many fracturings and dynamic movements from the earliest geologic time until the present, and has constituted a line of weakness along which mineralizing waters were permitted to circulate more freely than elsewhere. Impregnation of the country rock at successive periods with vein minerals and small amounts of gold has thus given rise to a workable zone of gold-bearing rock.

In the earlier days of the mine the ore was more completely free-milling and of higher grade than that now mined. It was highly oxidized and contained little or no sulphurets. As the workings penetrated deeper beneath the surface, oxidized material gave place gradually to sulphides, and more and more of the values in the ores failed to yield to amalgamation. For a time the concentrates from the mine were sold to smelting companies, but experimentation on their treatment led to the construction of a cyanide plant with a view to treating the more refractory portions of the ore.

CLOVER LEAF MINE.—The other mine which has been operated on Algonkian ores is known as the Clover Leaf mine (formerly the Uncle Sam), not far from the station of Perry, on the Black Hills & Ft. Pierre Railroad. Compared with the Homestake belt its production is comparatively small, but it is of singular geological interest. The ore body is a large, saddle-shaped mass of quartz, enclosed in the metamorphic schists, with its apex striking north 64° west and pitching to the southeast at an angle of 40°. The horizontal section of the quartz body as exposed on the 250-foot level has the appearance of the letter U with slightly flaring arms. The northern arm strikes north 40° west and the southern 75° west. This quartz body is thickest at the crest, and the lamination of the enclosing schist is parallel to its surface, curving around it so as to give to the mass the appearance of a folded lens at the crest of a southeastwardly pitching anticlinal fold in the Algonkian schist. Both of the arms of this quartz mass when followed out from the apex become narrower than the main body. The northwesterly has an average width of 20 feet, the southwesterly of about 10 to 12 feet. The gold is contained chiefly in the quartz, in which it often appears free and generally associated with small particles of galena. The quartz and the encompassing schist are heavily impregnated with pyrite which at the surface is completely oxidized. The ore is treated in a stamp mill and amalgamates readily.

Besides these gold-bearing lodes, there occur also in rocks of Algonkian age deposits of tin, notably in the southern portion of the hills and in the region to the west of Spearfish canyon, known as Nigger Hill. The country rock in which these deposits occur is a coarse muscovite granite, and the cassiterite is scattered through this rock in irregular patches, increasing and decreasing in amount with little or no regularity. The cassiterite occurs also in placers as stream gravels, which have been derived from the disintegration of the country rock containing the tin. The cassiterite in these gravels is but little rounded and differs in its black color from the usual reddish-brown type of stream tin so commonly found in the vicinity of the tin-bearing lodes.

Prospects of copper have also been found at different places in the schist areas of the Northern Hills, but they have not yet been of sufficient size or regularity to attract attention.

(TO BE CONTINUED.)

Pyritic Smelting.*

NUMBER II.—CONCLUDED.

Written by FRANKLIN R. CARPENTER, Ph.D.

It will be observed that the smelting proper at Mount Lyell is accomplished in two steps. A low-grade matte is made in the first smelting, which is enriched by a second smelting to a grade high enough for the converter. This in a differently constructed charge may not be necessary, depending upon the per cent of copper, degree of concentration and the proportion of iron to silica. A charge can be made of Montana ores which will not require the second, or concentration smelting; but the second smelting, being relatively small compared with the first, is never a serious matter and adds but little to the cost.

I have now sketched the two outside cases of pyritic smelting, both of which are eminently successful in their respective fields. There are many cases, however, which lie between these extremes, as at Butte, Mont.; in Gilpin county, Colo.; British Columbia and elsewhere, where the sulphide ores carry a large percentage of silica, and are treated by water concentration before smelting. This presupposes concentration mills of enormous capacity and roasting furnaces for the concentrates so obtained, both of which cost great sums of money, and which are at best very wasteful. By the further application of the principles already developed and the utilization of the cheap fuel now wasted, it is barely possible that the process might be modified.

Modern copper smelting methods have received their greatest development at Butte, and I will let no one go beyond me in admiration of the great work done there and sincere respect for those who have accomplished it. Their mills are models of mechanical ingenuity never surpassed, and their reverberatory furnace work is not elsewhere equalled. I do not lose sight of the fact that these last furnaces, which a few years ago, when first introduced from Swansea, had a hearth capacity of but 9 by 14 feet, and a smelting capacity often as low as ten tons per day, requiring to be clayed up every twenty-four hours, have now been developed into furnaces having hearths 20 by 50 feet and smelting more than 100 tons each in twenty-four hours, and which require claying not more than once in twelve days; also that they save more than 50% of the fuel used in the old furnaces. It is, therefore, with the greatest diffidence that I suggest that any change is possible in the methods of a camp which is to-day without a peer in the world for the excellency of its work — but let us not forget history: "The old order changeth, giving place to new."

Seemingly small things in metallurgy have often accomplished the greatest results.

A few years ago there was still running in Savoy a small iron blast furnace blown by a trompe, or box, in which falling water compressed air by entangling it in its fall—a blower which we may readily imagine neither heated the air nor dried it, yet the addition of this blowing machine, crude as it was, made the instrument which put out of blast all the Catalan direct furnaces in every part of the world. Without the trompe the blast furnace for iron would probably not have existed, and without pig iron all that is known to us now as the "age of steel" could not have existed.

Already three-fourths of the beautiful ancient Welsh copper process, with its roastings and resmeltings, to which the reverberatory furnace belonged, has gone by never to return, the one operation of converting having replaced them all.

I believe that when Hollway undertook to smelt the Rio Tinto copper ores without fuel other than what they themselves contained, he laid down a principle which will ultimately make every copper roasting heap and roasting furnace as useless as the Catalan forge, and the time is near at hand when one would no sooner waste his good iron sulphide fuel than he would his good coke. Already more ore is smelted raw at Butte than formerly. The first-class copper ore and the coarse concentrates go into the blast furnace raw, a trifle, as far as it goes, to pyritic smelting. But if the principles here maintained are correct, the large concentrating mills and roasting furnaces will gradually be replaced by a process that is all one of fire, and that fire largely derived from the oxidation of the now wasted pyrite.

I have done what I could to secure the actual composition and cost of treating an average ton of Butte ore, as it is broken at the mines, that I might make a comparison between the all-fire raw method here advocated and the combination water concentration smelting method now employed.

The following may not be absolutely correct, but it will do for comparison. The ores of this district, according to a recent paper, are mined in two classes. The first are said to average from 10% to 15% copper, and to constitute 10% of the ores raised. The second class comprises the remaining 90%, and yields from 3% to 6% copper. If all were broken down together we may take 5% as the average, and 30% to 40% silica, with the alumina, alkalies, sulphur and iron to balance.

I have arrived at the present cost per ton of ore from the testimony of Frank Klepetko in March, 1898:

Dressing (or water concentration), per ton of ore	$0.82
Roasting concentrates derived from a ton of ore	0.38
Smelting calcines derived from a ton of ore	1.20
Total per ton of original ore	$2.40
In the water concentration he stated the loss to be	18.0%
In the roasting	2.6%
In the smelting	4.2%
Total	24.8%

With copper at 14 cents per pound this is worth $3.47, making the total cost, including losses, $5.87 per ton of original ore.

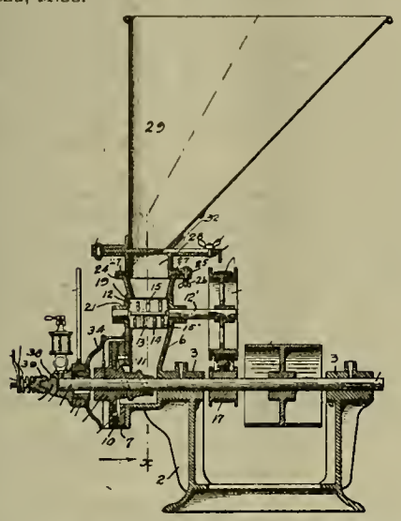
If this ore were smelted direct as it comes from the mines, without concentrating or roasting, by the addition of limestone and coke and the application of hot blast, it would cost fully as much per ton of ore, perhaps more; but I am sure that $3 per ton will cover it. This is more per ton, but I estimate a greater saving. According to the above statement, there was lost, in the concentrating, roasting and smelting, 24.8% of the original contents of the ore by the time the copper was raised to a grade sufficiently high for the converters—against which I figure but 9% in direct smelting, leaving a difference of $3.47 minus $1.26, equal to $2.21 gain per ton. As this gain is wholly in the copper, it adds a proportional length of life to the mines. If, however, the one smelting cannot be done for the cost of concentrating, roasting and smelting, this gain would be reduced by the difference. If the first smelting cost $3, which I am sure is ample, we should still have a gain of $1.60 in favor of raw smelting, always supposing these figures to be correct.

In our prejudice for the established methods, it will be well to remember a story told by a traveler from the Sahara desert. He came across a party of Arabs making iron, doubtless after a manner dating from the days of Abraham. The furnace consisted of a hole in the ground, around which were three blowing engines, each consisting of an Arab with a long tube, one end of which was in his mouth and the other

*Trans. Amer. Min. Congress, Deadwood, S.D., Sept. 9, 1903.

in the furnace. After blowing, from six to eight pounds of iron per shift was obtained.

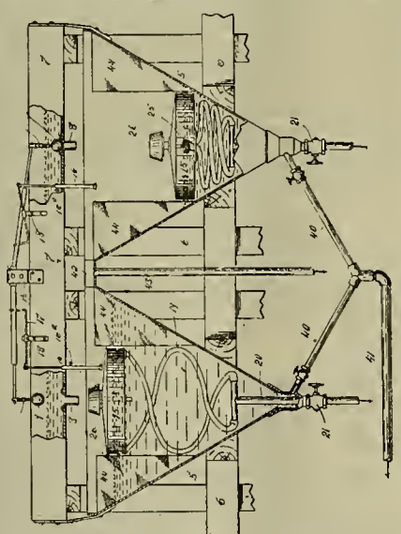
Our traveler was much impressed, but inquired of the boss metallurgist: "Why do you use this method of making iron?" He received a look of withering scorn and the reply, "What other method can there be? Neither our fathers nor ourselves ever heard of any other."



Because our fathers and ourselves have always burned our iron and sulphur outside of the furnace is no good reason for continuing it.

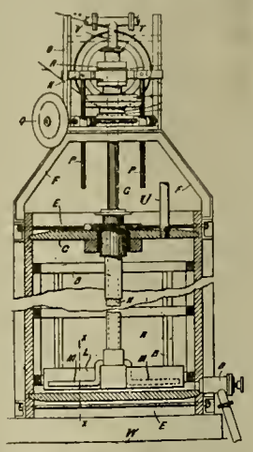
Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 8, 1903



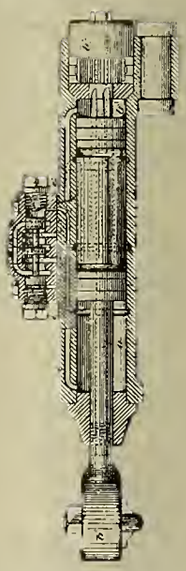
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

GRINDING MILL.—No. 737 953; C N. McLaughlin, Winona, Minn.



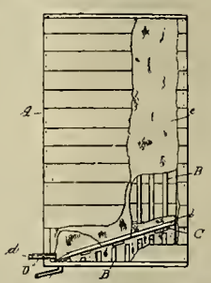
In grinding mill, combination, with lower hopper section 21 having flange 24, of hopper base having lateral flange resting upon flange 24 and downwardly projecting flange fitting within hopper section 21, and movable lugs or ears mounted on flange 24 and adapted to overlap lateral flange and prevent vertical movement of hopper base while permitting rotation or ready detachment.

ORE SIZER OR CLASSIFIER.—No. 738,743; W. B. Gilmore, Idaho Springs, Colo.



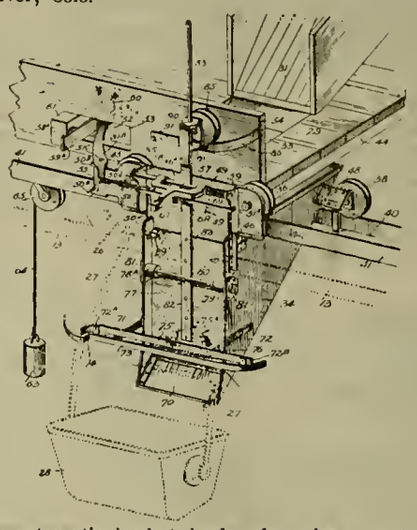
In sizing or settling apparatus, combination of two conical tanks, each having outlet for discharge of solid particles and distinct outlet for discharge of liquid, float located in each tank, flexible conduit connected with float at one extremity and with liquid outlet at opposite extremity, extremity of flexible conduit connected with float, being provided with collapsible hood, vertically movable spring-supported receptacle mounted on each float, lever connecting said receptacle with hood whereby latter is raised or lowered to bring hood above or below liquid level, receptacle having outlet to tank, pulp supply tank mounted above settling tanks and provided with outlets adapted to discharge pulp into receptacles 26 faster than it escapes from outlets of receptacles, tubular lever fulcrumed on supply tank and containing mercury, valve connected with each extremity of lever, auxiliary lever also fulcrumed on supply tank and connected with each arm of tubular lever at one extremity, depending rod connected with each auxiliary lever at opposite extremity, said rod lying in path of float of settling tank when latter has reached predetermined elevation, arrangement being such that as either float engages rod valve above tank containing actuating float will be closed to cut off supply of pulp to that tank, the other valve opened to permit pulp to pass to opposite tank.

APPARATUS FOR EXTRACTION OF PRECIOUS METALS FROM THEIR ORES.—No. 738,148; J. B. de Alzugaray and W. A. Mercer, London, England.



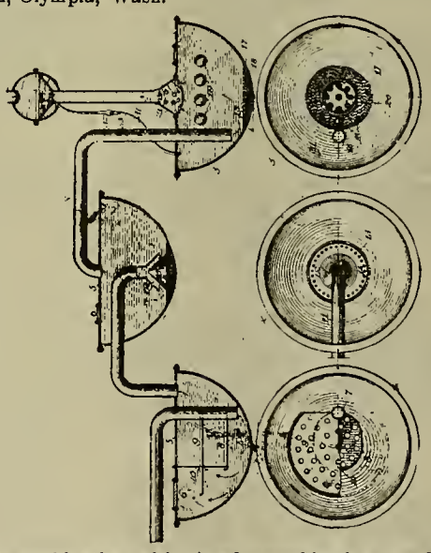
Apparatus for treating ores, consisting of closed containing vessel provided with fixed internal blades, rotating hollow spindle provided with ball bearings having hollow blades or beaters set at angle, means for raising and lowering spindle in vat, gearing for rotating spindle, and means connected with vat for supporting gearing and steadying spindle.

VALVE MECHANISM FOR ROCK DRILLS.—No 738,229; T. Officer, Claremont, N. H.



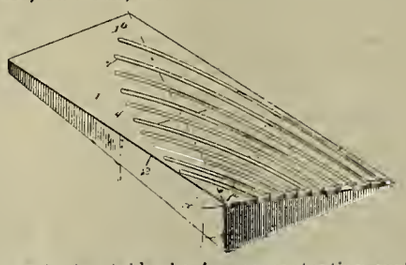
Valve mechanism containing pressure-actuated valve, chamber for each end thereof, means to admit actuating pressure to chambers from cylinder to reverse valve, means to admit locking pressure also to chambers from source independent of cylinder, and means to vent both chambers with valve in each of its extreme positions.

DEVICE FOR TREATING SLIMES.—No. 738,329; W. E. Holderman, Marysvale, Utah.



In device for treating slimes having liquid tight case, discharge pipe provided with valve in bottom, inclined floor in case, spaced bars on floor and sides of case, filtering fabric covering bars and overlapping upper edge of tank, molding to hold fabric in operative position and pipes provided with stoppers leading from filter out through case, tanks arranged in stair-like co-operative relation, pipes leading from bottom of each tank, conduit E to receive discharge from pipes, reservoir into which conduit discharges, and pipes in each tank provided with stoppers discharging from filters through outer case into tank next below it, pipes from lowest tank discharging into waste trough.

AUTOMATIC BUCKET LOADER FOR AERIAL WIRE ROPE TRAMWAYS.—No. 738,309; C. T. Finlayson, Denver, Colo.



In automatic bucket loader for wire rope tramways, combination with terminals and continuously running pendant buckets of operative tramway, of loading station, bucket loading hopper mounted on tracks at station, arm slidably mounted on hopper, spring between arm and hopper and projection on pendant of bucket adapted to strike arm and to move hopper through medium of spring, predetermined distance on tracks, means for returning hopper to loading station and means for discharging contents of hopper into bucket.

GOLD SAVING DEVICE.—No. 738,291; P. H. Carlyon, Olympia, Wash.

In combination with closed vessel having rounded bottom, inlet pipe extending into vessel and discharging against bottom to one side of center thereof, screens horizontally suspended within vessel and stopping short of sides thereof; and exit pipe extending from cover of vessel at point therein where material passing through vessel is relatively quiescent.

CONCENTRATOR TABLE.—No. 738,493; R. Schraubstadter, St. Louis, Mo.

Concentrator table, having concentrating surface in form of hyperbolic paraboloid, provided with riffles which have form of parabolas, and means for reciprocating table.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

The yearly report of the output of gold and silver, being prepared in the office of the director of the mint at Washington, shows a slight decrease in the amount of gold mined during the past year and a falling off in silver. Alaska increased her yield last year by $2,000,000.

The figures for the eight leading States and Territories are as follows:

	Gold.	*Silver.
Colorado	$28,468,700	$ 8.308.280
California	16 792.100	477,424
Montana	4.373.600	7.019 214
Utah	3,594 500	5,740,891
Alaska	8 345 800	48.760
South Dakota	6.965.400	180,306
Nevada	2,895,300	1,985,486
Idaho	1,475,000	3,103,044
United States	80,000,000	29,415,000

*Commercial value.

	Silver, by Ounces.
Colorado	15,676.000
California	900,800
Montana	13,243 800
Utah	10,831.700
Alaska	92.000
South Dakota	340 200
Nevada	3.746 200
Idaho	5,854,800
United States	55,500,000

In the above table the total value of production for all the States and Territories outside of those individually mentioned are shown under the caption of United States.

ALASKA.

R. T. Lamb, president of the Helvetia M. Co, operating at Windham Bay, says he is preparing to put in an air compressor and other machinery. The company expects to work during the winter.

A 1-foot ledge, carrying free gold, is reported located in Yankee Basin section, near Juneau, by F. Bach, P. Early, M. Kelly, T. Smith and R. R. Shepard.

The discovery of placer gold on Lowe river, 20 miles from Valdez, is confirmed, says the Valdez Prospector. So far as the work has gone, the gravel shows yield of 75 cents per cubic yard, being mostly coarse gold. There are 950 acres, with gravel from 4 to 30 feet deep.

The Alaska Juneau mines, in Silverhow Basin, near Juneau, were closed down on the 2nd inst. for want of water.

Nome reports say: A beach strike has been made on Kadiak island. Three men in ten days took out $1300. The gold bearing beach sands are said to cover a considerable stretch of coast, but the best diggings have been found near the mouth of Red river and near Cape Karluk.

ARIZONA.

GILA COUNTY.

At the Old Dominion C. Co. works at Globe, the work of putting in the converter and other machinery is progressing. No. 1 and No. 3 furnaces are in operation, and No. 2 is being repaired. Arrivals of coke continue. Construction of the concentrator building has begun. The electric light system is proving satisfactory, says Superintendent F. W. Hoar.

GRAHAM COUNTY.

In the east drift from the Sapphire shaft of the Coronado mine, near Clifton, 30 feet of sulphide ore is reported struck. Bucket samples from the face show 11.5% copper.

MARICOPA COUNTY.

(Special Correspondence) —The Arizona M. & Dev. Co. has bought the Ryland mine in Vulture district, 3 miles west of Morristown. They will put men to work next week on this property, which has been a producer in the past.

R. E. Humphhries is working men on his properties near Morristown.——G. Carguile expects to start development work on his claims in Cave Creek district next week.

Wickenburg, Sept. 15.

The smelter at Wickenburg started last week.——F. X. O'Brien has thirty men at work on his mine near Wickenburg.

MOHAVE COUNTY.

(Special Correspondence) —The Mohave G. M. Co. of Arizona has a tunnel property, developed by five tunnels, giving in all 600 feet of backs. The average thickness of vein is 10 feet. Stoping operations are in progress. Ore is being stored at the mine ready for shipment to the mill as soon as the railroad connecting the mine and mill is completed. There is a 40-stamp mill recently completed 10 miles from the mine, so placed because of the necessity of obtaining sufficient water. It will require several weeks to finish the railroad and ore will then be milled. The railroad has already been extended to the river at Needles, 7 miles beyond the mill.

Needles, Sept. 8.

The Hilty group, the Ben Harrison and Tom Reed claims, have been bonded to D. McFarland and work will be started next week. The mines are in San Francisco district, near Kingman, and have been opened by shaft.

It is reported the Earl mine at Stockton Hill, near Cerbat, will be started up.

Work on two shafts of the Mother Lode mine, near Chloride, has been begun by the P. & A. Co. One of the shafts is being sunk by contract from the 70-foot to the 100-foot level, while the company is driving the other. W. Miller is superintendent.

PIMA COUNTY.

The Twin Buttes M. & S. Co. has been incorporated by J. C. Baxter, J. Ellis and M. Irish at Tucson, to operate the Twin Buttes group, 35 miles south of Tucson, in the Sierritas mountains. The group comprises nineteen claims.

YAVAPAI COUNTY.

(Special Correspondence).—Superintendent J. Gray, of the Poland Extension mine, in Big Bug district, 12 miles east of Prescott, has been doing some prospecting, following a fissure which faulted the main vein and has struck a body of manganese ore running 160 ounces silver. A few men are returning to work, and indications are that the strike will soon be a thing of the past. Mr. Pickerell is working the Rockefeller and President claims in this district and has high-grade ore in the bottom of the Rockefeller shaft, down 780 feet. J. Lawler has struck a large body of sulphide ore in winzes sunk below the lowest level of the Hillside mine, 50 miles west of Prescott.

Prescott, Sept. 15.

It is reported J. Hanlon of Des Moines, Iowa, has bonded the Weaver & Henderson group of six gold claims in the Hillside section for $20,000. Development work will start next week.

Manager Monroe, of the Verde Chief C. Co., near Jerome, says development work will be resumed this week and sinking a winze from the long tunnel started.

E. S. Campbell of Prescott reports having bought the Hidden Treasure mine, in Black Canyon district, near Prescott, for $16,000, for Canton and Massillon, Ohio, men. Campbell has started preparations to build a mill.

The steam stamp of the Ideal M. Co.'s mill at Groom creek was put in operation last week. The main shaft on this property is down 195 feet, says Foreman P. Fitzgerald.

ARKANSAS.

BOONE COUNTY.

After a short lay-off, during which the company has rounded up its expenditure, including the mill, of $15,000, work has been resumed at the Dyson mine, at Harrison.

MARION COUNTY.

(Special Correspondence) —The McIntosh Co. is preparing to start its mill.——The White Eagle mill is shut down temporarily, owing to an accident to the engine.——Workmen are quarrying at the Silver Hollow mine for location of the mill. The development work shows good zinc values.——The Buffalo & Yellville Railway—a Mo. Pac.-Iron Mt. branch—has filed the survey of its proposed line which will run from Buffalo to a connection of the White River division of the Iron Mt. Railway, near Yellville. This road will give the Rush and Clabber Creek and Buffalo River districts convenient railroad facilities.

The Morning Star mill is in operation, turning out from five to seven tons of concentrates on a ten-hour run. Arrangements are under way to increase the capacity from a 50-ton to a 125-ton plant and work a double shift. Engineers have been on the ground investigating a water-power proposition in this county along the Buffalo river. At their prospective location it will necessitate the cutting of a 2000-foot tunnel which will give a head of 46 feet. It is thought an electric plant will be installed which would be able to furnish power cheaply to the mines.

Yellville, Sept. 13.

Forty-eight feet of zinc ore is reported shown by diamond drill boring on Jimmies creek, near Yellville.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence).—A new shoot of ore is reported on the 2100 level of the Oneida mine, near Jackson, in a crosscut run east from the shaft. The vein has been drifted a distance of 70 feet and is 8 feet wide, running $10 per ton. The Oneida is worked through a vertical shaft, sunk at the surface in the hanging wall country rock. The vein, which dips easterly, passes through the shaft at the 1900-foot level and is now east of the shaft.

Jackson, Cal., Sept. 15.

Some work is being done at the Shenandoah mine, near Plymouth, and it is reported sinking will be resumed, says the Dispatch.

C. Lessley has a bond for two years on the Madrone mine, near Pioneer. He is making a test crushing of rock.

At the Kennedy mine, at Jackson, the hoist is expected to be in operation next week. The addition of twenty stamps to the mill is going ahead, which will make sixty stamps at the new mill and forty stamps at the old works. The cement foundations are finished and the mortars are on the ground.

CALAVERAS COUNTY.

(Special Correspondence) —The Sheep Ranch mine and mill at Sheep Ranch, 8 miles north of Murphys, are closed down and only a watchman and pumpman are at work. It is expected the shut down will only be temporary, says Superintendent Anderson.

W. H. Clarey is developing a gold-bearing quartz property near Murphys.

Murphys, Sept. 16.

There are 100 men at work at the Campo Seco copper mine at Campo Seco, says the Citizen, and operations are progressing. The ore carries 6% copper, which is smelted up to 60% matte. The new working shaft is down 210 feet.

Progress is reported from the Bluejay mine, 2½ miles southeast of Mokelumne Hill, and the tunnel is in 645 feet.

At the Jones gravel mine at Railroad Flat, being operated by Seeman Bros., the tunnel has reached a depth of 75 feet, and is in 3 feet of gravel, the bottom of the channel having been reached, says the Calaveras Chronicle. Driving the tunnel ahead and breasting are in progress. The gravel is worked by sluicing.——The Boire gravel mine, on same channel, reports operations satisfactory. The gravel in this mine is cemented and requires milling.——The Miller gravel mine has men at work tunneling, retimbering and getting ready, and otherwise fixing up the property to increase operations.

F. O. Cortmarsh, manager of the Blue Jay mine, near Mokelumne Hill, reports steady progress at the mine, with the tunnel in 625 feet.

The Crystal mine at Angels, under Superintendent W. Morehead, is being prepared for mining operations. The work in the shaft and at the stations is progressing, says the Echo.

DEL NORTE COUNTY.

R. Wensch, in the French Hill section near Crescent City, says he is opening up a ledge of zinc ore 120 feet wide. The shaft is 60 feet deep. A crosscut is being run, and in a distance of 75 feet, 25 feet has been cut through the ledge. Assays show a workable percentage of zinc.

FRESNO COUNTY.

The Maine State Oil Co. at Coalinga has drilling under way on its No. 6 well. They expect to drill several other wells on the east side of its lease.

The well of the New San Francisco Crude Oil Co. that was brought in last month and reported to be pumping 150 barrels per day has been packed, which caused the well to flow at the rate of 300 barrels per day.

KERN COUNTY.

The Johannesburg Gold Mines Co. state: "Had it not been for the unforeseen interruption to our business, doubtless the energetic work we planned would have resulted in getting the property on a dividend basis this fall. The installation of our mill and our entire investment is at a standstill solely on account of existing labor troubles. We are surprised at any suggestion of dividends by this company from stock sales. Our business has not been conducted in a manner to warrant any such insinuation."

The Pyramid mine is being developed by the Verification & Development Co., 4 miles south of Randsburg.

The strike situation at Randsburg remains quiet, and Superintendent Barton of the Yellow Aster M. Co. says he has seventy men at work.

MARIPOSA COUNTY.

T. B. Stribbling and M. Marten report striking ore at Granite Springs, near Mariposa. The body of ore assays $25 in free gold. At one time there were two quartz mills in that section.

MONO COUNTY.

Near Lundy, the mill being built in Wasson canyon by Brown & Co. is about finished and crushing will begin on the Price ore next week, says the Bridgeport Union.

Aggler & Carmichael are taking out ore at the Wolverine mine, near Lundy.

NEVADA COUNTY.

(Special Correspondence) —J. Bryson of San Francisco, Cal., has bonded the Yuba mine, 6 miles from Washington on the Yuba river, and has gone to the mine to make a survey for an aerial tramway from the mill to the mine.

Nevada City, Sept. 17.

The Champion mines at Nevada City suspended operations this week and 100 men are out. It is stated the closedown is only temporary. In the meantime the pumps will keep the mine clear of water and the drifts and stopes will be kept open.

At Canada Hill, near Nevada City, Superintendent A. Charranat of the Banner Hill G. M. Co. of San Francisco says work is progressing on the tunnel to tap the gravel channel that comes down from Quaker Hill and has its outlet near Canada Hill. It is in 400 feet through soft blasting ground, and is expected to reach the channel within 200 feet more. The company controls all of the channel from the breakout to Quaker Hill, giving it an area of 1400 acres.

At the Murchie mine, near Nevada City, work will start this week on building a mill, says Manager Maltman. It will have nine stamps.

The South Idaho D. Co., near Grass Valley, has bought the Gambler (formerly the Stewart Parnell) claim, says Superintendent Carter. It adjoins the South Idaho.

The mill of the New York-Grass Valley mine, near Grass Valley, was put in operation last week, says Manager G. W. Root.

The Houston Hill works, owned by the Orleans M. Co., near Grass Valley, has been drained and development work will be resumed.

The New Eureka G. M. Co. has been incorporated at Nevada City, with J. Roberts, F. Tredinnick, J Foss, A. Martin and J. Rosewall, all of whom reside in Nevada City, as directors. They will work a group at Canada Hill.

C. L. Ellingwood of the Western Exploration Co. says they propose to reopen the Red Cross mine at Washington, near Omega, by means of a new tunnel that will start at the river.

T. F. McAvoy of San Francisco is arranging to reopen the Standard mine, adjoining the Jenny Lind mine, near Grass Valley.

A. L. & G. A. Biglow of North Columbia have started work at the Uncle Sam mine at Badger Hill and will build a mill on it.

PLACER COUNTY.

(Special Correspondence).—The Zuber bond on the Mike Cochran claim on Long canyon, southeast of Michigan Bluff, having expired on Sept. 1, Cochran is making preparation to work same himself. This is a gravel claim. —— The Ralston Divide Co, owned by French capital, is idle. A great deal of money has been spent there.

Auburn, Sept. 16.

The Haskell (Gaylord) gravel mine, near Auburn, resumed last week, and has thirty-five men at work, says E. C. Gaylord, superintendent.

The Bald Mountain Gravel M. Co. has started a tunnel from the bottom of Deep canyon, 200 feet lower than the present tunnel and using machine drills. Superintendent F. Veizke has fifteen men at work.

The California M. Co. has put in a 10-stamp mill at the ledge, on their property at Shady Run. The main tunnel is in 1400 feet, and a number of crosscuts have been made, opening up the ore body. This ledge is within the holdings of the Cedar Creek gravel mine, owned and operated by the same company.

PLUMAS COUNTY.

F., W. and C. Droege of Covington, Ky., have taken over the Johnny Bull group of mines in North canyon, near Greenville, which they have been working under bond, for $25,000. They have bought also the interest of F. W. Day, who retains the cyanide plant half a mile below the mine. Day proposes using it in connection with another property in that section. The Droege Bros. will increase development work on the group, and it is expected a milling plant will be built next spring.

SAN BERNARDINO COUNTY.

Manager Belcher, at Empire Flats, near Needles, says he has started work on his Bolivia mine, adjoining the Empire group, reports the Needles Eye.

The Providence Gold Syndicate, under Superintendent Northup, started dropping the stamps in their mill last week.

SAN DIEGO COUNTY.

The Cleveland and Pittsburg mines, near Escondido and half a mile from the Oro Fino mine, are being developed by an Eastern company, and work has been started to sink a shaft on the Cleveland to depth of 500 feet.

Work is reported progressing in the copper mine, near Olivenhain, and it is the intention of the company to build a

railroad from the mine to Encinitas station, a distance of 7 miles.

The Chula Vista Oil Co., near Chula Vista, are making arrangements to drill a 1500-foot well on one of their claims, says the Julian Miner.

The Oro Blanco M. Co. at Banner will resume work on the Oro Blanco tunnel which is to tap the Kentuck S. and Cincinnati Belle mines, says L. N. Baily, president of the Oro Blanco M. Co.

SHASTA COUNTY.

At the Balaklala mine on Squaw creek, near Kennet, development work is progressing and seventy-five men are at work. Five machine drills are running in the lower levels, drifts and raises are being run and the ore is being blocked out in blocks of 100 feet square.

An air compressor and a 5-stamp quartz mill are on the ground for the Shasta May Blossom M. Co., near De Lamar, says Manager M. Lindley; also a horizontal steam engine.

SIERRA COUNTY.

Twenty men are at work reopening the Keystone mine at Sierra City. Drifting for the shoot is in progress.

Meiklejohn & Stevens have ten men at work on their cyanide plant, working the tailings from the Young America mine, near Sierra City.——At the Cleveland mine, above Sierra City, an ore shoot is being opened up and a raise driven. Five men are at work and the 10-stamp mill will be started.

The Poker Flat M. Co. at its annual meeting last week decided to increase the plant to 100 tons daily capacity and to build a 50-ton reduction works. J. B. Lassiat is manager and superintendent.

The Forest City M. Co. reports work progressing at the Mabel Mextz mine, near Downieville, and the tunnel will be extended. Superintendent H. B. McCormick has six men at work.

TRINITY COUNTY.

M. Manley has an option of purchase on the Gold Dollar group of mines on Canyon Creek, 6 miles above Junction City. The group contains 190 acres of auriferous gravel. The working of the mine has been hampered by insufficient supply of water.

TUOLUMNE COUNTY.

The California Consols, Ltd., a Scotch company, has bought the Park and Mason quartz claims, near Carters; also the Leviathan quartz claim, an extension of the Louisiana mine, the owners excepting from the sale the standing timber and farming land.

At the Don Pedro mine, soutn of Chinese, the buildings are all up, roads have been built and water led to the site. Grading for the hoist is completed and the machinery is being set up. Six men are doing development work. The Don Pedro has 1500 feet of underground development work, and the ore shoot is said to be 400 feet in length and two stopes are 12 feet wide. There is also a shaft, showing in the bottom a body of ore 5 feet wide, says the Banner.

At the Mohican mine, near Groveland, the underground hoist is ready to start up as soon as the compressor plant is finished. The works and mine are to be lighted by electricity, says Superintendent F. Chappelet.

A one-third interest in the Defiance quartz claim, south of Carters and adjoining the Hunter mine on the north, has been sold to C. A. Holland, of Sonora.

A number of the mother lode mines expect to be compelled to shut down next week on account of the water shortage. Last month the supply going through the ditches was cut down 500 inches.

COLORADO.

The probabilities of a general strike in the Colorado coal fields seems imminent. The Colorado Fuel & Iron Co. refused to meet a committee of labor that assembled at Denver last week. The company said it would not meet with representatives of the United Mine Workers of America, but would meet a committee of its own employes.

BOULDER COUNTY.

The property of the Colorado Northern G. M. Co., at Copperrock, was sold at sheriff's sale at Boulder last week for $16,000 to A. W. Thompson of Allentown, Pa. Manager R. S. Spearhead says he is arranging to reopen the group.

CLEAR CREEK COUNTY.

Manager Robeson has let a contract to drive the Burleigh tunnel, near Georgetown, to the Seven-Thirty vein, the distance being 700 feet. Work is under way with two machine drills. After a point is reached directly beneath the Seven-Thirty shaft the bottom of which will be 250 feet above the tunnel, a raise will be driven and a diamond drill hole put through to tap the shaft and drain it of the 700 feet of water which fills it, says the Courier.

The Charter Oak mine, between Cascade and Ute creeks, near Idaho Springs, will resume under the management of Maxton Bros., it being owned by the Charter Oak-Chancellor M. & M. Co. It has been idle for several months. Owing to a lease and bond, the option on which has expired, the work will be resumed by the original owners. The shaft is 300 feet deep and drifting in the third and fourth levels to further open up the ore body will be done.

The Mason Con. M. Co. shareholders, at Idaho Springs, last week changed the name of the company to the Forty States M. Co. Their holdings consist of forty-two claims (210 acres) between Dumont and Freeland. It is opened for 140 feet on the Freeland side by the Lucy tunnel, but work is being confined at present to the Startle tunnel, driving in from the Dumont side, near Clear creek. The Startle tunnel is in 260 feet. The officers are F. G. Walther, D F Mason and S. S. Crooks. Development will be increased.

The Matte mill, near Idaho Springs, has been shut down to give the full capacity of the compressor plant of the mine for sinking the shaft. The flume will be repaired, which will give the company ample power for both the mill and mining purooses. The milling ore is being saved and the smelting ore is being shipped.

The Corry M. Co., C. S. Desch, manager, has started shipment of concentrating ore from the Diamond tunnel dump at Silver Plume to the mill.

The contractors on the Central tunnel, near Idaho Springs, drove 156 feet during August, in twenty-four shifts, an average of 6½ feet per working day. The tunnel is in 2068 feet and by October 1st they expect to cut the Edgar vein.

Operations will resume next week at the mill of the Elkins M. Co. at the mouth of the Union tunnel of the Terrible property, near Georgetown. Machinery has been placed, including the water receiver and water wheels, which will supply power for the mill. Water power will run the air compressor which is now driven by steam. One water wheel will be used for running the compressor and the other for driving the concentrating machinery of the mill, each being independent of the other.

Manager W. S. Marshall says he has closed down the plant of machinery on the Torpedo mine, near Idaho Springs, as there is not enough water in Spring gulch to furnish steam for the boiler and compressor. The work is being done by hand for the present, and they may haul water for the power later, as was done during a portion of last year. Every year Spring gulch—so named because of the number of springs originally found in it—carries less water. The Stanley mine drained a portion of it, and with the workings of other mines it would seem only a question of time when the stream will be entirely dry, says Marshall.

CUSTER COUNTY.

The Custer M. & R. Co., sinking the shaft on the Dolomite mine, near Custer (Rosita P. O), report work progressing. They are working on a vein 4 feet wide and a streak of pyrite and galena shows in the bottom of the shaft. A steam hoist will be put in. The ore is a telluride, carrying gold, silver, lead and copper.

Superintendent R. Southgate has started work on the Burnett lode, east from the Bassick mine, near Silver Cliff, owned by the Rito Alto C. Co. of Boston, Mass.

In the Bassick mine, near Silver Cliff, there are 125 miners at work, and it is reported that from the 200-foot to the 1600-foot level the crosscuts run recently have cut into the lost ore shoots showing telluride values. Ore is being sacked.

EL PASO COUNTY.

The eighty men employed at the Pikeview M. Co.'s coal mines, north of Colorado Springs, are out on a strike, and thirty men working the Danville mine are also out. Although the contributing causes for the strike are of various kinds, the direct cause for the walkout is said to be a small sum, a matter of only $4, says the Gazette. It is expected the trouble will be spread to include all the miners of the district.

FREMONT COUNTY.

The Union mills of the United States R. & R. Co., at Florence, that were forced to close down because of an insufficient ore supply due to the strike in Crippie Creek, are again in operation.

The Ocean Wave coal mine at Williamsburg, owned by the Rocky Mountain Fuel Co. of Denver, will have additional equipment of machinery and the roadways in the mine will be improved. The Bear Gulch coal mine of the Colorado Fuel & Iron Co. is undergoing repair. Electrical mining machinery is being placed in the mine and an electric power house will be built near the main entrance. The coal mine of the Colorado F. & I. Co., west of Florence, is idle, the machinery being out of repair.

The United Oil Co., near Florence, has had surveys made locating four more oil wells that the company will drill this summer.

The Lone Star M. M. & T. Co. has been incorporated to operate in Millersberg mining district, where it owns a group of four claims. P. A. Glascoe, A. F. Cherry, J. and W. Bregenzer, B. B. Brown, F. Fusey and C. Miller are directors. The main office will be in Pueblo.

GILPIN COUNTY.

A number of leasers are at work at the Robert Emmet mine on Maryland mountain, near Central City, and are taking out lead and copper ores, which run up to $100 per ton for first class. Some development work is also being done. Denver and Eastern parties are owners.

A body of telluride ore is reported opened up ½ mile from Rollinsville by R. Duncan and J. Taylor of Moon gulch, on the Last Lode claim, at depth of 150 feet. The vein is 1½ foot wide and was cut in the Phone tunnel.

Manager A. M. Willard says operations are being resumed on the group of the Travis Gulch M. & M. Co , near Central City. Three shifts will be put to work and the main shaft sunk. New York parties are interested.

GUNNISON COUNTY.

The Lillie Dell mine, in Gold Brick district, near Pitkin, has been leased and bonded for a year to J. H. Robinson of Denver, for $6000.

At White Pine, J. Landrigan & Co. have taken a lease and bond on the Glim group, says the Pitkin Miner.

T. R. Henahen and C. McCullough of Denver have bought the Boss group of seven claims, the Dandy, Daisy Hughes and Sunday ledges on Wealthy mountain, near the Independent mine, near Bowerman. A shaft will be started and a plant of machinery set up. The property shows gold values.

The Raymond Con. M. Co. has been incorporated by I. Carrier, W. Maher, and E. M. Lamont of Pitkin, with principal office at Canon City. The company will exploit, through a shaft and drainage tunnel, the Goldsmith, Midnight, Monte Carloand Raymond mines. The company owns and controls under bond and lease 310 acres in Gold Brick district. A plant of machinery is being put in place. The opening of the tunnel is on Ohio creek and has been driven 320 feet. Five hundred feet farther will cut the Goldsmith vein at vertical depth of 800 feet, and 1700 feet farther the Monte Carlo and Midnight veins, reaching the Raymond vein at vertical depth of 1264 feet. This will drain all properties on these veins, for which the company can secure royalty for drainage under the State laws, says the Pitkin Miner. Continuing the course of the tunnel, it will cut the Little Chief at depth of 2430 feet.

G. Russ has started operations on his Irwin group, near Crested Butte, adjoining the Ruby Chief group. A new shaft will be sunk and drifts to the ore shoot extended from the same. The ore carries ruby silver.

LAKE COUNTY.

The water situation in Leadville camp is at present under good control, says the Carbonate Chronicle. There are four basins which control the water situation, all of them more or less closely connected. They are the Leadville basin, Carbonate hill, East Fryer hill and Breece hill. The Leadville basin water level has been lowered 400 feet, and mining operations can be conducted to a depth of 700 feet. The handling of the water in the Coronado and Penrose mines is reduced to a minimum. The A. M. W. pumps control the situation on Carbonate hill, but the flow is not likely to be very heavy unless sinking operations commence. On Fryer hill the El Paso and Price shaft pumps have the heaviest work in the district. The completion of the Yak tunnel to No. 4 Ibex mine shaft has solved the water problem on Breece hill. The tunnel struck into the hill 200 feet below the deepest workings, and this means that operations can be carried to a depth of 1400 feet from the surface. In some of the outlying sections future operators will have to face the water problem, but in the main mineralized area the expense of mining has been greatly reduced by reason of the lowering of the water level.

At the Banker mine, near Leadville, it has been decided to do considerable diamond drill prospecting on the lower levels. Over 4000 feet of drifting has been done.

SAN JUAN COUNTY.

Three thousand feet of flume will be constructed for the Gold Prince M. Co. at Animas Forks, near Silverton; 1000 feet of the 3000 will be placed on each of the forks—the Animas and California gulch tributaries—and 1000 feet will extend from the forks to where the proposed mill for the new company is to be built.

SAN MIGUEL COUNTY.

At Telluride, the shut down in the mines and mills continues. The doors and windows of the Liberty Bell and Nellie mills have been boarded up.

In Marshall and Savage basins, near Telluride, mining is at a standstill because of the strike, except at the Tomboy mine, where twenty-five men are at work on development in the Argentine. Several small properties are doing development work, including the Mayflower in Gray basin, tributary to Bridal Veil basin. Besides the Mayflower mine, there are three others under development and exploitation, and it is expected work on these will be continued all winter. At the Double Eagle group a tunnel has been driven on one of the veins, opening up an ore body, and a small mill will be built this fall.——Adams, Hilgenhaus and L. White are operating a group of fifteen claims near the Dnuble Eagle, and near them the Blue Lake M. Co. has four men running a tunnel on the principal vein of the group.——In the Prospect Creek basin several properties, employing from five to fifteen men each, are under development.

TELLER COUNTY.

T. C. Johnson, having a lease on a block of the Burns claim of the Acacia M. Co. at Cripple Creek, says there is a considerable area of material near the surface that he will ship. Assays show value of $30 in gold. Johnson is prospecting in the area covered by the fire at Altman last spring, and reports satisfactory results.

In all nearly 1000 men are now at work in properties in Cripple Creek district which have resumed since the strike was called. The La Belle power house was temporarily shut down last week by the engineers going out, but has resumed with non-union men, and is supplying air to the Golden Cycle, Vindicator, Findley and Teresa mines. Stratton's Independence is breaking ore. The Rio Grande sampler at Victor is operating. The Mine Owners' Association has sent a committee to Joplin, Mo., to get miners. With the advent of the soldiers into the district quite a number of lessees and small operators ceased work. Most of them say they will not resume until the present trouble has been settled. Most of the lessees were experiencing difficulty in shipping out their ores.

IDAHO.

BOISE COUNTY.

The M. E. Hopkins Summit Flats placer mines of 640 acres in Boise basin, near Idaho City, have been sold to J B. Adams of Denver, Colo., for $50,000. Adams will start development by Oct. 1.

IDAHO COUNTY.

A tunnel has been started to tap the lead on the Massic mine, near Hump. This claim is 8700 feet above sea level and is on the side of Buffalo Hump mountain. Two leads have been found, one 18 inches and the other 4½ feet wide, showing gold values. The Prudential M. Co. owns the claim.

OWYHEE COUNTY.

C. W. Sanders, of New York, part owner of the Mammoth group of mines at the head of Blue gulch, near Silver City, has started operations. A few men are at work cleaning out the tunnel and more men will be added.

SHOSHONE COUNTY.

It is reported that another union of Cœur d'Alene mines is being negotiated. The American S. & R. Co. is forming an alliance with the Bunker Hill & Sullivan at Wardner, the Morning Star mine at Mullan and the Hercules mine, near Burke.——At the Hercules mine it is proposed to build an electric railroad from the mine to Burke, to connect with the Northern Pacific and O. R. & N. The track will be 1½ mile long, with a 2% grade.

All the miners at the Frisco mine at Gem are reported to have walked out last week and the mine closed, as the men were afraid to work in the mine on account of explosions and earthquake shocks, for which they cannot give a cause. The trouble seems to be between the 1800-foot and 2000-foot levels.

Suit has been brought by the Empire State-Idaho M. Co. against the Bunker Hill & Sullivan M. Co. to recover $75,000 for ore which, it is alleged, was unlawfully extracted from plaintiff's ground. The Empire State owns the San Carlos, the Likely and the Cuba Fraction claims, which join one another. The complaint recites that between September 1, 1900, and October 1, 1902, the defendant unlawfully entered the ledge having its apex within the San Carlos and Likely claims and into the Cuba fraction lode mining claim and extracted ores and mineral amounting to $75,000.

The Advance M. Co., organized at Wallace by J. Kammerer, P. Roddy, L. J. Columbus, H. P. Ward and W. J. Brack-

ing, is making arrangements to begin development of the copper property west of the Snowstorm mine, near Mullan. So far development work consists of 400 feet of tunnel, and it is thought the ledge will be cut in the tunnel at 100 feet farther.

MICHIGAN.

The total production of copper by the Lake Superior copper mines during August amounted to 16,155,000 pounds, as compared with 16,490,000 in July and with 17,155,000 pounds during June. Comparisons in detail follow:

	August.	July.	Jan.–June. (Inclusive.)
Calumet	6,500,000	6,800,000	40,800,000
Quincy	1,475,000	1,450,000	9,100,000
Tamarack	1,000,000	1,000,000	7,240,000
Osceola	1,425,000	1,400,000	7,050,000
Champion	1,000,000	950,000	5,675,000
Baltic	950,000	900,000	5,540,000
Franklin	440,000	500,000	3,000,000
Mohawk	475,000	550,000	3,475,000
Atlantic	400,000	425,000	2,700,000
Trimountain	850,000	900,000	5,895,000
Wolverine	755,000	750,000	4,985,000
Mass	275,000	250,000	1,385,000
Adventure	250,000	225,000	1,960,000
Isle Royale	315,000	300,000	1,215,000
Winona	45,000	90,000	655,000
Miscellaneous	.....	.....	180,000
Total	16,155,000	16,490,000	100,855,000

HOUGHTON COUNTY.

The Franklin, Jr., mine, near Hancock, in the crosscut west from the fourth level of No. 1 shaft on the Pewabic lode, last week cut the amygdaloid 975 feet west of the Pewabic. It is thought to lie close to the conglomerate lode opened formerly on the Franklin. Drifts south from No. 2 shaft have reached the strike line of No. 3 shaft on the Franklin, Jr., on the conglomerate lode at the seventh and fourteenth levels. The eleventh, twelfth, thirteenth, fifteenth, sixteenth and seventeenth levels are also being extended south to the strike line of No. 3, which has entered the ledge from the surface. Raising will start from the seventh and fourteenth levels and from the fourth and ninth as soon as they cut the shaft line.

On the basis of 13§ cents the August product of the Lake mines was worth $2,685,767.75.

Only two of the six compartments of the Red Jacket shaft of the Calumet & Hecla were operating last week on account of a change in the hoisting system, says the News. The double cages are being replaced by an automatic dumping skip. By means of these skips the rock will be dumped over the grizzlies to the floor immediately in front of the crushers. They have a capacity of 7½ tons and will take rock from nine pockets at as many levels.

No. 2 shaft of the Osceola mine at Opechee, northeast of Calumet, has been dismantled. The second skip has been put in use at the No. 1 shaft, making the full complement, of which four are at the North Kearsarge lode. The third skip will be in operation at the South Kearsarge. The No. 2 shaft is down to the 24th level and will continue to be used as a pump shaft for most of the levels.

KEWEENAW COUNTY.

The Mishawabik mine, near Allouez, reports having struck heavy copper in its shaft which has been started on the Kearsarge lode.

The Allouez mine, near Allouez, has put in power drills at its new shaft on the Kearsarge lode. The ledge had been entered 5 feet by hand drilling. The shaft lining through 50 feet of overburden has been made permanent. The shaft is making considerable water and four pumps are running to keep it free. The survey has been completed for the extension of the Mineral Range tracks to this shaft, but construction will not be started till spring.

At the Ahmeek mine, near Allouez, development work is progressing. Ground has been broken and a derrick put up at its southerly shaft (No. 1), and excavation started for shafthouse. Work of clearing site for No. 2 shaft is also under way, 1500 feet northeast of No. 1. The latter is 200 feet southwest and to the hanging wall side of the vertical exploratory shaft through which the chute in the Kearsarge lode was first located by the Ahmeek. The shaft will have a dip of 37°. Underground development on the Kearsarge lode on the Ahmeek is in 35 feet. Values are reported to hold up well. Two drills are working, one on the south drift, the other on the north. At No. 2, a vertical shaft will be put down to examine the lode and then a permanent shaft located as at No. 1. The lode is said to show a bend from the strike line of the Mohawk shafts and this would throw it 1300 feet nearer the eastern sandstone on the Ahmeek.

MINNESOTA.

The State of Minnesota has started granting leases for mining purposes under the lake beds, the Attorney General of the State having passed on the legality of such. An application was made last month to lease the beds of seventeen of the Minnesota lakes for prospecting purposes, and the problem involved the rights of riparian owners and those of the United States Government as well. In none of these cases were there any State lands located on the shores of the lakes. The privilege granted to the applicants is the "one-year prospecting lease," and for this the fee of $25 per quarter section is collected. Should the prospecting yield indications of ore the regular mineral leases will be applied for, and in case of mining operations the State will collect the regular royalty of 25 cents a ton besides taxes on the property. The lease granted to McClintock & Co is for the bed of Longyear lake, in St. Louis county, near Tower, and the terms of the lease expressly preclude any effort on the part of the lessees to reach the bed of the lake by draining off the water. Since filing the original seventeen applications McClintock presented eight more. In several cases mineral deposits are reported to have been found on the land in the iron ranges bordering on the lakes, with indications that the veins extend under the lakes.

MISSOURI.

The total value of $6,724,125 for the first eight months of 1903 for the southwestern Missouri zinc and lead district shows an increase of $350,660 over the same period of 1902, despite a smaller tonnage of both ores. A year ago zinc was selling at $39 50 top and lead at $49. Lead ore for the week ending Sept. 5th closed at $54 per ton and zinc at top price of $40, the assay basis quotable from $35 to $37 per ton of 60% zinc.

BARTON COUNTY.

In the new oil district near Golden City, J. W. Layne & Co. have a drill going down which is already in the oil sand, and report showing favorable indications. J. H. Cook & Co. are also at work.

JASPER COUNTY.

The Barrister M. Co., composed of F. L. Foriow, T. Stepp, J. Dahbs and B. Lyon report striking a jack prospect on its lease on the Guinn land, north of Webb City. They have forty acres in their lease and have cut into the ore body 50 feet, says the Joplin News-Herald.

Four more mills are being built, southeast of Webb City, and near each other. These mills are on the Aylor, being a second mill on the Holy Smoke lease, a third mill on the Patton & Dodge ground, a second mill on the Lucky Budge ground; also on the Connor land, adjoining, G. Taylor, T. Hill, W. B. Kane and J. A. Daugherty have started to build.

The Kibeka, or South Carthage lease, south of Carthage, output for month of August was: With five band jigs working, produced 286,000 pounds of ore. Of this, six carloads have been shipped and three carloads are in the bins on the ground. The output has been made by three companies, all only possessing hand jig plants, being M. Hall & Co., J Kirkendall and Brooking & Hodges. Three new prospects have been developed on the ground and are ready to put in their machinery to begin production.

At Duenweg, the Obert M. Co. is running steadily and turning out 6 tons of zinc ore per shift, says Superintendent E. Anderson. The Obert Co has a lease on sixty-eight acres of mining land, the ore being found at depth of 120 feet.

At Carthage, the Wire Stretchers M. Co. has quit sinking at 38 feet on the John Henkel land, southwest of Carthage, and will put down a drill hole ——C. E. Bryan, of Carthage, has secured a lease on the forty acres of land north of the Clary & Shults land, at Cave Springs, and work with a drilling outfit has started.

STONE COUNTY.

J. E. Putnam, of Joplin has bought several mining leases and options near Baxter, on which operations will be started this month, says the Baxter Springs News.

The Gaines, Brewster & Co. lease on the Felix Dardenne land, near the Quapaw mission, near Baxter, has been sold to F. Nicholson, of Joplin, for $7000, being a first lease on eighty acres.——A lease on forty acres of the Crawfish land has been given to J. O. Goodwin & Co., for $1500. This prospect shows values at depth of 126 to 172 feet. A test hole sunk 6 feet from this drill hole showed ore at 126 to 198 feet, being 72 feet of an indicated ore body. Development work will be increased. Goodwin & Co. have also bought three other leases, covering a total of 480 acres.——T. H Goodwin has leased from the Iowa & Oklahoma D. Co. ten acres, including the Tom Clark lead shaft.

The Galena Co-operative M. Co. report starting operations under Superintendent O. Miller. They will sink on the Cox land, 2 miles northeast of Galena, near the Helen Hunt mine. The ground is southeast of the Badger diggings, south of Bellville. Should the company make a strike the ground will be leased to miners on a 20% royalty basis.

MONTANA.

FLATHEAD COUNTY.

J. T. Vaughan of Vaughan & Greenwell, operating near Libby, says he shipped out last week the first clean-up of gold to be made on the Libby placers this season, and operations continue satisfactory.

B. Downey of Troy, part owner of the Banner & Bangle group near Troy, being operated by Larson & Greenough, says they are working fifteen men, and in No. 5 tunnel the vein is 16 feet between walls, being in two sections—one carries lead ore the other zinc. From these it is intended to ship 100 tons of each kind of ore to a smelter for making a thorough test. The ore to be shipped will run about 50% in lead and 50% in zinc.

G. W. Walker, part owner of the Copper Reward claim in the Cabinet range of mountains, near Libby, says they have opened up a body of ore at the face of the 350-foot tunnel and 100 feet below the surface. The mine is on Cherry creek on the opposite side of the mountain from the Snowshoe mine, and the tunnel is 900 feet lower than the main working tunnel on the Snowshoe.

GRANITE COUNTY.

Work on the Southern Cross (Fisher Jack) mine on lower Rock creek, near Phillipsburg, has been temporarily suspended on account of bad air. Air pipes will be put in and a blower. The Fisher Jack claims and the claims of the Union M. & Dev. Co. are under bond to Butte parties and G. W. Wilson of Phillipsburg, who is superintendent. Most of the work done has been in tunneling. On the Southern Cross a shaft was sunk in the tunnel to depth of 30 feet and a drift run from there.

Work has been resumed at the Albion M. Co.'s properties near Royal, says President Clark. It is proposed to build a mill. M. Brent and G. Wagner of Princeton are part owners.

The Milwaukee G. Extraction Co., operating the Hannah group of mines in Red Lion district, near Phillipsburg, are preparing to build a cyanide mill of 200-ton daily capacity, says G. H. Savage, manager. A sawmill is being set up to cut lumber for the mill and other buildings. Development work in the mine continues, the principal work being in the lower tunnel, driving to tap the lead at depth of 400 feet. Two tunnels have crosscut the lead.

A. Schroller and V. Page are working the Lucky Boy, a gold claim east of Granite, owned by them and F. Carr, of Butte. They have two shafts going down, both being sunk on the lead. The claim is near Track lake and adjoins the Dorothy M. Co.

F. Houle, part owner in a gold-bearing group on Harvey creek, above Quigley, is arranging to put in a cyanide plant. Work will be started next week.

MADISON COUNTY.

C. A. Plummer reports striking a body of coking coal near Monida. The coal is 23 inches wide and has been traced for some distance on the surface.

MISSOULA COUNTY.

The Buffalo M. Co. is developing a group of eight claims in the Bitter Root mountains, between Saltese and DeBorgia and 6 miles from the Northern Pacific tracks. Surface assays show values in lead and silver. At the bottom of a 30-foot shaft a sample along the vein for 10 feet gave 28% lead and thirty ounces of silver. A tunnel has been run 150 feet and is being extended 350 feet to crosscut the ledge. The company also owns claims on a ledge of copper ore 15 feet wide which parallels the above lead. More men are being put on and the company will build a wagon road to the property, when ore will be shipped.

The Monitor copper mine, near Saltese, has reverted to the original owners and they have resumed development work with eighteen men in charge of A. McCulium of Wallace, Idaho. Sinking the shaft has been started. It is owned by the Montana Con. M. Co. and was bonded by the Bitter Root C. M. Co.

POWELL COUNTY.

The Ophir placer mines have been consolidated, all placer ground on Ophir gulch and Carpenter's Bar, near Ophir, being turned over to a Minneapolis company, with W. R. Bourne of Shell Lake, Wis., president and T. Cooney manager. The company is making preparations to work the ground next spring.

SHOSHONE COUNTY.

The extension of the Beartop wagon road was completed last week and the Beartop M. Co., near Murray, have begun construction of a cable-bucket tramway, says Manager Groesbeck. The company expects to have all its outdoor work done by Oct. 1st., when the ore body of the discovery claim of the district will be developed. The new road is of value to the entire Beartop section, being convenient to the farthest claims. With a lower tunnel the Orofino owners can drop their ore into a bin above the road.

The Highland Chief M. & M. Co. has been incorporated with principal place of business at St. Paul, Minn., by B. L. Grant, Hudson, Wis.; C. C. Whitney, Marshall, Minn., and A. M. Phillips, C. W. Stanton and J. E. King of St. Paul, Minn., directors. The Highland Chief is on Pine Creek, west of Wardner.

WASHINGTON COUNTY.

The Idaho C. M. Co., owning the Alaska group and Arkansas claims in the Seven Devils district, near Landore, reports starting work on its properties. H. C. Breeden of Portland, Or., is president.

NEVADA.

DOUGLAS COUNTY.

The Nevada Placer G. M. Co. will test the Carson river gravel beds, near Gardnerville, says the Gardnerville Courier. They are putting in machinery.

ESMERALDA COUNTY.

C. Smith has taken a working bond on the A. Weber group of mines on Cat creek. These mines are 8 miles from Hawthorne and are surrounded by timber. Water sufficient for milling purposes can be obtained. Smith says the Nevada claim shows a 3 foot ledge of $10 ore, the Golden Nugget 2½ feet of $12 ore and the Lakeview also pay ore.

LINCOLN COUNTY.

Some of the superintendents at Searchlight last week offered to take the men back at the former scale, but the union refused. The following scale of wages has been adopted by the Mine Operators of Searchlight:

Miners	$3 00
Trammers and muckers	3.00
Miners, shaft work	3 50
Miners, wet ground	3.50
Engineers, 9 hours	3.50
Blacksmiths, 9 hours	4.00
Tool sharpeners, 9 hours	3.50
Timber framers, 9 hours	3.50
All other top men, 9 hours	3.00

Eight-hour men working under ground to be lowered and hoisted on their own time.

Last week in Los Angeles, Cal., the Searchlight M. & M. C. was incorporated to develop the Peerless group, near Searchlight, with G. I. Meyers of Mobile, Ala., as president, and O. B. Landon, H. E. Carter, A. B. Day and G. W. Morgan, directors. The property consists of six claims, the Julia, North Star, Henrietta, Diamond, Peerless and Dabu, south of the Blossom group of the Southern Nevada M. Co. Some work has been done on these claims, and prospecting shafts have been sunk in several places, showing ledges on the North Star and Dahu 5 feet in width and assaying $10 in gold. It is intended to open up and develop the property, and as soon as the showing justifies to build a mill.

NYE COUNTY.

At Lone mountain, near Tonopah, the Eureka M. Syndicate has been formed by T. G. Elgie, W. J. Stoneham and W. S. Williams to develop the Eureka claim, a western extension of the General Thomas mine. Work has begun.

At Hannapah, east of Tonopah, Superintendent Work reports during month of August 143 feet of work was done on the Newhouse group, besides putting in 100 cords of wood. In the north crosscut on the 250-foot level, at a point 40 feet from the vein, stringers of quartz were struck showing ruby silver. In the west drift, 100 feet from the crosscut, ore is showing in the face. The pumps are raising 30,000 gallons of water a day. Most of the water comes from the north crosscut. The company operating the Newhouse properties is the Hannapah M. & S. Co.

STOREY COUNTY.

P. Rauhach and G. J. Roote of San Francisco, Cal., have bought the Keyes mine in Sevenmile canyon, near Virginia City, and have put men to work cleaning up and getting the plant in readiness to pump out the water, which stands 200 feet deep in the shaft. M. Cullen is superintendent. Development work will be

started, and later a plant to work the mine will be put in.

WASHOE COUNTY.

High-grade sulphide ore is reported struck last week in the shaft of the Desert King mine in Wedekind district, near Reno. J. Sparks, S. H. Wheeler, R. J. Sanders and J. L. Herron of Reno are principal owners.

WHITE PINE COUNTY.

P. L. Keogh, president of the Sapho M. Co. of Ely, says their properties have been sold to Hurd. Shafner et al. of Philadelphia, Pa, for $100,000.

NEW MEXICO.

GRANT COUNTY.

The Santa Rita C. M. & S. Co. propose to resume work on the Pinos Altos mines near Pinos Altos, formerly owned by the Hearst estate.

GUADALUPE COUNTY.

At Dalhart, Texas, the Onervo M. Co. has been incorporated by C. S. Ross, A. S. Long. C. Rayburn and R. A. Stewart et al. to operate a group of claims 12 miles west of Conant on the Rock Island Railroad, and a shaft has been sunk by Superintendent R. A. Stewart to depth of 20 feet, showing ore carrying copper and silver values. It is intended to sink to 200 feet.

SANTA FE COUNTY.

R. B. Thomas of Cerrillos says at the smelter the shut down occasioned by burning out the water-jacket will end next week, having lasted thirty days. The delay in the resumption of the work has been due to the trouble experienced in securing material for repairs. In the smelter there are eighty men at work. The mines are running full capacity and have 300 men on the payrolls. The concentrating plant at Hanover is giving seventy-five men employment and is shipping copper concentrates to the smelter.

SIERRA COUNTY.

The Silver Monument mine at Fairview has closed down temporarily. —— Trails and roads have been broken to the Confidence mine at Fairview and several buildings have been erected. A machine drill will be used.

OREGON.

The Oregon State Mining Association was organized last week at Portland with the following officers: J. F. Wickham of Galice, president; J. H. Fisk of Portland, vice-president; L. Keizur of Baker City, second vice-president; A. L. Morris of Portland, secretary; J. F. Watson of Portland, treasurer. The purposes of the organization are to afford the mining men of Oregon an opportunity to consult with each other and exchange views on matters pertaining generally to mining interests in this section, says the Telegram. It is considered there is much to be done in the matter of legislation in the State of Oregon with regard to the mining interests, and aside from this there are other phases of the industry that will profit by consultation among representative mining men in the various districts, which will be followed by co-operative action in the lines decided upon. The question of forest reserves, and also the collection of a mineral exhibit for the Lewis & Clarke Fair, will be taken up.

BAKER COUNTY.

The Highland G. M. Co. propose to put up a 30 ton mill at its group, near Sumpter, says Superintendent Jackson, to handle the rock taken out in development.

J. H. Huhbard, R. B. Knapp and A. Swick, owners of the Dewey mine, near the Potosi mine, in the Greenhorns, near Sumpter, have started work.

The capacity of the California mine's reduction plant, near Sumpter, will be increased from its present capacity of 50 tons a day to 120 tons, says J. Michaels of Minneapolis, Minn., president of the Turnagain Arm Co., operating the California. The additional machinery will consist of a reverberatory roaster, leaching and cyaniding equipment and additional vanners.

CROOK COUNTY.

Ore carrying values in silver and gold is reported opened up in the lower levels of the Oregon King mine on Trout creek. C. M. Cartwright of Portland, and J. G. Edwards of Hay creek are part owners.

DOUGLAS COUNTY.

Gold and copper hearing ore is reported found on Section creek, 1 mile southwest of Glendale, by C. Stuerhoff.

JACKSON COUNTY.

The Gold Hill dam across the Rogue river, near Gold Hill, built to conserve the water for power purposes, has exposed a gravel har carrying placer gold in the hed of the stream which is believed when worked will more than repay the cost of building the harrier which caused its discovery, says the Telegram. A. Orme, foreman of dam construction, panned out $100 in two and one-half hours, and the Condon Power Co, to whom the dam belongs, are making preparations to work the property. The bed of Rogue river adjacent to the dam is being thoroughly prospected.

JOSEPHINE COUNTY.

The St. Helens M. Co and the Galice Hydraulic M. Co., on Galice creek, near Grant's Pass, have been consolidated as the Galice Con. M. Co., which has been incorporated at Portland by A. B. Cousin, E. E. Cable, H. Wiedler, G. B. Hengen, G. W. Kirkley, G. E. Waggoner and W. P. Wagy. A. B. Cousin of Portland is manager. The placer ground bought in the consolidation contains 600 acres, and well covered with timber. Water power of sufficient capacity to furnish electricity for their purposes is near by. The work thus far done is 10 miles of ditches, 1½ miles of pipe lines, derricks, sawmill, blacksmith shop and other buildings. The improvements to be added will be an 8 foot flume, which will be capable of running six giants and will have taps along its entire distance, where connections can be made. Manager Cousin has twenty-five men at work.

LANE COUNTY.

A 300-ton quicksilver plant is going up on the Black Butte mines, near Cottage Grove, says G. B. Dennis of Spokane, part owner. Four years of development work has opened up a good body of cinnabar. The Black Butte quicksilver mines are 18 miles from Cottage Grove. W. B. Dennis is superintendent. During the four years 12,000 feet of work have been done, which includes a vertical shaft to the 1000-foot level. At each 100-fnot station a drift running on the footwall has been driven either side of the shaft for 227 feet, and at each level the ledge has been crosscut for 80 feet. The average of the ore is 1% in mercury. A contract has been let for an additional tunnel 3000 feet long, which will give a vertical depth of 1700 feet, and will be the main working tunnel of the mine. The forty-ton distilling plant is being enlarged to 300 tons capacity, and the mine equipped with water power electrical plant, furnishing power and light.

MALHEUR COUNTY.

J. E. Gilman and J. Wright, of Chicago, Ill., part owners of the Singer group of mining claims on Snake river, 20 miles from Ontario, have arranged to open up the group and increase developments, says Superintendent C. B. Lyon.

WALLOWA COUNTY.

Work is reported progressing in development and construction at the Imnaha properties The steamer Imnaha is taking in machinery and supplies from Lewiston, Idaho, via the Snake river. It is expected it will be more available for freight purposes after finishing improvements on Wild Goose rapids. The main workings of the Eureka M. Co. on the Mountain Chief are nearly through, the divide separating the mouth of the Imnaha from the Snake river, near Imnaha, and are said to have opened a good ore body. Electric drills are being used. The Eureka Co. has its sawmill in operation, turning out lumber for the smelting plant. The masonry foundations are completed. At the Fargo mine, near the Eureka, and across the Imnaha river, work is in progress driving tunnels on the vein system. The Fargo Co. is using an electric power drill.

SOUTH DAKOTA.

CUSTER COUNTY.

After a shutdown of several months during which time new ore bodies have been opened up, the North Star 10-stamp mill, 8 miles northwest of Custer City, began dropping its stamps again last week, says Superintendent G. Salmon. The ore shoots have been uncovered in a series of shafts on the strike of the vein. The main shaft is down 360 feet.

The Extreme M. Co., owning the Minnie May mine near Custer, will build a 10-stamp mill. They have put up a sawmill to cut lumber for the mill and mine timbers. On the dumps at the mine are 10,000 tons of ore that averages $10 per ton, the values being in free gold and sulphides, says Superintendent I. Downing.

LAWRENCE COUNTY.

(Special Correspondence).—The Southern Cross M. & M. Co. will put in a hoisting plant and other machinery. This company came into possession of their property about two months ago. They have their shaft down 100 feet and 200 feet of drift at the bottom. Ore runs $20 per ton. J. F. Menzel is superintendent and E. R. Stewart manager.

Lead, Sept. 14.

(Special Correspondence).—J. L. Malm of Marysville, Mont., has bought a large tailings dump near Deadwood and will install machinery for treating the same.

Deadwood, Sept. 13.

The Aurizone M. Co. has been organized to develop a group in Bear Butte district. 7 miles from Deadwood, west of the Gilt Edge-Maid mine, above Galena The ground owned by the company covers 200 acres, and development work amounts to 1200 feet, in open cuts, tunnels and shafts. The directors are H. R. Luther, W. F. Hanley, N. H. Conger, A. T. Feay, C. Von Wœhrmann, J. B. Safford, W. F. Towner, S. McBratney and R. T. Perli. H. R. Luther of Chicago, Ill., is president.

A bond has been taken on a tract of mining property in Ida Grey district by H. J. Mayham, of Denver, Colo., and W. Sauntry, of Stillwater, Minn., including the Golden Wedge group of claims, and the Harrison, Ella No. 1 and Henniger lode claims, between the Penobscott group and Kicking Horse and Golden Gate group, 5 miles from Deadwood. Development work will be started this month.

PENNINGTON COUNTY.

The Sunbeam M. Co. has fifty men at work on Friday gulch, near Hill City, in development work on the mine and the construction of a 20-stamp mill. At present but ten stamps will be set up, though the building and the power plant will accommodate twenty stamps.

UTAH.

IRON COUNTY.

The cyanide plant of the mill at the Johnny mine at Stateline will be enlarged. A compressor plant has been set up and machine drills will be put to work underground. W. J. Halloran, D. Clift, F. Wilson et al, of Salt Lake City, are owners.

JUAB COUNTY.

The stamps at the Queen of Sheba mill in the Deep Creek country, near Ihapah, are reported to have been indefinitely hung up. No reason is given out by Manager Lawler. It is said the Midas mill will not be started up till next spring when the company will put in a pipe line to provide it with a permanent supply of water. Meanwhile work under ground will be continued.

PIUTE COUNTY.

On the Holland group of claims, owned by W. F. Snyder et al. of Salt Lake City, work will be resumed. The property is on Gold mountain, near Marysvale. The tunnel, started some years ago for the main ore channel, is in 1300 feet and will be driven 600 feet farther.

SALT LAKE COUNTY.

J. J. McDonald, local manager of the Utah C. Co. (Wall-De Lamar) mines, at Bingham, says a double-track tunnel will be driven into west ridge of main canyon above the Copper Belt crossing, starting in D. Macintosh or C. Read ground. As the ore (mineralized porphyry) is to be quarried at but a short distance from the surface, an opening capable of yielding 500 tons a day can readily be made.

The Native Copper claims at Alta have been leased for two years and bonded for $50,000 to A. O. Jacobson, manager of the Columbus M. Co. The property includes three full claims a quarter of a mile southwest of the Columbus mine. It has produced some copper, silver and gold, and 1500 feet of development work has been done. The entrance to the mine is through a tunnel, from which drifts, raises and winzes extend. The best values are in a lime-quartzite contact, says the Tribune. Jacobson has men to work in stoping and developing. He has secured options on some of the adjoining claims.

The bucket tramway of the United States C. Co. at Bingham was "hung up" last week, due to breaking of a coupling on main carrying cable. It has been respliced and necessary repairs made. The line transports an average of 400 tons of ore daily.

A machine shop is being built at the Utah C. Co. concentrator near Bingham and will be equipped with lathes, drills and other tools.

To operate the Frida and Papea claims, on East ridge, near Bingham, the Little Eddie G. & C. M. Co. has been incorporated by E. McCarrick, A. H. Page, J. McCarrick, C. J. McNitt and H. Lowe.

SUMMIT COUNTY.

President Treweek says they will resume sinking at the Wabash mine at Park City. The shaft is to be continued to the 1000-foot level from the 600-foot point.

TOOELE COUNTY.

The report of Superintendent Raddatz, of the Honorine mine, at Stockton, for the month of August shows 1100 feet of ground penetrated, the greater portion being that through which the tunnel is driving. On the 300 ton concentrator work is progressing, and the plant is expected to be ready for operations in November.

WASHINGTON.

CHELAN COUNTY.

A. J. Campbell of Sausalito, Cal., for Butte, Mont., parties is reported to have bonded the Grand View copper claims, near Wenatchee. The bond is for $20,000 for two years.

FERRY COUNTY.

Operations were started this week at the First Thought mine, near Orient, says the Northport News, arrangements having been made with the Northport smelter for treating the ore. The manager of the First Thought says fifty tons of ore a day will be shipped at the start, and gradually increased. The ore averages $25 in gold per ton. P. Burns is principal owner.

C. Hornsberg of Seattle, president of the Blue Bell mine on Sophie mountain, near Northport, reports closing a deal for six adjoining claims. The group is on the summit of the mountain, along the international boundary line, and the Velvet mine adjoins the boundary line on the Canadian side, opposite this group.

OKANOGAN COUNTY.

The Prize M. Co. of Seattle, owning a group of twenty-two claims on southeast side of Mount Elemeham, 9 miles north of Loomis and ½ mile north of Palmer lake, has arranged to build an electrical chlorination mill, having secured a water right and 233 acres of land on the lake shore for a millsite. The mill will have a capacity of twenty tons per day. The principal ore showings on the Prize group are on the Mollie Gibson, the Lakeview and the Contact claims, and carry gold, silver and copper. The mine is opened by two tunnels, a shaft, raises and winzes, but no connections have been made between the leads. All of the openings are in ore. H. E. Dunham is manager.

STEVENS COUNTY.

Near Ryan, machinery from the Examiner mine is being transferred to the Minorca plant, says Manager L L. Tower of the Minorca mine, including pump, engine, hoist, boiler and all attachments. He will get out ore for shipment.

Operations at the American Onyx & Marble Co.'s property, near Ryan, are under way, with the channeler at work, says H. P. Scheel of Spokane, manager. H. H. Martin is superintendent.

WYOMING.

LARAMIE COUNTY.

O. E. Tisch and D. D. Wallace report finding placer ground within a mile of the irrigation tunnel of the Wyoming Development Co., near Wheatland, and that it is their intention to take water from the Laramie river above the discovery to wash out the gold by hydraulicking.

SWEETWATER COUNTY.

An 18-inch seam of anthracite has been developed in the coal body near Thayer, owned by the Union Pacific, says the News. The Union Pacific is preparing to lay a line to the field and will open up at least one mine.

FOREIGN.

AFRICA.

ORANGE RIVER COLONY.

The Koffyfontein diamond mines report 1930 carats recovered during month of August.

WEST AFRICA.

Manager Wileman of the Con. Goldfields of the Ivory Coast at Grand Bassam reports a new reef 350 yards from Amangara, the outcrop showing 6 feet wide, and carrying gold values.

AUSTRALIA.

NEW SOUTH WALES.

Cootamundra reports state that W. Little, who has been prospecting for tin on Cucumbla station, near Cootamundra, has found silver.

Water trains are being run from Adelaide to Broken Hill. An agreement has been entered into between the Governments of New South Wales and South Australia whereby the latter is to supply 800,000 gallons of water per week. This will enable the mines to keep three-quarters of their ordinary average force at work. The South Australian Government has agreed to provide the specified quantity weekly at 12s 6d per truck of 1200 gallons, which is equal to 10s per 1000 gallons delivered at Cockburn, where the Silverton Tramway Co. undertakes its further transportation.

The Mining Warden at Walgett reports to the Department of Mines a discovery of precious opal near Walgett. There are fifty miners at work mining for opal; the deepest shaft is down 35 feet. The opal occurs in the desert sandstone formation, as at White Cliffs. The extent of the find has not yet been ascertained. A number of companies are being organ

ized in New England district and in Sydney to send prospectors to the field.

At Stanwell Park, a diamond hore put down on the South Coast coai fieid has struck the Bulli seam and shows it to be 6 feet thick and the coal of good quality. The company owning the ground will arrange to open up a coiiiery.

At Broken Hill mining and metallurgical operations have been partially restricted by the iack of water this season, hut a heavy rainfall on August 31st is reported to have replenished the Broken Hill Water Supply, Ltd, reservoirs to the extent of 98,000,000 gaiions.

QUEEENSLAND

During the seventeen years that the Mount Morgan M. Co. at Morgan has heen in existence the mine has turned out eighty tons of gold, worth about £10,500,000, and the dividends paid by the company have totalied £6,229,166.

In the centrai mining districts one of the drawbacks to miners and prospectors has heen a lack of locai smeiting works for treatment of refractory ores. The nearest works have been at Aldershot, hut cost of transportation is high. The Mount Morgan G. M. Co. will buiid a smelter at their works, not oniy for their own use, hut for outside mining operations. They have a considerahle amount of metal for the smeiter, hut not enough to keep it in full operation.

SOUTH AUSTRALIA.

The water right and eiectric power plant of the Pioneer-Lynn M. Co. has been sold to the International M & S. Co., owners of the Southern Cross and other quartz properties near Euchre Bar, 7 miies from Towle, for $7500 cash and stock. The sale includes a water right of 3000 inches, dam, flume, power house, 350 H P. turbine wheel, electric piant with complete equipment.

VICTORIA

The New Chum Raiiway mine at Bendigo has what appears to he the west leg of an Inverted saddie formation in the hottom of the shaft at 3866 feet, says the Journai. The ore is 9 inches wide. They intend to sink further in the hope that as they go down the ore hody wiii enlarge.

WESTERN AUSTRALIA.

At Menzies, in North Kaigoorlie, the directors of the Queensland Menzies mine have decided to replace the oid ten head of stamps hy a new set. Each stamp will weigh 1250 pounds. The additions to the plant are expected to be ready for operation hy December 1st. A contract has heen let to sink the Queensiand Menzies shaft a farther distance of 80 feet, making a total vertical depth of 526 feet.

The Great Boulder mine at Kalgoorlie is making preparations to put in a new hoisting piant at the main shaft, capable of hauling ore from a vertical depth of 3000 feet. It is also proposed to instaii a heavier haulage gear at Edward's shaft and huiid an electric power piant.

BRITISH COLUMBIA.

BOUNDARY DISTRICT.

The Granhy M. Co.'s smelter at Grand Forks, which was closed down for a week to permit of the hlowers being connected with the new furnaces, resumed operations on the 9th inst., when two furnaces were hlown in.

A company with W. T. Hunter of Greenwood as manager has hought the Jack Pot fraction adjoining the Athelstan mine, Wellington camp, for $15,000. The same company is operating the Athelstan mine on a bond, and making daily shipments of fifty-five tons of ore that averages $9 per ton.

The amalgamation is reported of the British Columhia C. Co. and the Snowshoe G. & C. Co., operating near Greenwood. A. J. McMillan at Rossiand is managing director of the Snowshoe.

EAST KOOTENAY DISTRICT.

There have been sixty men engaged in placer mining on Wiid Horse creek, near Fort Steeie, this summer, says the Prospector.

The Thompson M. Co., on Wiid Horse creek, near Fort Steele, has hegun cleaning up after the rainy season, and reports a large bed of paying gravel having been worked this summer.

The fear that the Canadian smelters would seek to secure to themseives a share of the hounty on iead granted hy the federal government for the relief of producers in the Kootenays has heen realized in the case of the St. Eugene siiverlead mine at Moyie. Director J. C. Drewry says they cannot at the present time secure a rate of freight and treatment from the smeiting works at Traii within $3 of the figure quoted hy the smelter for St. Eugene ores in March last. Drewry says under these conditions the St. Eugene will never operate.

ROSSLAND DISTRICT.

The O. K mill, near Rossland, started stamping ore from the I. X L. mine on the 2d inst. The I X. L. has been leased by G. Pringle and W. Craven, who wiii miii the tonnage collected on the dump during the early days when higher grade ore only was shipped.

VANCOUVER ISLAND.

After the settlement of the strike, Cumberland is resuming its normal appearance, and a number of men have gone to work on the company's terms, having heen idle since May 2nd, says the Rossland Miner. A few men, principally officers of the Western Federation of Miners, have left town. The miners who have started to work have ali signed a contract hinding them for two years, though they can leave at any time, except for the purpose of causing a strike or similar cessation of work.

The foreign shipments of coal from the Western Fuei Co.'s colliories at Nanaimo for the month of August amounted to a total of 17,996 tons.

It is reported the strike at the Van Anda mines has been settled, the men having returned to work. Manager Vaughan-Rhys agreed to recognize the union, hut reserves the right to engage union or non-unlon men as he sees fit. The union withdrew its demand for a nine-hour day for carpenters and blacksmiths, and there is no increase in pay. ——The men at the Marbie Bay mines on Texada island have resumed work under the former conditions.

KLONDIKE.

The Poverty Bar mining ground near Dawson has been sold to a company of Dawson men. It is claimed $2,000,000 have been taken out since opening up in the summer of 1897.

Official figures from the Territorial comptroller's office at Dawson shows that the gold shipments from Kiondike for the present season are $300,000 less to date than up to same date last season, says the Alaska Dispatch—this, too, showing in view of the fact that the creeks have all been dry and a shortage of water has existed this season. The shipments from Dawson this year are shown to be as follows:

May	$173,781
June	3,324.480
July	2,015,586

The shipments from Whitehorse this year were $246 in May, and $2370 in June; and the shipments from Fortymiie amounted to $1082 In June, with no report for July. Gold shipments made from Dawson last season for the first three months were as follows:

May	$19,890
June	3,550,324
July	2,313,130

The gold shipments from Whitehorse for June of 1902 amounted to $1880, and from Fortymiie $4652.

NEW ZEALAND.

Wellington reports the gold output of New Zealand during month of August amounted to 30,074 ounces, valued at £110,572, as against 35,609 ounces, valued at £137,456, for August, 1902.

MEXICO.

The Treasury Department of Mexico has issued a statement showing the foreign commerce of that country for eleven months, from July to May, for the years 1901–2 and 1902–3, which inciudes the following mineral exports (gold valuation):

	1902-3.	1901–2
Gold*.....	$12 688 453 13	$8,566,712 54
Siiver†.....	72,672.515 79	55,500,035 47
Copper	17.331,873 04	15,555,480 87
Lead.....	5,273,541 05	5,242,175 30
Other minerals.....	997,640 95	408,854 25
Total	$108,964,023 96	$85,273,258 43

*Mexican and foreign coin and bar gold.
†Mexican and foreign coin and bar silver.

CHIHUAHUA.

Nickel is reported found in J. A. Creel's copper mine at Terrazas camp. Between 3% and 4% nickel is found in some of the matte.

The Guggenheim Exploration Co. is developing the Jibosa mine, 3 miles south of Dolores station on the Mexican Central, says C. M. Sewell, superintendent. Regular ore shipments are going out.

The Mexican M. & Ex. Co. bas options on ali the apex properties on the Veta Colorado north of the Los Remedios mine in Parral district, for 4 kiiometers, says the Chihuahua Enterprise.

H. H. Cohen of London, Eng., and Los Angeles, Cai., has secured options on several blocks of mineral-bearing ground in Santa Eulalia camp and will put in diamond drills and other machinery.

There are three diamond drill outfits in Parral camp; one is operating on the Terrenates mine, one on the Esperanza, heionging to Chihuahua men, and the other on the La Luz, an extension of the Palmilla mine. The last mentioned helongs to the Hidalgo M. Co., and is under option to J. F. and C. B. Flynn.

D. White of Chihuahua and J. Duran, Jr., of Parral are working eighteen men on the Donato Guerra and the Aguila mines, in Sierra Ronces Valles section, near Parral. The ores are copper and silver bearing.

The Dithridge-Burr Ex. Co. is developing the Vencedora property, 6 miles south of Santa Barbara. The ore runs one-half kilogram in silver and two ounces gold to the ton. A smaii amount is being shipped, as the company will build a mili on the ground.

COAHUILA.

Manager W. H. Watson of the Caiabasas mine, at Monciova in Cotana district, says additionai machinery will be put in.

DURANGO.

Austin & Knotts are operating the Anita mine and miii at Guanacevi on lease.

JALISCO.

At Ameca, Las Moras M. Co. is preparing to put in a concentrating plant.

LOWER CALIFORNIA.

It is reported a smelter will be huiit at San Quentin. The Pyne Smelter Co. of Alameda, Cal., has bought the Luciana group of claims near Uriana, and the Esmeraida group has heen sold to Burns & Co. of British Columhia. On the gulf side of the peninsula are the Santa Rosalia mines, operated hy the Boleo M. Co , and employing 5000 men

NUEVO LEON.

The San Carios mines at San Jose, E. P. Self, manager, has completed its ore iine hetween the mine and the smelter, says the Enterprise, and the line between Linares and San Jose will he started this month. The entire works of the mines are being overhauled and repaired.

SAN LUIS POTOSI.

The smelter at San Luis Potosi is in fuii operation, producing two cars of lead and copper hullion per week. Several furnaces are undergoing repairs, as they were frozen up during the late strike.

SONORA.

The Yerkes M. Co., J. C. Underwood, manager, has resumed operations on its gold properties at El Cajon de Amarilias, in Altar district, after a temporary shut down.

The Esmeralda mine, 15 miles east of Cos, has been sold to Eastern men, says Manager C. Scott, for $60,000. Development work will be increased.

The Greene Con. C. Co., at Cananea, is preparing to huild another concentrator. It will he built ahove the present mill, and will have a capacity of 1000 tons per day, whereas the old concentrator has a capacity of 800 tons.

At Tahutano, the Sonora M. & M. Co. proposes to put in additional machinery at its mines, to the extent of $100,000.

The Sonora Placer M. Co. is reported to have hought the Maravillas mine for $200,000. A. W. Tennant is manager of the Sonora Placer M. Co. The Maravilias is near the Arizona line, 20 miles from Nogales and 4 miles from Washington camp in the Huacbucas. Development machinery will be put in.

PERSONAL.

H. A. BRADLEY of Denver, Colo., is in San Francisco, Cal.

I. A. CAMMETT of Denver, Colo., has returned there from Lead, S. D.

M. CULLEN is superintendent of the Keyes mine, near Virginia City, Nev.

W. O. MANSON of Denver, Colo., is in San Francisco, Cal., on mining business.

H C. BROUGHER, interested in Tonopah, Nev., mines, is in San Francisco, Cai.

J. F. WILKINSON of Mount Bullion, Mariposa county, Cai., is in San Francisco, Cal.

H. MURRAY, interested in mines near Cisco, Placer county, Cal., is in San Francisco, Cal.

F. RUTHERFORD is in San Francisco, Cal., from Agua Caiiente, Mex., on mining business.

T. SPELLACY, interested in the oil fieids near Bakersfield, Cai , is in San Francisco, Cai.

E. C. VOORHIES, owner of the Sutter Creek, Cal., Reduction Works, is in San Francisco, Cal.

J. H. HUBBARD, of Sumpter, Or., is manager of the Dewey mine in Greenhorn district, Oregon.

F. W. BRADLEY has returned to San Franoisco, Cal., from the Oneida mine, Amador Co., Cal.

N. B KNOX has returned to San Francisco, Cal., from an examination of mines near Carson City, Nev.

AFTER examination in Yavapai county, Arizona, W. E. Defty has gone to Mexico to remain until October.

A. B. COUSIN of Portland, Or., is manager of the Galice Con. M. Co., operating in Josephine county, Or.

H. H. COHEN of Los Angeles, Cal., is at his mines at Santa Eulalia, Chihuahua, Mex., from El Paso, Tex.

A. H. ELFTMAN of Siiverton, Colo., attended the American Mining Congress in Deadwood and Lead, S. D.

R. C. SPECHT, assistant superintendent of the Sheep Ranch mine at Sheep Ranch, Cai., is in San Francisco, Cal.

L. H. CARVER has returned to San Francisco, Cal., from an examination of mines in Siskiyou county, Cal.

V. G. HILLS, M. E , Cripple Creek, Colo., was a visitor to the Black Hills, S. D., during the Mining Congress.

A. D. JONES of Colorado Springs, Colo , is president of the Pharmacist G. M. Co., operating at Cripple Creek, Colo.

C. CHAMBERLAIN is acting manager of the Stratton estate's properties at Cripple Creek, Colo., vice W. G. Rice, deceased.

L. A. HAMMOND of D nver, Colo., manager of the Crocker-Wheeler Co., has returned to Denver from Deadwood, S. D.

J. F. MCCAMBRIDGE, superintendent of the Boston Tonopah mine at Tonopab, Nev., is visiting in Ohio and Pennsyivania.

E. C. ENGLEHARDT has returned to Denver, Colo., after a seven months' professional visit to Arizona and California.

J. M. BURNELL, of Denver, Colo., has returned via San Francisco from examining placer mines in Bolivia, South America.

W. J. RULE, of Sonora, superintendent of the Belle mine, near Tuttletown, Tuolumne county, Cai., is in San Francisco, Cal.

HORACE F. BROWN of San Francisco, Cal , bas gone to Cape Breton, N. S., to examine some coal and iron properties there.

R. F. CARR, vice-president and general manager of the Dearborn Drug and Chemical Co., has returned from Colorado to Chicago.

A. J. MCMILLAN, managing director of the Le Roi C. Co. and the Snowshoe M. Co. of Rossland, B. C., is in New York on business.

S. GREEN of Denver, Colo., representing the American Steel & Wire Co., is in the Black Hiils, S. D., in the interest of his company.

J. L. BRYSON, of San Francisco, has gone to the Yuba mine, near Washington, Nevada county, Cal , to take charge of the property.

A. A. BLOW, consulting engineer of the Australian S. & R. Co., of London, Eng., is in San Francisco, Cal., en route to Sydney, N. S. W.

W. BABCOCK, of Salt Lake City, Utah, manager of the New York Giant M. Co., of Deep Creek district, Utah, is in the East on business.

A. E. DAVIS of Chicago, Ill., interested in cyaniding at the Young America mine at Sierra City, Cal., is in San Francisco, Cal., on business.

F. C. COOLEY, representative of the General Chemical Co., Chicago, Ill., was a delegate to the Mining Congress at Deadwood and Lead, S. D.

C. O. MOLSON, resident representative at Salt Lake City, Utah, of the London Exploration Co., has gone to look over its interests in South Africa.

JOSEPH MACDONALD, general superintendent of the Alaska-Treadwell, Alaska-Mexican et al. mines on Douglas island, Alaska, is in San Francisco, Cal.

ROBERT SIBLEY of Berkeley, Cal., has been appointed professor of mechanical and electrical engineering at the University of Montana at Missoula, Mont.

H. J. DALY, of the Con. Mines Selection Co., Ltd., of London, England, is in Colorado from Kalgoorlie, Western Australia, and will go to London next week.

M. H. MCLEAN of the Detroit Copper Co., Morenci, Ariz , has returned there from the Black Hiils, S. D., after observation of the mining methods employed there.

A. F. HAZELTINE, formerly superintendent of the concentrator at La Cana-

nea, has gone to Sinaloa, Mexico, as superintendent of the Zaragossa mines and mill.

J. A. UNDERWOOD, former superintendent of the Carisa M. Co.'s mines, Tintic district, Utah, is superintendent of the Carey-Coleman gold mines in Choix district, Mexico.

W. A. CLARK, of Butte, Mont., principal owner of the United Verde C. Co, at Jerome, Ariz, is president of the National Irrigation Congress convening this week at Ogden, Utah.

J. M. HUTCHINS, of Chattanooga, Tenn., interested in the Josephine mine in Kern county, Cal., and in Bohemia and St. Helens district mines in Oregon, has removed to Portland, Ore.

W. BAYLEY of Los Angeles, Cal., president of the Copper Belt Railway and a director in the Bingham Con. M. Co. of Bingham, Utah, has returned from a trip East, stopping in Utah en route.

G. A. KOENIG, professor of chemistry and metallurgy of the Michigan College of Mines at Houghton, Mich., returned last week from an extended visit to the Warren district, near Bisbee, Ariz.

J. J. MCDONALD, having resigned as superintendent of the Commercial (Bingham Con) mine, will on October 1st assume local management of the Utah C. Co.'s (Wall-De Lamar) mines at Bingham, Utah.

O. C. ZINNS has resigned as assistant superintendent of the Zubiate M. Co., near La Colorada, Sonora, Mex, and has gone to Greenville, Plumas county, Cal., as mill superintendent of the Plumas G. M. Co.

Obituary.

D. SWEENEY, a pioneer miner of Shasta county, Cal., died at Red Bluff, Cal., on the 10th inst., from a general breaking down due to old age. Deceased was 86 years of age, and a native of Ireland, coming to California from Massachusetts in 1855. He is survived by two sons and two daughters.

W. G. RICE, who has been general manager of the Stratton estate properties at Cripple Creek, Colo., for the past two years, died at Colorado Springs, Colo., Sept. 13, after a protracted illness due to cancer of the stomach. Deceased was a native of Keokuk, Iowa, 50 years of age, and was for a number of years connected with the Denver & Rio Grande Railroad Co. He is survived by a widow, son and daughter.

Commercial Paragraphs.

THE G. W. Price Pump Co. of San Francisco, Cal., will open new offices at 521-523 Market street after Sept. 20, 1903.

THE Burt Mfg. Co., Akron, Ohio, recently shipped two 15 inch and one 12-inch Burt exhaust heads to the American Steel & Wire Co, Worcester, Mass.

FRANCIS SMITH & Co., No. 83 Fremont street, San Francisco, Cal., are rebuilding their shops, destroyed by fire on the 17th inst, and announce that they are still prepared to receive orders for sheet iron and steel pipe for hydraulic, irrigation and power plants, well pipe, etc.

THE New York offices of the sales organization of the Westinghouse Electric & Manufacturing Co., consisting of the New York Sales Department, Department "I," the Export Department and the General Agent's office, have been removed to the new Hanover Bank Building, corner of Nassau and Pine Streets. The mail address of the several departments of the Sales Organization in New York will be No. 11 Pine Street. The telephone number, 6131 Cortlandt, remains unchanged.

Catalogues Received.

Catalogue No. 12 of the Foos Gas Engine Co., Springfield, Ohio, with illuminated cover and full-page engravings, gives good showing of their several makes of gas and gasoline engines.

Catalogue H of the Burger gas and gasoline engines manufactured by the Woolley Foundry & Machine Works, Anderson, Indiana, gives detailed illustrated description of the several parts of the machine and how it is put together.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPTEMBER 8, 1903.

738,595.—MOORING SCOWS—J. Ayers, Portland, Or.
738,394.—WOODEN STAVE PIPE—A. Bannister, Alameda, Cal.
738,517.—FILLING TEETH—R. K. Belden, S. F.
738,400.—LIFE RAFT—B. W. Booker, Berkeley, Cal.
738,520.—TOOL TURRET—O. L. Brainard, Verdi, Nev.
738,403.—ELECTROVIBRATORY APPARATUS—F. H. Brown, Los Angeles, Cal.
738,408.—GRAVEL WASHER—J. G. Camp, Sacramento, Cal.
738,291.—GOLD SAVING DEVICE—P. H. Carlyon, Olympia, Wash.
738,525.—TRANSMITTER—J. P. Conway, Los Angeles, Cal.
738,296.—GANG EDGER—F. W. Cook, Seattle, Wash.
738,416.—DRILLING ENGINE—J. B. Damas, Sonora, Cal.
738,420.—GAS GENERATOR—W. C. Dillon, Los Angeles, Cal.
738,422.—THY SQUARE—A. Duffy, S. F.
738,423.—MOLDING FLASK—E. G. Durant, Pasadena, Cal.
738,671.—HARROW—J. F. Fulkerson, Oxnard, Cal.
738,316.—PHONOGRAPHS—E. Gilbert, Portland, Or.
738,317.—PHONOGRAPHS—E. Gilbert, Portland, Or.
738,611.—PULLEY FASTENING—A. W. Hight, Ballard, Wash.
738,612.—BORING MACHINE—E. Hipolito, Los Angeles, Cal.
738,686.—BOTTLE—W. E. Johnson, Hatton, Wash.
738,455.—BLACKING BRUSH—E. R. King, East Oakland, Cal.
738,615.—SAW SET—P. H. L. Kletto, Bates, Cal.
738,348.—WINCH—J. J. McDonald, Port Madison, Wash.
738,571.—MINER'S CANDLESTICK—R. P. Rasmussen, Integral, Cal.
738,361.—HARROW—G. D. Schlosser Sunnyside, Wash.
738,635.—OIL BURNER—G. W. Sievert, Los Angeles, Cal.
738,579.—GAS EXTINGUISHER—V. A. Strom, Alameda, Cal.
738,503.—PIPE COUPLING—F. R. Waters, Salem, Or.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

FOUNTAIN BLACKING BRUSHES.—No. 738,455. Sept. 8, 1903. E. R. King, East Oakland, Cal. This invention consists in the construction of a two-part brush attached to a reservoir having a controlled valve through which the liquid is allowed to flow when the brush is in use and which is closed at other times, in conjunction with this is a cap by which the brush is enclosed when not in use, and the brush may be made with a screw or other like structure adapted to receive a removable handle. This handle may be in the form of a bottle or containing reservoir, in which the blacking or liquid may be placed upon the market for sale, and it has an interlocking connection which when the cork has been removed can be directly connected with the socket of the brush, so that the bottle becomes the handle of the brush.

AUTOMATIC GAS EXTINGUISHER.—No. 738,570 Sept. 8, 1903. V. A. Strom, Alameda, Cal. Three-fourths assigned to C. E. Strom, E. R. Taber and F. H. Farmer, of same place. This invention consists of a disk located in the path of the heat rising from the gas flame when ignited and so contrived that the hot air thus rising will raise the disk. Connections between this disk and a lever which actuates the gas-cock are so disposed that the gas-cock will be retained open while the gas remains lighted and the heat rises, but if by any means the gas should become extinguished the weight of the disk is sufficient, when not acted upon by the heat, to release the gas-cock lever and allow it to be automatically closed by weight or spring.

DETACHABLE LIFE RAFTS FOR SHIPS.—No. 738,400. Sept. 8, 1903. B. W. Booker, Berkeley, Cal. This invention relates to improvements in apparatus for rescuing people from sinking vessels, and has particular reference to a form of ship construction whereby a portion of the vessel above the water-line may be detached from the rest of the hull in case of disaster or wreck at sea and made to serve as an ark of refuge for the survivors. In order that the ark may not be damaged by fire in case of the burning of the ship, it may be covered with a sheathing of metal, asbestos or other suitable fireproof material. Around the top, end and sides of the ark may be disposed a series of air-tight compartments, whereby the ark when afloat will be maintained always in upright position.

WOODEN STAVE PIPES.—No. 738,394. Sept. 8, 1903. A. Bannister, Alameda, Cal. This invention consists of socket pieces interposed between the abutting ends of the strips which form the continuous staves and in the employment of bands or metallic strips underlying the bands by which the staves are held together. With this construction curves can be produced, and a structure results which is more nearly uniform in strength at all points than a similar structure of riveted metal.

DRILLING ENGINES.—No. 738,416. Sept. 8, 1903. J. B. Damas, Sonora, Cal. This invention consists of a cylinder having a double-ended piston reciprocating therein, the rod of said piston connecting at one end with the drill or other striking device, and in conjunction therewith of a valve having ports by which steam is admitted alternately at either end of the cylinder, and a second port and passage connecting with the cylinder at the rear end and serving to act as a cushion to prevent the piston from striking the rear end of the cylinder. In conjunction with this is a tilting or oscillating fulcrumed lever pivoted in a centrally disposed chamber and having its lower separated ends so disposed with relation to the reduced central portion of the piston that the enlarged heads of the piston serve to alternately tilt the lever and move the valve at the instant when the piston arrives at either end of its stroke.

MINERS' CANDLESTICKS.—No. 738,571. Sept. 8, 1903. R. P. Rasmussen, Integral, Cal. This invention relates to devices by which a candle may be supported from any convenient point near the work to be done in underground mines. This invention consists in a spring clamp socket for holding the candle firmly, with a means for opening it and a means for suspending said socket from a handle, so that in whatever position the handle may be placed the candle will always stand vertical and will burn evenly.

Latest Market Reports.

SAN FRANCISCO, September 18, 1903.

METALS.

SILVER.—Per oz., Troy: London 26⅞d (standard ounce, 925 fine); New York, bar silver, 57½c, refined (1000 fine); San Francisco, 57⅛c; Mexican dollars, 46c @47½c; San Francisco, 44⅜c New York.

COPPER.—New York: Standard, $13.75; Lake, 1 to 3 casks, $13.75; Electrolytic, 1 to 3 casks, $13.62½@13.75; Casting, 1 to 3 casks, $13.37½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £56 1s spot per ton.

Notwithstanding the fact that most of the new mines are operating nearly up to their full capacity, it is stated that the total output for the year on the Lake is almost certain to be less than 200,000,000 pounds, which is at least 10,000,000 pounds below what was considered a conservative estimate six months ago.

Following are the figures of the German consumption of foreign copper for the months January-July, 1903, compared with the same period of 1902 and 1901, in tons:

	1903.	1902	1901.
Imports	49 263	47,765	38 842
Exports	6,283	5,517	5,449
Cons'ption	42,980	42,248	33,393

Out of the above, the imports from the United States were as follows: In 1903 36,549 tons; 1902, 35,780 tons; 1901. 26,921 tons.

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.75. London: £11 3s 9d per long ton.

SPELTER.—New York, $6.00; St. Louis, $5.00; London, £21 5s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

TIN.—New York, pig, $27.40; San Francisco, ton lots, 28½c; 500 lbs., 29c; 200 lbs., 29½c; less, 30c; bar tin, per lb, 30c @32c. London, £120 10s spot.

PLATINUM.—San Francisco, crude, $18.00 per oz.; New York, ingot, $19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, $47.00@47.50; large lots; London, £8 12s; San Francisco, local, $44.50 per flask of 76½ lbs.; Denver, $49.50. Export, $43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER.—Half-and-half, 100-lb. lots, 18 75c; San Francisco, Plumbers', 100-lb. lots, 15 50c.

NICKEL.—New York, 50@60c per lb.; ton lots, 45@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300 to 500 lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.85 @18.85; gray forge, $15 60; San Francisco, bar, 3c per lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27 00@29.00; open hearth billets, $28.00 @30 00; San Francisco, bar, 7c to 12c per lb.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25 00; extra sizes higher: redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $2.35; Roche Harbor, $2.35 per hhl.

CEMENT.—Imported, $2 50@2.75 per hhl.; California carload lots, $2 25 f. o. b. at works; small lots, $2.50 per hbl. in sacks, 4 sacks to hhl.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.50 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c per set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c per lb.: carloads, 23@23½c; in tins, 30c; soda ash, $2.00 per 100 lbs.; hyposulphite of soda, 3@3½c per lb.; caustic soda, in drums, 3@3½c per lb; Cal. s. soda, hbls., $1.20@1.40 per 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, hhls., 10c; caustic potash, 10c in 40-lb tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c per lb; copper sulphate, 5½@5¾c; chloride of lime, spot, $2 50@2.75: sulphuric acid, in carboys, 66% B, 1¾@2c per lb.; nitric acid, carboys, 8c per lb.

OILS.—Linseed, boiled, hhl., 44c; cs., 49c; raw, hhl., 42c; cs., 47c; Lucol oil, boiled, hhl., 41c; cs, 46c; raw, hhl., 39c; cs, 44c. Kerosene—Pearl, per gal., 20½c; Astral, 20½c; Star, 20½c; Extra Star, 24½c; Eocene, 23½c; Elaine, 26½c; Water White, in hulk, 14½c; Mineral Seal, iron hhls., 18½c; wooden hhls., 21c; cs, 24c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, hulk, 17c; do., cs., 23½c; 86° Gasoline, hulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½ c; Lard Oil, E. W. S., hhl., $1.00; cs., $1.05; Neats-foot Oil, pure, hhl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 70c; Bleached do, 75c; Whale Oil, cs, 50@55c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymho, $7.50; Pennsylvania, hd., $14.00; Scotch, $8; Cumberland, $13; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in hulk, $13 in sacks; Sunnyside, $8.50, long ton.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 6½c; in 25-lb. tin pails, ½c per lb. above keg price; in 1 and 5 lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead—In hhls., 1 ton and over, 6c; do. in kegs, 6½c.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., 6½c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BORAX.—Concentrated, 6@7c per lb powdered, 8@10c; fused, 20@25c.

BORAX.—Crystal, 7c; calcined, 25c.

MANGANESE.—Pure, per lb., 60c.

SODIUM.—Metal, per lb., $1.00.

MOLYBDENUM.—$2 per lb.

CHROMIUM.—(90% and over) per lb., $1.00.

BISMUTH.—Subnitrate, per lb., $1.75.

MERCURY.—Bichloride, per lb., 90c.

PHOSPHORUS.—(American) per lb., 75c.

SILVER.—Chloride, per oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1, 99%, small lots, 37c per lb.; 100 lbs., 35c; 1000 lbs., 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, per lb., $3.50.

ZINC.—Metallic, chemically pure, per lb., 50c; dust, per lb., 10c; sulphate, per lb., .04c.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Always on the right side of question of time—the

ELGIN WATCH

Every Elgin Watch is fully guaranteed. All jewelers have Elgin Watches. "Timemakers and Timekeepers," an illustrated history of the watch, sent free upon request to

ELGIN NATIONAL WATCH CO., ELGIN, ILLINOIS.

SITUATIONS WANTED.

ASSAYER AND METALLURGICAL CHEMIST with best of references desires position. Address C. W. L., this office.

A THOROUGHLY COMPETENT ASSAYER and Analyst, 15 years' experience, with a good practical knowledge of mining, milling and smelting, is open for engagement, with chance for advancement. Excellent references. Address "Everett" care of this office.

COPPER SMELTERMAN IS OPEN FOR ENgagement. Experienced blast furnaceman, metallurgist, assayer, sampler, etc. Good references. Address "Furnace," care of this office

MILL FOREMAN WANTS POSITION—CONcentration, amalgamation, cyaniding and assaying; 20 years' experience. Best of references. Address "Millman," 1056 South Gaylord St., Denver, Colo.

MINES SUPERINTENDENT WANTS POSITION with a substantial company that has a mill on property. A qualified mining engineer who can run a mine or mill, cyanide plant, assaying and surveying. Address "Mining," this office.

POSITION DESIRED AS DRAUGHTSMAN, Surveyor, Assayer or Bookkeeper. Good references. Address H.W.K., Box 74, Long Beach, Wash.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

WANTED—POSITION BY A MINE SUPT. OR manager of 30 years' experience in practical mining and milling; past 17 years spent in superintending, managing and examining mines. Profitable handling of low grade ores a specialty. Climate no object. References from first-class companies. Address "Utility," this office.

RELIABLE MINING MAN

having charge of property in Mariposa county, temporarily closed down, would examine, assay and report on mines in this vicinity. Correspondence solicited. P. O. Box 65, Coulterville, Mariposa County, Cal.

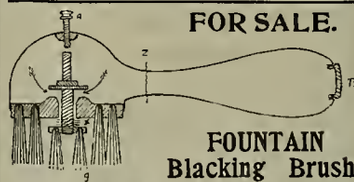
MONEY LOANED MINES.

Developed or partly developed which have Ore in sight. First-class references. Established 1855.

E. N. BREITUNG & CO.,
Marquette, Mich

—THE—
Manganese Mines Company



has a large quantity of ore ground and sacked for sale at Livermore, Cal. Any persons requiring same can get prices by applying at their office,
19 STEVENSON STREET,
SAN FRANCISCO, CAL.

FOR SALE.

MINING PROPERTY FOR SALE.

Consists of 13,000 tons of tailings, 25,000 tons of dump—both good values. Water for working same. Situated 3 miles from railroad. No crushing power required. Guarantee a saving of 80%. Partners cannot agree, so it will be sold cheap. Inquire of James McDermott, Brooklyn Hotel, San Francisco.

FOR SALE.

FOUNTAIN Blacking Brush.

A New and Cleanly Means of Applying Liquid Blacking.

With no pressure on bristles the small brush is kept in position shown by dotted lines *Y*, by the spring *X*. With pressure on bristles, as by rubbing, the small brush is raised to position shown in cut, opening the valve *A* and allowing the blacking to flow onto the bristles as indicated by arrows. Thumb screw *A* securely locks valve, making brush absolutely tight. Bottle in which liquid blacking is sold can be made to fasten on brush at line *Z* and serve as a handle

Pat. in U. S. and abroad. For sale separately or as a whole. For particulars, address E. R. KING, Lafayette, Contra Costa Co., Cal.

NOTICE

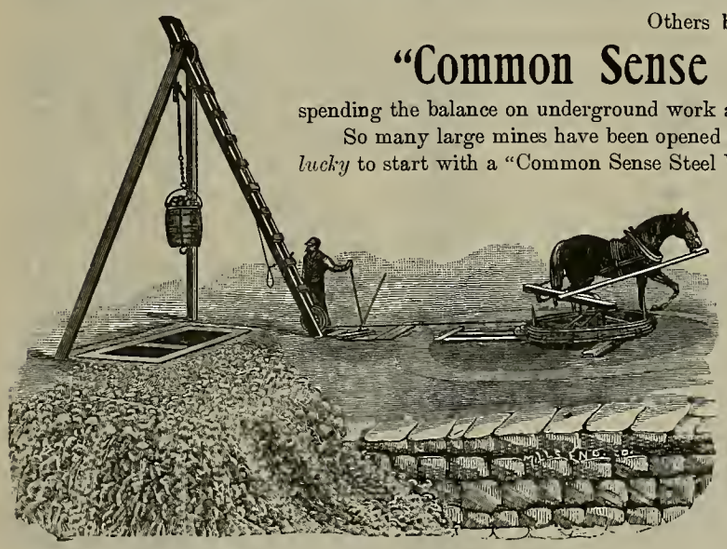
of Receiver's Sale of the Electric Plant, Apparatus, and Other Property of the Cochiti Gold Mining Company.

Notice is hereby given that the Receiver, by appointment of the District Court of the Second Judicial District of the Territory of New Mexico, for the County of Bernalillo, in that certain cause pending therein wherein Raymond P. Ripley and others are defendants, will, under and by virtue of an order of said court made August 20, 1903, receive bids for the purchase and sale of all the property of the said Cochiti Gold Mining Company, now in his possession as such receiver. Said property consists of a complete cyanide mill of two hundred and fifty tons capacity, built of structural iron, various other buildings such as stores, boarding house, store house, bunk houses, etc., etc. The machinery consists of dry crushing apparatus, Davis and Allis finishing rolls, twenty steel leaching tanks of two hundred and one hundred and thirty tons capacity; also sixteen thousand dollars worth of mining and mill supplies; office furniture, etc. And also, situated at Madrid, N. M., an electric power plant and structural steel building, one eight hundred horse power engine, one 600 K. W. generator, complete switches, etc., etc., for a twenty-thousand-volt transmission, and other property such as is generally used in connection with such a mill run by electricity, including one hundred miles of copper transmission wire.

Also the Albemarle, Pamlico, Huron, Ontario patented mining properties, and the U. M. C. and three-fourths interest in the Red Cloud, containing in all almost one hundred acres and having five thousand feet on the strike of the vein. These mines and the mills are situated at Albemarle, Sandoval County, New Mexico, twenty-four miles from Thornton on the A. T. & S. F. Ry.—the other property at Madrid on said railway.

Bids will be received by the undersigned for the sale of said property, or any part thereof, for sixty days from the date of this notice. For the Madrid power plant property, and the electrical machinery, bids must be itemized, fixing the price to be paid upon each separate article; and, also, separate bids must be submitted for the wire, on account of conflicting interests in the property. The buildings and other property may be removed by purchasers from the premises on which they are located.

A reasonable deposit, certified check or cash, must accompany each bid as a guaranty of good faith and responsibility.



Lists of the property and all other information requested will be furnished upon application to the Receiver. WILLIAM SPENCER, Receiver.

P. O. Address: Albuquerque, New Mexico.
August 21, 1903.

Some People "Get Gay" and Blow All the "Dough"

THE COMPANY PUTS UP

FOR FINE SHAFT-HOUSES, HOISTS, Etc.

Others buy

"Common Sense Steel Whims,"

spending the balance on underground work and develop bonanzas.

So many large mines have been opened up in this way that it's now considered *lucky* to start with a "Common Sense Steel Whim."

THE STRONG MINE,

in Cripple Creek district, was among the first prominent mines discovered. Mr. F. E. Kearney became interested in it shortly after its discovery, bought a "Common Sense Steel Whim" and put the shaft down 150 feet, opened up a small body of ore which gave the mine its start, and today it is worth $1,500,000.

No patent on this common sense way of developing bonanzas;

The Patent is on the Whim.

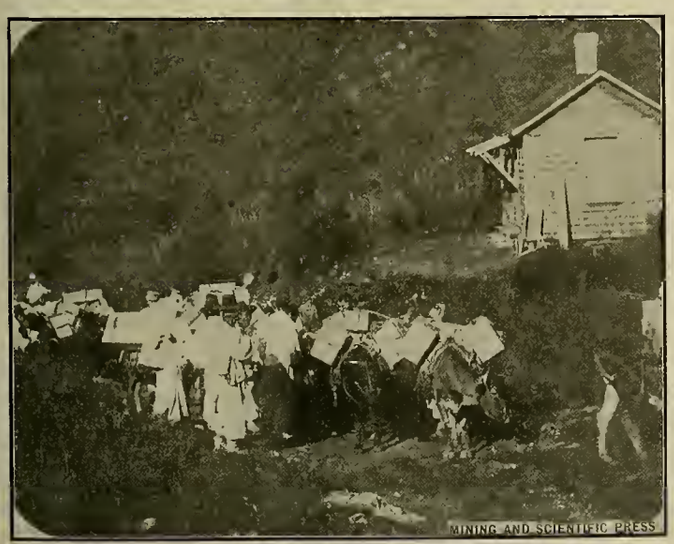
Whole No. 2253.—VOLUME LXXXVII. Number 13. SAN FRANCISCO, CAL., SATURDAY, SEPTEMBER 26, 1903. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

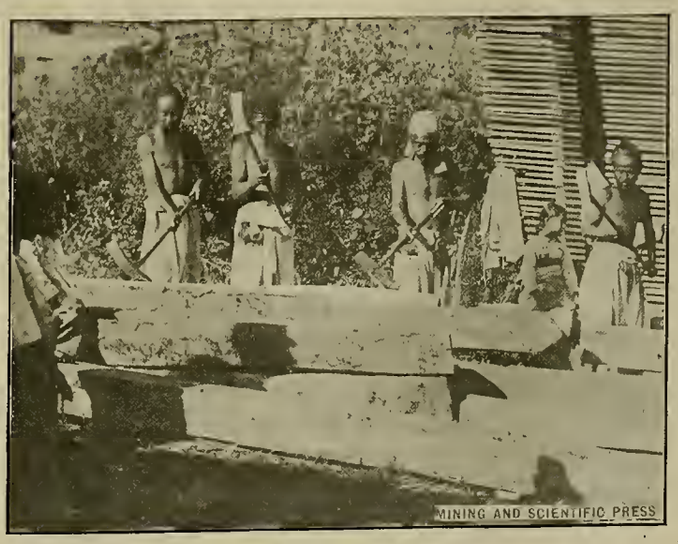
Duplication of Names.

It seems advisable to have some sort of legislation to protect investors and others from the imposition of those persons who give to their unproven mining schemes names so similar to those of famous and valuable properties that the inexperienced and unwary are readily deceived, and invest in worthless stocks, or those having only present speculative value, merely because the name is a familiar one and is associated in their minds with success and dividends. There are great and valuable mines throughout the West, the names of which are household words, and there should be some means of putting an end to this sort of piracy, which permits a mine promoter to assume for his unknown property a name so similar to that of some great and well-known mine that those who are not thoroughly familiar with the mining industry are easily imposed upon, and make investments in the belief that they are buying into a "going concern," and that dividends are assured, either at once or in a very short time. The names of mines are as various, almost, as the names of the men who locate them, and there is no end to the names that may be given; but as a matter of fact the names are often very confusing, owing to the duplication of the name and the duplicity of the promoter. Often a new enterprise may derive some glory, reflected from a near rich neighbor, but this need not extend to the duplication of names. In most cases this is done with only a single purpose—that of taking an unfair advantage of the unwary. Those who contemplate the investment of a large sum of money in a mining enterprise should approach it with the same caution that would be exercised in an investment in merchandising, in real estate or in bonds. Many people seem to think—judging by the ease with which they are induced to part with their money—that the simple fact that the investment is in a mine is sufficient assurance against possible loss. The word mine is not synonymous with profit, nor is it equivalent to failure. The mining industry of America has paid—and is still paying—larger dividends on capital properly invested than any other business, but there is much required of a mine beside a euphonious name, or a pirated one. One in looking over the names of mines is impressed with the constant repetition of those names which have become familiar and associated with large and long-continued dividends. These mines are not in a single locality, but are found all over the mining region.

As there is no law prohibiting this duplication of names, the only thing that would-be investors can do is to investigate any mining investment which they contemplate making. In general, if the investor feels too poor to have such an investigation made by a competent mining engineer, he is too poor to take the risk which such an investment involves. It is true, a number of people of moderate means may consolidate their funds and thus form a strong association, and collectively they can investigate the merit of a new enterprise, and thus protect themselves at small individual cost from imposition on the part of those who would take advantage of their lack of knowledge, individually, and of their dislike to incur the expense of investigation, which, singly, would probably in most cases exceed the amount of the intended investment.



Forty-Stamp Mill at Mia Bong, Korea.



Mining in Korea.

The most important mining operations at present being carried on in Korea are under the ownership of the Oriental Consolidated Mining Co., of San Francisco, Cal., of which H. C. Perkins is president. This company controls a large concession in the northwestern portion of Korea. On the concession there are one 80-stamp, two 40-stamp and two 20-stamp mills, and it is the intention to soon add 60 more stamps, making a total of 260 stamps. One of the accompanying illustrations is that of the company's 40-stamp mill at Mia Bong. Another view is that of a train of cows packing nitro powder and other supplies to the mines. Nearly all of the packing is done on these animals, for which purpose they answer very satisfactorily to the natives who pack and drive them. It is not uncommon to see 200 cows in line on the trail bearing various burdens of things intended for use in the mines. The third picture represents native carpenters squaring timbers with their clumsy adz, in the use of which, however, they are expert. The mines consist of quartz veins which, according to H. B. Kaeding, of San Francisco, Cal., are in a granite country. The veins are accompanied by dikes of granite porphyry and other dike rocks. The company's mills are completely equipped with all modern appliances, and have cyanide plants as well. The several mines are connected by telephone and the plants lighted by electricity. A dam is being built for the purpose of utilizing water power, with which it is the intention to eventually supply all the mines on the concession, by electricity. About 5000 men are employed. All labor is performed by natives, all officers and bosses being from the United States.

Korea is situated north of the 34th parallel, extending to the 44th parallel, and is directly west of California, but the climate is much more rigorous than at the same latitude on the Pacific coast of North America.

Silver.

The present condition of the silver market emphasizes the distinction between silver as a commodity and silver as a currency. No nation can by legislation permanently advance the price of silver as a commodity. But any nation in proportion to its wealth and power can try to create and maintain a relative value for its silver currency, with due regard to the requisite limitation of its silver coinage.

There is in present transit from San Francisco to the Philippines several hundred kegs of silver coin minted at Philadelphia and destined for Oriental circulation. Meanwhile silver as a commodity is steadily appreciating in value; a further rise of less than 6 cents per ounce above to-day's quotations would occasion some complications. The currency system of the Philippines is on a gold basis, the gold peso being the unit of value; the silver peso is redeemable at a gold value of 50 cents. In this silver peso are 416 grains of silver, and in its present upward move should silver as a commodity touch 65 cents per ounce, it would be worth more as bullion than as coin, and, instead of passing into circulation, would be melted down into bar silver and be absorbed. Though it is not probable that that figure will be reached, yet the possibility is present illustration of the difficulty that beset any attempt to set a standard of values as between that which is a currency or commodity, as circumstances determine.

When the U. S. Government began buying silver for the Philippine coinage, it paid 49 cents; it suspended purchase when the price touched 55 cents. Though there is a demand from France and India for silver, and China gives indications of willingness and ability to absorb a fresh supply, yet the contingency indicated is a remote one, because of the plentitude of possible supply. The subject is, however, of interest in every mining camp in America where at present prices silver can be produced at a profit.

The Choice of Manager.

One of the most unfortunate things that can overtake a mining enterprise is the employment by the owners of an inexperienced, or dishonest manager. The position of mine manager is a very responsible one, and requires not only strict integrity, but experience in mining and metallurgical operations, and good sound business capacity and experience as well. The manager should have a knowledge of the details of the business under his direction, though it is not essential that he should "take a hand" at mucking or tramming cars, or even running a machine drill, but he should know something of all of these things, and to have had actual experience in these toilsome tasks is not to his disadvantage.

An American engineer, who a few years ago was unknown to fame, accepted a position as manager of a large mine in South Africa. The salary attachment was large—that is, large for him—more than he had ever received before for his services. In accepting this position he displaced a European engineer who had held the place at a salary far below that paid the American engineer. The new manager made many changes in and about the mine and works, and for a time the company thought they had imported an extravagant luxury—an American engineer—but the end of the year showed that the new manager had not only accomplished all his predecessor had been doing, but exceeded him, and produced from ore of the same grade and tonnage as that formerly worked, a profit of over $150,000 in excess of that made by the former manager. This was during the first year, the following year he increased this materially, and the stockholders realized they had found a valuable man in their manager. The secret of the whole business, if it is a secret, was that the American engineer not only had technical training—his predecessor also had that—but he had learned much in the school of hard experience in the frontier mining camps of the Western United States. He was accustomed to encountering difficulties and finding ways of meeting and successfully overcoming them. He seemed equal to almost any emergency.

In a general way it may be said that of such men as he are the mine managers of the West made up. Some have had more experience than others, some have a greater faculty for mastering obstacles than others, but on the whole they are a class of men equal to almost any occasion, and who, if given an opportunity, will distinguish themselves—for there is much in opportunity.

There are those managing mines in the West, however, who represent a different class. One of these, in charge of a property for an Eastern company, had a small prospect far up on the mountain side. He described the property and its prospective merit in such glowing colors that he nearly persuaded the directors to send him a large mill and smelter, explaining that long before the machinery could be placed in position to operate he would have developed through a tunnel, over 2000 feet in length, sufficient ore to keep the reduction plant in operation for several years. There were some members of the board, however, whose natural business caution suggested that the mine be examined by some other engineer for corroborative testimony. This was finally decided upon, and the engineer engaged reported no ore in sight, and that the proposed tunnel could not be completed within fourteen months, and would probably take longer, and would cost, with compressor equipment, no less than $25,000; that it was highly problematical whether the proposed tunnel would develop any ore; and suggested that the surface showing of ore be followed downward by means of a shaft to determine something of its extent and value before any expensive, long and deep tunnels be run, and particularly before any reduction machinery was bought.

While the prospect was a good one, the company were so discouraged—not to say disgusted—with this sudden awakening, that the mine was shut down for a time; but is in operation again along more common sense lines.

It is most unfortunate that mining property sometimes falls into the hands of mine fakirs, who either are wholly ignorant of mining as a business, or are unprincipled and seeking only to further selfish ends. Mining companies should place the management of their properties in the hands of men of experience and integrity, and when this practice becomes more common, mining investments can not fail to become even more popular than they are to-day. Many mining enterprises of the latter class referred to are placed in the hands of the promoter or principal stockholder as a reward for the large personal influence they wield, but it is often at a sacrifice of the remainder of the stockholders.

Reducing Costs.

Where a mine is in operation and it seems either necessary or desirable to reduce working costs, the first step usually taken by a wise manager is not in making a cut in wages, thereby decreasing the efficiency of the labor employed, but changes are made by the introduction of labor-saving devices, conveying belts are substituted for arrangements requiring labor, and ore and materials are handled by mechanical devices instead of men, and everywhere that it is possible to substitute a mechanical device for men it is done. Plants are built to work automatically as far as possible. The result is generally a greatly increased output at reduced cost, and the men displaced by the machinery are employed in some other branch of the industry. There are a few who condemn labor-saving devices of any sort, but such ideas are short-sighted and foolish as well. Labor-saving machines and devices are in demand and they have come to stay, and the experience of the past shows that they in most cases make work for a larger number than are displaced by the machines. Labor-saving devices render the work of the laborer lighter and usually they permit him to make a higher rate of wages than he previously earned.

Along the line of reducing costs much attention is being given the utilization of waste products. Experiments made in the iron manufacturing regions of Pennsylvania show that the large volume of gases generated in blast furnace operations may be utilized as a means of power. Some engineers who have given this matter a great deal of earnest attention predict that the next decade will see the gases of blast furnaces which are now allowed to go to waste employed in the production of power, and that for this purpose the gases will have a value at least equal to the metal product of the furnaces. This is an extremely optimistic view to take of the matter, but there is little doubt that the near future will see these waste gases utilized in the manner indicated. The gases which arise from the top of the blast furnaces contain a large amount of carbonic oxide, upward of 25% usually, constituting a valuable fuel. For generations these gases have been allowed to pass off into the atmosphere, but the metallurgical world has at last awakened to the fact that these gases possess great value, and already they are being utilized.

In the metallurgy of other ores than those of iron it is now a recognized fact that some of the gases evolved in smelting operations represent a direct waste of valuable raw material. The sulphur which for ages has been burned either in the open air or in furnaces in the treatment of ores, is now recognized as an excellent fuel, by the means of which the ore may be practically made to smelt itself. The pyritic smelting process has a wide field of usefulness, and we may expect to see it introduced into many mining regions where the cost of transportation makes prohibitory blast furnace operations of the ordinary type, where a large amount of carbonaceous fuel is essential in the treatment of the ore. Great advancement has been made the past twenty years in metallurgy, both in mechanical and in chemical operations; but the greater advance has probably been made along mechanical lines. In the future it may be expected that an equal advance will be made along chemical lines.

THERE are many evils in the modern methods of mine promotion. Among these are the gross misrepresentation of facts and the duplication of the names of valuable properties, with which the new scheme is in no way identified or entitled. If mine promotion could be relieved of these two evils, of which the greater is the misstatements made concerning the extent of ore deposits and their value, the placing of meritorious prospects would be accomplished with comparative ease.

CONCENTRATES.

THE COAL in croppings of a vein is usually of poor quality, and the coal generally improves with depth.

♣

LEAD PAINT should never be used for structural iron, as it exercises a corrosive influence.

♣

WITH a 12-inch pipe running to a turbine, with a tank of water holding 1,500,000 gallons, and with a 10-foot fall, there would be a pressure of 4½ pounds per square inch at the turbine.

♣

THE rock from Pocabontas, Ark., is a fine-grained quartzite, containing small crystals of pyrite. The accompanying ore is green carbonate of copper malachite. This ore contains 71.9% cupric oxide.

♣

SUPERHEATED STEAM is superior to saturated steam on account of the large losses due to the condensation of the latter. The method of superheating the steam as it leaves the boiler is simple, and consists merely in passing the steam pipe through the heated gases before it enters the tender.

♣

VENTILATING FANS, having propeller-shaped blades, have proved inefficient in mine ventilation, though fans of this type answer admirably for the ventilation of mills or other rooms, where the resistance is low, but for mines the direct-acting centrifugal fan has been found to meet most requirements.

♣

THE usual form of lead in zinc blende is as sulphide. Oxide and sulphate are formed when it is roasted. These compounds react with the still undecomposed sulphide, forming sulphur dioxide and metallic lead, which volatilizes. Lead sulphide and oxide are also directly volatile, though at a higher temperature than the metal.

♣

ORES containing free gold which is at all coarse cannot be successfully treated by cyanidation, as the coarse particles of gold will not dissolve in the solution. Such ores should first be amalgamated, and subsequently the tailings may be cyanided, if they contain sufficient values to warrant it and it is found the material is amenable to the process.

♣

THE mineral from Pinon, Montrose Co., Colo., is evidently a highly metamorphosed rock, evidently from the plane of a fissure, where it has been subjected to movement and crushing. The scaly mineral incrusting the dark pieces is gypsum (selenite). The rock has no value, though ore may occur elsewhere in the same fissure or vein.

♣

PLATES which have been cleaned with a rubber will usually yield a further amount of amalgam by placing over them either a quantity of hot sand or sacks upon which boiling water has been poured. As soon as the plates are hot go over them again with the rubber. A still further amount of value may be obtained by careful scraping with a steel chisel, but the latter process cannot be recommended.

♣

THE small black rock specimen from Greenhorn, Or., is olivine basalt of ordinary type. The metallic gold color showing on one side has been produced artificially, probably by one striking the rock with shoes nailed with brass tacks. The other specimen is apparently a fragmental rock, consisting of rounded grains of quartz and other hard minerals cemented by a much decayed material. It has the appearance of being arkose—that is, derived from granite.

♣

THE small rock specimens from Buena Vista, Colo., contain quartz, orthoclase (potash feldspar), more or less altered, and small greenish white scales of an altered hisilicate mineral, probably originally hornblende. It has a finely granular structure, and may be called an aplite. It is too greatly altered to make identification positive. It also contains, as secondary, pyrite in small crystals and grains. Specimens for determination should be larger than those here referred to.

♣

JAVASITE is a composition of sulphur trioxide 31.9, iron sesquioxide 47.9, potash 9.4, water 10.8. It is ochre yellow, yellowish brown and clove brown in color, with a yellow, shining streak. It has a hardness of 2.5 to 3.5, and is brittle. The mineral is found in many ores, particularly those in sedimentary formation as in quartzite and limestone. It often looks like yellow silt, and sometimes presents a bright subadamantine luster. The brownish varieties are sometimes found in lignite.

♣

WITHOUT DOUBT the "order of drop" of stamps in a battery has an important influence on the capacity of the battery, if not also on amalgamation. If the stamps are allowed to fall in the order 1, 2, 3, 4, 5, it would result in the pulp being all driven toward the end of the battery where No. 5 is located. It is the aim of the mill man to have an even distribution of pulp in the battery at all times, and this is accomplished to a great extent by the sequence of drop of the stamps. The two methods most in vogue are 1, 3, 5, 2, 4 and 1, 4, 2, 5, 3. Beside these 1, 5, 2, 4, 3 and 1, 5, 3, 2, 4 are also often used. In various regions the number of stamps per mortar varies all the way from a single stamp to eleven stamps, but long experience has demonstrated that the most satisfactory results are obtainable with five stamps per mortar where more than two stamps are employed.

♣

THE grade of mill plates is variable, ranging from 1½ inches per foot to 2½ inches or over. Heavily sulphuretted ore requires heavier grades than lighter quartz, comparatively free from sulphides or other substances of high specific gravity. The amount of water employed in the battery also has an important influence on the amount of grade given the plates. A large volume of water with heavy grade is almost certain to result in scouring. Many mill men divide their plates into a series of steps. The height of drop should be about ½ inch, as a greater drop will cause scouring.

♣

MERCURY has many uses besides the amalgamation of ores. One of its chief uses is in the making of mirrors. This is accomplished by means of tin amalgam. A sheet of tin foil of the same size as the glass to be silvered is laid upon a level table and rubbed over with mercury, a thin layer of the metal being afterward poured upon it. The glass is then carefully slid upon the table and directed in such a manner as to push before it the excess mercury. Heavy weights are then laid upon the glass, and in a few days the tin and mercury will be found to adhere firmly to the glass. The amalgam contains one part of mercury and four parts of tin.

♣

IN figuring the width of belting for high-speed work, the matter of centrifugal force must be taken into consideration. The natural tendency of the particles of the belt is to move straight ahead and not pass around the pulley. This tendency forces the belt away from the pulley, so that as the speed increases the belt adheres less and less to the surface of the pulley, and a wider belt is required to transmit a given power than would otherwise be the case. For this reason doubling the belt does not double the power it will transmit, but multiplies it by something less than two, and for this reason, also, there is a limiting maximum speed above which a belt can not be run without great loss of power. For laced belts this is about 5400 feet per minute, and for cemented belts about 6300 feet per minute.

♣

IN Mexico, where A intends to prospect for mineral, he should present a written notice to the mining agent of the district within which he wishes to prospect, and the agent, after clearly defining the limits of the territory within which the prospector may operate, shall return one of the duplicate notices to the prospector, after endorsing thereon the day and hour of the presentation thereof. This secures to the prospector the exclusive privilege of exploring within the territory described in the notice, but a failure to secure such permit from the mining agent of the district gives to the prospector no privileges, and any person entering on the same territory and complying with the requirements of the law may "denounce" any mineral veins or deposits that may be discovered.

♣

IN the bromo-cyanide (Sulman-Teed process) the bromine solution is made up in a separate tank, having a strength of 7% or 8% bromide of cyanogen. From this tank the bromide solution is added to the regular cyanide solution, but an excess must be avoided, as the bromo-cyanogen is no longer operative after passing the zinc boxes. The amount of bromo-cyanide should not be greater than 25% of the potassium cyanide present in the regular solution. The process has been successfully applied on some arsenical gold ores. The theory of the process is that the bromo-cyanide process contains a greater cyanogen "potential" than the ordinary solution. By the Sulman-Teed process the gold is precipitated by means of what is known as zinc fume in a special apparatus, known as the Sulman precipitation cone.

♣

THE speed at which a flywheel may run with safety is determined by the strength in tension of the arms of the wheel; by the strength, in a tangential line, of the weakest point in the rim, which, in sectional wheels, is the point of the union of sections, or of both combined. Thurston, in A Manual of the Steam Engine, says: "For a maximum safe stress of 10,000 pounds per square inch, or 1,440,000 pounds per square foot, as for wrought iron or steel, the breaking speed has been found to be about 300 feet per second. For cast iron, the maximum speed is about 220 feet per second, and about one-third of these velocities are usually taken as safe. The safe speeds are not far from 150 to 200 miles per hour." A wire-wound flywheel of special construction in the Mannesmann works at Landore, Wales, is over 20 feet in diameter, wound with seventy tons of wire, and runs at 240 revolutions per minute, which gives a tangential velocity of 15,080 feet, or 2.85 miles per minute.

♣

THE least expensive method of mining ores is probably by the open-cut system. This method is largely in use in the Minnesota iron mines, where the ore occurs in immense shoots either at or near the surface. The iron ore is of such a character that it breaks up upon blasting into comparatively small fragments and it is loaded upon railroad trains by means of steam shovels. The cost of mining by this method is but a few cents per ton and is considerably cheaper than any other method known. Gold ores are rarely, if ever, mined in this manner, owing partly to the fact that the gold-bearing deposits seldom occur in a form to make this method of mining advisable. The next cheapest method is by what is known as the milling system. This is by means of an open cut in which the ore is broken and passed down through a raise (mill hole) to a chute below, from which it is trammed to the reduction works. Underground methods are the most expensive. No average of cost of mining can be stated, for the reason that conditions vary so greatly. One mine may be able to deliver rock at a mill for less than 40 cents per ton, and at another mine in the same vicinity the cost may exceed $4. Cheap mining requires a large deposit or vein, good standing ground, good climatic conditions, cheap supplies, good miners and good management.

♣

NITROGLYCERINE is manufactured in large quantity at a number of places in the United States. It is used chiefly in the preparation of various kinds of explosives, chiefly for rock blasting. Its manufacture may be briefly described as follows: A quantity of concentrated nitric acid is mixed with twice its volume of strong sulphuric acid, in a lead-lined tank. The mixture is cooled by means of leaden coils through which a stream of cold water is constantly circulating. Glycerine is sprayed into the acid, particular care being taken to prevent a rise in temperature above 30° C. The mixture is then allowed to cool, upon which a large percentage of the nitroglycerine floats on the surface and is drawn off into water and thoroughly washed. The lower layer is then drawn off into water for the purpose of separating the nitroglycerine remaining, which sinks to the bottom. An alkali is added to the last washing water to neutralize any free acid which may remain, and the nitroglycerine is then ready for use. It is one of the most violent explosives known. As nitroglycerine can only be used conveniently in blasting in "down holes" it is mixed with various absorbents in varying proportions for convenience in mining operations. Nitro-powders are equally effective in dry or wet holes. Blasting gelatine, which is made by dissolving collodion-cotton in nine times its weight of nitroglycerine, is stated to be a more powerful explosive than nitroglycerine alone.

♣

GOLD is malleable and ductile to a greater extent than any other metal known, and it possesses these properties at all temperatures below the point of fusion. A single grain weight of gold can be drawn into a wire 500 feet in length, and sheets can be obtained by beating of which 300,000 would be required to make an inch in thickness, and these leaves, though so thin as to transmit light (green in color), may be still further reduced in thickness by floating for a short time on a solution of cyanide of potassium. In hardness gold is between aluminum and silver. Pure gold has a tensile strength of seven tons per square inch, but an admixture of some other metals having high atomic values, such as lead, bismuth, tellurium, etc., renders the metal very brittle. One part of bismuth in 2000 of gold makes an alloy which may be crumbled in the fingers. Gold fuses at about 2240° F., and when highly heated is slightly volatile. The volatility of gold is increased by alloying with some other metals. Experiments have shown that 100 parts of gold alloyed with twelve parts of copper, if subjected to a heat sufficiently high to keep it melted for a period of six hours, loses 0.234% of the gold and an increase in the amount of copper was accompanied by an increase in loss of gold. Gold alloyed with silver only is not as volatile as when copper is also present. There is always a certain loss by volatilization when gold is poured from a melting pot into molds, particularly when copper is present.

♣

THE Federal statutes limit each placer claim to an area twenty acres, but permit an individual to take as many as eight separate locations of twenty acres each, or total of 160 acres. These may or may not be contiguous locations. On each claim $100 worth of work must be performed annually, or, if desirable, the work may all be done at a single place—$800 worth for the benefit of all the claims which, to take advantage of this provision of the law, must be contiguous, or if only two or more are contiguous the work necessary to "represent" the two or more claims—$100 worth being done for each claim in the group. For instance, if five claims were located in one group, at one place, in a gulch, and three claims in another group in another gulch, it would be proper and miner-like to begin work on the lowest or down-stream claim, and in one instance $500 worth of work must be done or improvements made, and in the other case $300 worth. An association, company or corporation cannot take up more than 160 acres of placer ground, and such association must consist of at least eight persons. It is also necessary that placer locations shall conform as nearly as possible to the subdivisions of the surveyed lands, and for this purpose forty-acre tracts may be subdivided into ten-acre tracts—a block of ground 660 feet square. The mining laws of Arizona require that a hole 10 feet deep be sunk on the claim within ninety days after location (or deeper if necessary to show ore in place), and to record the location in the office of the County Recorder, and to properly monument the claim. In addition to the above the annual assessment work must be done as required by the laws of the United States. In a group of claims located in Arizona the territorial law requires that the 10-foot shaft, or its equivalent, be sunk on each claim, but the annual assessment work may thereafter be all done at one place—$100 for each claim in the group—if it can be shown that such concentration of work be for the benefit of all the claims of the group.

The Mechanical Drying of Minerals.*

Written by C. O. BARTLETT.

While the mountains of our country are rich in deposits of gold, silver and other precious minerals, and lead and zinc are found in many of our prairie sections, as well as in the mountains, and coal and oil in nearly every section, all of which have heen and are now heing searched for in every locality, yet there are many places where there are deposits of fine clay, suitahle for firehrick, sewer pipe, crockery, paints and Portland cement, which remain untouched.

Ten years ago the manufacture of Portland cement in this country was comparatively a new industry, and we were paying exorhitant prices for English and German hrands. Engineers hegan to investigate, and soon found a fine quality of clay, marls, limestone and chalk suitahle for making Portland cement. Capitalists put money into the husiness, and the result has heen that last year more than 15,000,000 of harrels of Portland cement were manufactured in our country, and of a better quality than could he produced in England or Germany. Entire huildings are now heing made of it and railroads are using it extensively.

To utilize these clays, limestones, etc., in cement, it was found necessary to dry them. Clay varies in moisture from 10% to 25% and limestone from 6% to 12%, hence the necessity for some kind of mechanical drier. As it is with clays for Portland cement, so with clays for paints. A certain so-called clay near Bedford, W. Va., is so rich in iron and aluminum that by drying and calcining (burning out the vegetahle matter), leaving iron, aluminum and silica, and afterwards mixing in oil, it makes a fine paint, rich in aluminum, and a pine hoard painted with one coat, will stand a high heat for some time without hurning the wood.

I have seen so-called clay paint in Madison county, Mont., so rich in aluminum and iron that by simply drying, pulverizing and mixing with oil, it has stood a severe weather test for years.

There are three ways to mechanically dry minerals:

First—By direct heat, by which is generally meant the use of the rotary drier, or a horizontal cylinder, set in hrickwork with front and grates similar to a horizontal hoiler. The cylinder is set on an incline and revolves from five to eight revolutions a minute. The material to he dried is fed into the cylinder at the front end, the fire heing at the other end, and at each revolution of the cylinder the pulp is carried forward toward the discharge end.

Second—By air, which has first heen heated, either hy direct heat or by steam pipes, and afterwards passed through the material to he dried.

Third—By steam heat direct, hringing the material to he dried in direct contact with the steam cylinder or pipes.

The first method is the cheapest, for the reason that hy using direct heat a temperature of 2500° to 3000° can be had, while by using heated air the temperature is very much less, and hy using direct steam heat the temperature is only from 230° to 330°, according to the amount of steam pressure, and this temperature is on the inside of the pipes of cylinder, which means considerahly less temperature on the outside, where the material is. By first superheating the steam the temperature can be made much higher, but the cost of superheating the steam will nearly counterhalance all gain in temperature. Great care should he taken in the construction and erection of all direct heat driers; all iron parts should he so constructed as to allow for contraction and expansion. All settings and bearings for the drier should he suhstantial, on account of the liahility to get out of place hy the settling of the brickwork and hy the extreme heat. The steel sheets of the cylinder should he of the entire length, and all seams should run the longitudinal way of the cylinder. There should be no cross seams at all.

In huilding steam driers great care must he taken with every joint and rivet, otherwise the contraction and expansion will cause the joints and rivets to leak.

In drying any and all kinds of materials they should first he broken into 2-inch cubes or less, as it does not pay to dry large pieces. All material is supposed to have been crushed hefore entering the drier.

It is necessary to have as large heating surface as possihle and to keep the material heing dried constantly in motion, cascading it through the heat so that the heat can easily penetrate through a thin hody of material, carrying off the moisture.

The cost of drying minerals depends, first, upon the amount of water or moisture contained therein. In other words, concentrates, ores or silica will not carry more than 10% or 12% moisture, while clays and marls will carry two or three times as much, and peat will sometimes have as much as 80% moisture. It is generally safe to estimate on evaporating ten pounds of water for one pound of coal (or its equivalent) used. When drying concentrates, ores, limestone and other similar suhstances, where the fire can pass through the material to be dried, therefore, it will he readily seen that it will not pay to dry any kind of material containing 80% moisture, unless it is very valuahle. It can be dried, but the cost of doing it will prohahly he more than the finished product is worth.

To dry peat, we start with 100 tons of peat containing 80% moisture, and reduce it to 5% moisture, which means to evaporate 75 tons of water, leaving 25 tons of peat, containing 5 tons of water. It will take one pound of coal (or its equivalent) to evaporate ten pounds of moisture, which means no less than 15,000 pounds of coal to dry the 100 tons of peat, and it is difficult in drying peat to evaporate ten pounds of moisture with one pound of coal, for the reason that when nearly dry it becomes combustible, and is liable to take fire and hurn, consequently it requires slow firing.

There are those who believe it is an easy matter to dry 200 or 300 tons of peat a day, and that it can be dried cheaply, hut I wish to say to all such that it is much easier to say than to do. It is far hetter to store the peat in large sheds, or even out of doors, where it will drain and dry by the winds and sun, down to 40% moisture, after which it may he profitably dried on mechanical driers.

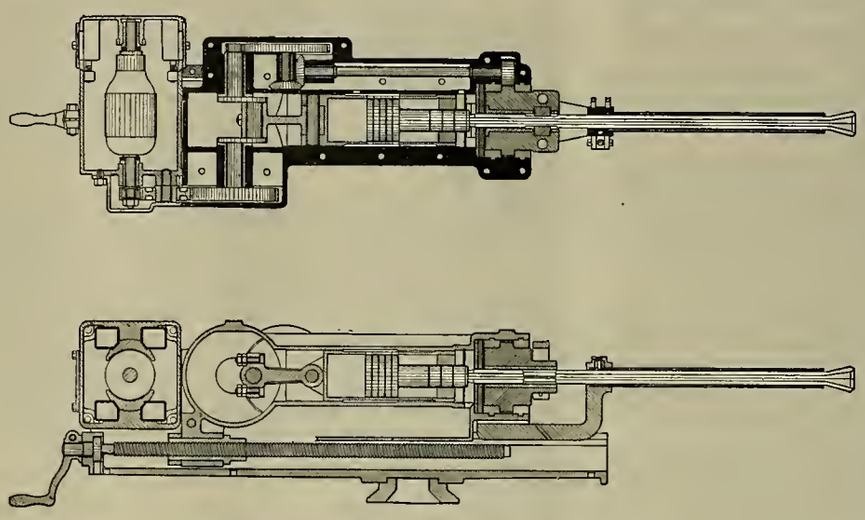
It is quite a different matter to dry 100 tons of concentrates, or ores, for here we have but 8% to 10% moisture, which we wish to reduce to 2.5%, which means about 11,000 pounds of moisture, requiring ahout 1100 pounds of coal (or its equivalent) to dry it, and as the freight rates are frequently high in the mountain regions it will pay to dry out the moisture before shipping. It does not pay to ship water in ores and concentrates, for the cost of drying them is usually less than the cost of freight.

The second important matter as to the cost of drying minerals is, whether the material to be dried will admit of passing the products of the fire through the material without injury. Better results can often be obtained from the same amount of fuel hy first passing the heat around the outside of the drying cylinder, then through the material. By this means (the temperature of the gases passing off) the drier can be brought down to 125° F., which means that nearly the entire heat of the coal (or its equivalent) is utilized, but when used on the outside of the drying cylinder only, not quite so good results can he ohtained.

Most minerals, such as concentrates, ores and clays, are not injured hy passing the products of comhustion through them. Some fine clays, and even some kinds of sand used for glassware, will not admit of it, on account of the danger of coloration by the fire products. In all such cases it is necessary to use oil or gas for fuel, or to keep the products of combustion on the outside of the drying cylinder.

The third important feature is, Whether the material to be dried is of a siliceous or clayey nature. If it is silica the moisture is easily driven off; if of a clayey nature it will he more difficult to evaporate the moisture, hesides the sticky material is liable to adhere to the parts of the drier, causing trouhle, and consequently more expense in drying. It is seldom, however, that anything adheres to a heated surface.

The next feature as to the cost of drying is whether the material is of an expensive nature, or whether there is danger of hurning, such as coal, peat and similar materials. If so, the heat must he of a low degree. There is no danger of hurning anything when it contains a considerahle amount of moisture, and in drying some kinds of such materials it is sometimes well to use two driers, firing heavy on the first drier while there is plenty of moisture, and finishing on another drier with light firing.



The fifth feature, regarding the cost of drying, is whether it be necessary to dry to a very low degree of moisture; in other words, it is more expensive to dry down to ½% than to 2%. Generally speaking, however, it is not necessary to go helow from 2% to 5% on most materials.

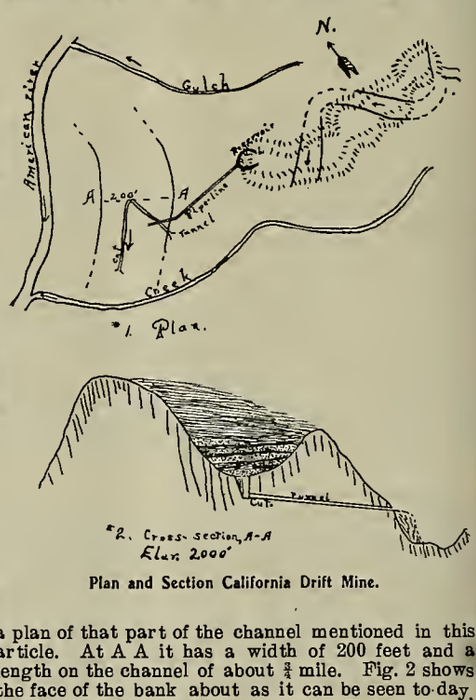
*Trans. Am. Min. Congress. (Condensed).

The Box Electric Drill.

The Box electric drill was on exhihition at Deadwood, S. D., during the session of the American Mining Congress. F. E. Shepard of the Denver Engineering Works Co., Denver, Colo., had charge of the drill exhihition.

By referring to the accompanying illustration it will be seen that the connecting rod joins with a small light cylinder moving inside of the main drill shell, the cylinder being reciprocated by the motion of the crank. Inside of this moving cylinder is a heavy piston with a thick piston rod. This comhined one-piece-steel piston and rod is the hammer of the drill, and when in motion strikes the end of the drill steel with the end of the heavy piston rod. Each end of the moving cylinder is filled with air at atmospheric pressure, which, being alternately compressed and rarefied, is designed to act as a spring. To compensate for possible leakage, and to insure a full supply of air, two ports are cut in the side of the moving cylinder, located so that as soon as the piston moves from its central position one port is opened to the atmosphere and a supply of air rushes in. These two ports also serve to equalize the pressure on hoth sides of the piston every time the piston passes its central position.

Box Electric Drill



A hinge hetween the guide shell and the cone of the clamp enahles the whole drill to he tipped to one side or the other, therehy enabling long drill steels to be inserted or removed from the drill or hole without disturbing or changing the "set-up" of the drill.

The Denver Engineering Works Co., Denver, Colo., manufacture the drill.

A California Drift Mine.

Written for the MINING AND SCIENTIFIC PRESS by W. E. THORNE.

In the following the writer has endeavored to show some facts, not "theories," in regard to some of the cement covered gravels of California. Fig. 1 shows a plan of that part of the channel mentioned in this article. At A A it has a width of 200 feet and a length on the channel of about ¾ mile. Fig. 2 shows the face of the bank about as it can be seen to-day, having vertical height of 200 feet. The surface of

Plan and Section California Drift Mine.

tbe lava is covered by a growth of pine and spruce trees, most of it being small timber.

Number 1, or bedrock gravel, carried tbe most values and is about 5 feet in deptb. Number 2 is about 6 feet deep, carries some gold, but not enougb to pay to drift; number 3, 4 feet in depth, some gold; number 4, 3.5 feet deep, small values; number 5, 5.5 feet—in tbis, tbe upper cbannel, was found the coarsest gold, but not so rich as No. 1. All tbe bedrock gravel was drifted out in the early 50's and is said to bave paid well. Later it was worked by hydraulicking, about one-balf being worked over, tben the debris law put a stop to tbe work. In working ovsr tbe ground a good many quartz veins were found. In some of tbe side channels tbat crossed thsse quartz veins there was found an abundance of quartz boulders, also extending into tbe main cbannel, giving to tbe cbannels in sucb places nearly all white gravel and causing tbe miners to call tbem white cbannels, but were really only a part of tbe same cbannel. As a rule, tbese parts were tbe richest.

In sketcb No. 1, tbe channel from tbe east, according to some of tbe miners who were at work tbere, consisted of two series, running in almost opposite directions, but after a careful examination and by running levels over tbe same, tbe conclusion was reacbed that it was tbe same channel—as tbe sketch indicates. It was found tbat tbe upper end of tbe lower section was about 10 feet above tbe lower end and tbe lower end of tbe upper section was about 10 feet above the upper end of tbe lower section. Tbe missing section, of course, we could not tell tbe lengtb of. In places on tbis small cbannel we found there bad been two flows of lava, as we found two beds of gravel, one above the other. In the section of tbe main cbannel there are found four distinct flows of lava. In some parts of this work it was found tbat the erosion bad cut tbrougb the lava and in such places tbe bed of gravel was continuous. Again in working up the side cbannels we found tbat they bad not been covered by tbe first or second flows of lava and tbis would account for some of the gravel being on top of tbe lava in places, also proving that where we can now see five distinct gravel bsds tbat tbey did not extend all along the cbannel, but only formed small bars in places.

In working this by tbe bydraulic metbod a ditch was built some 12 miles with a capacity of 250 miner's incbes; tben by a series of storage reservoirs, one at tbe bead of tbe pipe line, a No. 3 giant was used for tbree or four hours at a time. A bedrock cut was brought up from the lower end and for a time carried off all the tailings; later a tunnel was driven and all material passed out tbat way. Tbere is quite a lot of clay in places in tbis gravel. Tbis caused the company to bave an undercurrent built about ½ mile down tbe canyon. Tbis undercurrent caught enougb gold to pay for a watcbman all tbe time during operation and leave about $100 per montb for the company. A sbort time after tbis company ceased operations tbree practical miners obtained a lease on the canyon between tbe undercurrent and tbe lower end of the main sluices and in less than six montbs they had cleaned up about $2500. Tbis sbows tbat a good undercurrent at tbe lower end of tbe main sluices migbt have been a good investment. The bedrock is of clay slates and after exposure tbey decompose rapidly. In some places tbat which looked like solid rock proved to be full of small seams that bad been cemented by tbe decomposing of tbe iron pyrites and were very rich in some places, paying to work to 3 or 4 feet in deptb.

Aerial Tramways.*

Written by S. DE ZOMBORIA, C. E.

In addressing you upon tbe subject of aerial tramways as an economical means of transportation, it is not my objsct to enter into a technical discussion of tbe subject, but, rather, to discuss the conditions wbich warrant the construction of such aids to mining enterprises, and those types wbich will give the most satisfactory results from tbe mine operator's point of view, as well as some of the many advantages of this system of transporting ores from the mine to the reduction plant.

As a curious fact, we could mention tbat wire ropes served for transportation methods many centuries past, and researcb among the ruins of Pompeii have brought to light wire rope, specimens of which are to be seen in museums in Naples.† Tbere are wood cuts in some of the mediæval German books which show perfectly developed tramways. The early methods of tbis mode of transportation passed into oblivion, bowever, and it was not brought again into extended use until the '40s of the last century.

Almost from the origin of trams we find that two distinct types were known—the single and the double rope tram. Tbe home of tbe former was in England, while tbe double rope system is extensively used in Germany and tbe wbole world.

Tbe experience of tbe past two or tbree decades bave sbown many marked advantages of this type of transportation. Discussing the merits of botb tbe single and double rope types the advantages migbt be expressed tbus :

Undulated profile is of little importance, since tbese tramways are equally effective on plains or in a mountainous country. Expensive understructures, viaducts or trestle work, is absolutely unnecessary, the ropes being suspended on wooden towers, wbicb are of simple construction, erected at intervals of 200 or 300 feet. If tbe formation of tbe ground does not permit tbese distances, it is possible to construct spans of even as many tbousand feet. Deep gulcbes and ravines (wbicb are effectual barriers to transportation of otber types), offer no obstruction to a rope tramway, and some of tbe finest tramways in the country bave solved just such problems for mine operators. Climatic conditions in no manner interfere witb tbe action of a tramway, permitting tbe continuous operation in most inclement weatber. Thus tbe beavy expense of keeping mountain roads open during tbe winter are avoided.

Anotber marked advantage is tbe fact tbat tbe time occupied in construction is mucb less tban for tbe construction of other systems of transportation. Especially is tbis true in a mountainous country. Tbe adaptability of tbe tramway is so great tbat it will meet tbe most urgent demands made upon it, and, unlike rail or wagon roads (should occasion demand), tbe plant can be wrecked and installed in a new location at moderate cost and witb a surprisingly short loss in operating time.

In tbe main these advantages apply to both tbe single and double rope types. Both types bave tbeir advantages. I only will compare tbem. Tbe single rope type being mucb simpler in its construction, baving less parts, bas tbe advantage in being cbeap in primary cost and erection. Its principal drawback is tbat it can convey only a limited amount of material. Tbere are tramways of this system with an bourly capacity of tbirty-five tons, yet tbese particular tramways did not get beyond tbe experimental stage, and it is not advisable to deliver more tban 20 tons per bour. Tbe practical mine operator, wbose bope and ambition is to vastly increase tbe output of bis mine, would hardly consent to install a system wbich in itself was of so limited capacity. Yet its main advantage, as stated, is its cbeapness of construction, a fact wbich always must be taken into consideration.

Anotber disadvantage of this system is the fact that tbe strain upon tbe parts is heavy, with consequent expense of repairs and loss of time in operation, itself no small item in working costs.

Tbe double rope system, wbich is of far more extensive use, is more costly in installation, but is always advantageous on account of its capability of increased capacity as occasion demands in tbe future development and output of a mine. Speaking of capacity, I could mention tbat tbere are lines whicb deliver 250 tons of ore per bour. This special line has been in almost continuous operation since tbe fall of 1898, and since its installation its repairs have been of such trifling cost tbat even its builders have been surprised. Operating costs are low. One Colorado tramway, wbicb traverses a very rougb, mountainous country, approximately 10,000 feet in lengtb, is bandling ore at a cost of 17.6 cents per ton, with the cost of maintenance 1.5 cent per ton. These admirably low figures are due to tbe fact tbat tbe systems now being perfected require the services of only very few men on the entire line. The addition of automatic devices, wbich perform tbe work of loading and dumping, bave generally decreased the labor costs until now only one or two men are required to watcb tbe loading of the buckets. As is generally understood, most of the double rope tramways wbich are in operation througb tbe mining districts of the country, require no power, being operated by gravity entirely. Even tben the power which is produced by tbe weight of the buckets can be turned into a source of profit, being sufficient to meet demands for ventilating purposes, for the operation of dynamos for lighting plants and operating mine pumps, as can be seen in some of the larger Western mines.

Tbe division of strain upon the ropes in this double-rope system reduces the repair bills and at the same time renders stoppages less frequent.

Returning for a moment to the matter of automatic systems: There is to-day a tendency to render these tramways more and more automatic in tbeir operation. It is a question in the mind of the trained engineer. Just what is the limit ? What is of more concern to the prospective or actual owner of a tramway ? How far can we go in making the tram entirely independent of human control and then take the risk of the eventualities which are connected with all such machinery ?

Reduction of labor costs is always an object in considering operating costs, but yet, in the opinions of many engineers, it will not be advisable to entirely dispense with it. The aim of tbe constructing engineer should be to plan a tramway which would be as nearly automatic as is consistent witb due regard for the safe conveyance of its traffic.

In all the double-rope systems which are in general use, tbe principle of construction is tbe same. That is, the ropes, pulleys and sbeaves, as well as the otber machinery in use, perform tbeir duties in the same general fasbion, differing only in design. The difference between the systems is cbiefly in the matter of attacbing buckets to tbe rope. Tberefore, double-rope tramways migbt be divided into tbree general types: First—Tbe system in whicb a clip or lug nut is permanently attached to tbe running rope wbicb drags tbe bucket suspended on a standing or immovable rope.

Second—Tbat system in wbich a clutch attacbed to tbe bucket seizes tbe running rope and remains attacbed thereto by means of friction. This latter system migbt be further subdivided into two classes : One in wbicb tbe friction is created by an eccentrically operating lever locked and released automatically, securing a constant friction tbat is independent of the angle whicb tbe traction rope forms witb the borizontal; second, one in wbich tbe clutcb exerts friction on tbe traction rope by a lever on whicb tbe weigbt of tbe bucket is transmitted. Tbis friction varies with tbe cosine of the angle tbe line forms with tbe horizontal.

The tbird and latest development is that system in wbich tbe buckets are fastened permanently at certain distances to the traction rope. On tbis system tbe buckets are loaded witb a walking bin, wbich runs simultaneously on parallel rails above tbe buckets in the station, loading tbe same.

It is impossible to here enter into extended discussion of tbe merits of tbese tbree systems of double-rope tramways; but I will mention some of the most marked differences. Tbe clip system enables us to bandle the buckets at exactly tbe same intervals. Tbis prevents accidents wbich might result from tbe failure of laborers to keep tbe buckets loaded and moving at the proper distances. One marked disadvantage of tbis type is tbe fact tbat tbe wear on the traction rope is constantly in tbe same place, tbereby weakening the strength of tbe rope at these points.

Sbifting tbe clips from time to time is resorted to in an effort to overcome tbis difficulty, but with a more or less extended loss of time. In tbe second class tbis difficulty is not encountered, because tbe grip seldom if ever clutcbes tbe same spot on tbe traction rope at tbe same place twice in succession. Slight alterations, also, in tbe relative position of tbe buckets on tbe rope work no disadvantage in the operation of tbis second type. To secure an even distribution of tbe buckets along tbe line, signals are easily arranged by whicb tbe workman is enabled to estimate tbe proper intervals. With the assistance of tbe electrically working, friction-grip arrangement, as well as witb tbe clip, all grades can be overcome, because the friction on tbe traction rope is constant and uniform. In tbe type in wbicb tbe weigbt of the bucket is transferred by means of a lever on tbe clutch and is transformed to friction, tbe limitation of tbe grades to be overcome is confined to tbose not in excess of 45°.

Tbe third system—tbat in wbicb tbe buckets are attacbed permanently to tbe traction rope—is probably tbe most promising one, as tbere tbe loading of tbe buckets is automatic, witb corresponding savings in operating costs. Tbe more or less complicated grips and clip catchers are done away witb. It requires buckets of less expensive construction and overcomes any grade tbat any other system of rope tramways can traverse. Tbis last type of construction is of sucb recent development tbat comparatively few plants are in operation in this country. As far as is known, it renders most successful service.

And now a word as to tbe costs of installation of rope tramways. Naturally, tbe single rope tramway is tbe cbeaper type of construction, but popular opinion is more favorable towards tbe double rope tramway, as evidenced by tbe number of tbat type which bave been and are being installed by mine managers. Tbe heavier the traffic to be bandled tbe heavier and more substantial parts must be used in the construction work. Many other considerations, based upon the peculiar conditions wbich attend the installations of tramways at different mines, must be considered in the individual case. Generally speaking, we are witbin limits when we say that including all the machinery parts tbe average price per foot of line constructed may be regarded as ranging from $1.80 to $2.00 per foot. These figures include tbe necessary wire cables, towers, sheaves and buckets. To these figures must be added tbe construction costs, which vary according to freight rates, prices of timber, labor and delivery to the point of construction. Very naturally this affords a wide variation in costs, but as an example it might be cited that in Colorado tbe construction costs would probably be from $1.00 to $1.15 per foot. Therefore, it is safe to estimate the entire cost of a tramway per foot in this region (Black Hills, S. D.), wbere the conditions are approximately tbe same as in Colorado, at from $3.00 to $3.10 per running foot.

The subject of rope tramways and tbeir application to mining and manufacturing industries the world over is a subject upon which any engineer might talk for hours. The economics which are effected in all industries in which tbeir use is possible are so generally recognized that no argument in tbeir behalf is necessary. Every mining man of the

†The Broderick & Bascom Rope Co. of St. Louis, Mo., of which the author of this paper is one of the aerial tramway engineers, have excellent photographs of some of these old Pompeiian cables.

*Trans. Am. Min. Congress. (Condensed).

West can probably cite examples of mines whose profitable operation without the aid of tramways would not be possible. In conclusion, let me repeat a beautiful tribute to the tramway, the work of a fellow engineer unknown to me, whose beautiful allegory is more expressive than language of my own:

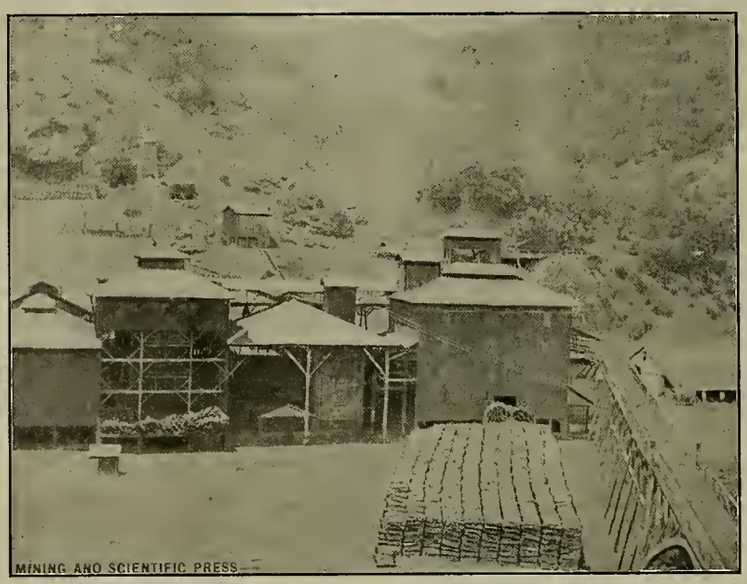
"Nestled silently in the clouds, away up above the timber line, nature has hidden almost inaccessibly its treasures. Deep down below in a valley stands a reduction plant which day by day with the aid of human genius converts ore into wealth. Reluctant to give up her treasures, nature wages a constant warfare with man, calling to her aid the snows and ice of winter altitude, precipice and ravine. But man won the fight. Two slender wire cables, puny in appearance despite their strength, span ravine, rise over precipice and scale the heights, disappearing among the clouds. With their aid man has encompassed the defeat of nature. Silently, unpretentiously, disdainfully ignoring the grumbling of nature over her defeat and her efforts to overthrow the work of man, the cables modestly move forward—the connecting link between mountain and valley, a private soldier of the mining industry, always alert, always performing his duty, always obeying his commands and rendering invaluable service in adding to the wealth of the nation."

Quicksilver Reduction at New Almaden, Cal.

Written for the MINING AND SCIENTIFIC PRESS by WALTER W. BRADLEY.

Much has already been said and written in the past about the quicksilver mines and their equipment at New Almaden, 12 miles south of San Jose, Santa Clara county, Cal. It is not the writer's intention to enter into a lengthy technical discussion of means and methods employed there, but merely to give a short sketch of the present-day operations at their reduction works, as observed in a recent visit. The ore is brought down from the mines, about a mile distant, by gravity tramways and in trains pulled by mules. By dumping on grizzlies it is separated into three sizes—"granza" (coarse), 3 to 7 inches in diameter; "granzita" (medium), and "tierras" (fines) under 1½ inch in diameter. These three sizes are each handled by separate furnaces. There are two circular shaft furnaces for the granza, and four tile furnaces—three for granzita and one for tierras.

Such of the tierras as need drying are spread out, and, when dried, are elevated to the charging floor by means of a water hoist—a tank of water balancing a car full of ore—there being a tank under the rails of both hoist platforms. As water is plentiful, this furnishes a cheap and simple method of raising the ore the short distance necessary. This tierras furnace will hold ninety tons of ore and is of three compartments. Each compartment is charged every forty minutes from a half-ton car, making a total of fifty-four tons charged every twenty-four hours. It requires fifty-two hours from the time a charge enters at the top until it is drawn out from the bottom. The interior of each compartment of the tile furnace is constructed of a series of tiles set one above another at an angle of 45° with the horizon, each tile tilted toward the next below, as shown in the accompanying diagram.



Arrangement of Tiles in Quicksilver Furnace.

Each double set of inclined tiles terminates in a hopper-shaped bottom, in which the roasted ore collects and from which it is drawn out into cars below. The charges are all shaken down simultaneously by iron arms operated by an exterior mechanism. About 12 feet below the charging floor is the firing floor, where a fireplace runs across one side of the furnace, being fed at both ends with 4-foot sticks of wood (oak and redwood). This furnace is the one seen on the left of the center in the accompanying picture (where the firewood is piled on the platform).

The furnaces in which the granzita is roasted are similar in construction to the tierras furnace, except that the tiles are farther apart. There are three of these furnaces—one of twenty-four tons daily capacity, one thirty-six tons and the third eighteen tons. The last two are located in a separate building, across Hacienda creek, a few hundred feet distant. The tramway leading to them is seen on the right of the picture. Both the 24-ton and the 36-ton furnaces are of double compartments. The two furnaces for the granza are respectively of nine and seven tons daily capacity. In construction they are modeled somewhat after the cupola. The firing floor is 12 feet above the bottom and point of discharge and about 20 feet below the charging floor. There are three firehoxes at equi-distant points around the circular shaft, which is 8 feet in diameter. Wood is also used here and a temperature of about 1300° F. is obtained. The furnace is charged every two hours.

Quite a lengthy treatise could be written and illustrated on the evolution of the condensing process and construction of the condensers at New Almaden. The lower grade of the ore of late years, as compared with the bonanza values in early days, has been the most important factor in causing these changes. Mercury, like other things of value, is elusive and prone to escape man's grasp. Recently, as Foreman Wasley informed the writer, they cleaned up the foundations of one of the old retorts, taking off the surface dirt and scraping clean the bedrock—all of which material was panned out as placer gold is panned. This netted several thousand dollars' worth of mercury. The first chamber through which the vapors pass after leaving the roaster is lined with iron pipes carrying circulating cold water. From the top of the first chamber the vapors pass to the bottom of a second chamber, and, emerging, are led with a right angle turn to another series of chambers, and then through a series of flues, which zigzag back and forth across the hill before reaching the flue (see hill on left of picture), running up to the stack. At each turn of the flues is a small chamber, which is cleaned up once a year, enough mercury being obtained from them to a little more than pay the expense of maintaining them. As a result of this lengthy condensing system, very little smoke and fumes are visible emerging from the stacks on the hill. The entire plant handles about 4000 tons per month of ore which is said to average 0.5% mercury. The cinnabar occurs in disseminated particles, looking like small, red blotches, throughout the containing gangue.

Quicksilver Furnaces at New Almaden, Santa Clara County, Cal.

The total output of the New Almaden mines since 1850 is given at approximately 1,000,000 flasks of quicksilver. The present company is the Quicksilver M. Co., with Thomas Derby of New Almaden as superintendent.

The St. Louis Exposition.

Written by G. W. PARKER.

On April 30, 1904, the gates of the greatest world's fair and universal exposition which the world has ever seen will be opened at St. Louis, Mo. When the Louisiana Purchase Exposition is spoken of, almost the first question asked is: "How is it going to compare with Chicago?" Many visitors to that great show, myself among them, conceived the idea that the exposition business had attained the acme of success in the White City of Chicago. If any one had suggested that within a half century at most a greater exposition would be thrown open to the world, he would have been considered of unsound mind. But the seemingly impossible is being accomplished. A decade has scarcely rounded out since we walked with wonder through the great buildings of the World's Columbian Exposition, gazed with awe upon the splendors of the illuminated Court of Honor and amused ourselves among the mysteries of the Midway Plaisance, and now we see rising at St. Louis another and a greater dream city. And when this is said, it is said without exaggeration.

The experience gained through the wonderful industrial development of the United States during the last quarter of the nineteenth century shows that it is to our coal mines, more than to any other one cause, that our present supremacy among the nations of the earth is due. In a recently published volume on the adjustment of wages, W. J. Ashley of the University of Birmingham, England, comments on the former superiority of Great Britain, which was founded on her coal, and shows how since 1889 the United States has outstripped that country in iron and steel manufacturing, and that we are forging farther and farther ahead, not only of Great Britain, but of the world—because of our wealth in coal. In 1901 the United States produced practically 40% of the entire world's supply of pig iron and 44% of the entire output of steel. In 1902 this country added nearly 2,000,000 tons to the pig iron product of 1901, and reached a total of nearly 18,000,000 long tons. In 1902 we produced almost exactly double the amount of pig iron made in this country in 1892, ten years before, and about four times that made in 1882. In the first half of 1903 the furnaces of the United States turned out pig iron equal in amount to that produced in all other countries in the world in a similar period for 1901.

A large space has been reserved in the Mines and Metallurgy building for the display of the exhibits representing the coal mining industry. This will be divided among the States according to the extent of their exhibits, and as nearly as possible according to geographical location.

Some of the interesting features of this coal display will consist of large relief maps of some of the principal coal fields of the country. It might be desirable to have such maps of all the coal mining region, but it is not possible to prepare them. Only such regions can be illustrated in this way as have been made the subject of topographical and geological surveys. It is possible, however, to obtain enough of such data and to prepare enough such maps to illustrate in a general way the manner in which our coal supply is stored away. These maps will show practically in miniature the country represented.

Another interesting feature will be maps of two or three typical mining towns or camps, illustrating the character of such communities in the different States. These maps will also show the tipple and other buildings connected with the operations of the mines, miners' houses, etc. On still larger scale will be shown models of working mines in the different States and illustrating, as far as possible, typical conditions existing in those States. It is proposed to show by such models drift mining by the pillar-and-room system; shaft mining under the pillar-and-room system, as practiced principally in Illinois and Indiana; slope mining under the pillar-and-room system, and under a modification of this system, as practiced in Arkansas and the Indian Territory; strip or open-work mining, as practiced to a considerable extent in Kansas and Missouri, and shaft mining under the long-wall system, as practiced in Kansas and Missouri and also in Illinois.

It is also proposed to illustrate ventilation, underground haulage and hoisting, and the pumping or hoisting of water.

Public Lands in Cuba.

The following statement shows the extent of the public lands in Cuba:

Province.	Area—Acres.
Santiago de Cuba	432,744
Puerto Principe	6,387
Santa Clara	22,677
Total	461,808

The boundaries of these lands are not fixed, and in consequence they have not been entered in the registry of property (Registro de la Propiedad). They are covered with forests, and as most of them are in the interior no availments can be made, owing to the absence of roads. Some of the public lands under the care of the Department of Finance are rented and other portions have been ceded to private parties in consideration of an annual tribute of 5% of the value assigned to each caballeria (thirty-three acres).

Some Structural Features of the California Gold Belt.

NUMBER VI.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

The Potazuba mine is situated a short distance northwest of the Baliol mine, but it is in the black clay slates of the Calaveras formation, and is in no way connected with the greenstone schists. The Potazuha vein has a strike N. 20 W., and can he traced by recurring surface outcrops several hundred feet. A shaft has been sunk 500 feet on the vein and extensive levels run. About 150 feet south of the shaft the vein is intersected by a fissure, striking approximately E.—W., and dipping south at ahout 50%. The quartz vein of the Potazuba ends abruptly at this intersection, it having the appearance of flexing sharply to the westward. Near this point of intersection on the surface a good prospect was discovered, and development disclosed a short shoot of high-grade gold quartz, extending from the surface to about the 100-foot level. From this ahout $20,000 was taken, when the pay ceased, and although a large amount of development has since been done, another pay shoot was not found. It is said hy some of the miners that the north drift followed a slip out into the east wall, ahandoning the main fissure, which maintained its true course, but as the writer never had an opportnity to investigate the grounds upon which this statement was made is unable to give any opinion, though such things are not unknown in the operation of mines.

Northward the Potazuba fissure enters the diorite, which forms a large mass in this vicinity, with an increasingly greater width to the northward. As only shallow shafts and prospect holes have been sunk on it, nothing can be said of it further than that gold is present occasionally in the quartz. The vein in the diorite is more massive than in the slates, where it is usually handed.

Two miles north of the Potazuba, at Gold Mountain mine, is found a large vein, 10 feet in thickness, lying at a low angle with a dip to the northwest. This vein occurs in the diorite (or grano-diorite), heing a portion of the mass near the Potazuba, above referred to. At Gold Mountain this vein has heen developed extensively and a large quantity of the ore milled. It contains sulphides of iron, copper, lead and zinc in small amount, with occasionally mispickle. Gold is associated with the eulphides, and is also found free, but owing to the low grade of the ore it has not been largely remunerative. An unusual amount of silver accompanies the gold for this part of the California gold helt. The quartz is massive with many vugs lined with crystals, and is wholly unlike even the massive quartz of the Mother Lode series.

North of Amador City, on the mother lode, occur some of the largest outcrops along the entire length of the belt. The shafts and tunnels are numerous on the various mines, and in some of these interesting structural features have been developed. The quartz occurs in the form of huge masses, usually of lenticular form, though not always as symmetrical as the term "lens" may suggest. Some of these occur wholly in hlack slate, and othere in the amphiholite schist, while a third class is found at contact of these two formations.

The Bunker Hill mine has developed several shoots of gold ore, some of which are of large size. This mine in its early history produced a large amount of gold, and recent developments have discovered additional bodies of ore.

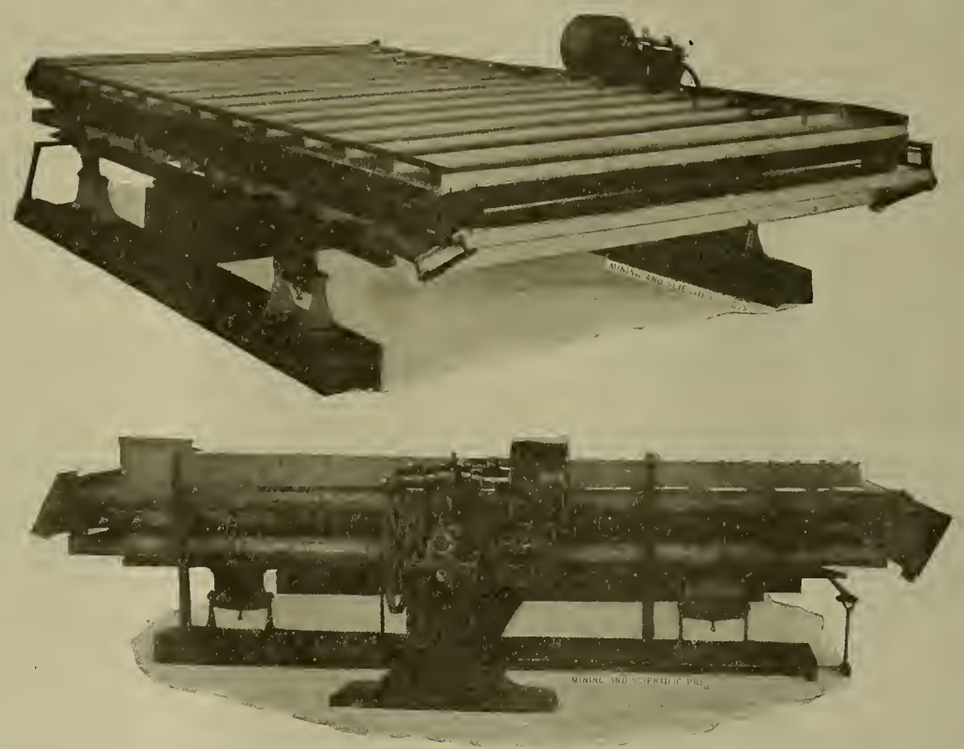
A mile northward from the Bunker Hill is the Fremont Consolidated, which comprises a number of claims, one of which, the Gover, was formerly worked to a depth of 1500 feet on the vein. In the old Gover workings large ore hodies were found in the lower levels, one of which is stated to exceed 65 feet in width. This mass of quartz is divided by interior fissures, which lie approximately parallel with the walls. The quartz contains free gold and auriferous pyrite. A new shaft (Fremont) has been sunk near the southern end of the property since 1899, and this has also developed large masses of quartz similar in etructure to those occurring in the neighhoring mines.

In the upper portion of the Gover mine there are two veins, each lying at contact of slate and greenstone schist, the slate strip 90 feet wide occupying the central area between the veins. This slate increases in width with depth. The easterly, or hanging wall vein, occupies the contact to a depth of nearly 800 feet, where it pinches and becomes obscure. The foot wall vein continues for eeveral hundred feet as a solid vein and then hranches into numerous stringers. A zone of crushed slate, containing fragments and veinlets of quartz, calcite and other secondary infiltrated mineral, evidently marks the crossing of the foot wall fissure across the slate strip toward the hanging wall schist until it reaches the contact. On the ninth level of the mine the slate, which here forms the foot wall of the vein (the hanging wall vein having pinched out ahove), "straightens up" and a large mass of quartz forms between the slate and schist. As these large quartz masses are found at various levels between the surface and the 1000-foot level, it is not unreasonahle to expect to find them at intervals to much greater depth. In the south end of the Gover mine, on the fourth level, a fault was found which dislocated the vein, horizontally, its southward continuation being found 50 feet to the westward. This fault was described by the writer in the twelfth report of the State Mineralogist of California in 1894, and was at that time the first fault noted on the lode. Since then, however, numerous faults have been recognized along the lode, some of which have previously been described in these papers.

Proceeding northward along the gold helt the Pioneer mine, near Plymouth, is one of unusual interest, hy reason of its rich ores and the sudden disappearance of values in the vein. In this property there are also two veins, an easterly, or hanging wall vein of massive quartz, and a westerly vein of banded structure, the latter usually proving to be the better vein. These veins occur wholly in black slate. The lower workings are low grade; the country is heavily fissured, and there is some reason to believe that possibly the development was misdirected and that a further search in depth may result in finding the downward continuation of the upper ore bodies.

The Plymouth Consolidated mines at Plymouth have heen closed for many years, and the writer has never had an opportunity to inspect the underground workings of this property. It is said, however, that both walls are hlack slate, and this statement is probahly correct, as indicated by the dumps. Pieces of diabase and amphibolite schist are frequently seen also, but these may have come from crosscuts. The main ore shoot is described as a large mass of quartz with ribbon structure, 30 to 100 feet wide.

The Shenandoah mine is east of what is recognized as the mother lode, being east of the latter several thousand feet. The inclosing formation is diorite, which, near the vein, is altered to amphibolite schist. The gouge is black and often slaty. In this mine, also, is frequently seen two veins of quartz, the one massive, the other banded. It is a simple fissure, however, both veins occurring therein. The banded ore is generally the hetter in grade. There are no unusual structural peculiarities in this vein.



The Bay State mine is on the mother lode, 4 miles north of the town of Plymouth. There are in this property two veins lying side by side. The easterly, or hanging wall vein, is a heavy massive quartz vein, usually with small values, the foot wall section is banded and often granular. A large amount of calcite is present in the interstitial spaces of the quartz rock, and often on exposure the rock crumbles. A dike rock accompanies the vein. Beside these there are several other veins in the property lying westerly from that described. One of these is known as the Kretcher vein, which lies within the slates. Southward it joins a second vein, which has the black slate for a hanging wall, and a diabase foot wall. These veins hoth have a banded structure and have produced some good gold ore.

(TO BE CONTINUED.)

The Wilfley Slime Table.

Herewith are two vignette illustrations of the Wilfley slime table, as manufactured and supplied by the Mine & Smelter Supply Co. of Denver, Colo. Thls table was devised with intent to concentrate the slimes and finely divided particles of mineral which were too fine to be saved on standard Wilfley tahles. By placing the Wilfley elime table below these concentrators the manufacturers state that slimes and fine mineral are caught and saved automatically.

The Wilfley slime table is described as being an entirely new invention, in which is used a new principle for the separation of fine particles of mineral from its gangue. The table, as will be noted from inspection of the accompanying engravings, consists of a number of small, shallow troughs, arranged side by side, and attached to chain belts, forming in the whole a large helt which moves across the table very slowly. While this belt, or series of troughs, is slowly moving across the table a progressive motion is given the whole. This motion is produced hy a simple movement similar to that used on the standard Wilfley tables, the rotation of the helt being produced hy worm gear and sprocket wheels and chain. According to the claims of the inventor, the progressive motion carries off the silica and gangue, leaving the small particles of ore, concentrates and slimes in the troughs of the main belt or table top. As these troughs are slowly hrought to the lower side of the table they encounter a spray of water, which washes them into a concentrates box placed on the floor underneath the table, the troughs coming up on the opposite side of the table thoroughly clean. The tailings, silica, etc., are designed to pass off the end of the table into launders, which dispose of this worthless matter upon the dump.

The Wilfley Slime Table.

The manufacturers say that the Wilfley slime tahle is designed to receive the entire tailings and wash water from one or two standard Wilfley tables and reconcentrate the tailings, and that the slime tahle is adjusted to all classes of tailings by simple adjustment of the stroke and the adjustment screws under the rocker supports. The table is stated to require about 1 H. P. to operate it at a speed of 190 revolutions per minute. The shipping weight is 2300 pounds. The Mine & Smelter Supply Co. further say: "This table has been thoroughly tested with tailings from Michigan, Montana, Colorado, Arizona, New Mexico, Old Mexico and Nevada, and has given results in every case which have caused us to believe that there is a large field for this tahle."

Aluminum and Bauxite.

The report on aluminum and hauxite for 1902 by J. Struthers has just been issued by the United States Geological Survey. The production of aluminum in the United States during 1902 was approximately 7,300,000 pounds, as compared with 7,150,000 pounds in 1901, the sole producer being the Pittsburg Reduction Co., which has large plants in operation at Niagara Falls and at Shawingan Falls, Quebec, Canada, and is installing a large plant on the St. Lawrence river, near Massena, N. Y. The chief use of

aluminum is for the transmission of electrical currents and for alloys possessing exceptional physical and chemical properties, though a considerable part of the output is manufactured into domestic articles of various kinds. Two growing uses of the metal are for lithographic work and for the production of intense heat by the combustion of the metal as powder.

The production of bauxite during 1902 amounted to 27,274 long tons, as against 18,905 long tons in 1901. Georgia yielded the greater bulk of the product, the remainder coming from Alabama and Arkansas. The consumption of bauxite in 1902 amounted to 43,112 long tons, as compared with 36,218 tons in 1901.

The domestic production of alum and aluminum sulphate in 1902 amounted to 88,614 short tons, valued at $2,238,171, as compared with 82,496 short tons, valued at $2,026,554 in 1901. The imports in 1902 were valued at $16,808, as compared with $20,781 in 1901.

Notes on the Metallurgy of Copper of Montana.*

NUMBER IX—CONCLUDED.

Written by H. O. HOFMAN.

ELECTROLYTIC REFINING OF COPPER.—The work of the two electrolytic refining plants in the Butte district, at Great Falls and Anaconda, is of especial interest, as they work under different conditions of power, while they treat similar anode copper by the multiple process. The works at Great Falls, driven by water power, have 312 tanks, 9 feet 9 inches long by 2 feet 4 inches wide by 3 feet 9 inches deep, in three sets of 104 tanks, each set having a separate solution; a tank is charged with twenty anodes and twenty cathodes; the current is of forty amperes per square foot of cathode area; two Westinghouse direct-current machines generate 9000 amperes at 200 volts. The works of Anaconda, driven by steam power, have 1400 tanks, 8 feet long by 4 feet wide by 4 feet deep, in sets of 200 each. A tank is charged with seventy-six anodes and eighty cathodes, the current is of ten amperes per square foot of cathode area. There are seven dynamos, each generating 4000 amperes at sixty volts for 200 vats.

The anodes of the Butte district assay: Cu, 98% to 99%; Ag, 40 to 120 ounces per ton; Au, 0.1 to 1.5 ounce per ton. They are cast either direct from the converter or the converter copper is first refined in a reverheratory furnace.†

The converter charge is blown to the point at which the copper still retains considerable sulphur dioxide in solution. In pouring anodes from the converter, the copper strikes a launder, swung in position, which delivers the copper into open flat moulds resting on a car moved slowly on rails laid between the posts of a stand. The strong evolution of sulphurous gas upon cooling makes the anodes very uneven. The moulds are of copper, but have cast-iron centers that take up the impinging force of the stream of metal. If the copper is first to be refined, the metal from several converters is emptied into ladles which discharge their contents into the stationary refining furnaces. Here the rabbling of the copper, in order to cause the oxidation necessary to produce set copper, has been replaced by forcing air into the copper by 1-inch wrought-iron pipes inserted through the side and end doors of the refining furnace. The two hours required for rabbling have been reduced to one and one-quarter hour by blowing; 6 feet of pipe are used up with a forty-ton charge. Oxidation is continued until a small ladle-sample, when broken, shows the characteristic single bubble in the depressed center. Care is taken to bring the copper only to this point, when the copper is saturated with cuprous oxide, as otherwise the surface will quickly become oxidized and covered with melted oxide. The set copper is then poled to tough pitch copper, fifteen poles (3 inches at end, 7 inches at butt and 15 to 18 feet long) being required for fifty tons of copper. From the reverheratory furnace the anodes are cast by means of an improved form of Walker casting machine.

A tilting reverheratory furnace constructed along the general lines of the Bruckner cylinder was used at the old Anaconda works, but given up after a short trial.

Converter anodes are less evenly corroded, give more scrap and furnish a mud of lower grade than do anodes from the refining furnace. Coarse copper, e. g., with Cu, 99.27%; As and Sb, 0.07%; Ag, 61.14, and Au, 0.22 ounce per ton, cast from the converters into anodes, gave 8% scrap, and the anode mud, after having passed through a 40-mesh sieve, washed and dried, contained Cu, 41%; Ag, 7000, and Au, 18 ounces per ton. Similar copper, refined in the reverheratory furnace and cast into anodes, gave in corroding only 5.5% scrap, while the 40-mesh anode mud assayed Cu, 18%; Ag, 15,000, and Au, 38 ounces per ton.

The Great Falls anodes are 24 inches wide by 35 inches long by 3 inches thick at the top and 2½ inches thick at the bottom; they are beveled at the bottom; the two lugs on top are 4½ inches wide by 2½ inches long by 2 inches thick. The anodes are suspended from cast copper cross bars (1½ inch by 1¼ inch) by means of the Morrow clip, a loop of sheet copper, 2½ inches wide (recently replaced by a rod ¼ inch in diameter) by 3½ inches high, the ends of which are allowed to project into the anode moulds before they are filled with liquid copper. A converter anode weighs 500 pounds, and is sufficiently corroded in about eighteen days to be withdrawn and regarded as scrap, a new anode being put in its place. The Anaconda anodes are 24 to 24½ inches wide, 32⅞ inches long, and 1¼ inch thick at the top, and 1 inch at the bottom. They have two top lugs 6 inches wide with holes, and are suspended in pairs from iron copper-covered cross bars (⅞ by 1⅝ inch), nineteen to a tank, by means of copper hooks ⅝ inch thick. An anode weighs 230 pounds and is corroded in thirty-seven days.

The cathodes are made in the usual way, in tanks set apart for the purpose. They are slightly longer and wider than the anodes. At Great Falls they are 26 inches wide by 36½ inches long and weigh two and one-half pounds; at Anaconda they are 11 inches wide by 33 inches long and weigh three-quarters to one pound. At Great Falls the cathodes are suspended by the Morrow clip, which is fastened to the starting sheet by a machine, which punches a hole through the loop and sheet, bends over the lugs and clamps them fast. At Anaconda the upper rim of the starting sheet is bent and clamped over the ends of a piece of sheet copper, 4½ inches wide by 11 inches long; four cathodes go to a cross bar; the electrode distance ranges from 1½ to 2 inches.

The tanks are made of 3-inch plank and are lined with eight-pound lead; the bottoms have a board cover to protect the lead lining from pieces of anode copper that may become detached. At Great Falls, the vats are arranged in pairs with three conductor bars, the central bar serving as cathode bar for one tank, and as anode bar for the other. At Anaconda, with the Thofern disposition, the tanks are arranged in single rows.

The electrolyte contains with the heavier current 170 grams concentrated sulphuric acid and forty-two grams copper per liter; with the lighter current, 150 grams acid and forty grams copper. The resistance appears to begin to increase when the copper rises above forty-two grams. The temperature of the electrolyte at the head tank is 64° C. and 50° C., and the circulation, six and three gallons per minute. Solutions are admitted and drawn off, either at the ends or the sides, precautions being taken by means of perforated lead baffle plates to have an even distribution, and thus avoid stirring any mud. The different forms of plunger pumps, which were formerly used to raise the electrolyte, have given way to Pohle's air lift pumps working under a pressure of twenty-five pounds. These have proved very satisfactory, especially since the delivery pipe has been cut in two near the discharge and the ends joined by a rubber hose, thus breaking any electric connection. The electrolyte becomes enriched in copper and takes up iron, arsenic and antimony. A foul solution contained, e. g., per liter:

Cu, 51.8 grams; Fe, 13.2 grams; As, 14.02 grams; Sb, 0.62 gram; H_2SO_4, 48 grams.

The low percentage of antimony is due to the practice of adding daily enough concentrated crude hydrochloric acid to the head tank to maintain .04 gram chlorine per liter in solution. This addition precipitates antimony, it is believed, as oxychloride. When there is deficiency of hydrochloric acid, a sample plate becomes streaked, tarnished, black and, at the same time, brittle. The excess of copper over the normal is removed by shunting off part of the electrolyte and making it pass through tanks with lead anodes. By retarding the flow of this current through a second set of tanks, arsenic will be deposited with the rest of the copper. The slime deposited in such a purifying vat showed Cu, 57.1%; H_2SO_4, 11.8%; Ag, 0.3%; As, 7.2%; Sb, 1.8%; H_2O, 18.4%; difference: traces of $PbSO_4$ and traces of Fe.

While the difference in potential between electrodes with soluble anodes is 0.6 (Great Falls) and 0.3 (Anaconda) volts, with insoluble anodes it rises to 2.5 and 2.0 volts. When iron is to be removed, the solution freed from copper, and arsenic is concentrated by heating to one-third of its volume and then cooled, when most of the iron will crystallize out in the form of ferrous sulphate. At Great Falls the cathodes are renewed every second day. They weigh fifty-five pounds and contain Cu, 99.95%; As, 0.0012%; Sb, 0.0033%; Ag, 1 ounce. Although this method of working uses up a large number of starting sheets, it is found to be advantageous, as with the large current of forty amperes there is a loss in efficiency on account of short circuiting if the cathodes are allowed to grow heavier. Thus with two-day cathodes there is an ampere efficiency of 91%, while with four-day cathodes this falls off to 85%. The cathodes, taken out four at a time by means of an overhead traveling pulley, are transferred to lead-lined cars and replaced by starting sheets. The twenty cathodes in a car are then raised together by means of an electric crane, dipped into water, drained, dipped into milk of lime and allowed to dry. The coat of lime protects the plates in melting down from the sulphurous gases in the products of combustion of the refining furnace.

At Anaconda, cathodes are removed only when the anodes are completely corroded. After two days depositing they are, however, taken out and straightened. A tank receives its anodes all at once; in the same way all the cathodes are taken out in one operation.

The anode mud made at Great Falls is removed by a steam injector pump and rubber hose from the electrolyzing vat into a settling tank covered with a 40-mesh screen; it is then drawn off into an acid egg, forced through a filter press, steam dried (when it still retains 2% water), broken up, sampled, sacked and sold.

At Anaconda, the anode mud is discharged through an opening in the bottom of the electrolyzing vat, after the solution has been drawn off from the side, into a V-shaped trough leading into a tank; from this it is drawn into an acid egg and forced into a tank in the refining department, drawn onto filter cloths, washed, dried, sampled, sacked and sold. Until recently the mud was treated at the works. It was melted down in a reverheratory furnace, refined by the addition of nitre, cast into small ingots and parted with sulphuric acid, the silver being precipitated by means of the copper.

The anode scrap at Great Falls is remelted in the converter, while at Anaconda it goes back into the anode furnace.

REFINING OF CATHODES.—The reverheratory furnaces used for refining converter and cathode metal have retained the pear-shaped form of the original Welsh furnaces. They have charging doors on both sides, and the usual working and ladling doors at one end; and there are air flues in the bridge leading onto the hearth.

The following are the leading details of a standard furnace: Length of hearth, 22 feet 6 inches; width at bridge, 7 feet 1.5 inches; at middle, 14 feet 8 inches; at flue, 1 foot 8 inches; hearth area, 225 square feet; thickness of hearth at bridge, 2 feet 7 inches; at flue, 2 feet; depth of metal, 12 to 13 inches; length of grate, 8 feet 6 inches; width, 7 feet 1.5 inches; depth of grate below top of bridge, 2 feet 6 inches; ratio of grate to hearth area, 1 : 3.7; height of roof above bridge, 1 foot 10 inches; above hearth at bridge, 2 feet 3 inches; at flue, 1 foot 10 inches; rise of arch, 1 inch per foot; size of flue at vulcatory, 3 feet 9 inches by 19 inches; of flue leading to chimney, 24 by 19 inches; size of chimney, 32 by 32 inches; height, 80 feet; charge: liquid, 125,000 pounds; cathodes, 75,000 pounds; analysis of bituminous coal: ash, 18.8; fixed carbon, 54.6; proportion of charge to coal by weight, 3 : 1; tons of charge to number of poles, 4 : 1; tons of charge to bushels of charcoal, 1 : 1.

The method of working differs little from that in common use, excepting that flapping, or rabbling, is replaced by blowing with compressed air; the metal bath, in poling, is covered with charcoal only toward the end of the operation, a few poles, however, floating on the metal; of the two poles inserted through the working door, one is depressed near the door, the other toward the middle of the furnace; ingots, cakes and wire bars are cast by means of suspended ladles, 14 inches and 19 inches in diameter. All moulds are of copper. Cake and wire bar moulds are painted with a mixture of lamphlack and benzine; they are warmed at first by pouring in some copper. Ingot moulds are smoked before the first round by means of burning rosin held in a ladle. The tests applied to the copper are those of the Bell Telephone Co. for No. 12 wire: Conductivity, 96% to 97%; tensile strength, 65,600 pounds; torsion, forty twists in 6 inches between the clamps with 1% elongation. Three test bars are made from each charge, one bar being made when dipping begins, one when the charge is half out, and the third at the conclusion of the ladling. The test bars are 8 inches long, and have the full cross section of a regular wire bar. From each of these bars a section 6 inches long by 1 inch square is sawed; this section is rolled into a rod and afterward drawn cold to a No. 12 wire, Brown & Sharpe gauge, on which all tests are made. Conductivity tests are made with the Willyoung conductivity bridge.

†Refining converter copper before casting into anodes has been given at Great Falls in spite of the advantages mentioned later on in the text as regards corroding, because the gain did not warrant the expense. At Anaconda, where power is generated by steam, it is of considerable advantage to have refined anodes.

American Machinery for South Africa.

The importation of machinery into South Africa is increasing, as these figures from Consul-General Hanauer show:

Description.	1901.	1902.	1903.
Machinery:			
Mining.....	$ 305,864	$ 573,526	$ 968,263
All other.....	1,337,387	2,672,631	3,166,149

The steady extension of the railroads in South Africa account for the increased importation of locomotives, which were valued in the three years at $545,315, $1,148,095 and $1,963,253, respectively.

New lines of railroad, estimated at 4000 to 5000 miles in length and to cost about $100,000,000 to $125,000,000, are projected. American manufacturing concerns are already in the field; thus the Pittsburg Westinghouse Co. has a contract for the construction of a line of roads in the De Beers mining district. The General Electric Co. of New York is

to furnish to the railroad shops of the Natal government 119 motors, 6 dynamos of 300 H. P. each, 3 electrical cranes and other appliances. Another United States firm has received an order for seven locomotives for the Cape Colony railroad.

The municipal tramway of the city of Durban is being constructed by an American firm.

Good Roads for Mines.*

Written by JAMES W. ABBOTT.

It is indeed an anomaly that while in every other phase of civilization—in the home, the office, the city, on rail and water—we lead the world's progress, the general standard of maintenance and construction for our common roads has remained stationary during the past hundred years. The lumberman hauls his logs, the farmer his cotton, wheat and corn, and the miner his machinery, supplies, coal and ore over roads no better than those used by his forefathers a century ago.

It is a no less striking paradox that the old world countries have splendid roads because they can not afford poor ones, while our material resources are so abundant that we have been bearing year after year the appalling loss from bad roads without realizing the drain. From abundant data gathered in all portions of the United States by the office of Public Road Inquiries, it was demonstrated years ago, and has been signally confirmed by my own investigations, that the cost of wagon freighting under average existing conditions is, approximately, 25 cents per ton per mile. It is also interesting in this connection to note that the contract price (determined by very earnest competition) paid in 1901 by the Government for hauling supplies in Yellowstone National Park, where the mountain road system is of a very high standard, was 25 cents per ton per mile. In gathering statistics of the cost of freighting to and from mines by wagon road, I have found several instances, where the roads were the best, in which this average cost figured exactly 25 cents per ton per mile. I have found none in which the rate was even a fraction lower. Climate, the price of labor, hay and grain, volume of material to be handled and the newness, or otherwise, of the mining region, are all, of course, factors in determining this cost of wagon freight. But the one factor which always controls, and which overshadows in importance every other, is the character of the road. I have in mind a mining camp, situated far below timber line, distant 18 miles from a populous, thriving agricultural center and important railroad point, where the established freight rate each way is $12 per ton—66⅔ cents per ton-mile. At no place along the line is the rise excessively rapid, but the grade in places is so very steep that 3000 pounds is an average load-up for a six-horse team.

At the request of the Department of Agriculture, on Nov. 20, 1895, a circular letter was addressed to many consuls in European countries, requesting information similar to that already elicited in this country on the cost of hauling farm products. A very large number of reports in answer to this circular were received and published. They show costs ranging from 6 cents to 13 cents per ton-mile for hauling different products under different conditions. While no certain general average cost per ton-mile can be adduced from these figures, any one who studies them will conclude that it lies between 10 cents and 12 cents. With reference to the question, whether this light cost in Europe is not partially due to lower prevailing standards of wages, it may be said that, while wages there are somewhat lower than with us, the cost of feed averages considerably higher; that very much of the hauling in Europe is done with one horse or mule, while all the data from which the American average was adduced assumed one driver for not less than two horses.

Assuming the cost of hauling at 25 cents per-ton mile, and taking figures for production from census returns, the director of the office of Public Roads Inquiries in April, 1896, estimated the grand total annual cost of hauling on the public roads of the United States at about $950,000,000. Had these roads been constructed on European standards, this cost would have been reduced more than one-half.

For the same year covered by this estimate the gross freight receipts of all the railroads in the United States was less than $730,000,000.

It is only by some such comparison that the mind can grasp the significance of these figures of annual waste, which, although they equal the entire amount expended since its beginning by the Government on improvements to rivers and harbors, does not fully measure the appalling loss to this country from its defective highway system. We must add a great many millions for perishable products spoiled because they could not reach market in time, the restriction or congestion of railroad freight, due to closed roads and their subsequent opening (because of climatic conditions), the failure to reach market when prices are good, the enforced idleness of vast numbers of men and animals, the limitation to the area of profitable cultivation of the soil or exploitation of the ground, and many other adverse results due to prevailing highway conditions.

But it is particularly to the effect upon the mining industry that I desire at this time to call special attention. The tonnage involved in mining operations is always very great. The machinery required for mine and mill equipment runs into tonnage alarmingly fast in the very great majority of cases. Material of all kinds which enters into this equipment must be transported a greater or less distance over a common road. In the beginning of most mining enterprises the product, as well as all needed supplies, including fuel, must be hauled in wagons. Whatever this wagon haul costs more than it would over properly constructed roads is a tax to be deducted from possible profits. Take a mining enterprise that requires an average wagon haul of twenty tons a day for 300 days in the year; supposing that improving the road will result in a saving of but 25 cents on each of these tons; this means $5 a day, or $1500 for the year. All who are familiar with mining methods in the United States will recall instances without number where a great drain upon the net output has been suffered year after year without persistent effort for relief, and, in many cases, even without protest.

The annual product from the mines of the United States has a money value of more than one billion dollars. The amount which is expended annually to cheapen the transportation of these products by rail and water, and for mechanical devices of all kinds by which they may be placed upon car or boat or removed therefrom, is prodigious. Isn't it an anomaly that, with almost insignificant exception, no effective study is given to this waste in wagon freighting? Compare existing practice in this respect with what the railroads are doing. Grades are being cut down, curves lightened, tunnels bored, heavy steel rails substituted for the lighter ones, more capacious cars and more powerful engines purchased, and every method practiced to reduce the cost of transportation. In the 1901 report of the Pennsylvania Railroad Company will be found some very interesting pages bearing upon what has been accomplished along this line. In 1865 the average cost of hauling each ton of freight 1 mile was practically 2½ cents, and the average profit ⅝ of a cent. In 1901 the average cost of the haul had been reduced to ⅝ of a cent, and the average profit had fallen to ⅛ of a cent. We see that by the improvements effected the cost of the haul has been reduced to one-sixth of what it formerly was. As demonstrating the critical need for this economy, appears the profit on the transaction, which has decreased to a less figure than it was when the cost was so much greater.

The loss resulting to the mining industry from unsuitable roads is by no means confined to regions where there are actually developed mines. The wealth still hidden in the almost impenetrable fastnesses of our Western mountains probably far exceeds all that has ever yet been disclosed. The intrepid prospector and his faithful burro outline the primitive trail into each new district. These trails in turn give way to pathways which are dignified as roads. These roads gradually develop into great arteries and money is often poured out to open a new mining camp, a tithe of which thus squandered would build good roads. Prospects which, if accessible by good roads, would tempt capital and be developed quickly into mines, lie idle year after year and decade after decade, solely because there is no way by which they can be economically equipped and operated. With short-sighted economy, counties hoping to make such prospects accessible, build roads leading to them, located with such steep grades and in such improper places that the cost of hauling over them soon becomes manifestly impracticable. They actually defeat the very purpose for which they were built, because the fact that some kind of a road is already built makes it ten times more difficult to raise the means to construct another along correct lines. The man who exerts his influence against the building of a road which must inevitably prove unsuitable, confers a greater benefit upon a mining region than he who subscribes himself and induces his neighbors to do likewise for a kind of road which effectually disappoints the very hopes which it at first encouraged. Many a mining enterprise of merit has been irretrievably wrecked because an expensive and appropriate equipment has failed to produce a paying mine where wagon transportation has been so excessive as to consume the profits. It is only through economy and by the most careful methods that a very large percentage of mines have been made commercially successful. Is it not just as important to look carefully after that portion of the expense which goes into wagon transportation as it is to hoist cheaply, to drill effectively, to ventilate properly or to save the ultimate nickel by elaborate metallurgical methods?

The fundamentals of any mountain road construction are grade and drainage. From an extended observation and experience in mountain road construction and in mountain freighting, I have reached the conclusion that under no circumstances, on any road designated for general freighting, should there be a grade exceeding 12%. I further believe that no distinct economy is secured by reducing mountain grades, at much cost, below 8%. This latter conclusion, reached by myself solely from experience and observation, has been confirmed by traction experiments made by the Government and by individual engineers.

Of course, the most difficult place upon any road where trail wagons are not used determines the load which can be hauled. The engineer who is locating a mountain road should determine in his own mind, from all the circumstances in the case, what his maximum shall be, and, when he has once determined it, should adhere to it inflexibly in making his location.

Grades should always be eased and the roadbed widened on curves and the approaches to every sharp curve should be level.

It is much easier to drain a road on a side hill than one located along the bottom of a gulch. Roads facing the east and south dry out more quickly after being wet than those which face the north and west.

A side hill road should always slope towards the inside bank, and never towards the outside; otherwise the tendency will be for the outside of the grade to get lower and the inside higher, until it becomes dangerously sidling.

The essential principles of mountain road construction are few and simple. The main need is common sense and the power to reason clearly. If every mining man would get these principles firmly fixed in his mind, and whenever he rides over the road would mentally inquire: "Is the road here rightly built? How could it be made better?" the beneficial results of the industry would be quickly apparent. Out of such habit would come discussions and a general influence for better methods and higher standards.

Next winter there will be introduced into both houses of Congress bills designed to bring in the Government as a co-operating factor with States, counties and localities in improving roads. These bills will provide for the appropriation of a definite sum to be apportioned equitably among the States, the amounts thus apportioned to be expended in conjunction with equal amounts contributed by the States. They will provide for apportionment directly according to population. Some favor apportioning half the amount according to population and the other half equally to each State, on the same basis as the States get representation in Congress.

The States must provide by law how their quota shall be raised—that is, whether the State shall furnish it all, or the State a part and the county a part, and perhaps the locality another part.

All bills will provide that the money shall be expended under the direct supervision and control of expert road builders, in Government employ, and the effort will be made to thoroughly safeguard the funds from waste or peculation.

This is a movement that grows as its benefits become apparent. One good road brings another. We don't expect the Government to help build all the roads, but we do expect it to help start us.

The Golden San Juan.*

Written by A. H. ELFTMAN.

Taking Red mountain as a center, a circle with a 10-mile radius will include most of the producing mines of Ouray, San Miguel and San Juan counties. Prominent among the mines are the Camp Bird, Virginius, Revenue, Smuggler–Union, Tomboy, Barstow, Yankee Girl, Gaston, Silver Ledge, Henrietta, Gold King, Sunnyside, Esmeralda, Silver Lake, Highland, Mary, North Star and others. Between these are numerous prospects, the development of which was begun during the last three years, and many of which are now nearing completion of the dead work and will soon enter the list of producers. This prospect work has been especially active in San Juan county.

The San Juan district, embracing the southwest portion of the State, produced in 1902 22% of the output of Colorado. This area produced $5,490,000 in gold and about the same value in other metals.

One-half of all the copper produced in Colorado came from this district. Its gold value was three times the value of its silver. It paid 26% of its production as dividends.

The ores of the San Juan country occur principally in fissure veins, which traverse the country in well-defined systems, traceable often for distances of 5 miles and more. The veins are well mineralized, and at frequent intervals form large ore shoots. The veins vary in width from 1 foot to 200 feet. Ore bodies 25 to 50 feet wide are of common occurrence. The ore shoots are frequently 1000 to 1500 feet long.

Generally speaking, the ores of the San Juan country are milling ores. The ores which are or have been worked vary in value from a probable minimum of $600 to several thousand dollars per ton. The ore from the Camp Bird is all milled and runs from $40 to $200 per ton. The Tomboy ore runs from $7 to $20 per ton. The Gold King ore averaged over $25 per ton in 1902, and this will be materially increased during the present year. The Sunnyside ore last year averaged $35 per ton. Silver Lake ore varies from $8 to $70 per ton.

The cost of mining and milling the ore varies from

*Trans. Am. Min. Congress. (Condensed).

$4 to $7 per ton. The mining is principally carried on hy tapping the ore hodies at depths of 1000 feet or more by tunnels. The ore is then transported to the concentrators hy aerial tramways.

In milling, the ore is crushed by drop stamps or rolls, then passed over copper plates to the concentrators. Ahout one-third of the values are saved hy amalgamation, the halance heing saved as concentrates, which are shipped to the smelters. The tailings run from $2 to $5 per ton.

The cyanide process is being applied to these tailings with satisfactory results.

I have only attempted to call your attention to the existence of the San Juan country. In many ways the size of the ore hodies and the original mineralization are the same as those found in the Black Hills. While the San Juan country has always been looked upon as a silver camp, it is, however, a unique fact that the deeper the mines go the proportion of the gold value increases and free gold hecomes more ahundant.

Ore Deposits of the Northern Black Hills.*

NUMBER III.

Written by J. D. IRVING.

MISCELLANEOUS DEPOSITS IN THE ALGONKIAN ROCKS.—At several localities within the productive mining region ores have heen found which may he properly described with the Algonkian lodes. They are partially in eruptive rocks and partially in brecciated material composed of schist and porphyry, while at times they form veins which pass from one rock into the others; at other points they pass from porphyry inty Camhrian rocks. While none of these have yet attained any great importance, there are two that deserve special mention. The first is in Strawberry gulch, where quite a numher of small mines have been intermittently worked. Much of the ore occurs in a decomposed porphyry in the form of thin auriferous limonite sheets, filling the small fractures, or of impregnations in the country rock. In general, these pass downward into unoxidized pyrite, while in a few cases sphalerite and galena have heen reported. The porphyry mass in which these ores have been found is extremely large and so irregularly intruded into the schists that its relation to them can not he readily made out. Some of the ore ohtained from the mines is reported to have heen rich, hut it has so far heen too irregular in its occurrence to form the hasis of extensive mining. The second locality where ore has heen found, which is chiefly in porphyry, is the Old Ironsides mine, near the mouth of Squaw creek. Here there is exposed in the side of the creek a sheet of mica-diorite-porphyry ahout 40 feet thick, with beds of Camhrian rock both above and below. Through these rocks run a series of vertical fractures striking about north 85° east, along which silicification has occurred and from which telluride of gold has heen introduced into the adjacent rock, often to considerahle distances from a fracture. Some of the crystals of telluride—presumahly sylvanite—are quite large. The deposition has occurred chiefly in the diorite-porphyry, but also to a minor degree in the Camhrian rocks. At the surface, where the rocks are highly oxidized, gold may he seen along the fractures in a free condition. There are other places in which ore has been found in eruptives, either as fillings of fissures or as impregnations, but they are not of any economic value. The eruptive rocks, as a whole, have not heen the loci of considerable deposits.

ORE DEPOSITS IN CAMBRIAN ROCKS.—As a producer of gold the Cambrian is second in importance only to the Algonkian series. In the rocks helonging to this age, or those which lie immediately above the metamorphic schists, there are four varieties of ore—first, the gold-hearing conglomerates or gravels, generally known as the cement deposits; second, the refractory siliceous ores; third, the pyritic ores, and fourth, the lead-silver ores.

THE GOLD-BEARING CONGLOMERATES.—At the hase of the series of Camhrian strata, immediately above the upturned schists, there is generally a hed of gravel. It varies in thickness from a few inches to more than 30 feet. Throughout a large number of areas where the Camhrian strata yet remain uneroded this conglomerate is generally ahout 3 or 4 feet thick, and passes upward into a hard, dense quartzite, which has a vertical range of from 15 to 30 feet. The quartzite is almost universally present at the hase of the Camhrian series. The gravel is generally quite thin, hut attains a notahle thickness in a few localities. One of these is in the vicinity of Lead City. Here the gravel is gold-hearing and has produced very heavily in the past. The productive areas of this gold-hearing gravel are closely grouped ahout the Homestake helt. They are five in numher. One, comprising the Durango and Harrison mines, is west of the Homestake lode, near the southern extremity of the present outcrop. The other four, east and north of it, include the Hawkeye, Monitor and Gentle Annie. One of these lies just east of the Caledonia cut; another on the divide between Bohtail and Deadwood gulches; the third on that between Bobtail and Deadwood gulches, and the fourth on the north side of Bohtail gulch, beneath a heavy capping of rhyolite, which forms the high ridge beyond. The gold-hearing conglomerate occupies irregular depressions in the old schist surface, and was probably not uniformly distributed along an old shore line. It thins out to nothing along the strike of the Homestake lode and allows the higher measures of the Camhrian series to lap over onto the mineralized rock of the Algonkian. A general downward inclination of the schist surface toward the northeast may also he ohserved.

It is not possihle to give exact houndaries to the original extent of these gold-bearing gravels on account of the dissected nature of the areas which now remain. The gravel is composed of rounded, water-worn pehhles of quartz schist and a few fragments of softer schist, which seem to decrease in ahundance as one proceeds farther from the Homestake lode—that is, from the old pre-Camhrian shore line. The gold-hearing portions of the gravel may he at once distinguished from those which are harren by the character of the material which cements the pebhles. In the gold-bearing portions this is chiefly oxide of iron when weathered, or pyrite when it has not suffered alteration. The non-gold-bearing portions, on the other hand, have also a rather sandy, quartzose matrix, or are in some instances slightly calcareous. The gold in the richest portions of the conglomerate—those first mined—is chiefly placer gold, for it is rounded and worn hy attrition and is concentrated near the hedrock. It was undoubtedly derived from the erosion of gold-hearing lodes in the Algonkian rocks, and mechanically deposited in depressions along the old shore line. Some of it has heen dissolved by ferric sulphate which has resulted from the oxidation of the pyrite and has heen redeposited from this solution in thin films in the laminæ of the underlying schists. This has also produced an enrichment of the lowermost layers of conglomerate. Besides these two types of gold which occur in these gravels, it is also possihle that gold was introduced with the pyrite which either cements or once cemented the pehbles. The introduction of pyrite was suhsequent to the deposition of the conglomerates, since it penetrates fractures in the quartz pehhles. It is prohably a replacement of the original quartzose cementing material. Intrusions of rhyolite cut the conglomerate in many places, and are often quite heavily impregnated with pyrite. The close relation hetween these gravel deposits and the Homestake lode, together with their ahsence along its line of outcrop, seems to indicate that the Homestake zone projected ahove the level of the surrounding rocks and formed in the old Camhrian sea a reef ahout which these gravels were deposited. A greater portion of their gold was thus, with little question, derived from the disintegration of the old Homestake lode. They are not to be compared exactly with the gold-hearing sands which are found in the Nome district of Alaska, but are somewhat exceptional, not only hecause they are the only representatives of what may he termed fossil placers, hut hecause they are not uniformly deposited along the shore, hut were confined to the vicinity of an outcrop of a large gold lode, and the detrital material from that lode was held in irregular depressions in the suhmarine surface in the vicinity.

REFRACTORY SILICEOUS ORES.—Of all the ores occurring in rocks of later age than the Algonkian, the refractory siliceous ores have thus far heen the most important factor in the gold production of the northern Black Hills. They are widely distrihuted over a large area, extending from Yellow creek on the southeast to Squaw creek on the northwest, in a hroad, irregular helt.

This helt includes five productive areas, which will he later discussed. The country rock in which the ore occurs is a dolomitic limestone of fine-grained, crystalline texture, and varying, like the ore, in its degree of oxidation. It is termed "sand rock" hy the miners. In its fresh condition it is a dense, gray, crystalline rock, showing innumerable small cleavage faces of dolomite and generally interrupted by hands of greenish-hlack shale of varying width. When oxidized it has a deep red color, hut presents the same crystalline texture, while with very advanced alteration it passes into a red, earthy material termed "gouge." Chemical analysis of this rock shows it to be a dolomite of nearly normal composition, while the microscope shows that it is composed of irregular masses of dolomite, with some scattered grains of quartz or clearly-hounded rhomhic crystals of dolomite. When the rock has been mineralized these are altered to silica and often heautifully preserved. The dolomite beds of this character which have so far heen most extensively prospected occur at two positions in the Camhrian series. The first is immediately ahove the hasal quartzite, from 15 to 25 feet ahove the schists of the Algonkian, and known as the "lower contact;" the second, from 18 to 30 feet below the scolithus, or so-called "worm-eaten" sandstone that forms the top of the Cambrian series, termed the "upper contact." Many other beds of dolomite occur at intervening levels and some of them have produced a little ore. There has as yet been hut little systematic prospecting upon these beds, and it is very probable that they may become important ore horizons in future. The ore is an extremely hard, brittle rock, composed largely of secondary silica and carrying, when unoxidized, pyrite, fluorite and, at times, harite, wolframite, stibnite and jarosite. It shows many cavities, which are lined with druses of quartz crystals, or contain clusters composed of cubes of fluorite. Some of the cavities show large crystals of barite. In some localities the siliceous ore is heavily charged with wolframite, so that in many instances it grades from beds of siliceous ore into flat hodies of almost pure wolframite. Occurrences of this kind are found in the Yellow creek and Lead creek areas. When carrying large quantities of wolframite the ore usually contains great quantities of harite. The ore occurs in flat, banded masses in which the handing is continuous with the bedding planes of the adjoining strata. These masses possess a regular, channel-like form and follow zones of fracture that vary for the separate districts in their general direction, but exhibit a very uniform trend within the limit of any single productive area. These channel-like ore hodies are known as shoots and have a width of from a few inches to, in rare instances, 300 feet. The average width is, perhaps, about 30 feet, although all widths hetween 5 and 100 feet are of frequent occurrence. The length is in all cases many times in excess of the breadth, and in the case of the Tornado–Mogul shoot is ahout ¾ mile. The vertical dimensions vary from a few inches to a maximum of 18 feet. The average thickness is ahout 6 feet. The shoots generally follow either single fractures which are parallel to their longer diameter, or broad areas of parallel or intersecting fracture. The heds of rock that lie above the ore are generally shale of a more or less impervious character, but sills of eruptive rock not infrequently play the same role. On the lower contact the floor is sometimes of basal Cambrian quartzite, but in many cases varying thicknesses of dolomite intervene hetween it and the ore. In such cases the widest portion of the shoot is directly beneath the impervious rock of the roof, for the solutions have spread out and replaced dolomite to the greatest distance along the under surface of the impervious rock. The shoots have thus a wedge-shaped form in many cases, the hroadest portion of the wedge heing at the top.

THE FRACTURES.—When the ore that forms the hody of a shoot has heen removed, the fractures by which the mineralizers have gained access to the rock replaced may be traced in the overlying and—where they are uncovered—in the underlying heds. These fractures have been rendered prominent by a slight silicification of the adjoining rock, which has often caused them to project from the softer shaly material. They are often iron-stained, also. These silicified iron-stained fractures are commonly known as "verticals." They may be ohserved in greater or less number in all of the shoots of the refractory siliceous ore. The fractures are generally slightly warped surfaces along which slight movement has occurred, or they may he composite zones of fracture caused by the intersection of many small irregular fissures. The displacement along such planes of movement is generally very small—not more than 2 or 3 inches—but it sometimes reaches 6 or 7 feet. They are usually without appreciable open space, for the walls have not generally heen removed from one another for distances greater than $\frac{1}{4}$ inch. Some notahle exceptions occur. They are generally vertical, or nearly so. They frequently extend into the heds that form the roof of the ore hodies, and sometimes terminate in the ore-bearing beds themselves. They have also heen traced through the lower quartzite into the Algonkian below, hut on entering that formation their traces are lost in the vertical laminæ of the schists.

(TO BE CONTINUED.)

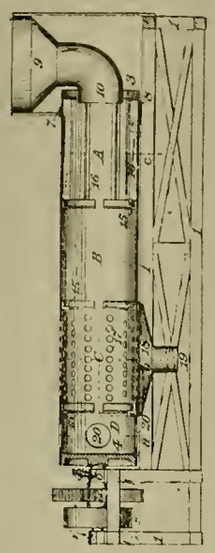
The Hampson Patent Turntable.

Among the points of merit in the Hampson patent turntable, illustrated herewith, are that there will

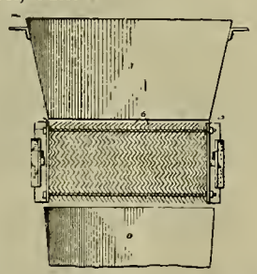
The Hampson Patent Turntable.



be found no tracks to clog up with ore, dirt or snow. The car can he pushed on or off, to or from any track at any angle: no matching of rails necessary. The manufacturers say that it doubles the amount of work possihle with other turning devices, and that the heaviest car can be turned by a child. These tables are made only by the Colorado Iron Works Co., Denver, Colo., under authority from the patentee. Standard size, 36 inches diameter; weight, 600 pounds.

Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 15, 1903.

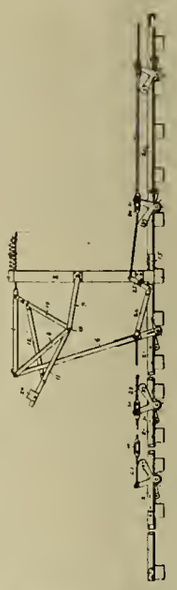


Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MACHINE FOR WASHING AND CLEANING GRAVEL IN GOLD MINING.—No. 738,408; J. G Camp Sacramento, Cal.

In machine for washing and cleaning gravel, combination of rotably mounted cylinder, feed spout leading into one end thereof, and transverse retaining plates dividing interior of cylinder into sections, first adjoining delivery spout, provided with longitudinal lifting plates, second is imperforate and unobstructed, third provided with perforations for escape of water and of smaller portions of material treated, and fourth provided with discharge openings of larger diameter for passage of larger portion of material treated.

ORE SEPARATOR.—No. 738,331; C. F. Lancaster, East Liverpool, Ohio.

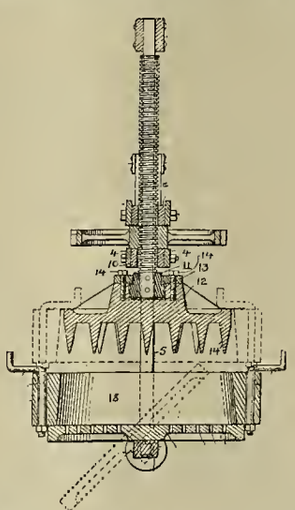


Ore separator, comprising in combination with magnet, separator box, magnetizable corrugated plates supported therein, adapted to be excited by magnet, and feeder for feeding material between plates.

ROTARY DRIER.—No. 738,106; D. Grupe, Davenport, Iowa.

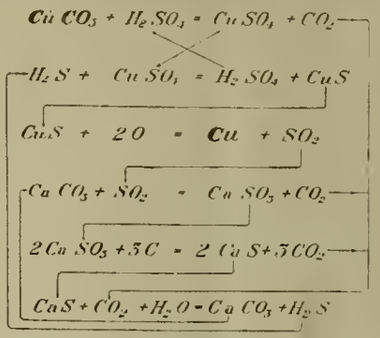
Rotary drier comprising cylindrical shell having discharge opening, inner supporting plate and outer plate providing steam chamber at one end of shell, steam supply pipe connected with steam chamber, outer supporting plate having central opening and located at outer end of shell, steam flues having their inner ends fixed in inner supporting plate and extending into steam chamber, outer ends movably mounted in outer supporting plate and extending beyond same, small steam chambers having inner openings in which outer ends of flues are fixed, and outer openings opposite inner openings, removable caps secured to outer openings of small steam chambers.

MINE CURTAIN RAISER.—J. Wack, Canton, Ohio.



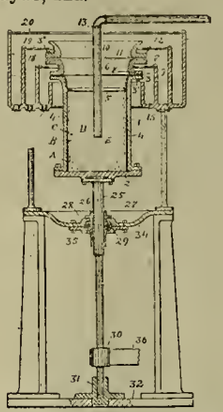
In combination, curtain frame, curtain hung on frame, adjacent rocking frame comprising rock shaft, rock posts on shaft, curtain arms pivoted to rock posts above and attached to curtain below, toggle levers pivoted respectively with curtain arms to rock posts and to curtain frame, toggle joints being tied to curtain arms, weight on rocking frame located to bear with curtain when same is lowered, and partly counterbalance it when raised, and means for oscillating rocking frame whereby is curtain raised and lowered.

EARTH BORING AUGER.—No. 738,760; A. M. Bevier, Superior, Wis.



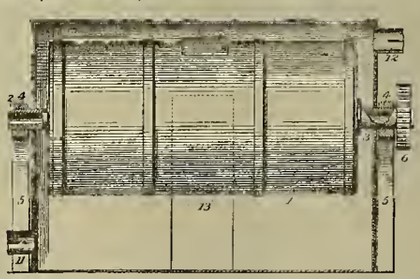
In auger, combination of cylinder, open at one end and provided at end with boring point forming continuation thereof, and having port formed in opposite end, and outwardly opening valve adapted to govern port.

PRESS FOR SQUEEZING MUSHY, ZINKY OR COPPERY LEAD DROSSES.—No. 739,003; W. H. Howard, Pueblo, Colo.



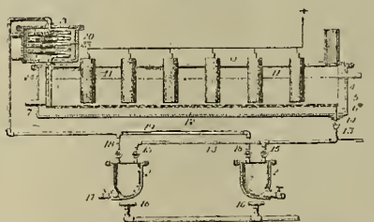
In press, combination with support, of fixed upright screw secured therein, plunger loosely swiveled on lower end of screw, plurality of teeth projecting from under side of plunger, adapted to indent material being treated, frame supporing material, and nut meshing with screw for feeding frame up toward and down from plunger without relative turning thereof, whereby after material has been withdrawn from plunger latter can be freely turned to cause teeth to make new series holes in material.

PROCESS OF TREATING ORES.—No. 739,011; F. Laist, Salt Lake City, Utah.



Method of generating hydrogen sulphide and precipitating copper by subjecting an alkaline earth sulphide in the presence of water to the action of carbon dioxide, producing hydrogen sulphide and carbonate of alkaline earth, conducting hydrogen sulphide into the presence of copper in solution, precipitating copper sulphide, treating copper sulphide to obtain metallic copper and gases rich in sulphur dioxide, absorbing gases by alkaline earth carbonate, forming sulphite of alkaline earth, and reducing sulphite to sulphide.

CONCENTRATING MACHINE.—No. 739,081; T. H. Hicks, Fort Wayne, Ind.



In concentrating machine, rotatable cylindrical vessel adapted to contain mercury, discharge opening for mercury escaping from vessel, mercury-coated lining covering interior of vessel and extending through discharge opening, means for adjusting area of discharge opening to prevent discharge of water or ore while permitting discharge of mercury.

PROCESS OF TREATING TELLURIDE ORES OF GOLD AND SILVER.—No. 739,138; C. E Baker and A. W. Burwell, Cleveland, Ohio.

Process treating ores of gold and silver containing base metal and tellurium by combining base metal and tellurium with chlorine, and separating base metal chloride from other metals or metallic compounds in mass.

ELECTROLYTIC PROCESS OF RECOVERING METALS FROM THEIR COMPOUNDS.—No. 739,139; C. E. Baker and A. W. Burwell, Cleveland, Ohio.

Electrolytic process of recovering metals from compounds by electrolyzing the metallic compound with liquid cathode of a metal more volatile than metal to be recovered, distilling resulting amalgam or alloy, and condensing the vaporized cathode metal and continuously returning it as condensed to cathode.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Bartels Tin M. Co. is driving two tunnels into the hills back of Tin City, 15 miles above York, says the Valdez News.

S. Elmgreen and A. B. Frick report finding ore on Windfall creek, near Juneau. The strike is 8 miles from Yankee Cove.

R. K. Neill of Spokane, Wash., of the Kendall mine, interested in the Kyak oil fields, says the English company is sinking a well and is down 400 feet. It has not yet reached the oil sands. Two other companies are putting up rigs. M. J. Sinclair and J. A. Finch, of Spokane, are also interested in the district. The oil has been tested and is said to be of good grade.

The Saw Tooth Power & M. Co. is being organized by several operators at Cape Nome to supply all of Seward peninsula with electricity and water power for hydraulic mining. East of Port Clarence and a few miles from salt water are the Saw Tooth or Kigiuaik mountains, in which rise several streams. It is proposed to harness these small rivers and generate an aggregate of 100,000 H. P., using the water power for generating electricity, which will be carried by wire to Nome and all other mining districts of Seward peninsula. The electric current will then be utilized in lifting the water from the various rivers and creeks for hydraulic mining purposes. At present steam plants are being used, but the cost of the machinery and fuel is so great that they can be employed only where the ground is rich. Two engineering parties are now in the field surveying the falls and rivers of the Saw Tooth mountains. It is expected to get part of the machinery in next summer.

ARIZONA.

GILA COUNTY.

(Special Correspondence).—Copper mining is active in the Globe district. The Old Dominion has disclosed by recent developments ore reserves which in richness and quantity excel estimates heretofore given. The Old Dominion company is running two jackets of 125 tons each. In one of them it is treating sulphide ores from the Copper Hill mines, owned by the Arizona Commercial Co., which company has recently developed in its lower levels large bodies of sulphide ores. The new shaft of the Old Dominion is being pushed night and day, and excavations for a new and modern plant are being made.

There are a number of small properties that are shipping ores to the Globe and El Paso smelters at good profit.

The Black Warrior C. Co., Amalgamated, recently made a run in its new plant which is leaching, concentrating, smelting and refining, the result of which was satisfactory. The superintendent reports higher grade ores on the lower level. The company will put in a new 100-ton blast furnace to treat these ores together with refiners' slag from the refining furnace.

The Pacific M. & M. Co., J. D. Coplen, general manager, J. B. Coplen, superintendent, has fifteen claims in the Globe district, and also owns fifteen claims in Pima county. The company is developing its property and proposes to erect a plant of three-fold character, leaching, concentrating, smelting and refining, total capacity 500 tons per day, as their developments show carbonates, oxides and glance ores, with sulphide coming in at the lowest level, 250 feet below the outcrops on the surface. There is nearly 2500 feet of development work consisting of tunnels, shafts, winzes, adits, etc., on the Globe properties. On the north side the ore body can be tapped at a depth of 400 feet by tunnels; on the south side it can be tapped at the depth of 500 feet by a tunnel. Development has been planned by the company by running a drift from the lowest point throughout the entire length, some 8000 feet on the vein, gaining a depth of more than 1000 feet.

Railroad building in Arizona the coming year promises to be a most important factor in the affairs of Arizona. Tonto Basin reservoir, to be the largest artificial body of water in the world, now building by the Government 35 miles north of Globe, will figure in the mining development of that section.

Globe, Sept. 15th.

MARICOPA COUNTY.

The Mormon Girl mine, at Cave Creek, has been sold to Davis & Sons of Congress and Chicago, Ill., men. The ore shows free gold and sulphurets. They are repairing the mill to use until they can build one to be run by electricity.

At the Oro Grande mine, near Wickenburg, the 5-stamp test mill is being put in place, says Vice-President G. B. Upton. The mill has 900-pound stamps, and is of the same pattern as the proposed larger mill.

PIMA COUNTY.

To work a group of mines in the Old Hat district in the Catalina mountains, near Tucson, the Gold Canyon M. & M. Co. has been organized. The officers are: C. H. Pogue, A. H. Tihbals, B. Brooks, D. S. Cochran and W. I. Perry of Tucson, W. H. Tihbals of Salt Lake City, Utah, and J. S. Acker of Prescott.

YAVAPAI COUNTY.

The Tiger G. M. Co., operating in the Bradshaw mountains, southeast of Prescott, has completed a survey from the Oro Belle mine to Bradshaw City for a narrow gauge railroad, which railroad later will be extended from Bradshaw City to Crown King, says the Prescott Courier. A wagon road has been built from Bradshaw City to Crown King, having a 4% grade, and can be used for the railroad when it is built. The Cleveland tunnel has been run in 815 feet from the Cleveland to the Gray Eagle ground, and at the end of the tunnel a station cut and a hoisting engine set up. A double compartment shaft is being sunk.

T. J. Rigby, president of the Rigby M. & R. Co., which is building a chlorination plant at Mayer, says work is progressing. The plant will handle the siliceous ores.

Shipments of onyx are being made to London, England, from the onyx quarries at Mayer.

YUMA COUNTY.

It is reported work will be started on the Rio del Monte claims, 8 miles south of Harrisburg, next week. Machinery has arrived and development will be increased. The group consists of thirty-two patented claims and owned by J. P. Jones and R. F. Pettigrew.

J. P. Moffett of Palomas, manager of a group of mines in Castle Dome district, says, with Eastern parties he is arranging for opening of work next month. The five claims in this group are 18 miles north of Gila City and 8 miles south of the Luce mine. Since location, three 60-foot shafts have been sunk, exposing veins of pyritic ore carrying copper, gold and silver, giving average assays of $30 values.

CALIFORNIA.

AMADOR COUNTY.

At the Bunker Hill mine, near Amador City, grading for the 20-stamp mill was completed last week and construction work is under way.

The work of repairing the shaft at the Argonaut mine at Jackson, preliminary to starting up, is expected to begin this week. Supplies of timber and lumber are being received.

At the Kennedy mine at Jackson the new hoist is in operation, using the old skips temporarily. The new skips are expected to be attached this week.

CALAVERAS COUNTY.

Operations are going ahead at the Voinich mine, near Angels, and the shaft is down 195 feet. The lode lies 8 feet east of the shaft, the shaft being sunk on the foot wall side and parallel with the pitch of the vein, says the Echo. Several stringers of ore have been cut, coming from the west and making for the main lode. The company is preparing to put in heavier machinery and a compressor, and is also making ready for a 20-stamp mill.

At the Angels mine, at Angels, owned by J. V. Coleman, the 20-stamp mill is running steadily and work is progressing on the second twenty stamps that are being added. It is expected to have them dropping by Oct. 15.

The Utica M. Co.'s group at Angels, embracing the Stickle, South Stickle, Madison and Gold Cliff mines, are all running in full operation. The log yards of the company are being filled up, and sawed timbers and planks are coming in for the winter operations. As soon as the Madison is unwatered extensive explorations will be made.

The Red Bird gravel mine in Chili Gulch, near Mokelumne Hill and adjoining the Duryea mine on the east, was bonded last week to a Chicago, Ill., company for $2100, says F. L. Peek, part owner. Work will begin next month.

At Jenny Lind, F. M. Hammond manager, the California G. Dredging Co. is building a dredger to work the gravel beds. The work of prospecting the gravel has been going on for several weeks, and several tracts along the river are under bond.

EL DORADO COUNTY.

(Special Correspondence).—The Georgia Slide mines—Blue Rock, Pacific, Beattie and Parsons—are not working at present, due to lack of water. Schirer Bros. & Co. have given up their lease on the Parsons mine.——The El Dorado C. Co., near Georgetown, are doing work on the Modoc mine.——The Josephine at Volcanoville is reported shut down temporarily.——E. W. Chapman has bought the Gem mill and says he will remove it across the gulch to the Garfield mine and begin development. The 80-foot incline shaft shows ore.——The Two Channel Co. is not working at present.

Georgetown, Sept 23.

Superintendent O. Emery of the Emery G. M. & W. Co. says the company is preparing to extend its ditch system so as to convey water to the placers in Secret Diggings district, 3 miles north of El Dorado.

FRESNO COUNTY.

The Westmoreland-Coalinga Petroleum Co. has been organized by Eastern men, and W. P. Kerr is field manager. The company's holdings are ½ mile south from the producers of the California Oil Fields, Ltd., and 28 Oil Co., near Coalinga.

The Coalinga Star Oil Co. was organized last week at Grass Valley by W. A. Sleep, R. J. Fitzgerald, D. E. Matteson, W. G. Thomas, D. E. Morgan, I. W. Hays and L. C. Wilhelm, to operate on a 20-acre tract which they have bought at Coalinga. The principal place of business will be Grass Valley.

KERN COUNTY.

The Columbian Oil Co., at Kern river, near Bakersfield, is preparing to drill seven additional wells on its land, and work has started on the first of this number. The company has five wells completed and pumping, says Superintendent Coburn.

The Potomac Oil Co., which is pumping nine wells in the northern part of Kern river, near Bakersfield, intends to sink six more wells this winter, says Superintendent Ritchie. He has a reservoir with a storage capacity of 8200 barrels.

Twenty-one non-union miners arrived at Randsburg on the 23rd inst., to work for the Yellow Aster M. Co.

It is reported the Spreckels-Crocker-Woolworth combination have, in addition to their control of the Monarch oil property at Sunset, absorbed the several leases of that company—the Ohispo, the Copper Con. and the Tremont. These properties have producing wells. It is also thought the same men have bought the Clark-Bryan-Wilson property, which was sold a short time ago for $40,000, says the Bakersfield Californian. The Spreckels-Crocker-Woolworth men are owners and operators of the Pacific Oil Transportation Co., operating its own steamers and refineries.

LOS ANGELES COUNTY.

The holdings of the Dividend Oil Co., consisting of nine wells on Boyleston avenue, Los Angeles, have been sold to the Boyleston Oil Co., of which B. G. Adams and H. E. Adams are president and vice-president, respectively. The price paid for the property, which includes two pumping plants and storage tanks of 5000 barrels capacity, is reported to be $15,000.

NEVADA COUNTY.

(Special Correspondence).—Six feet of free gold ore has been opened up in the Yuba mine, near Washington. Lessee Miller has transferred his lease on 100 tons of ore to the company for $1000 cash, he being permitted to remove the ore already broken. J. L. Bryson is manager.

Washington, Sept. 24.

T. F. McAvory, managing director of the Standard M. Co., says he intends to put in additional machinery on the mine on Alta Hill, near Nevada City.

The Planet Con. Drift M. Co. has bonded all its property at Lowell Hill, near Nevada City, to C. A. Bailey of San Francisco, says the Miner. It adjoins the Liberty Hill mine, and will be worked by drift mining. It is intended to drift on the bedrock and then stope the gravel. They have a surface area of 320 acres on which there is considerable timber.

PLACER COUNTY.

The water right and electric power plant of the Pioneer-Lynn M. Co. has been sold to the International M. & S. Co., owners of the Southern Cross and other quartz properties near Euchre Bar, 7 miles from Towle, for $7500 cash and stock. The sale includes a water right of 3000 inches, dam, flume, power house, 350 H. P. turbineeew hl, electric plant with complete equipment.

SAN BERNARDINO COUNTY.

(Special Correspondence).—The Chase G. M. Co., operating at Stagg, is preparing to put in a 10-stamp mill and cyanide plant. E. H. Stagg, of Johanneshurg, Kern county, is manager.

Stagg, Sept. 22.

SAN LUIS OBISPO COUNTY.

In Carisa oil district in eastern San Luis Obispo county, west of McKittrick (Kern county), development work is increasing. Three drilling rigs are on the ground. Wagon roads have been built, one through the Temblor hills from McKittrick to the Carisa district. On the Congdon property, a supply of water has been developed, and work on the oil well being drilled is going ahead. H. H. Bardin, manager of the Los Chimneas ranch, southwest of the Congdon well, reports finding oil shale. Four wells are to be drilled.

SHASTA COUNTY.

The Great Western G. Co. report paying $90,000 as second payment on the Afterthought copper mine near Bella Vista this week. The total price was $150,000. The final payment is due in March, 1904. The Great Western has had a working bond on the property for over a year, and is putting in a 150-ton smelter. Machinery is on the ground, and the building is going up.

Work was resumed last week at the Quartz Hill mine, of the Original Quartz Hill M. Co., near Redding, under Foreman A. Jackson. A 300-foot shaft will be sunk and a cyanide plant will be built, says President M. Maryanski.

The Star of Hope mine, at the head of Little Churn creek near Churntown, near Redding, is being reopened and ore produced for shipment to the Keswick smelter. The mine was formerly the Dale & Dawson mine. S. S. Stickley, of Buckeye, and C. Dale are owners. A drift has been run from a lower level and a ledge tapped.

SISKIYOU COUNTY.

J. F. Reddy of Spokane, Wash., has bonded the interests of his associates in the Blue Ledge and Sam's Ledge copper mines on Elliott creek, consisting of twenty-seven claims, for $150,000.

Manager Conolly of the Quartz Hill M. Co. has finished a 7-mile ditch to Scott Bar, and is getting ready to start hydraulic mining, with expectation of putting up a new quartz mill in place of the 10-stamp mill, later on, for working quartz veins of the claim, reports the Siskiyou News. The ditch is 7 feet by 3 feet, and carries 1200 inches, with a pressure of 240 feet at Scott Bar.

TRINITY COUNTY.

O. H. Bagley and E. W. Bacon have a lease from the Brown Bear M. Co. on the bed of Deadwood creek, from the China tunnel to the Gibson arrastra, where they have built a 4-foot flume with several undercurrents, and are running through the tailings from the Brown Bear mine, near Deadwood. A concentrator is being set up. The values are in sulphurets and fine gold.

TUOLUMNE COUNTY.

(Special Correspondence) —The Black Oak G. M. Co., near Soulsbyville, G. W. Campbell manager, are putting in two 4-inch steam pumps to handle the water of the mine while repairs are being made to the Cornish pump system. New rods are being put in for the Cornish pump, each piece of timber being dipped in an asphaltum-tar mixture for a preservative. The work of replacing has progressed down 300 feet.

Soulsbyville, Sept. 23.

(Special Correspondence).—Development work is progressing at the Street mine, near Tuttletown. Stroud & Kinsman, owners, are preparing to add another five stamps to their 5-stamp mill; also two more concentrators and a heavier engine and boiler.

Tuttletown, Sept. 24.

P. Seiler of San Francisco has bought the Ajax mine and mill site, near Sonora, together with all improvements, machinery, water rights, etc.

The electric current was turned off from the Phœnix lake power plant on the 14th inst., says the Mother Lode Magnet. The shutdown this year does not include any of the mines on the east belt or about Tuttletown, the Dutch mine at Quartz, Jumper at Stent, or the Crystalline, near Jamestown. At the Jumper mine half the men were laid off for a few days. Operations will be resumed with the auxiliary steam plant. The management will keep forty stamps dropping steadily and 100 men at work. This is said to be the first time that the Jumper mill and compressor have been kept running during the dry season. Forty-two men were laid off at the Republican mine at Jacksonville, only a few being retained. The sixty stamps in the Harvard mill at Jamestown were hung up by the giving out of electric power. The mine will work a few men during the dry season on development. The Shawmut mine, near Chinese, let out 200 men, but will keep sixty men on, doing development work, making repairs and running the chlorination plant. At the Rawhide, near Jamestown, twenty men are retained. The Tuolumne Water Co. says it has a considerable reserve supply of water in two reservoirs and Phœnix lake, sufficient, it is thought, to supply patrons for battery and other purposes than power for two months.

YUBA COUNTY.

The State Anti-Debris Association has

refused to consent to an application made by Eastern men to work the Blue Point mine, east of Marysville. The mine, which is owned by P. Campbell, is closed under an injunction. It is desired to work the mine by a new process and to put in additional machinery, but before doing so a certain slide of gravel, amounting to 800,000 cubic yards, must be removed by the sluice process, and the petitioners sought to get the consent of the association to its removal so the parties removing it would not be in contempt of court. The Campbell mine is above the barriers being constructed by the Federal and State Governments near Deguerre Point, on the Yuba river. The Anti-Debris Association holds that to wash down the gravel would impair the navigability of the Sacramento river.

Near Rackerby the Seabolt & Davis quartz mill was destroyed by fire last week, the result of a forest fire in that section. The building and machinery were valued at $4000 with no insurance.

COLORADO.

BOULDER COUNTY.

Work is again under way at the Trojan mine in Sugar Loaf district, near Boulder. The mine is said to have two separate veins, one bearing gold, the other silver. The two veins are coincident at top, but at depth of 50 feet separate, and at this point two shafts are sunk, one on each vein. These are down 200 feet. J. Cohry, of Denver, J. T. Phillips, of Eldora, and J. Myers, of Wall Street, own the mine.

——A depth of 200 feet has been reached in the shaft of the Fanchon mine, near Sugar Loaf, and will go deeper and a crosscut be run to cut the Dinero, Orinoco and Gunnison veins.

CHAFFEE COUNTY.

C. E. Mulloy, of the Ohio-Colorado Smelting Co., at Salida, says the smelter is running full force and handling a large tonnage. The new stacks have been completed and the twelve additional roasters will be finished by Oct. 1st.

CLEAR CREEK COUNTY.

A third lode has been cut in the Wilcox tunnel, near Georgetown, which is in 1100 feet. Men have been put to work with machine drills to drift on this lode. It showed pyrite and galena.

The Coming Nation mine, on Santa Fe mountain, near Idaho Springs, was sold last week to J. B. Papenbrock of Cincinnati, Ohio; W. H. Hamilton of Terre Haute, Ind., and other Eastern men for $25,000. They have incorporated as the Wire G. M., M. & Cyaniding Co., and will start development work this month.

Plans are being drawn for a concentrating plant for the Con. Gem M. Co., to be built near the mouth of the Newhouse tunnel, near Idaho Springs, says Manager W. E. Renshaw. The first section of the mill will have a capacity of 800 tons daily. In connection with the concentrating plant a cyanide process is to be used. The second section, to be built later, will be of 500-ton capacity. The Con. Gem M. Co. controls a number of the principal veins cut by the Newhouse tunnel, including the Gem, Freighters' Friend, Silver Edge, Franklin, et al. Drifts are being run from the Newhouse tunnel. Low grade ore body is as wide as 50 feet. The first raise is being run to connect with the Gem shaft. Four additional raises will be driven to connect with other shafts of the property.

EL PASO COUNTY.

The strike of the coal miners at the Danville and Pike View coal mines, north of Colorado Springs, has been settled by a compromise and the men have returned to work. One hundred and fifteen men were affected.

GILPIN COUNTY.

Sinking operations have begun at the Gomer mine, near Russell gulch, under lease and bond to Tanner, Carlson, Anderson and King, of Idaho Springs. The shaft was 100 feet deep and they intend to go at least 100 feet deeper, and later put in a heavier plant of machinery. C. A. King, of Idaho Springs, is superintendent.

Sinking operations have been suspended at the Shafts Extension or True Democracy shaft on King flats, near Central City, at depth of 500 feet, and drifts are being run. Lead and copper-iron ore is showing. On the west side of shaft, besides drifting, a crosscut is being run north. E. O. Wolcott and D. Sullivan, of Denver, with Bolsinger Bros., of Nevadaville, are interested.

It is reported the Mutual Benefit G. M. Co., operating the Pleasant View mine, on Gunnell hill, near Central City, propose to build a concentrating mill at the property this fall, says Manager Remer.

The Onoko G. M. Co is putting in a steam plant for its Phillips mine in Leavenworth gulch, near Black Hawk. It includes a 10x12 double friction hoist, capable of hoisting from depth of 1000 feet, and a 60 H. P. boiler. The company is shipping smelting ore to the Denver smelters and concentrating ore to Idaho Springs. The ores are coming from the 120-foot level. They will sink the shaft from the 220-foot point to 500 feet.

CUNNISON COUNTY.

The Waunita Mutual G. M. Co. has been incorporated by F. E. Sargent, of Idaho Springs, and H. F. & E. S. Alnutt, of Pueblo, to operate the Pog Leg group of three claims, 1 mile south of Bowerman. Development work has begun. An 8-foot vein has been opened and shows values in gold.

LAKE COUNTY.

The Twin Lakes G. M. Co., near Leadville, last week sold several of its claims to the International Investment Co. for $60,000, including the Spokane, Victor, Oro Cache, Wedge, Mountain Maid, Golden Eagle, Mammoth, Homestake and others.

Operations have been resumed in the South Winnie mine by Long, Callen, McArthur et al. of Leadville, and several other parties have taken a lease on the north end of the Fanny Rawlings, and are cleaning out the old workings.

The A. Y. & Minnie mine at Leadville is making shipment at rate of 2000 tons a month of ore. Heretofore the mine has been operating almost exclusively on milling ore, but some lead sulphide is being opened up which, it is claimed, can be handled at profit without running through the mill.

LARIMER COUNTY.

The president of the Mount Zirkel C. M. Co., operating the Mount Zirkel mine, at Pearl, says they will build a concentrator this fall and that slime tables will form an important part of the equipment.

MINERAL COUNTY.

Another Chilian mill for the Humphreys concentrating mill at Creede is being set up. Work has begun on the ground for the erection of the steam power plant and is expected to be finished by Nov. 1. With this addition of power the mill will be run at full capacity, as only half the jigs and tables in the mill are being used at present, owing to lack of power, the water having decreased.

PUEBLO COUNTY.

The coal land contest between the Government and the Colorado Fuel & Iron Co. that has occupied the attention of the Public Land Office and the Washington authorities for the last four months, has been settled by a compromise. The steel company will pay $20 per acre, the price asked for the coal land, instead of $2.50, paid for timber and stone land claims. It is understood the Colorado F. & I. Co. will pay about $500,000. The Victor Fuel Co. has also settled with the Government on same basis on a number of coal land claims taken up under the Timber and Stone Act.

The annual convention of district No. 15, United Mine Workers of America, which includes Colorado, Wyoming, Utah and New Mexico, is in session at Pueblo. The miners are asking a higher wage scale, an eight-hour day, no discrimination against members of the United Mine Workers, a bi-weekly pay day and changes in the system of weighing. The sentiment of the delegates seems to be in favor of a peaceful settlement if possible.

SAN JUAN COUNTY.

Work on the tunnel to drain the properties of the Frisco M. Co. and the San Juan G. & S. M. Co. at Mineral Point, near Silverton, is progressing, says N. R. Bagley, manager. It will cut six claims of the Red Cloud M. Co. at 600 feet depth. A shaft will be sunk to connect with the tunnel at the junction of the Cashier and Yankton veins. This development work is expected to be completed next spring, when other development on the veins and the hullding of a concentrating plant will be started.

A cross-compound eight-drill air compressor with drills has been put in at the Barstow mine at Red Mountain, near Silverton, says the Standard.

SAN MIGUEL COUNTY.

The Smuggler-Union M. Co. has bought the two Foster lode mining claims in Bridal Veil basin, near Telluride, for $300. A few men will be put on assessment work.

The Telluride M. Co., operating claims in Prospect Creek basin, south of Telluride, has bought a three-quarters interest in a group of seven mining claims, and have put men to work on development. In the spring a small reduction plant will be built.

Superintendent J. P. St. Claire says he will have the retention dam being constructed for the Tomboy, Smuggler-Union and Liberty Bell mining companies, near Telluride, to retain tailings from the mills and reduction plants of the quartz mining companies, and preventing the waste sand from running down the river and into the flume and pipe lines of the Keystone Hydraulic Co., finished this week. The valves for flushing the tailings out in the spring during high-water season have been set.

J. H. Litchfield, manager of the Double Eagle M. Co., is preparing to build a small milling plant at his property in Bridal Veil basin, near Telluride, and expects to have it in operation by Oct. 15. The principal gold values will be saved by amalgamation and iron and silver by concentration.

The Valley View group of five claims, a tramway, 10-stamp mill and millsite, near Telluride, have been sold to the Japan-Flora M. & T. Co. The group is across the gulch from the buildings at the Bullion tunnel and 1 mile from the Japan tunnel. No work is being done at present, but it is said as soon as the existing labor troubles have been settled men will be put on and extraction and treatment of ore begun.

Manager H. Buckley of the Silver Bell mine at Ophir has granted his mill men an eight-hour day and three shifts have been put on. Manager Davidson of the Caribou - Montezuma also granted an eight-hour day. This practically settles the labor troubles in Ophir, with the exception of the Butterfly-Terrible mine, whose manager, J. S. Keating, refused to treat with the union.

TELLER COUNTY.

A notice has been posted in every mine owned by members of the Mine Owners' Association in Cripple Creek district which says that no member of the Western Federation of Miners need apply for work. The Anchoria-Leland resumed last week, as also the Stratton's Independence at Victor, the military guard lines being extended to take in the Independence. The men not needed at the Golden Cycle were put on at the Independence. A number of men from Duluth, Minn., were put to work. The situation, in general, is quiet and the number of men at work is increasing.

The Cripple Creek drainage tunnel, by measurement made on the 18th inst., was throwing into Cripple Creek 2083 gallons of water per minute. Nearly all of the mines in the north end of the camp have felt the result of the pulling of the bulkheads. There has been a noticeable lowering of the water, particularly in the Elkton mine.

IDAHO.

BOISE COUNTY.

The shaft on the Mammoth quartz claim on Summit Flat, near Idaho City, has been unwatered. The shaft is 300 feet deep. W. A. Magee owns the Mammoth and the Jupiter, the latter being an extension of the Mammoth.

The Hopkins Summit Flat placer mines of 640 acres in Boise Basin, near Idaho City, have been sold to J. B. Adams for $50,000. Adams will start next month.

J. H. Berkshire of Winona, Mo., part owner of the J. I. C. M. Co. at Pearl, says they will put in an electric hoist, with an electric drill equipment, and will sink the shaft several hundred feet. The vertical shaft is down 125 feet, with two tunnels started from the bottom to tap the veins on either side, which are 200 feet apart. Both carry values at the surface. Later a mill will be built. J. C. Johnson of Pearl is president and manager.

The Quarles coal mine at Horseshoe Bend, 3 miles from Pearl, is being operated. The coal sells for $3 at the mine and for $6 in Emmett, a distance of 12 miles, and for the same price at Pearl. The development consists of a tunnel in 70 feet on a 4-foot vein.

BLAINE COUNTY.

The Golden Rule M. Co. has been organized to work a group near Hailey, under the management of S. B. Gieske.

IDAHO COUNTY.

W. Yearsley and E. L. De Camp of Colfax, Wash., have put men to work on their placer holdings on Slate creek, near Salmon river, in Florence district.

The Dewey mill at Roosevelt, in Thunder Mountain district, is in full operation.

LATAH COUNTY.

A. Hutsenteller reports locating mica deposits of commercial value near Moscow, and he and S. Rodgers of Lewiston will develop them.

SHOSHONE COUNTY.

The Eagle Creek Placer M. Co. has put in its hydraulic elevator at the mouth of Fancy gulch, near Murray. Seventeen hundred feet of 22-inch steel pipe was laid from the flume to the elevator site, and it is expected there will be ample power to sink 35 feet, if necessary to find bedrock. The flume is 4 miles in length.

T. Brown has leased the Bobby Anderson silver-lead mine, near Wallace. Ore has been opened up and preparations are being made for shipping. The Nabob silver-lead mine on Pine creek has also been leased.

In the 2400-foot crosscut tunnel being driven on the Hercules mine at Burke, 16 feet of galena-bearing ore is reported cut last week. This tunnel gives a depth of 1000 feet on the vein.

E. Hunter and W. M. Howland of Moscow report finding high-grade silver-lead ore on the north fork of the St. Joe river, 30 miles south of Wallace, 10 miles from the St. Joe river and 50 miles from the State wagon road. A 10-foot prospect hole showed the vein 22 inches wide.

MICHIGAN.

HOUCHTON COUNTY.

The mineral bins of the new South Range smelter of the Copper Range Con. Co., near Houghton, will contain flues for gases from the furnaces to dry the mineral as it comes from the mills, says the News.

The Quincy group, at Hancock, is reported showing good copper ground on the twenty-fifth level on the Mesnard and near the Franklin mine line.

KEWEENAW COUNTY.

The third head for the Mohawk mill, near Allouez, is on the ground and is expected to be in operation by Dec. 1st. The No. 4 steel rock house is ready for sheathing. When No. 4 shaft reaches the seventh level sinking will be suspended until the rock house is completed. The Mohawk territory reached through No. 4 shaft has been opened up. The vein of mohawkite which produced values of $140 per ton on the upper levels has been cut at the seventh level north of No. 1 drift. It is said to be without value where cut last.

The mill of the Phœnix Con. C. Co., near Phœnix, is reported put in operation last week. The Phœnix has been an intermittent factor at the lake since the Phœnix mine proper was opened in 1844. The mineral territory comprises 2505 acres, being the Phœnix, St. Clair and Garden City mines, and also eighty acres of the Atlas tract. The new mill is on Eagle river, two miles north of the mine. There is one stamp, twenty-four jigs and twelve concentrators. The building is of wood and the capacity will be 300 tons of rock daily. The property has produced copper, mostly in the shape of mass, and at one time a mass weighing 500 tons was taken out. Five fissure veins have been opened up.

ONTONAGON COUNTY.

At the Adventure mine, at Greenland, plans are being made for a test of the mineral deposits at greater depth.

The Michigan mine, at Rockland, will become a producer with one head of stamps at the Mass mill as soon as the extension of the Ontonagon Co.'s branch of the Mineral Range Railroad is completed, which will be next month. The rock house is completed. A forty-five-drill compressor will be put in this fall.

MINNESOTA.

SAINT LOUIS COUNTY.

An important find of iron ore is reported made on the Mesaba range, east of Biwahik, on lands owned by the Longyear Mesaba Land Co., of which J. M. Longyear of Marquette, Mich., is president. The find is south of the Miller mine. The limits of the ore deposit have not yet been located. The find is south of the ore formation as indicated on former geological maps and was made by Eaton Bros. of Duluth and Mesaba range men. They also discovered the Miller mine, which has been leased by the La Belle Iron Co. of Steuhenville, Ohio.

MISSOURI.

JASPER COUNTY.

At Webb City the pump put in by the Missouri Zinc Fields Co. has drained the ground so that the Duluth M. Co. is able to get into its ground, and it is being opened up. Their mill is running. The Slaight mill, which has been used as a custom mill, will start work in the ground; also the Carmean and Canada's Jewel C mine will resume. The Missouri Zinc Fields Co. expects to have deep-mining under way on the entire lease next month.

C. D. Pratt, manager of the Merit M. Co., says they are working the Sterling and other tracts at Tuckahoe. On the Sterling tract the ground was cut up considerably by former operations to depth of 160 feet, but there is still ground left untouched said to carry ore. The ground is soft, requiring much timbering. Because of cost of timbering, Pratt decided to take up the entire ground from the surface down past the ore level, or 160 feet. The ground to be worked lies between two hills, and at the head of the draw a mill has been built with a self-feeding hopper, and the ground will be shot down and elevated to the mill. Everything will be taken in as it comes, even the old dumps, and sent to the mill.

STONE COUNTY.

S. R. Ping has unwatered the Wyandotte ground, near Galena, and is taking

out ore. He says he expects to lease out all the shafts at a royalty.

The American Z. M. Co is opening up a prospect on its lease north of the Sweet Marie ground at Galena. W. L. and C. Cox, A. Brookings, A. L. Patton and T. Warden are interested.

MONTANA.

BROADWATER COUNTY.

The Stray Horse concentrator, near Winston, began operations last week.

LEWIS AND CLARKE COUNTY.

A 100-stamp mill will he built on the Jay Gould group, near Marysville, says the Basin Progress. There is a cyanide plant already on the property.

The Standard Ore Co. of Helena has operations under way on the Jay Gould mine, near Marysville, which the company has bonded. President Cory says the values are principally in gold and silver, and the average shipments made from the old workings went $40 per ton. A 100-ton mill will be built, a cyanide plant being already there Work will he carried on in the drift on the 300 foot level, which is in 1500 feet, all in ore, and stoping will he done above this level.

MADISON COUNTY.

The foundations for the Oregon mill near Pony are in place, the mortars set, and the machinery on the ground. Superintendent Weidman expects to have the mill in operation hy Oct. 15th.

Manager W. B Millard of the Kearsarge group of claims at Summit, near Virginia City, says he will move the Kennett 60-stamp mill to Summit. The equipment includes amalgamation, concentration and cyaniding. The development of the mine will he increased. A hoisting plant will he put in at the shaft, which will he sunk to depth of 600 feet, or 250 feet below the present workings. A tunnel will be driven in on one of the claims north of the Kearsarge and on the east side of Alder gulch. It is expected this tunnel will be driven in 1000 feet and will crosscut several veins. It is expected to have 200 men on the payroll. R. B. Turner is superintendent. The office will he moved from Virginia City to Summit.

SILVER BOW COUNTY.

The mines owned by the Amalgamated Copper Co., that have heen closed while the smokestack at the Washoe smelter at Anaconda was being connected with the plant, are again in operation. These include the Mountain Con., High Ore, Parrot, Anaconda, Moonlight, Never Sweat, Bell, St Lawrence and Diamond.

Butte reports say the High Ore mine of the Anaconda group of copper mines has resumed operations. As fast as the men can he summoned the other eight properties of the Anaconda group will he put in operation. The mines employ 3000 men and have been closed since July 1st, pending alterations heing made in the Washoe smelters at Anaconda. All the mines are expected to he in full operation this week.

NEVADA.

ESMERALDA COUNTY.

R. K. Colcord and J. Yerington of Carson report work progressing in laying the pipe for the mill at Pamlico, near Hawthorne. The pipe line is within 3 miles of the mill site, and machinery for the mill is being hauled in

W. R. Smith, part owner of the Copper Contact group, near Sodaville, reports a breast of ore 14 feet high exposed in the open cut and three teams are delivering ore at the railway.

EUREKA COUNTY.

(Special Correspondence).—There is considerable ore in the Eureka district, assaying from $3 to $15, and a method is heing sought by which it may be concentrated. The metallic values run about 10% lead, $2 gold, 8 to 10 ounces silver, 5% iron, with a limestone and quartzite gangue The discovery of a process for saving these values by concentration or reduction will mean much to Eureka.

Assays of the dump at the Geddes & Bertram mine in Secret canyon give returns of $1 65 in gold, $2.66 silver and a small percentage of antimonate of lead. This dump contains 40,000 tons. It can he cyanided.——The break in the three-compartment shaft of the Jackson mine, Eureka district, has been repaired and ore shipments resumed.——The Keystone mine, north of Eureka, is putting on more men and running a tunnel. C. Broessmer says he has opened up ore in his claims, north of Eureka, showing 8% copper, 18 ounces silver, 13% lead, $2 50 gold.——The Silver Connor mine has blocked out a good body of ore, and assays give an average of $6.53. It is expected to strike good ore below the 450-foot level of the Silver Connor, and below the present workings of the McNaughton, adjoining. The Silver Connor is idle at present. Assessor's records of smelter returns, Eureka district, show a production of $160,000,000 in bullion to date.——Ore shipments from the Barton & Altoona mine, on Adams hill, give 7.3% lead, 18 ounces silver and 2 ounces gold; also 76 6% silica and 5% iron.——Ore shipments from the Oro, on Adams hill, show 46 5 ounces silver, 2 6% lead, 1.65 ounces gold.

Eureka, Sept. 23.

LINCOLN COUNTY.

G. P. Smith, manager of the Newport & Nevada M. Co., operating the Horseshoe, Ross and Buck claims at Fay, says he expects the mill to be in operation hy October 1st. It will handle 160 tons of ore per day. In addition to this it is intended to run the tailings from the old Horseshoe mill through the leaching tanks.

LYON COUNTY.

The Jackson-Phillips mill in Silver City, which has been idle for some time, will resume crushing and reducing ore next week. The Pollard mill is crushing Silver Hill ore. With the starting of the Rock Point mill at Dayton and the smaller mills and cyanide plants that are in operation prospects are improving.

NYE COUNTY.

The diamond drill at work at the bottom of the 700-foot shaft of the Mizpah mine at Tonopah is down 500 feet, and the core is said to show a lode porphyry similar to that found in the upper levels of the mine. No water has yet heen struck. The west drift from the 500-foot station in the Mizpah has passed 100 feet beyond the east end line of the Buckboard, and the ore coming out is sacked for shipment. The ledge is said to be following a direct westerly course and cuts through the center of the Buckhoard.

W. M. C. Jones of Riverside, Cal., has hougbt a group of six claims 1½ mile from Ray, near Tonopah, and organized the F. E. A. M. Co. to develop it. On two of the claims four ledges have been traced which show assays of copper, silver and gold.

The King Baldwin M. Co. has been incorporated at Spokane, Wash., hy W. C. Miller, E. J. Roberts and W. J. Hall of Spokane, and J. King and C. A. Baldwin of Tonopah. The company is opening up a group of claims at Cloverdale, near Tonopah, with W. C. Miller as superintendent.

WASHOE COUNTY.

Manager A. Onn has begun operations at the No. 2 mine at Olinghouse, prospecting the surface to the north of the shaft and near the end line of the Williams property.

The Jumper mine at Olinghouse, near Wadsworth, will be worked hy Jelinek & Jackson.

WHITE PINE COUNTY.

The Bull Hill gold mine (the American Flag), in Gold Canyon mining district, 3 miles from Cherry creek, has heen honded for $20,000 to J. Sharpe and G. E. McMurray, of Cripple Creek, Colo., says the Cherry Creek Miner.

The 5-stamp mill of the Wide West M. Co., of Boston, Mass., in Egan canyon, 2 miles south of Cherry Creek, is in operation, says Superintendent Leishman.

NEW MEXICO.

GRANT COUNTY.

At Gold Gulch camp, near Silver City, H. Moses and M. V. Portwood have bought a two-thirds interest in the Owl claim and are sinking a shaft on the south end. This shaft is started 15 feet above the other shafts and is down 45 feet, having struck the zincblende body whlch is said to carry the gold. The Sanders one-third interest in the Owl has heen sold to J. Robertson of Easton, Texas, and W. Craig of Lone Mountain for $5000. Sanders retains his interest with Cornell in the Pactolus. A boiler and pumping plant is on the ground.

SIERRA COUNTY.

The pump at the pumping station of the Hillshoro G. M. & M. Co., at Hiiisboro, has been repaired and water is being forced over the hill to the company's mill in Ready Pay gulch, says the New Mexican.

J. Gardner is developing the Bertha mine at Hillsboro and is running two crosscuts to tap the vein. The Bertha is between the Empire and Garfield mines.——Machinery for the South Percha mill, near Hillsboro, is on the ground.

OREGON.

BAKER COUNTY.

(Special Correspondence).—Operations are progressing at the Gold Pan mine, 4½ miles southeast of Sumpter. They have a vein of ore, 6 to 10 feet between walls, averaging $6 gold per ton. The hoisting plant is run by a 25 H. P. gasoline engine, and costs $1 10 per day for gasoline. This does all of the hoisting, as well as running an 8-inch Cornish pump.

Sumpter, Sept. 22.

Work was resumed last week at the Maid of Erin mine, near Sumpter, says Manager C. P. Bowers. The 10-stamp mill is working on an ore reserve of 2000 tons and development work will he increased. The ore averages $6 a ton. Water power is used.

Superintendent Smith says work has hegun on the 10-stamp mili for the Snow Creek mine, near Whitney.

Operations will be increased on the Potosi, Golden Gate and Orphau Boy mines of the United Exploration & G. M. Co., near Sumpter, says Manager W. E. Hurd. Driving of tunnels will be continued on the latter two, which are in Granite and Red Boy districts, respectively. At the Potosi they wili sink, for which a hoist and pumps are going in.

The Fortune M. & M. Co., of Spokane, G. W. Daines president, has hought for $20,000 cash the Red Lion group, near Greenhorn City, and which adjoins the Morning mine. The company also owns the Humboldt group in same section, and the other company, of which Daines is also manager, owns and is operating the Belcher mine. They also control the Forty-Nine Jimmy mine. The Red Lion group is composed of two claims and a millsite, 3 miles from Greenhorn City. The property has heen developed by open cuts on the Red Lion. Ore milled from this cut assayed $15 There is a tunnel 169 feet long, with crosscuts showing ore with average of $8 per ton in gold.

The smelter at Oswego has heen sold to the Ladd Metals Co, of Portland, and will be used as a refinery. Men are at work placing a small furnace in position. Ore from the Bohemia district, Douglas county, has been contracted for and a shipment is beng prepared. The Ladd Metals Co. is preparing to operate its mine in Washington county, Idaho, from which will he shipped "pig copper." A smelter is being built. It is not the intention of the company to run the Oswego plant as a smelter, hut only use it in testing. When this has been completed the plant may be converted into a refinery.

CROOK COUNTY.

J. W. Robinson of Ashwood says the Oregon King mine, on Trout creek, near Ashwood, is being reopened.——The Red Jacket mine is being developed and ore is showing at a depth of 170 feet. It is owned by North Yamhill men.——The White Butte is sinking a new shaft, having abandoned the old workings.——The Oregon Queen G. & S. M. Co., composed of local men, is developing.

DOUGLAS COUNTY.

Manager J. F. Hard says he is preparing to build a sawmill of 7000 feet daily capacity on the Vesuvius claim, near Bohemia, to cut lumber for use on Hard's mining properties in Bohemia district.

The flume and dam of the Oregon Securities Co., near Bohemia, are completed and the power house under way. The Champion Tunnel is going ahead, hut all the work done thus far has been by hand. Coal is being hauled to the mine and the compressors will start next week. It is expected to have the mine and mill running to full capacity by Nov. 1st. Work is progressing on the Vesuvius and Oregon-Colorado mines.

GRANT COUNTY.

Manager J. W. Messner of the Prairie Diggings mine, in John Day valley, near Prairie City, expects to have his sinking plant in operation next week. The mili is operated hy water power and a steam plant has been set up for the hoist, which has a capaclty of 600 feet depth. The shaft was sunk 80 feet by hand, but, on account of the water, a centrifugai pump operated by steam is being put in. Levels will be established at 100 and 200 feet.

JOSEPHINE COUNTY.

The Dowell mines, on Mount Baldy, 3 miles east of Grant's Pass, have been hought hy the Comstock G. M. Co. of Danville, Ill. The Doweli mines consist of three quartz claims, the Golden Eagle, Mountain Eagle and Gray Eagle, and are partially developed. At one time a mill was operated on the claims.

The Gold King mine, on Josephine creek, near Grant's Pass, has heen bought by the Gold King M. Co., comprised of Texas men who have held it under bond. M. Marks of Seattle, Wash., is superintendent. The shaft that is being sunk shows a vein 6 feet wide, and carrying average values of $16 a ton in gold.

C. L. Mangum is developing a group of fourteen copper claims near Waldo. The claims are between the Cowboy and Waldo mines of the Waldo S. & M. Co. The ledges are from 4 to 25 feet in width.

The Champlin M. Co., composed of Montana and Chicago, Ill, men, who will dredge Foots creek, a few miles south of Grant's Pass, report preliminary work under way. Shipments of lumher are arriving, both for the construction of the dredger and for the dam that is being built across the creek near its junction with Rogue river.

MALHEUR COUNTY.

Manager W. Morfitt of Ontario, Or, says the Red Oxide mine, near Malheur City, has been sold for $7000. The Red, White and Blue mine will put in a mill, and the Black Eagle will increase its plant to a 100-stamp mill.

SOUTH DAKOTA.

LAWRENCE COUNTY.

(Special Correspondence).—S. D Foss, of Chicago, Ili, is at Central City, preparing to start work on the Aifreta mine, of which he is part owner. This mine ls near the Columbus mine.

Central City, Sept. 20.

(Special Correspondence)—The Lucky Strike mine is 2 miles southeast of the Clover Leaf mine, near Rouhaix, and covers 315 acres. The working shaft is down 100 feet and they are drifting from the 100-foot level on a vertical fissure vein. This company will put in a hoist, hoilers and compressor. C. A. Allen, of Deadwood, is manager.

Rouhaix, S. D, Sept. 20.

(Special Correspondence)—The Horseshoe mill is dropping sixty stamps and the other sixty will he ready for operation by Oct. 1st. The ore is crushed through two No 5 gyratory crushers and conveyed to the hins by a 500-foot helt conveyor. The helt is 24 inches in width. W. L McLaughlin is manager and C. C. Griggs, mill superintendent.

Terry, Sept. 20.

At Tinton a 100-ton mill is being huilt for treatment of tin ores The mill site is ½ mile from the mine, on lower ground, and a tramway with a 6% grade will deliver the ore direct hy gravitation. Water and timher are also right at hand.

PENNINGTON COUNTY.

The Lakota M. & R Co, owning the Grizzly Bear group, 5 miles southeast of Hili City, report having plans under way for a 40-ton cyanide annex to the mill to save the gold that escapes the amalgamatlng plates.

Seven miles from Hili City, adjoining the Burlington group on the north, the Sunbeam M. Co. has the shaft down 40 feet and a 20-stamp mill is being built. On the 300-foot level a drift is heing run on the ledge, which shows 4 feet in width of $50 ore. Besides this ledge, there are two others of lesser size and values.

TEXAS.

JEFFERSON COUNTY.

Fire on the 23d inst. in the east end of the Shoestring oil district, near Beaumont, destroyed twenty-five oil derricks, causing a loss estimated at $125,000. The principal loser was the West-Davis Oil Co. Other losers include the Davy Crockett, Emmett Landy and Jackson Tobin companies.

UTAH.

BEAVER COUNTY.

A bond and lease has been given on the Jumbo group, below the Cave mine, near Milford, to W. Thompson, of the American Exploration Co., for eighteen months at $75,000.

M. L. Powers has resumed work on his bismuth prospects in the Granite range, near Miiford, and will continue operations during the balance of the year.

JUAB COUNTY.

The Godiva mine near Eureka has a few men at work preparing to reopen it.

It is expected the Eureka Hill mili, near Eureka, will start up this fall. Smelting grade copper and silver-lead ores have been shipped, hut miiling ore is being broken down.

PIUTE COUNTY.

The Signal Peak M. Co. has been organized at Richfield to exploit a group in Gold Mountain district near Marysvale. D. D. Hanks, A. Rowley and E. E. Hoffman are officers.

Seventy men are on the payrolls of the Annie Laurie mine at Kimheriy. The tunnel at the Annie Laurie extension mine near Kimberly is in 300 feet and passing through seams of copper ore in the porphyry, says the Tribune.

SALT LAKE COUNTY.

Ore shipments were started iast week from the mines of the Continental-Alta M. Co. at Alta, says Managing Director H. M. Crowther of Sait Lake City. While shipments are in progress fifty men will be kept on the payroll, most of whom will be on development work.

The management of the Highland Boy mine of Bingham is negotiating with the smelters for terms that will enable the company to increase its daily output to 800 or 1000 tons of copper ore.

The copper-bearing properties of the Columbia M. Co. at Bingham have heen sold to H. & H. G. Catrow of Dayton, Ohio, O. A. Tihhitts et al for $225,000. Catrow says development will he continued and a mill built for concentration of the second-class

rock. Meanwbile be has in view tbe utilization of two other plants now idle in the camp. O. A. Tibbitts will be manager.

The Columbus Con. M. Co. are preparing to start work on their power plant, which is expected to be completed January 1st. The plant will cost $40,000. In addition to the equipment in tbe building there will be 4½ miles of pole line. The 300-kilowatt generator is to be driven by water power. Tbe works are to be in Little Cottonwood canyon, 12 miles below the company's mines at Alta. It is proposed to generate sufficient electrical power to drive tbe macbinery of the mill to he built later, also for tbe machine drills in tbe mine.

The Columbia C. Co. at Bingham are preparing to put in an air compressor and machine drills, also for building a concentrator, and it is expected arrangements will be made in the meantime to employ one of tbe present Bingham mills for the reduction of tbe low grade ores.

The Alta Germania M. Co. has been incorporated to operate a group of three lode claims in Little Cottonwood district near Alta The officers are: J. Sauer, L. Hohein and A. J. Weber.

W. W Armstrong, A. Colbath, L. A. Jeffs. J. A. Kirby, C. Heath, J. C. Clasby, W. V. Rice, J Orbednorfer, D. Keith and E. Bamberger have incorporated the Alta-Quincy M. Co; principal place of business, Park City, and W. W. Armstrong president. The company's ground adjoins the Columbus group at Alta. Development work is in progress.

SUMMIT COUNTY.

Sinking is again under way at the Wabash mine at Park City, and it is intended to go down 400 feet more, giving a total depth of 1000 feet.

The Presidential G. M. Co. has been organized to operate tbe Presidential group of six claims at Park City. The ground is east of the Steele Con. mines and near the Kearns & Lynch ground. E. D. & E. S. Crowther, F. S. Harris and M. Sommer are incorporators.

TOOELE COUNTY.

The Sunshine mine and mill at Sunshine were closed down last week, says Manager L. Harris. The company is said to be behind in its payrolls one and one-half months, and was employing fifty men. R. E. Busb is superintendent.

To further exploit the ore body the Herschel M. Co. of Mercur will begin driving to it next week from an opening in Sacramento gulch. Their ground adjoins the Sacramento M. Co.

WEBER COUNTY.

The Vindicator G. & C. M. Co. has been organized at Ogden to operate a group of ten lode claims in Byone's and Burch Creek canyons, with G. F. Busch, E. Bichsel, S. T. Meyers and G L. Becker as officers.

WASHINGTON.

DOUGLAS COUNTY.

Coal is reported found on the south half of the Coiville Indian reservation at a point 8 miles from Bridgeport and near the Columbia river, by S. Valentine of Bridgeport. Valentine has been denied the right to take up tbe land, as the Watervilie land office decided that the act allowing entries on the south half of the reservation under the mineral laws did not permit of coal filings. Valentine is continuing to hold and develop his find. He says a lead 8 feet wide has been opened up. It is so situated that the product could be handled from the mine to boats and barges on the river by a gravity system.

FERRY COUNTY.

F. W. Rolt of Rossland, B. C., secretary of the Zala Con. M. Co., operating tbe Zala M. mine at Sheridan, says a hoist and sinking pump are being put in on the 300-foot tunnel level. At present fifteen men are at work. The winze below the 300-foot level is down 55 feet. About 100 tons of ore has accumulated in the bins, ready for shipment. The winze is filled with water.

Last week the pumps were started and work resumed at the Tom Thumb mine, near Republic, says W. D. Cburch, superintendent.

Machinery consisting of a 40 H. P. boiler and a 32 H. P. hoist will be put in at the Minnehaha mine, near Danville. This will enable the management to go 500 feet deeper on the ledge. The company is driving a tunnel to cut the main vein at depth and the face of this tunnel is in ore.

OKANOGAN COUNTY.

E. T. Hogie, part owner in the Wyandotte M. Co., operating at Chesaw, says development work is being increased on their Oregon mine. A shaft has been sunk on a vein carrying gold, silver, lead and copper. M. A. Smalley is manager.

STEVENS COUNTY.

E. J. Wilson, manager of the Northport smelter, says the smelter is running four furnaces and the remaining two are being overhauled to permit of automatic feeding from tram cars The automatic feed is being put in all of tbe stacks. Tbore are 45,000 tons of ore on tbe dumps at tbe smelter and the plant is running 900 tons a day. Coke is coming in freely.

WYOMING.

LARAMIE COUNTY.

Tbe shaft house of tbe Louise mine 25 miles west of Cheyenne, was dynamited by unknown men last week, and the boiler and hoisting machinery completely destroyed, but other machinery escaped damage. The macbinery belonged to O'Reilly Bros., who have a contract to sink the Louise shaft 200 feet. H. Schwartz, superintendent of the Hecla M Co, which owns the Louise, says the wrecking of the machinery will delay work but a short time

The Colorado F. & I. Co. has begun work of opening its Cbicago group of iron ore properties. Tbe Colorado & Wyoming Railroad is being extended to tbe mines (8 miles), leaving tbat railroad 2 miles from Guernsey. The company takes out 1600 tons of ore a day at the Sunrise mines, and when the new properties are opened its capacity will be doubled. The ore is sbipped to Pueblo, Colo. The company's average production of coal and coke is shown by its annual report to be 17,000 tons a day. The sales average 10,000 tons a day, and it needs for its own consumption an average of 7000 tons a day.

FOREIGN.

AUSTRALIA.

QUEENSLAND.

The 18th annual report of the Mount Morgan G. M. Co., Ltd., recently issued, shows that the cost of treating the oxidized ore during the year amounted to 11.69s, and that for treating the mundic ore 15.18s, the average for all ores being 13 51s per ton. The cost of mining mundic ore per ton amounted to 11.74s, and for mining oxidized ores 3 03s. The total cost of both mining and treating the sulphide ores was 26.93s, and the total for mining and treating oxidized ores was 14 73s. For all ores the total cost of mining and treating amounted to 21.02s per ton. This does not include a few shillings for general expenses.

SOUTH AUSTRALIA.

The Northern Territories M. & S. Co., at the Howley mine, report work of putting in compressor plant and rock drills progressing. At the Mount Ellison mine the lode has been cut by crosscut from the main shaft at a depth of 120 feet. Water has been struck, temporarily retarding development. At the Iron Blow mine the engine and pump in position and ore bins started. In the smelting works the water jacket furnace is going in. No. 1 reverberatory furnace well forward; No. 2 reverberatory furnace, bottom brickwork and ironwork in position, and stack built up to 30 feet. No. 1 reverberatory furnace will be completed by November 1st, and No. 2 reverberatory furnace by December 1st. Work on the tramway is progressing.

WESTERN AUSTRALIA.

(Special Correspondence) —The ore in the Lakeview Consol. mine will average one ounce gold throughout. Extraction is satisfactory since properly treating tellurides. The Government here will not allow strikes. The courts have established a minimum wage and prescribe the conditions. The country is divided into districts and an award applies to all the mines or other works in that district. There are very comprehensive laws regulating mining and the government inspection is very strict; they even establish the procedure in case of accident. There is a large income tax and other taxes are very high.

Kalgoorlie, Aug. 1.

At Kalgoorlie the Great Boulder Perseverance M. Co. report, on Aug. 5, cutting what is believed to be the Perseverance main lode at the 900-foot level. The crosscut struck the ore body at a point 200 feet north of the Lake View Consols boundary and for a width of 8 feet the average value of the ore is 25 dwts.

BRITISH COLUMBIA.

BOUNDARY DISTRICT.

C. Woif, secretary of the Waterloo M. Co., in Camp McKinney, says the company will increase its stamp mill from five to ten stamps. Eighteen men are at work at the mine.

The third section of the ore bins for ore from No. 2 tunnel of the Knob Hill mine is being built, giving greater capacity from this part of the Granby mines at Phœnix, which will be needed as soon as the 2000-ton daily rate is started. Forty cars daily are being sent to supply tbe four furnaces at the company's smelter at Grand Forks. As soon as the slag-carrying locomotives arrive tho fifth and sixth furnaces will be blown in. They were connected up during the recent closedown. It is expected the six furnaces will be in operation by Nov. 1st.

EAST KOOTENAY DISTRICT.

Manager S. S. Fowler of tbe Paradise mine, on Toby creek, near Windemere, says the company is considering building a tramway a distance of 3½ or 4 miles. There are twenty-five men at work on development, and the ore being taken out is showing good values in lead.

The M. McInnis group of four claims at Crow's Nest has been sold to the Canadian Pacific R. R. Co. for $110,000. Tho railway company will develop this property to supply tbeir own coal requirements.

Work of repairing the St. Eugene concentrator, near Fort Steele, and putting in the zinc-saving apparatus has begun. Thirty men and six teams are building a flume 3 miles long at Perry creek. South Dakota men are preparing to enter into the work of turning Bull river from its present bed for its gold. It is supposed that the channel or bed of the river has been a veritable sluice box and can be cleaned up as soon as the river is turned into its new channel.

Work at the Bull river placer mines, near Fort Steele, is progressing. The road from the Chickamun to the falls of Bull river has been completed. Timber has been cut and buildings are going up. Men are at work cutting the right of way for the flume.

The Gold River M. Co. has put men at work cutting out the right of way for a ditch from the upper canyon to the falls on Bull river, near Fort Steele, says the Prospector.

NELSON DISTRICT.

The Relief mill on the Relief mine, near Erie, owned by Finch & Campbell of Spokane, Wash., has closed down for the year owing to lack of water. It will not be started until spring. The Relief ores are treated by a stamp mill and a cyanide plant. The principal values are in gold, averaging $10 per ton

Tbe Star group, Morning mountain, near Ymir, is reported sold for $30,000—10% paid. A 40-stamp mill will be erected. G. W. Stead of Philadelphia, Pa., is interested.

ROSSLAND DISTRICT.

E. B. Kirby, manager of the War Eagle-Center Star Cos., at Rossland, says the Rossland Power Co., a subsidiary company of the War Eagle and Center Star, has made arrangements to build a concentrator for treatment of low-grade ores of the War Eagle and Center Star mines. The mill will be built near Trail, ¾ mile north of the smelter, along the line of the Columbia & Western railroad, between Trail and Robson, and near the Columbia river. It will have a capacity of 200 tons a day to begin with, but it will be constructed so as to be enlarged later. Work will begin next week, and C. M. Eye will be superintendent. It is understood the Canadian Pacific will put in switches and other facilities at the millsite to handle the material for the concentrator. Water for the mill will be taken from Stoney, Rock and Murphy creeks, and conducted to the concentrator by a flume. Sixty men will be put to work.

SLOCAN DISTRICT.

In the Slocan, G. Jenkins of the Idaho mine at Aiamo will put in a 9000-foot tramway. Twenty-five men are at work on the Idaho; others are renovating the old concentrator, with which the new tramway will connect the mine. This concentrator was the first one built in the Slocan, and has been idle for over four years.

VANCOUVER ISLAND.

J. Dunsmuir says, near Cumberland, further development work is being done near Hamilton lake, where two slopes are being driven into the anthracite bed, and coal is expected to be struck this week. The men have started sinking a shaft at the same point. They have overcome the water more easily than was expected.

WEST KOOTENAY DISTRICT.

C. E. Averill of Indianapolis, Ind., has bought the Del Ray group—a free gold property adjoining the Homestake mine, in Lardeau section, near Camborne. He will start development on the Del Ray this week.

YALE DISTRICT.

The Coulee Coal & Iron Co. has been incorporated at Colfax, Wash., by T. Oliver, J. W. Lloyd, E. M. Warner, G. W. Palmer, H. H. Wheeler, C. E. Scribner and D. Leinbach of Colfax, to acquire and develop coal veins and iron ore deposits in the State of Washington and in British Columbia; to build and operate smelters, coke ovens and transportation lines in connection with their mining properties. Tbey own 3840 acres of coal land in Nicola coal basin, 150 miles northeast of Vancouver.

CANADA.

ONTARIO.

Secretary Berry and Director Pudritb of the Summit Lake G. M. Co., operating the Little Master group, near Wabigoon, report the main shaft going down and showing ore carrying free gold. The Big Master mine and stamp mill are in full operation.——At the Nelson Bay group of the Gold Standard Co. Superintendent N. C. Ahlstrom says work is progressing. Crosscutting is being done toward the dip of the vein as it appears on the surface. Notwithstanding this work is under the bottom of the lake, the miners have no trouble with water.

MEXICO.

CHIHUAHUA.

Stallforth Bros. of Parral, lessees of the Quebradillas mine at Minas Nuevas, report having a body of ore 20 feet wide at the 845-foot level. They paid a royalty of 75% on the first 65,000 tons extracted, and the royalty as per contract has since been 25%, says the Enterprise. E Stalknecht is manager.

The Mexican M & Ex. Co. have secured the lease on the Prieto mine, near Parral, and will start work next week ——The American Zinc Extraction Co., of Kansas City, Mo, A. E. Swain, superintendent, is down 400 feet in depth on the Tajo mine, which adjoins the Prieto mine on the northeast, says the Enterprise.

G. A. Burr has an option on the Purisima mine, in Las Animas district, near Parral. A meter of the vein averages 1300 grams silver per ton. The mine is near the Mexican Central railroad.

J. A. Creel's smelter at Terrazas was blown in last week and is turning out copper, says F. A. Schneider of El Paso, manager.

The Hoff & Robinson working interests in the Concepcion mine in Santa Eulalia has been given up, and the owners, C. Alleman, W. J Jones and C. Gasson, will continue the work in connection with Manager Gasson's work on the Kansas Boy mine.

R. J. Oaxaca has bought the two 5-foot Huntington mills and other machinery of the Boston company at the Placer de Guadalupe, near Parral, and will use it in treating ores of his mines other than the Oaxaca mine in the same section. The Oaxaca mine is idle pending the settlement of the estate.

The Guggenheims are doing nothing with the Veta Grande y Annexas at Parral except to ship the dumps, no work going on underground. It is claimed the dumps will return the price paid for the mine—$200,000 gold. A new shaft is expected to be sunk, says the Enterprise. J. F. Soule is superintendent.

The San Francisco del Oro mine, near Parral, owned by English capitalists, organized as the San Francisco del Oro, Ltd., J. B. Hyslop, manager, is being prepared for increased production. An aerial tramway a mile long is near completion. An electric pump and hoists are being put in and two air compressors are on the ground. Work is going on at both ends of the 3160-foot tunnel which is to tap all three mines for working and draining purposes, says the Chihuahua Enterprise. The cable tram will have a capacity of 100 tons every ten hours. Tho principal values are in gold.

COAHUILA.

Manager E. Ludlow of the Mexican Coal & Coke Co. says he has contracted to furnish 22,000 tons of coke to smelter No. 3 at Monterey, Nuevo Leon, from the Las Esperanzas coal mines at Las Esperanzas, in the northern part of the State. The coal body is 8 feet thick and is producing 2000 tons per day.

DURANGO.

The Durango M. Co. has been incorporated by Michigan men to exploit the mines of C. Fowler at Yerba Buena, near San Pedro.

OAXACA.

The Tiacoiuia M. Co., of Oaxaca, has been incorporated by R. W. Drennan and A. L. Zeckendorf to exploit the El Placer and Dolores y Annexas free gold mines, 18 miles east of Oaxaca. The ores are said to average $20 gold per ton.

In Sierra Juarez gold-silver district, 40 miles northeast of Oaxaca, most of the mines so far developed are at about 8000 feet elevation and are tunnel propositions. At the Natividad mine ten stamps are being added to the mill, making twenty in all. The Oaxaca M. & M. Co. of Denton, Tex., men, at its Barrohuates mine, has a 10-stamp mill running, and reports shipping $3000 bullion per week. The ore runs seven ounces in gold. The Sierra Juarez M. & Dev. Co. of Nashville, Tenn., has a 5-stamp mill in operation and expect to in-

crease the plant. The Mexican-American G. M. & M. Co., of Waco, Tex., is putting up a 10-stamp mill on the San Jose de Gracia mine. Several other companies are increasing operations. The Natividad and Socoro rivers furnish a sufficient water power. The Natividad is putting in an electric plant on the Natividad river for its mine and mill and the American-Mexican Co. has made a ditch a mile long for utilizing the waters of the Socorro river to generate 200 H. P.

SINALOA.

R. Coleman et al, of Salt Lake City, Utah, having bought the Lluvia de Oro mines in eastern Sinaloa, are arranging to put in a 20-stamp mill at the mine. Table concentrators will be used. This plant will handle ore taken out in development; and ultimately they propose to build a 100-stamp mill, water power and transmission of electric power to both mine and mill, together with an aerial tram line of 1½ mile in length.

SONORA.

Two furnaces at the smelter of the Greene Con. C. Co., at Cananea, which have not been in operation for several months, were blown in last week. It is also understood that four furnaces will be built, says the Cananea Herald.

The offices of the Sonora River Placer M. Co., operating on the Sonora river, have been moved from Los Angeles, Cal., to Cananea, says A. W. Tennant, manager.

A. Goldbaum and S. D. Kempton of Hermosillo have started work on the Imperio del Cobre mine, 30 miles south of Cananea. The ores carry gold, silver and copper.

The San Blas M. Co., which has taken over the San Blas mine, 45 miles northwest from Caborca, in Altar district, has been incorporated in Massachusetts. The claims are gold-bearing, with five veins, three of which were opened and operated by the antiguas. The directors are D. J. Brown, L. R. Godfrey, E. H. Beer, G. N. Rich, G. H. Miner, E. F. Gibbs and J. H. Trayne of North Adams, Mass., with J. A. Singey of Caborca, manager.

PERSONAL.

C. L TUTT, interested in Colorado mines, is in San Francisco, Cal.

I. E GOODNER has returned to Madison, Wis., from Deadwood, S. D.

T. REGAN of Boise, Idaho, is in San Francisco, Cal., on mining business.

R. DE LARGE has returned from mill construction at Tucson to Dewey, Ariz.

B. C. RIBLET has returned from an Eastern business trip to Spokane, Wash.

A. H. ELFTMAN of Silverton, Colo., is in Minneapolis, Minn., on mining business.

F. S. INGALLS of Yuma, Ariz., has been appointed Surveyor-General of Arizona.

G. A. HANCOCK has resigned as manager of the Comstock mine at Park City, Utah.

R. K. NEILL, of Spokane, Wash., returned last week from a trip to the Kyak, Alaska, oil fields.

R. G. WILSON is president and manager of the New York M. Co., operating at Park City, Utah.

H. E. CRAWFORD of New York is in the Black Hills, South Dakota, examining mining properties.

F. J. MURPHY, who has mining interests in Arizona, is in San Francisco, Cal., from Needles, Cal.

F. H. MORLEY has opened an office as mining engineer in the Exchange Building, Denver, Colo.

A. B. ADAMS of New York, interested in mines in Mexico, is in San Francisco, Cal., from the East.

GARDNER H. SMITH has returned to Pasadena, Cal., from a mine examination in Sierra county, Cal.

E. L. WHITE, State Mine Inspector for Colorado, has returned to Denver, Colo., from Deadwood, S. D.

J. T. MILLIKEN, formerly of Colorado, is manager of the mill of the Imperial M. Co. of Deadwood, S. D.

T. EVANS, owning mining and railroad interests near Cananea, Sonora, Mexico, is in San Francisco, Cal.

C. M. COLEMAN has retired as secretary and manager of the Keystone Hydraulic Co. near Telluride, Colo.

G. V. NORTHEY of Sulphur Creek, Colusa county, Cal., is in San Francisco, Cal., on mining business.

MANAGER H. G. BRUNNIER of the Conlin mine, Grass Valley, Cal., is in Davenport, Iowa, on business.

G. J. BANCROFT of Denver, Colo., is looking over mining properties in the Black Hills, South Dakota.

JESSE J. MACDONALD has returned to California from a successful cyanide operation in Peru, South America.

W. C. HODGE, JR., of the United States Geological Survey, is in San Francisco, Cal., from Washington, D. C.

F. A. LEACH, superintendent U. S. Mint, San Francisco, Cal., has returned from an extended Eastern visit.

JOHN LAWLER of Prescott, Ariz., owner of the Hillside mine, in Yavapai county, is in San Francisco, Cal.

J. H. BERKSHIRE has returned to Winona, Mo., after an examination of his mining holdings at Pearl, Idaho.

MANAGER REMER of the Mutual Benefit G. M. Co. is in the East on mining business from Central City, Colo.

C. W. PURINGTON, who has been making examinations in Clear Creek county, Colo., has returned to Denver, Colo.

O. A. TIBBITS of Dayton, Ohio, is manager of the Columbia M. Co., operating at Bingham, Salt Lake county, Utah.

H. F. JURS of San Francisco, Cal., was in Deadwood, S. D., during the mining congress, and has gone to St. Louis, Mo.

R. W. HILL is secretary and manager of the Keystone Hydraulic Co., near Telluride, Colo., vice C. M. Coleman, retired.

J. E. PHILLIPS of Denver, Colo., has returned there from New York on business for the Engineering Co. of America.

C. C. DERBY of Mount Bullion, Mariposa county, Cal., manager of the Mariposa Com. & M. Co., is in San Francisco, Cal

J. MCINTIRE of Sacramento, Cal., superintendent of the South Keystone mine in Amador county, is in San Francisco, Cal.

W. D. PAGAN of New York, interested in the North Star mine at Grass Valley, Nevada county, Cal., is in San Francisco, Cal.

L HAHN of Hastings, Neb., interested in the Four Metals mine, Deep Creek district, Tooele county, Utah, is visiting the camp.

O. HARKER, formerly with the Guggenheim Ex. Co., is superintendent of the Henrietta mine near Bajan, Nuevo Leon, Mexico.

J. W. LANGLEY, D. S. MURRAY AND E. D. THOMPSON of Salt Lake City, Utah, have gone to the Jackson Hole country in Wyoming.

J. B. HARRELL is superintendent of the Casbier 100-ton amalgamating and concentrator mill at Breckenridge, Summit county, Colo.

J. M. NOUGUES, JR., superintendent of the Josephine mine at Volcanoville, El Dorado county, Cal., is in San Francisco, Cal., on business.

I. MILLER, president of the Springfield-Nevada M. Co., is in the East on company business from Olinghouse, near Wadsworth, Nev.

E. COPLEY of Salt Lake City, Utah, is in the East in the interest of the Sheba and Nevada-Humboldt companies in Humboldt county, Nev.

CHAS. M. HAMPSON has returned to Denver, Colo., from Yankee Hill, Colo., where he started up the new plant of the Y. C. M. M. & T. Co.

MANAGER G. D. B. TURNER of the J. I. C. mine of Park City, Utah, has gone East, and will visit shareholders in Scotland before returning.

W. L. COBB, of San Francisco, is making an examination of the old Piute mine, east of Bakersfield, Cal., with a view of installing a 5-stamp mill.

C. F. STAVER, superintendent of the Vandalia mine, near Shingle Springs, El Dorado county, Cal., has returned to the mine from San Francisco, Cal.

J. A. YEATMAN of San Francisco, Cal., has gone to McCoy, Eagle county, Colo., to superintend installation of placer mining equipment with artificial head.

O. HENKEL AND T. BIRCH of La Colorada, Sonora, Mexico, have gone to South America for the South American Dev. Co. at Zaruma, Ecuador, as mine foremen.

JOHN ROSS, JR., manager of the Wildman-Mahoney mine at Sutter Creek, Cal., has returned from a business trip to Boston, Mass., and is in San Francisco, Cal.

MR. GREEN succeeds W. Frank Pierce in the presidency of the Standard Electrical Co, which removes its principal office from San Francisco to San Jose, Cal.

G. W. MYERS of San Francisco, Cal., has gone to Randsburg and Bagdad, Cal., and the desert district, on business for the Chrome Steel Works of Brooklyn, N. Y.

ROY D. HUNTER, Western manager of the Sullivan Machinery Co., with headquarters at Denver, Colo., and H. P. Dinsmoor, assistant manager, are in San Francisco, Cal.

E. H. PLATT has resigned the superintendency of the Commercial Lead Co. of Flat River, Mo., to take an important position with the Denver Engineering Works Co. of Denver, Colo.

W. MAGENAU, professionally engaged for the past six months in Guanajuato and City of Mexico, Mexico, has been appointed superintendent of the Commercial Lead Co. of Flat River, Mo.

G. E. QUINBY of Joplin, Mo., has been appointed State Inspector of lead and zinc mines for the western district of Missouri, which includes Joplin district, as well as the mines of central Missouri.

W. WESTON, mining engineer for the Moffat road, has left Denver, Colo., for a month's inspection and report on the Routt county, Colo., anthracite and bituminous coal fields. He will make his headquarters at Yampa and Steamboat Springs.

F. W. DENTON, in assuming charge of the Trimountain copper mine near Painesdale, Mich., has appointed J. Jolly, formerly head mining captain at the Baltic mine, as head mining captain of the Trimountain, and M. Trethewey, under captain at the Baltic, is appointed to the place held by Jolly.

ON the 22d inst. several of the friends of Ross E Browne, E. M., of San Francisco, Cal., gave him a dinner in San Francisco, Cal., prior to his departure for Johannesburg, South Africa, where he goes to take a position with an important mining company. There were present at the dinner: C. F. Hoffman, H. Bratnober, C. G. Yale, E. H. Benjamin, C. H. Lindley, F. W. Bradley and F. Leach of San Francisco, Cal., H. T. Power of Michigan Bluff, Cal., Mr. Perkins of Johannesburg, South Africa, and G. Hesse, S. B. Christy and A. C. Lawson of the University of California, Berkeley, Cal. Mr. Browne will be accompanied by his family and K. F. and J. D. Hoffman, the entire party going to London, England, when J. D. Hoffman will proceed at once to Johannesburg, Mr. Browne and family going later to South Africa.

THE following are announced as the graduating class of 1903 of the A. Van der Naillen School of Engineering of San Francisco: Electrical department—J. M. Minor, Arcata, Cal; F. R. George, Los Angeles; G. R Stebbins, North Platte, Neb.; J. Dooley, Sacramento, Cal; H. W. Koster, San Francisco; W. Bruce, Oakland; H. J. Ferguson, Knight's Ferry, Cal.; E. L. Hueter and L. H. Heuter, Alma, Cal.; F. B. Volkerts, Sebastopol, Cal.; W. Lazar, San Francisco; E P. Mann, Los Gatos, Cal; H. H Lewis, Sunnyside, Nev.; W. McCann, Ferndale, Cal.; F. H. Wilkins, Los Banos, Cal.; H. M. Tilson, Del Paso, Cal.; Arthur J. Iland, San Francisco; C. B Jackson, Pleasant Grove, Cal; C. J. Klevesahl, San Francisco; F. E. Duprey, Winters, Cal; R. Towle, Emmett, Cal; P. Potrz, Berlin, Germany; W. H. Grass, Milford, Cal; J. R. Rhodes, Uklab, Cal; L. D. Armstrong, Fortuna, Cal; D. W. Isaac, Tesla, Cal.; A. Jennings, Wickenburg, Ariz; H. W. Holmes, Alameda, Cal.; M. A. Herriman, San Francisco; R. H. Parker, Sierra City, Cal.; G. M. Dawes, San Francisco; P. W. Landell, Philippine Islands; W. E. Hollenberg, Reedley, Cal; F. Isbell, San Francisco; T. A. Church, San Francisco; G. R. Johnson, San Luis Obispo, Cal.; F. Hazelwood, Highland, Cal.; L. F. Scalione, Healdsburg, Cal; R. D. Tucker, Spanish Ranch, Cal.; R. L. Stewart, San Francisco; G. H. Farnsworth, Honolulu; W. H. Perry, Walla Walla, Wash.; O. A. McCobb, Hollister, Cal; L. Stark, Winters, Cal; V. G. Guthrie, Winters, Cal.; H. B. Stone, Chico, Cal.; C. W. Farrow, Downieville, Cal.; H. J. Zweifel, Jr., Downieville, Cal.; D. McCaustland, San Jose. Mining department—B. N. Sharp, Sandon, B. C.; W. G. Rennison, Kaslo, B. C.; G. F. Williamson, Amador, Cal.; M. C. Schmidt, Villaldama, Mexico; W. T. MacDonald, Chihuahua, Mexico. Draughtsmen—S. L. Cassella, Alma, Cal.; W. Krelling, San Francisco; J. Maxemin, Mazatlan, Mexico; S. Heiman, San Francisco; A. W. Pearson, Mt. View, Cal.; L. H. Brown, Red Bluff, Cal. Assayers—E. Williams, Nome, Alaska; D. D. McCallum, San Francisco; A. L. Stern San Francisco; T. S. Forrest, Ballard, Wash.; G. W. Bishop, San Francisco; J. Conway, Uncompahgre, Colo.; V. J. Hall, San Francisco; H. H. Lockhart, Descauso, Cal.; J. O. Lampshire, Los Angeles; M. E. Sayre, San Francisco; F. M. Evans, Victor, Colo.; A. T. Lesser, Garnet, Mont.; A. R. Wistrand, Menominee, Mich.; E. Pinter, San Francisco; M. B. Pope, Salt Lake, Utah; J. Thiebes, Bisbee, Ariz.; J. A. Millmore, Woodstock, Canada; E. N. Stone, Gazelle, Cal.; C. Gurnee, Nome, Alaska; W. A. Hersey, Penryn, Cal.; M. Brigman, Simiikameen, B. C.; G. H. Shaw, Murphys, Cal; R. E. Moore, Woodland, Cal.; W. H. Donohue, Tarryall, Colo.; J. M. Jessen, Omaha, Neb. Surveyors—A. G. Engblom, San Francisco; F. W. Wood, San Antonio, Tex.; H. P. Strough, New Hope, Va; D. M. Blood, Oakland; A. W. Steward, Butte, Mont; E. E. McCartney, San Francisco; E. O. Ord, Jr., Benicia, Cal.; W. H. Lipscombe, Mulberry, Cal.; G. Conlin, Victor, Colo.; S. H. Jordan, Angels Camp, Cal.; E. I. Clawiter, Mt. Eden, Cal.; W. M. Burns, San Dimas, Mexico; D. F. Valentine, Melbourne, Fla.; F. P. Zoffman, Jolon, Cal.; A. Joaquin, San Luis Obispo, Cal.; J. H. Elkinton, Oakland; B. A. Jeffery, Jackson, Cal.; J. P. Mackenzie, San Francisco; G. Schrader, Los Angeles; R. B. Wilcox, Stephens, Or.

Books Received.

"Chemist's Handbook," from Western Chemical Manufacturing Co, Denver, Colo, celluloid cover, with much technical information of value to chemists, assayers and others.

"Engineering Preliminaries for an Interurban Electric Railway," by Ernest Gonzenbach, is the latest work on electric railway engineering. The book is for the thoughtful perusal of those who contemplate building an electric railway, or who desire comprehensive information on this important subject. It deals with general requirements, makes a comparison between trolly and third-rail systems, and with power house and roadbed construction. Price, $1. McGraw Publishing Co., New York City.

"Iron, Steel and Other Alloys," by Henry M. Howe, author of the "Metallurgy of Steel," has been received. The publication of this book marks an epoch in our knowledge of metals and alloys. The work is thoroughly comprehensive, dealing with the composition of various alloys, blast furnace practice and the various types of furnaces. The book is written on new lines and deals comprehensively with the "solution theory" of metallography. It is a book at once for the student and practitioner. Price, $5. Sauveur & Whiting, 446 Tremont street, Boston, Mass.

"Chemistry, Inorganic and Organic," by Chas. London Bloxam (ninth edition), rewritten and revised by John Millar Thompson, LL. D, has been received from the publishers. The fact that this valuable textbook has issued its ninth edition is sufficient in itself to recommend the book to those who desire a thoroughly reliable treatise on the important subject of which it treats. Most books on chemistry deal with either organic or inorganic chemistry separately, but in this volume both are treated, making it a handy book of reference. There are 872 pages in the volume, with nearly 300 illustrations. The chapter on the fractional distillation of petroleum will prove of value to those interested in oil. The metallurgical section is particularly interesting and valuable. Price, $6; published by P. Blakiston's Son & Co., 1012 Walnut street, Philadelphia, Pa.

"The Metallurgy of Zinc and Cadmium," by Walter Renton Ingalls, is the title of a handsome volume on this important metallurgical subject, just published. It contains 700 pages of profusely illustrated text. The illustrations contain carefully made working drawings of furnaces and other machinery used in the handling and reduction of these ores. The zinc industry is an important one, comparing favorably with that of lead or copper, but until now there has been a dearth of technical information on the subject of the metallurgy of zinc. Mr. Ingalls is also the author of the "Production and Properties of Zinc." The present volume deals with the ores of zinc, their treatment in various types of calcining and roasting furnaces; the utilization of gases, and principles and practice of zinc distillation. Cadmium is also treated in a thorough manner. The latter part of the volume is devoted to the manufacture of the various products of zinc. Price $6, postpaid; Engineering and Mining Journal, 261 Broadway, New York City; 20 Bucklersbury, London, E. C., England.

Obituary.

B F. MORLEY, manager of tbe Buena Vista smelter, at Buena Vista, Colo., and of the Mary Murphy mine at Romley, and Adolph Abrahamson, superintendent of the mine, were killed by foul air wbile making an inspection of tbe mine workings on tbe 22nd inst. Tbeir bodies were recovered later. It is supposed the air in tbe mine had heen vitiated by powder gas The property is not operated at nigbt and tbere were no otber men in the mine when Manager Morley and Superintendent Abrahamson were making tbeir tour of inspection.

JOHN F. BLANDY died at Prescott, Ariz., Sept. 17, from a complication of diseases. He had long been in ill healtb. He was born in Newark, Del., April 24, 1833. He received his education at Freiberg, Saxony. He was engaged in mining in Lake Superior region for several years. In 1881 he removed to Arizona, wbich place has since heen his home. For several years be was Territorial Geologist of Arizona and his various official contributions, publisbed while acting in that capacity, are among tbe most valuable of the mining literature of Arizona.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING SEPT 15, 1903.

739,131—FIRE KINDLER—J. Adler, S F.
738,872—SAW SHARPENER—G. Y. Anderson, Dyea, Alaska.
738,752—ELECTRIC SWITCH—A. H. Babcock, Oakland, Cal.
738,756—COMPENSATOR—F. G. Baum, Palo Alto, Cal.
738,757—COMPENSATOR—F. G. Baum, Palo Alto, Cal.
738,981—FOOD CONTAINER—A. Buntenbach, London, Or.
738 982—EARTH AUGER—A. Buntenbach, London, Or.
739,058—BARREL AIR VENT—E. R Charles, Petaluma, Cal.
739,151—SHELL DECAPPER—M. Chick, San Diego, Cal
738,827—GAS GENERATOR—W. S. May, Clifton, Ariz.
739,215—WATER METER—Potter & Swank, Riverside, Cal
739,219—EXPLOSIVE ENGINE—J. H. Redfield, Spokane, Wash.
739,220—EXPLOSIVE ENGINE—J. H. Redfield, Spokane, Wash
739,028—ABRADING TOOL—J. O. Rollins, Tuolumne, Cal.
739,119—TACKLE BLOCK—H. W. Stocking, Avalon, Cal.
739 234—PUMP—Z Storch, Alameda, Cal.
739,042—SAND PUMP—M. C. White, Los Angeles, Cal.
739,043—OIL BURNER AND FURNACE—D. C. Wilgus, S. F.
739,248—SEAL—Wood & Cooper, S. F.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

EARTH AUGERS.—No. 738,982. Sept. 15, 1903. A. Buntenbach, London, Or. This invention relates to improvements in devices for boring holes in the ground for the reception of fence posts and the like. Its object is to provide an auger of simple construction, having means for feeding constantly a small quantity of water into the bole to soften the earth and aid in the boring.

FOON CONTAINER.—No. 738,981. Sept. 15, 1903. A. Buntenbach, London, Or. This invention has reference particularly to sucb containers as are used for sausages; and its primary object is to provide a simple and attractive substitute for the gut which constitutes the ordinary sausage casing; but it may also be used for the reception and preservation of a great variety of foods and other products.

ABRADING TOOLS.—No. 739,028. Sept. 15, 1903. J. O Rollins, Tuolumne, Cal.; one-half assigned to J. B. Ferguson of same place. This invention is designed to provide a fully equipped machine for shoemakers, wherehy they will have the means at hand for keeping the various knives and other tools in order, and are enabled, by means of the drill attachments, the grinder and the pollsher, to supplement to a marked degree tbeir own handicraft.

HYDROCARBON BURNERS AND FURNACES—No. 739,043. Sept. 15, 1903. D. C. Wilgus, San Francisco, Cal. The general object of this invention is to render more practicable the use of oil fuel in conjunction with marine boilers. Specifically its objects are, first, to provide a burner in which all tendency on the part of the burner to clog hy reason of impurities in the oil may be obviated without shutting off the fire or removing the burner from the furnace; secondly, to so construct the front of the furnace that the heat is equably distributed over tbe entire area of the fire box, while the engine room will be kept comparatively cool.

SEALS.—No. 739,248. Sept. 15, 1903. L. E. Wood of San Francisco, Cal., and C. R. Cooper of Berkeley, Cal. This invention relates to a device for sealing cars, rooms and receptacles of any sort, and it is especially designed for use upon freight cars, wbere it is desirable to seal the doors to prevent any removing or tampering of the goods contained therein. It consists essentially of a flexible metal strap adapted to pass through the hasp and staple or lock of any description hy which tbe door is secured, and in a means for securing the ends of said metal strap, so tbat it cannot be opened or removed without showing that it has heen tampered with.

Latest Market Reports.

SAN FRANCISCO, September 25, 1903.

METALS.

SILVER.—Per oz., Troy: London 27⅜d (standard ounce, 925 fine); New York, bar silver, 59c, refined (1000 fine); San Francisco, 59c; Mexican dollars, 47c @49c; San Francisco, 45½c New York.

The present price of silver in Now York and San Francisco is certainly the most encouragement silver men bave bad in many months. Tbere are tbose who predict a still higher price for the metal in tbe near future. It is making a vast difference to silver-lead miners, and in fact to all those whose ores carry silver in considerable quantity.

COPPER. — New York: Standard, $13.50; Lake, 1 to 3 casks, $13.50; Electrolytic, 1 to 3 casks, $13.50; Casting, 1 to 3 casks, $13.37½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £55 7s 6d spot per ton.

A slight falling off in the price of copper is noticeahle, hut these small fluctuations in price from day to day do not signify anytbing of importance. The past week the market has been unusually quiet, hoth sellers and huyers apparently waiting for something unusual to turn up.

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.75. London: £11 2s 6d per long ton.

SPELTER. — New York, $6.00; St Louis, $5.00; London, £21 per ton; San Francisco, ton lots, 6½c; 100-lh lots, 7c.

TIN.—New York, pig, $26.75@27 00; San Francisco, ton lots, 28½c; 500 lbs., 29c; 200 lbs., 29½c; less, 30c; bar tin, ℔ lb, 30c @32c. London, £118 5s spot.

PLATINUM.—San Francisco, crude, $18.00 ℔ oz.; New York, ingot, $19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, $46.00@47.00; large lots; London, £8 7s 6d; San Francisco, local, $43@44 ℔ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.— San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.75c; San Francisco, Plumbers', 100-lb. lots, 15.50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 45@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300 to 500 lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.85 @17.35; gray forge, $15 35; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27 00@29.00; open hearth billets, $28.00 @30.00; San Francisco, har, 7c to 12c per lb.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine hy hydraulic process from Middle Yuha Mining Co., in La Mina del Diablo Mine, near Sierra City, Sierra County, Cal., draining into ravine wbich dralns into Middle Yuha River; from South Yuha Mining and Development Co., in Melster Mine, near Emigrant Gap, Placer County, Cal., draining into Diamond Creek which reaches Yuba River; from Toy Kee, in Fairplay Mine, near Scales, Plumas County, Cal., draining into Rock Creek, which reaches Yuba River, gives notice that a meeting will he held at Room 96, Flood Building, San Francisco, Cal., Oct. 12, 1903, at 1:30 P. M.

Commercial Paragraphs.

THE Union Iron Works of San Francisco, Cal., are furnishing a 5-stamp mill to the Cbrystal M Co., Cottage Grove, Or., and a 40-stamp mill to tbe Nortb Star, Grass Valley, Cal.

THE General Metals Co., with offices in the Bowling Green Building, 11 Broadway, New York City, has recently been formed to take over the rights and property of tbe Telluride Reduction Co. of the same address, wbose specialty was the reduction of ores hy the hromide process. Tbe officers of the new company are as follows: C. E. Finney, president; J. H. Hanan, vice-president; H. B. Halgh, treasurer, and A. D. Keep, secretary. Mr. Finney was for years connected witb the American S. & R. Co., and later with the Loomis-Pettibone Gas Machinery Co., and is widely known throughout the mining field. The General Metals Co. expects sbortly to begin the erection of plants in several important mining camps in this country and Mexico.

SITUATIONS WANTED.

ASSAYER AND METALLURGICAL CHEMIST with best of references desires position. Address C. W. L., this office.

ASSAYER, EXPERIENCED IN CYANIDING, desires position. References. Address "Assayer," care of Mining and Scientific Press.

BY EXPERIENCED ALL AROUND MINE SUPERINTENDENT who is also a PRACTICAL UNDERGROUND FOREMAN, and will act as both in a small mine or in either capacity in a large property Expert in timbering and mining large ore bodies and catching up badly caved workings. Can mine from the grass roots to any depth; erect and repair buildings, boilers, mine and mill machinery, and make estimates. *No fancy salary asked.* Have good references. Address "Confidence," care of Mining and Scientific Press.

COPPER SMELTERMAN IS OPEN FOR ENgagement. Experienced blast furnaceman, metallurgist, assayer, sampler, etc. Good references. Address "Furnace," care of this office.

CYANIDER DIRECT FROM THE WAIHI G. M. Co Ltd., N. Z., wants position. Latest cyanide practice Holds certificates, references, etc. Address B. Dawson, Bank of British N. America, San Francisco, Cal.

MINE SUPERINTENDENT WANTS POSITION with a substantial company that has a mill on property. A qualified mining engineer who can run a mine or mill, cyanide plant, assaying and surveying. Address "Mining," this office.

POSITION DESIRED AS DRAUGHTSMAN, Surveyor, Assayer or Bookkeeper. Good references. Address H.W.K., Box 74, Long Beach, Wash.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 25 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum Can furnish the best of reference. Address "Mine Mansger," care of Mining and Scientific Press, San Francisco, Cal.

WANTED—POSITION BY A MINE SUPT. OR manager of 20 years' experience in practical mining and milling; past 17 years spent in superintending, managing and examining mines. Profitable handling of low grade ores a specialty. Climate no object. References from first-class companies. Address "Utility," this office.

YOUNG MAN DESIRES POSITION AS MILL Man. Has had six years' practical experience in amalgamating and concentrating, and a fair knowledge of the operation of engines. Will give best of references upon application. Address C. L. B., care this office.

HELP WANTED.

WANTED—A FIRST-CLASS ASSAYER AND Chemist, one with a practical cyanide experience, for position with a company owning its own property and 50-ton mill. Address C. B. L., this office, stating salary wanted, experience and age.

FOR SALE.

MINING PROPERTY FOR SALE.

Consists of 13,000 tons of tailings, 25,000 tons of dump—both good values. Water for working same. Situated 3 miles from railroad. No crushing power required. Guarantee a saving of 80%. Partners cannot agree, so it will be sold cheap. Inquire of James McDermott, Brooklyn Hotel, San Francisco.

NOTICE

of Receiver's Sale of the Electric Plant, Apparatus, and Other Property of the Cochiti Gold Mining Company.

Notice is hereby given that the Receiver, by appointment of the District Court of the Second Judicial District of the Territory of New Mexico, for the County of Bernalillo, in that certain cause pending thereln whereln Raymond P. Ripley and others are defendants, will, under and by virtue of an order of said court made August 20, 1903, receive bids for the purchase and sale of all the property of the said Cochiti Gold Mining Company, now in his possession as such receiver. Said property consists of a complete cyanide mill of two hundred and fifty tons capacity, built of structural iron, various other buildings such as stores, boarding house, store house, bunk houses, etc., etc. The machinery consists of dry crushing apparatus, Davis and Allis finishing rolls, twenty steel leaching tanks of two hundred and two hundred and thirty tons capacity; also sixteen thousand dollars worth of mining and mill supplies; office furniture, etc. And also, situated at Madrid, N. M., an electric power plant and structural steel building, one eight hundred horse power engine, one 600 K. W. generator, complete switches etc., etc., for a twenty-thousand-volt transmission, and other property such as is generally used in connection with such a mill run by electricity, including one hundred miles of copper transmission wire.

Also the Albemarle, Pamlico, Huron, Ontario patented mining properties, and the U. M. C. and three-fourths interest in the Red Cloud, containing in all almost one hundred acres and having five thousand feet on the strike of the vein. These mines and the mills are situated at Albemarle, Sandoval County, New Mexico, twenty-four miles from Thornton on the A. T. & S. F. Ry.—the other property at Madrid on said railway.

Bids will be received by the undersigned for the sale of said property, or any part thereof, for sixty days from the date of this notice. For the Madrid power plant property, and the electrical machinery, bids must be itemized, fixing the price to be paid upon each separate article; and, also, separate bids must be submitted for the wire, on account of conflicting interests in the property. The buildings and other property may be removed by purchasers from the premises on which they are located.

A reasonable deposit, certified check or cash, must accompany each bid as a guaranty of good faith and responsibility.

Lists of the property and all other information requested will be furnished upon application to the Receiver. WILLIAM SPENCER,
Receiver.

P. O. Address: Albuquerque, New Mexico.
August 21, 1903.

THE WOOD ROCK DRILLS

are built to be "Cleaned up with a sledge hammer" and "Wiped off with a scoop shovel" and still "Stay with you."

They drill faster, last longer, and cost less for repairs than any other.

THE

Bleichert Wire Rope Tramway.

MORE BLEICHERT TRAMWAYS IN USE THAN ALL OTHERS.

Manufactured by **THE TRENTON IRON CO.,** Trenton, N. J.

Engineers and Contractors and sole licensees in North America for the Bleichert System. Also, Wire Rope Equipments for Cable Hoist Conveyors, Surface and Underground Haulage, Etc. Illustrated book upon application.

New York Office--Cooper, Hewitt & Co., 17 Burling Slip.
Chicago Office--1114 Monadnock Building
DENVER OFFICE--R. D. SEYMOUR, Manager, 1711 Tremont St.

ARTHUR KOPPEL'S
FORGED STEEL
SHOES AND DIES

are of the right hardness and toughness; of the best quality in every way. Wear longer and more evenly and crush a ton of ore cheaper than any other. Patterns of all standard sizes kept in stock to ensure quick delivery.

WE ALWAYS CARRY A LARGE STOCK OF

Steel Dump Cars; Ore, Mine and Skip Cars;
Steel Rails from 8 lbs. up, Turntables, Switches, Etc.

WRITE FOR CATALOGUE "F."

ARTHUR KOPPEL, Dept. 6, Manufacturer,
66-68 BROAD STREET, NEW YORK.

The Percentage of Extraction in Ore Treatment.

The endeavor of every mill and smelter man is to secure as high a percentage of extraction from the ore he treats as he can possibly obtain economically. In former years the gold saved from, what was considered at that time, free-milling ore, was often not in excess of 60% to 70%, reminders of which are seen in the tailings dumps throughout the mining regions, which have in more recent time been retreated by the cyanide process, yielding usually from 80% to over 90% of the values formerly lost. In smelting much the same thing has occurred. Smelter dumps are not usually worked over, but better results are now obtained in smelting operations because of superior furnaces and advanced methods in ore treatment.

Concentration, which has been a pronounced feature in ore treatment in Europe for many years, has really only lately been given the widespread attention in the United States that its importance deserves, and to concentration is due much of the increased percentage of saving. There has been no very material change in recent years in methods of amalgamation or in the construction of stamp mills, though the arrangement of mills has been improved, their action becoming automatic in the several stages of ore crushing, from rock breaker to concentrators. The mills are also built more substantially in most cases that formerly, but these factors influence the cost of treatment rather than the percentage of values saved.

After amalgamation, whether inside the batteries, or on the outside plates, the object is to save that which escapes amalgamation. The modern mill man is more flexible than formerly. If his values are high after amalgamation he does not hesitate to experiment with a view to making a better saving by some other method. In former years he had fixed ideas concerning almost everything about the mill. He used a given amount of water in the battery, regardless of any change in character of the ore; the stamps were given a stated height of drop and maintained at that whether, according to modern ideas, it was the drop best suited to the ore or not. He employed a high or low discharge and nothing could induce him to change it. Screens were a "hobby" and but one kind was good—the kind he used. The result of these "rule of thumb" arrangements was usually high-grade tailings. And the higher grade the ore the greater was not only the amount but the percentage of loss.

In these days of modern ideas, and practice, thought and careful experiment, the result is very different. Often we find a larger tonnage being crushed than formerly, and the percentage of loss much lower, even in the battery. Concentrating machines have been greatly improved and many devices to secure the highest possible results have been introduced—among them hydraulic sizers, which make the saving of the valuable contents of the ore, usually sulphide minerals of high specific gravity, a matter of easy accomplishment, the machines and auxiliary devices working automatically. Each of these mechanical contrivances, whether a form of Spitzkasten or a concentrating machine, are subject to adjustment, and this feature adapts them to many variations in the ore.

After amalgamation and concentration, although over 80% of the values have been extracted, there still remains in many cases sufficient value to justify additional treatment by cyanidation, and this branch of metallurgy has added largely to the output of the gold mines within recent years. Not only are additional values saved from the ore as it comes from the mills from day to day, but the old tailings dumps, which for many years possessed no available value, have been successfully treated.

In every branch of ore reduction the same constant effort is being made to save a higher and still higher percentage of values; but there is a limit beyond which the mill man can not go with satisfactory economic results. Wherever the cost of securing a higher percentage of extraction exceeds the value of the result obtained, the limit of economy has been reached, and this principle is equally applicable, whether it be in reducing the cost of smelting, of saving the ultimate atom of free gold in the battery, in an attempt to extract a few additional cents per ton by the cyanide process or by any other method.

Parsimonious Economy.

The policy pursued by some mine superintendents, and often by explicit order of the board of directors, that of keeping the mill running at all hazards, is almost suicidal in an undeveloped mine. The mine being unable to promptly and continuously supply ore to the mill to its full capacity, any attempt to run the mill necessitates a method of operating the mine entirely at variance with the best practice. The mine should be opened systematically in order that the best and most economical methods may be employed. Drifts must be run to determine the extent of the ore bodies; raises must be driven to render the ore bodies easily and cheaply available; ventilation must be provided; chutes built and much other preparatory work done, that the stoping which follows may be carried on as rapidly as possible and at the least cost. This same demand for immediate dividends from ore blocked out, without expending any portion of the money gained from it, in the further development of the mine, usually results in the early closing of the mine upon the ore in sight being exhausted. There are numerous instances of the unfortunate result of this short-sighted policy in almost every mining district. It should be the endeavor of the management to so work and develop the mine that for each ton of ore extracted at least one other should be exposed in the reserves. Of course where no ore exists none can be developed by any amount of dead work, but too often no development is done where it is subsequently shown there was abundance of ore, and the mine is closed in consequence, it remaining for some other manager or superintendent to discover it through the medium of practical methods and a system of exploration which must produce results, good or bad. Economy which is parsimonious and short-sighted is extravagance, and is as much to be censured as any other wasteful use of available funds.

Mining in Mexico.

The production of gold in Mexico has risen with the introduction of American capital. In 1877–78 it was about $746,000, and in 1880–81 had increased to over $1,000,000. From that date up to 1890–91 it ranged between $650,000 and $1,000,000, but in 1892 it began to show a material increase, being that year $1,075,637. Since then a large amount of American capital has gone into Mexico, and the output has increased steadily until the present. In 1901–02 it was reported by the treasury department of the republic to have been $9,932,676. It is thought the output for the year 1902–03 will exceed $11,000,000. The silver production during the same period, 1877 to 1902, has steadily increased from $24,836,903 in 1877–78 to $72,530,983 in the years 1901–02. Statistics for 1903 are not yet available, but in 1902 Mexico imported copper ore and matte to the value of $10,000,000. A decade earlier the importation of copper was less than $100,000. During this period Mexico's shipments into the United States of bar and ingot copper has risen from $84,000 to nearly $3,750,000.

Exports of iron and steel from the United States into Mexico have increased very largely, machinery alone increasing from $1,500,000 in 1892 to over $7,000,000 in 1902.

The mineral resources of Mexico are very extensive, and although her mines have been worked for nearly 400 years, there still remains a large extent of territory almost unknown. The Mexicans have always worked the silver ores successfully, and also the high-grade gold ores, but the large masses of low-grade ores have waited for centuries for the advent of American miners, with modern methods of mining and milling to make them available at a profit. Deep mining, too, has been practically confined to the operations of foreign companies. It is true there are great shafts in Mexico, sunk to a depth of 2000 feet or more by native labor, under the direction of native engineers, but these mines are almost dry. A large inflow of water has always stopped native mining operations, no matter how rich the ore. Small quantities of water they could take care of by bailing, or even packing the water out as they do ore, but beyond a few hundred gallons daily their means of combatting it did not extend. There are many opportunities in Mexico to-day in mining, but it must not be supposed that really good mines are more numerous there than they have been or are still in the mining regions of the United States. There are many poor mines in Mexico, as there are in every other mining region, but capital has been looking in the direction of Mexico for some time past, and a large number of American enterprises are stated to be on a secure and profitable basis in that republic, more so than at any time in the past.

One of the causes which has led to this exodus of capital from the United States to Mexico is the long-continued labor troubles which have disturbed mining investments in the United States. There are neither labor unions nor strikes in Mexico, and it is doubtful if that republic will permit labor organizations to tie up the mining industry as it has done and is doing at present in the United States. Probably the government would take no cognizance of the unionizing of the workmen, nor would it endeavor to prevent the miners when organized from quitting work singly or in a body, but the test would come when the strikers undertook to prevent others from working. All are familiar with the summary punishment of offenders against the government in that country, and it is not likely that belligerent strikers would succeed in carrying out their plans in Mexico without a conflict with the government, and that would mean defeat.

Cheap Mining and Milling.

The annual report of the Consolidated Mercur Gold Mines Co. of Salt Lake City, Utah, for the fiscal year ended June 30, 1903, shows that satisfactory progress has been made in reducing the cost of the treatment of their ore. A slimes plant is being installed, and the cost of ore treatment, which was reduced from $3.50 during the previous year to $2.88, will probably be still further reduced. The new process will also be employed in the treatment of the old tailings dumps. During the year 346,359 tons of ore were treated at a cost for mining and milling of $2.88 per ton; the expense of mining being $1.30 per ton and of milling $1.58, showing that as cheap mining and milling can be accomplished in Utah as in some other States where costs are generally believed to have reached a bedrock figure. In one of the company's mills 55,099 tons of tailings were treated by cyanidation for 49 cents per ton, which is also a low cost for this method of treatment. The cost at the large plant of the Homestake at Lead City, S. D., where about 1200 tons are treated daily, is stated to be $0 353. The costs in the large plants of the Rand, South Africa, range from $0 55 to $0.72 per ton.

The Cripple Creek Strike.

While the Cripple Creek, Colo., region is not under martial law, the military authorities have found it necessary to handle the strike situation there in a vigorous manner, owing to the apparent apathy of the civil authorities in that district. Many have objected strenuously to Governor Peabody's sending the militia to Cripple Creek, claiming that there was no disorder there, and consequently no necessity for troops. It is true there had been but small show of violence in the district prior to the arrival of the militia, and but little since.

The mine operators were anxious to continue work in the mines, as many of them would sustain great loss individually, and nearly the entire district would be seriously damaged if the water were permitted to raise in the workings. Anticipating by past experience the result of any attempt on their part to resume work in any of the mines where the union men had been called out, by filling the places of the strikers with non-union miners, the mine operators called upon the chief executive of the State for the protection they had reason to believe would be denied by the civil authorities. Under military protection non-union men from the Cripple Creek district, Minnesota iron districts, from Joplin, Mo., and from other places are now at work to the number of nearly 1000.

The radical and arbitrary methods of the Western Federation are not at all in favor with the mine owners and operators of Cripple Creek district, and notice has been issued that hereafter no Western Federation man can find employment in any of the mines where they have called out their men. In line with this sentiment and action, the Gold Coin Co., employing 260 Western Federation men, on the 30th ult. notified the miners that they must leave the Western Federation. A strike was immediately called, all of the men promptly responding. There appears to be no good reason for the present strike in Cripple Creek district. The mines were paying the wages, and working the hours demanded by the Western Federation of Miners. The trouble began several weeks ago when the mill men at Colorado City struck. As the Cripple Creek mines were sending ore to these mills, the miners undertook to support the cause of the striking mill men by declaring a strike at all of the mines shipping ore to the mills at Colorado City. The strike for some weeks was effective, but gradually the operators have been able to secure a force sufficient to keep the mines clear of water, and a large tonnage of ore is going out daily.

In this strike, as in most others, the minority is dominant. A large percentage of members of the union do not favor the strike, but loyalty to their organization causes them to accept the ultimatum, and join the minority. It is said that many of the miners out on strike actually do not know why the strike was called, but supposing it to be for the "good of the cause," blindly follow their leaders. The ultimate outcome of this strike is already in sight; the Western Federation will lose, not only the strike but also opportunity to work in Cripple Creek district again. Many of the men as individuals may possibly be taken back, but only after they have forsaken the banners of the Western Federation.

In Arizona, California and southern Nevada the strike situation is practically unchanged. Many mines are still idle owing to these difficulties, and a few which had been closed down are again in operation with non-union men. The most prominent of these is the Yellow Aster mine, near Randsburg, Cal., where about 200 non-union men have been brought in by the management.

CONCENTRATES.

CHLORIDE OF GOLD is wholly an artificial product and so far as known does not exist in nature.

THE green scaly mineral on the rock from Columbia, Cal., is neither nickel nor copper, but a variety of chrome mica.

IT REQUIRES about sixteen sacks of ordinary size of clean iron sulphurets to weigh one ton. This will vary with the amount of moisture present.

THE suction hose of mine pumps are wound with strong steel flat wire to prevent collapse of the hose by reason of atmospheric pressure when the pump is in operation.

BOTH band and post brakes are efficient on hoisting engines, but most engineers prefer the post brake. Brakes of this type are found on nearly all large hoisting engines.

OIL concentration is being practiced at a number of localities, but all of these plants are not working by the same process, as there are several processes which claim to be efficient.

MANY copper mines of value show little or no trace of copper in the surface outcrop. Some of the largest iron gossans under which lie great masses of copper ore show no copper at the surface.

THE white lime-like mineral from Borate, Cal., is a silicate of alumina (clay) with some lime and magnesia, and a small amount of iron. It also contains sodium chloride; no borax mineral.

HOISTING ROPES should be kept well lubricated, and occasionally cleaned and carefully examined to see that the rope is in good condition. Crude petroleum has been used with satisfactory results at some California mines.

THE pump rod of a jackhead or Cornish pump may be made to operate in a shaft where the angle of inclination changes, if the angle be not too great, but an angle not too sharp for skips to travel will probably not be found too great for angle pump rods.

THE exhaust of a steam mine pump need not be carried to the surface. It can be condensed in the suction hose. The open exhaust of steam into mine workings where there are timbers is detrimental to the timbers, causing them to rot quickly. Poorly ventilated workings also cause timbers to rot quickly.

A CROSSHEAD is useful in shaft sinking where a bucket is used in hoisting. It keeps the bucket from swinging and makes it possible to run more rapidly than would be safe without its use. The crosshead should be at least twice as long as its width between the guides, to prevent becoming jammed in a shaft.

THE chemical symbol for potassium cyanide is KCN, or KCy. Potassium cyanide is prepared by fusing in an iron crucible a mixture of eight parts dry potassium ferro-cyanide with three parts dry potassium carbonate. When the evolution of carbon dioxide ceases the fused mixture is poured into an iron mould. This produces the commercial cyanide of potassium.

SILVER-LEAD ores are those in which lead, either as galena or carbonate of lead, are an important constituent, together with silver values. These ores often also contain iron and zinc and sometimes copper. In many instances the zinc content increases with depth, replacing the lead, and the copper values often disappear to a greater or less extent, iron sulphide taking its place.

ORES are not being commercially reduced by electricity so far as Concentrates knows, though mineral substances not recognized, popularly speaking, as ores, are treated in electric furnaces, and various substances manufactured. Among these are the metal aluminum and the abrasive mineral carborundum. The cost of producing power in San Francisco, Cal., in large plants has been estimated at $20 per year per horse power.

ORES of copper contain as high as 82% metallic copper —this being cuprite, the red oxide, but copper ores representing the run of mine—not selected, seldom exceed an average of 25%, and in fact rarely reach it in large amount. There are more copper mines working on ore running less than 10% copper than there are over it. Some copper mines are profitably worked on a very low percentage of metal owing to favorable conditions for mining and reduction of the ores.

THE small pebbles from Greaterville, Arizona, are of two kinds. The black, hard pebbles are iron ore, and probably of no value where found. The others consist of galena with sulphate and carbonate of lead, and, if they can be saved separately, probably constitute a valuable ore. The lead ore is of higher specific gravity than the iron ore, and should be separated without difficulty. Possibly the two kinds of ore may be shipped together at a profit, as the iron would make a valuable flux for smelters. If there is enough of this material obtained in sluicing, samples should be sent to smelters with inquiry as to what they will pay for the ore in quantity.

IT is more expensive to stope and handle ore in a vein having a dip of less than 35° than in one where the dip is 40° or over, for the reason that the rock will not run by gravity on a rock slope of less than 35°, and much shoveling becomes necessary. In such a mine it is economy to drive the levels rather closer than in a steep vein. In some veins of high angle of dip, the levels are run 150 to 200 feet apart. In a flat vein, such as above referred to, the levels should not be over 60 to 75 feet apart.

A DIRECT-ACTING hoisting engine, sometimes called first-motion hoist, is one in which the piston rod is connected directly with the main shaft of the hoisting reel, by means of a crank. In a machine of this type each stroke and return of the piston makes one complete revolution of the hoisting reel. Other types of steam hoist are those run by gearing, and those operated by means of friction wheels. Water hoists are either geared or of the friction type. Hoisting reels are not driven by belts.

THE open-sight compass is an instrument by means of which fairly accurate land surveying may be done by any one who has the necessary experience in this work. The magnetic needle is of little use under ground, owing to the numerous objects, natural and artificial, which deflect the needle. In view of this all underground surveying is done by means of the plate and vernier, the magnetic needle being employed occasionally as a check, though for the reasons above stated it is not reliable even for that purpose.

WHEN steam is turned into a pipe line containing water, the temperature of which is lower than that of steam, some of the steam may be condensed, forming a partial vacuum. This causes the water to be forced violently in the direction of the reduced pressure, and a loud hammering of the pipe (water hammer) is heard. This may proceed to such an extent as to do material damage to the line. To prevent water hammer the steam line should be well drained, and when the steam is turned off the engineer should see that the vents are open, that no water may condense and accumulate in the pipes.

THE telluride contents of ores are not easily concentrated by any simple process of hydraulic classification. However, after crushing the ore and passing it over belt or table concentrators, it should be run through spitzkasten (hydraulic classifiers) and the separate products retreated on special belt machines. The tailings might then be run over carefully constructed canvas tables. But with all of these precautions the loss is considerable. Telluride ores are generally rich enough to be shipped at a profit, or treated by some modification of the cyanide process.

WHERE two shafts on a mine are nearly at the same level at the surface, natural ventilation is likely to be unsatisfactory. It may be improved by building over one of the compartments of a shaft an air-tight structure extending upward 30 feet or more. The condition can be still further improved if the compartments of the shafts be bratticed—made air tight. In some mines the direction of the air currents change with the seasons, an upcast shaft during the summer becoming a downcast during the winter season. In some instances the direction of air currents have been known to change daily, being a different direction during the day from that at night.

NATURAL SAND weighs more per given volume than sifted sand from the same material, because in natural sand the grains vary in size, and the smaller grains fill the interstitial spaces between the larger grains. To find the percentage of voids in sand or other fine material, take a graduated glass cylinder and pour into it 100 measures of sand. Pour this into another vessel, and in its place pour 60 measures of water. Then slowly pour into the water the 100 measures of sand. It will be noticed that the sand now only occupies 94 measures, having lost 6% by more compactly settling, but the surface of the water will have risen to about 121 measures: Of this 121 — 94 = 27 measures of water will be above the top of the sand, which leaves 60 — 27 = 33 measures of filling the voids in 94 measures of wet sand, or 0 351 of the wet mass, or practically 35%.

IT HAS been stated repeatedly herein that gold nuggets do not "grow," regardless of the numerous "theories" to the contrary. There is no rational evidence to lead to the belief that a mass of gold once included in the loose material of a gulch, which represents the breaking down or disintegration of the neighboring hillsides, ever accumulates a single atom of gold to itself, or increases in any manner, either in weight or bulk. The oft repeated story that gold nuggets contain a little grain of sand or iron oxide as a nucleus, about which the nugget has been built up, is a myth. Gold is derived from veins or deposits in solid rock in place, and from the moment of its exposure to the powers of disintegration and erosion it begins to grow smaller in size and weight, and as gold in its original state in the rocks is universally rough, with sharp edges, or a generally ragged appearance; when a nugget is found smooth and rounded by the attrition of the rocks with which it has been associated in the stream bed, it is safe to say that such a nugget has lost a large portion of its original weight and size by the process. The theory that gold nuggets grow in placer or alluvial deposits of any kind is not susceptible of direct proof.

NO ARBITRARY FIGURES as to the relative cost of milling and smelting ores can be given, as the factors which influence both smelting and milling operations are so variable. Moreover, ore which is adapted to milling is often unsuited to smelting without the admixture of other ores, and smelting ore is seldom amenable to milling. In California, under favorable conditions, milling is accomplished at less than 50 cents per ton. This contemplates large capacity per stamp, a free milling ore and free water power. Smelting under favorable conditions has been accomplished at a cost of $1.35 per ton in British Columbia. While this shows that milling is less expensive than smelting, it is probable that the smelting ore yielded over 90% of its value by smelting, but that an attempt to mill it would result in greater percentage of loss with also a greatly increased cost over the figures given by reason of reduced capacity per stamp and the necessity for concentration.

WHEN the government issues a patent to a mining claim that patent secures to the holder of the claim the exclusive right to all veins apexing within his territory as defined by the lines of his claim. The question of extra-lateral right, however, has been a subject of litigation, and has not been positively determined by the United States Supreme Court. The question arose over priority of location as between a mining and an adjoining agricultural patent. Under the laws of 1866 the end lines of a mining claim need not of necessity be parallel, and claims located under that law where the end lines were not parallel have not been denied the privilege of taking the extralateral right, even though the diverging lines were in the direction of the dip of the vein, consequently giving to the claim owner an increasingly greater length of the vein with increasing depth. No precedent has as yet been established by the United States Supreme Court regarding the matter. As to claims having parallel end lines, whether located under the laws of 1866 or those of 1872, the claim owner has the extralateral right.

SADDLE REEFS are a form of vein or ore deposit occurring in the Bendigo region of Australia. In this form of deposit the quartz veins or lenses conform to the inclosing rocks and are contorted and folded with them, which has led some geologists to believe that the veins were formed prior to the tortion of the strata. Somewhat similar occurrences elsewhere, however, where the schists or slates have been silicified and contain gold and auriferous pyrite, do not lead to the belief that this mineralization was prior to the folding of the inclosing rocks, but subsequent to it. The form of the saddle reefs suggests that the folding of the strata produced open spaces, or, at any rate, zones of dis-cission in which the quartz masses were subsequently deposited by substitution in part for the original material of the rock and partly by deposition in open spaces. Veins in slate are not uncommon where little or no flexure has occurred, and these veins often show perfectly the structure of the original slates. It is quite possible that were a formation containing such veins subjected to folding, the veins would be found with much the same appearance as they now have, except for the curving dip due to folding. It is said that some of the veins of the Nova Scotia gold fields are also saddle reefs.

OFTEN in locating a claim, the prospector, having neither chain, tape nor other means of measuring the lines of his claim with even approximate accuracy, "steps off" the distances and locates accordingly. It rarely occurs that he appropriates too little, the reverse being usually the case. The courts have held that such a location, where made without injury to others at the time it is made, is only voidable as to the excess claimed, and not as to the whole claim. Upon application for patent, the monuments may be changed and the lines drawn in to cast off the excess. An excessive location can not be said to be a fraud upon others, as it can not take away rights already acquired by prior appropriation. Subsequent locators may measure the ground from the initial point of the excessive location—the discovery stake or monument—and this notice generally specifies the number of feet the locator claims in either direction along the lode; but where it does not, the locator can only claim 750 feet along the vein on each side of his discovery notice. Consequently, in the event of an excessive location having been made, and the locator having neglected to state in his discovery notice the number of feet he claims on each side of his discovery stake, he may hold 750 feet on one side of the stake; but should he have less than 750 feet on the opposite side, where a subsequent location has been made abutting upon his claim, he will be unable to secure his full 1500 feet, as he can not encroach upon the newer locator. On the other end of the claim he will lose all in excess of 750 feet. In the absence of State or local law requiring a preliminary notice of location, a locator may claim an area so greatly in excess of the statutory location as to indicate bad faith. There then being no guide to the subsequent locator, the entire claim may be held as useless for any purpose and wholly void. (Ledoux vs. Forester, 94 Fed., 600.) A 1500-foot claim can not be shifted from one end of a 2000 foot claim to the other to take in a discovery subsequently made by another within the excess end of the 2000-foot claim.

Hydraulic Mining in Southern Oregon.*

Written for the MINING AND SCIENTIFIC PRESS by DENNIS H. STOVALL, B S.

The little county of Josephine alone, in southern Oregon, contains nearly 100 hydraulic placer mines—placers they are that are husy from three to nine months in the year. Probably there is no other section of like area the world over that can claim such an acreage of placer ground. The story of the origin of this hig placer field is an interesting one, notwithstanding the fact of its heing geological in tone. A long time ago, before this part of old earth was torn upside down and made over again, there flowed northward from what is now Siskiyou county, Cal., a great river. This mighty stream was from ½ mile to 1 mile in width, and its ancient hed can he traced to-day from the Oregon–California line northward through the Waldo, Illinois, Galice, Grave and Cow Creek districts, disappearing entirely near Glendale, where the mountains of Cow Creek canyon have huried it from view. The formation of new mountains, rivers and streams have uncovered portions of the ancient stream's hed; at others they have buried it deep heneath towering crags and mountain peaks. But it is the auriferous filling, the conglomerate mass of gravel, clay and decomposed matter of this ancient river that makes the diggings of the placer mines of southern Oregon to-day. Streams and rivers cutting across this old channel have scattered the gold for miles and formed the smaller later channels along these waterways and gulches. A numher of the largest of the southern Oregon placer mines are located directly on this ancient channel, among them heing the Old Channel and Galice Creek hydraulic mines of Galice creek; the Deep Gravel, Simmons, Osgood and Wilson-Meredith of Waldo district, and the Columhia, Lewis and others of Grave Creek district. On the rocks and houlders of these diggings are found imprinted the forms of fishes and strange creatures that inhahited the waters of the ancient rivers in the long ago.

How this old channel came to be filled from rim to rim, heaped up in many places with an auriferous filling, is something the writer can not explain; as a matter of fact, the practical miner gives hut little time to a study of it, hut uses his "thinker" to the all-important matter of securing hetter and more economical methods of getting and saving the gold. The hanks in this old channel lie from 10 to 230 feet deep on the hedrock. The greatest hank throughout its whole extent is that being worked hy the Old Channel Mining Co. in the Galice district. This gravel hank has a height of 235 feet, and is heing operated upon at the present time by a hattery of two giants, working under a gravity pressure of 500 feet. To he safe, the piper is ohliged to play his giant on this bank from a distance of 450 feet. The great streams gnaw at the foot of the towering pile, and the gravel falls off in slahs of 10,000 tons. The dirt of this old channel yields easily to the giants, and there is a comparative ahsence of hig boulders.

All of the ground in this old channel carries gold. First, there is the coarse gold found with the boulders and the lower stratum next the hedrock. Ahove this is the stratum known as "pipe clay" hy the placer miners; and still ahove this is the capping of red clay, carrying its values in fine or flour gold, a large per cent of which is saved hy a system of undercurrents. This is a steel screen arrangement in the bottom of sluices through which the hlack sand and finer particles are drawn off and spread out over a hroad riffle tahle. This enahles the miner to catch hoth the flour gold and the platinum, which in late years has heen found to be a very valuahle part of the black sand of these diggings, but which in years past was thrown away as valueless.

In recent years there has been a general combination of minor or smaller placer holdings in southern Oregon into large properties under control of one management. It is found better for all concerned to combine the water rights and facilities, as one claim of twenty acres does not in many instances make sufficient territory to warrant the expenditure of a great sum in the construction of large ditches and of a length necessary to tap the main water course far enough up to give an elevation of 100 feet ahove the ground to he worked; and a pressure of less than 175 feet is not of high efficiency in working placer ground by hydraulicking. There are streams in southern Oregon on which placer bars and channels are located that have sufficient fall to allow a pressure of 275 feet with 1 mile of ditch hy running the ditch with a grade of 1 inch to the rod; but these favorahle conditions seldom prevail, and to get such a fall a ditch from 5 to 20 miles in length is necessary. There are a numher of ditches in southern Oregon of from 20 to 35 miles in length, constructed at great cost around the steep and rocky mountain sides, flumed across gulches and tunneled through solid rock. It is this feature of placer mining in southern Oregon that the miner must first consider, for it is the hig feature of the husiness. Where will I get my water supply; how many miles of ditch will it require to bring it to my ground; how much will it cost, and how much pressure will I have when I get it there? Ditches here have cost all the way from $2000 to $60,000; but, once built, they are there to stay, as slides and hreaks do not figure so materially in the running expense of a ditch in this country.

Another feature that figures prominently in the business of placer mining in southern Oregon, as in all other placer regions, is that of dumping grounds for the tailings. Fortunately, there are no laws in Oregon that prevent the miner from dumping his tailings into Rogue river or any of its trihutaries, and it is on these that all of the placer mines are located. It only remains for him to have plenty of fall from the end of his sluices to the river, stream or gulch helow. The greater part of this old channel in question lies far up on the mountain tops, or at sufficient elevation to allow the miner ample dump for mountains of tailings and refuse. At the Old Channel mines there is a sheer fall of nearly 500 feet from the end of the sluice to the hottom of the canyon helow. Yet there is much rich ground lying along gulches and streams that has not sufficient slope to carry away the tailings. For a long time this ground lay untouched. Then the "grizzly" and the "hydraulic elevator" were introduced and the way was easy. By these machines the tailings, houlders and refuse are lifted to a height of 35 and 40 feet, thus giving dump enough to last for a numher of years without the elevator being moved.

Taken all in all, placer mining in southern Oregon is a very conservative husiness—much more so, in fact, than quartz mining generally in this or any other country, for the reason that the placer miner has all of the elements of his business in sight, and he can compute heforehand just what it will cost to equip his property, how much it will require to operate it and how much he will realize, as the ground to he worked can he thoroughly tested and prospected before a shovel of dirt is moved for mining purposes. Mines here clean up from $2000 to $100,000 annually, depending upon the richness and amount of ground worked. It costs from 2 to 5 cents per yard to work the ground—ground that produces from 8 to 20 cents per yard, leaving a good margin of profit. Gravel that averages 20 cents per yard will pay the miner his money hack in two years with interest; if the ground pays 30 cents, it is considered a honanza. The average ground of the southern Oregon old channels runs from 6 to 8 cents a yard. Ground of this worth, where there is a water supply of 2000 inches for eight months in the year and good dumping grounds, forms the elements for the making of a paying placer mine—and it can he truthfully stated that there is much of this ground in the old channel placer fields of the southern Oregon districts.

*See illustrations front page.

Knocking in Steam Engines.

The most frequent causes of knocking in steam engines, writes D. B. Nixon to the American Manufacturer, are lost motion in the cross head, wrist and crank pin hoxes, looseness in the pillow hlock or main hearing hoxes, looseness of the piston rod or follower plate, the crank pin or crank shaft being out of line with the cylinder, or the wrist pin, crank pin, or main hearing journal being worn oval; the slide valve having too much lead or not enough; the exhaust opening heing too soon or too late; the valves heing hadly proportioned, or the exhaust passage outside of the cylinder heing contracted. Other causes are shoulders heing worn in each end of the cylinder, in consequence of piston packing rings not traveling over the counter hore at each end of the stroke; or shoulder heing worn on the guides, resulting from the cross head shoes not overlapping them when the crank is on the dead center; the piston not having sufficient clearance at either end of the cylinder, in consequence of its heing altered by taking up the lost motion in the hoxes; there not being sufficient draught in the keys to take up the lost motion in the connecting rod boxes; the packing heing screwed too tight round the piston rod, excessive cushioning, resulting from the leaky condition of the piston, which allows the steam to occupy the space between the cylinder and piston head, as the crank approaches its dead center therehy subjecting the engine to an enormous strain, as at this part of the stroke the flywheel is traveling very fast and the piston moving very slowly; lost motion in the connection by which the slide valve is attached to the rod. Engines out of line frequently knock sideways at the half stroke, but most generally at the outward and inward upper or lower dead center, as these are the points that the greatest strain is thrown on the bearings in consequence of the direction of the connecting rod having to be reversed.

The foregoing causes of knocking in engines constitute the principal ones. Knocks arising from lost motion in any of the revolving, reciprocating or vibrating parts of an engine may be located by placing the fingers on the part, while the cross head is heing moved hack and forth on the guides hy the starting har, but knocks induced hy the valve opening or closing too soon, by the contraction of the exhaust, or hy the valves heing improperly set, are the most difficult to discover, as they are different from those induced by lost motion, the sound heing a dull, heavy thud in many instances, causing the engines, huilding, and even the foundation to vibrate at each stroke. While an intelligent and careful search will in most cases result in successfully locating the knock, some will for a time haffle the most expert engineer. There are instances where the indicator has heen applied in order to determine the precise location of the knock or thud.

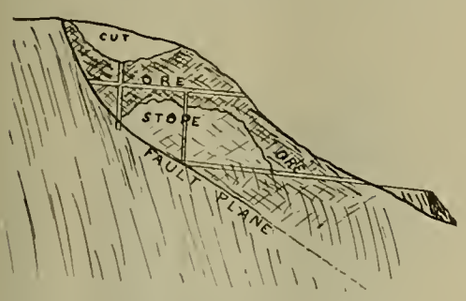
Some Structural Features of the California Gold Belt.

NUMBER VII.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

The line of that portion of the central gold helt of California, known as the mother lode, extending northward 5 miles from the village of Plymouth, is marked hy the canyon of Indian creek to the El Dorado county line, and northward, in El Dorado county for a farther distance of 10 miles by the canyon of the north fork of the Cosumnes river and a trihutary from the northward, as far as the German mine. This is a condition frequently ohservahle along the line of the lode in other counties. The great system of fissures occurring in the slates, which are naturally softer than the accompanying greenstones, has rendered their erosion more rapid, and the canyons are the natural physical result. The structural peculiarities of the lode generally have a marked influence on the topography of the region through which it passes. Huge outcroppings of quartz, though sometimes seen in the valleys, more frequently form prominent landmarks on the summits of the hills. Noted instances are found in Mount Ophir, the Virginia, Mary Harrison and Louisa mines, south of Coulterville, and the Pinon Blanco, 3 miles north of Coulterville, and the McAlpine hill in Mariposa county; the Eagle–Shawmut outcrop near Jacksonville; Golden Rule hill and Quartz mountain, and the heavy outcrop north from Whisky Hill to Table mountain, near Jamestown, in Tuolumne county; Carson hill in Calaveras county, and the great outcrops hetween Amador City and Plymouth, in Amador county.

The mines along the lode from south line of El Dorado county are opened on a series of outcrops, some of them of large size. The geology of the veins is comparatively simple, and as far as known have no unusual structural features.



The German mine, ahout half way between Nashville and Mud Springs, is more interesting than some of the others of the vicinity, owing to the intrusion of granitic dikes in the lode. The rock formation in the vicinity of the German mine consists of the hlack clay slates, amphiholite schist and massive diahase tuffs and hreccias. The gold-hearing veins of the German mine are found partly in the slaty diahase tuffs, hlack in color and greatly resembling the clay slates. The latter are found both to the eastward and westward, hut as far as observed do not come into direct contact with the vein itself. The most interesting occurrence, however, is the intrusion of dike rocks of acid type into the ore-bearing zone. The dike rocks vary from a fine-grained quartz porphyry to a rather coarse-grained granite. The indications are that the several dikes were intruded at different times.

Although much later than the diahase of the vicinity, and also later than the gold-hearing veins, these granitic dike rocks have been crushed and sheared and suhjected to great alteration. In width they range from a few feet to more than 100 feet. In some instances zones of fracture are found, with the infiltration of much silica and the deposition of gold and pyrite, but as far as known none of these occurrences were rich enough to constitute a payable ore. The granitic intrusions sometimes assume unusual shapes. One instance was noted where a large mass had heen injected from the southward into the slates, and where exposed had somewhat the form of a segment of an inverted cone. Following around this was a gold-hearing quartz vein several feet in width. The concentric structure of the interior of the dike suggests that the dike was folded in the slates by subsequent movement, together with the accompanying vein.

Northward from the German mine granitic rocks become more and more abundant until they predominate in the region between Mud Springs and Placerville. These rocks are not, strictly speaking, granite, hut a rock of the granitic series, the presence of plagioclase in nearly all of them in greater or less amount giving to them a wide range from diorite to granite, and in some localities augite is ahundant and the rock inclines toward diabase. In these rocks near Logtown, ahout 2 miles northwest of the German mine, are found numerous veins of gold-bearing quartz. In some instances these occurrences are rather an impregnation of silica and other minerals, with pyrite and gold, than veins. Most of these zones, however, contain as an accompaniment what may be considered veins. In the

Minnehaha mine, which is a fair representative of the type of vein formation found here, the vein dips at about 10° below the horizon. There is no distinct line of demarkation between vein and wall—the silicification gradually disappearing, and with it the gold. In the porphyry near the vein were noticed a great number of veinlets of quartz leading toward the central zone. Some of these were found to be gold bearing.

Another type of vein unusual in this part of California is found at the Oro Fino, or Big Canyon mine, 5 miles south of Shingle Springs, in El Dorado county. This consists of a zone of fractured diabase, which has been impregnated and cemented by silica, forming a mass of dense and

Section Vandalia Mine, El Dorado County, Cal.

extremely hard breccia. It carries pyrite and gold. The pyrite is very finely disseminated throughout the mass, which is about 40 feet in width. Veinlets of calcite traverse the rock in every direction. The walls, both foot and hanging, are diabase, but little altered. In fact, the transition from ore to waste rock is often so gradual that only by sampling could the miners distinguish between them, there being no line of demarkation. About one-third of the values in the ore were stated to be free, and subject to amalgamation, the remainder being associated with the pyrite which was concentrated on belt machines and the sulphides treated by chlorination.

About ½ mile north of the Oro Fino mine is the Vandalia mine. Here the ore deposits occur in a siliceous rock having a schistose structure. It may have been either an intruded dike rock or possibly a sedimentary (quartzite), but it is found so greatly metamorphosed that the question of its origin is difficult of determination without making a microscopic examination, and this the writer did not do. However, the structural peculiarities incline to the belief that it is an altered felsite, or other similar intrusive rock. The ore shoots are extensive, but do not conform to the strike and dip of the schistose structure of the zone within which they occur. The schist is heavily impregnated with auriferous iron sulphide, which near the surface is oxidized, forming an iron gossan. The gold in the rock is extremely fine and difficult to amalgamate. In recent years the ore has been successfully treated by the cyanide process. The workings are extensive and the mine is opened through four tunnels—two on each of two levels. In the course of development a fault plane was encountered dipping from the west, which has cut off the ore bodies, and exploration on the under side of the fault has thus far failed to rediscover them. This fault plane has a dip to the eastward, being steeper near the surface than in depth, and it also has a curving strike. It is an unusual geological occurrence in the gold belt of California, and in this instance it is not impossible that the ore deposition may have occurred subsequent to the fault.

(TO BE CONTINUED.)

Cost of Shaft Sinking on the Rand.

The following detailed statement of sinking 858 feet of an inclined shaft at the Kleinfontein's new shaft is from the London Mining Journal, and shows that, although sunk largely with native labor, the cost does not vary so greatly from that of this class of work in the United States under conditions nearly similar, as concerns the hardness of rock, etc.; but, as no shaft has been sunk in a metal mine in the United States at a rate equaling that on the Rand, this slight difference in cost is the more notable. There are numerous instances in America where the cost of shaft sinking has been greatly in excess of $65 per foot, by reason of the great hardness of the rock or increased cost due to the large volume of water. It is not always the hard rock shaft that is the most expensive, however.

The shaft in question is 21 feet by 6 feet in the clear, and during the months of January, February, March, April and May of this year a progress of 858 feet was made. During the last month of working a total footage of 213 feet 6 inches was performed, and this we think constitutes a world's record for sinking a shaft of this size. The average monthly footage for the five months was 171.6 feet.

The statement gives details of all costs in connection with the work, which was carried out in the usual way on the Rand, viz., drilling machines and skilled work attended to by Europeans and all the manual work performed by natives.

Cost of sinking East shaft, from January 1, 1903, to May 31, 1903. Total footage sunk in that period, 858 feet. In May, 1903, 213 feet 6 inches were sunk. Cost, £11,836 19s 5d:

Cost per foot sunk, £13 15s 11 04d. Total value, £11,836 19s 5d.

144 rounds were worked, during which 4032 holes were bored, equal to a total depth of 28 963 feet 2 4 inches, or an average depth per hole of 7 feet 2.2 inches.

Improved Method of Pile Driving.

The adaptability of rock drilling and air compressing machinery to various forms of mining is illustrated in a variety of economic instances, but the wide range of such engineering work is not so universally noted. Herewith is presented an instance wherein is in operation a method of using an Ingersoll-Sergeant pile driver. The work of driving sheet piles, especially where two or three courses are necessary, entails much difficulty, and the device illustrated is designed to do away with much of the

Ingersoll-Sergeant Pile Driver.

cost, annoyance and delay. The machine has some resemblance to the new Ingersoll rock drill, there being a striking anvil added, and can be worked with light or heavy blow, at any desired speed, with either compressed air or steam, and by means of the lifting staple at the upper end can be quickly changed from pile to pile.

One of these machines will do the work of fifteen to twenty men and takes but two men to operate it. In the one shown herewith the cylinder diameter is 4 inches; length over all, 5 feet 6 inches; size of jaw, 6 inches long, 2½ inches wide; clearance necessary, 3¾ inches. The machine is made and supplied by the Ingersoll-Sergeant Drill Co., 26 Cortlandt street, New York City.

The Metallurgy of the Homestake Ore.*

Written by C. W. MERRILL, B. S.

The Homestake M. Co. has acquired through consolidation the ground and equipment of the Father De Smet Con. G. M. Co., the Deadwood-Terra M. Co., the Caledonia G. M. Co. and the Highland M. Co., at and near Lead, Lawrence county, S. D., in the northern portion of the Black Hills. The company owns or controls 250 claims, comprising 2616 acres, and covering about 8000 feet along the strike of the lode.

At the surface there are several veins, of which three have united in depth, where the main vein ranges from 300 to 500 feet in width. The 1100-foot level is the lowest at present. The rock of both walls is, so far as known at present, carbonaceous slate, and the country is penetrated by a system of porphyry dikes, and in some places capped with porphyry.

The output of the company uo to January, 1903, has been, approximately, $70,000,000.

THE ORE.—The oxidized, open-cut ore is nearly all treated in the three mills on the northern part of the property, which are as follows: The Mineral Point (formerly the De Smet), of 100 stamps; the Monroe (formerly Caledonia), of 100 stamps, and the Pocahontas (formerly the Deadwood-Terra), of 160 stamps. A cyanide plant, to treat the leachable portion of the tailings from these North End mills, has recently been installed and put into operation at Gayville, or Blacktail, as it is now known.

The Homestake lower level ore, which comprises the greater part of that being milled at Lead, may be described as a hornblende, garnetiferous schist or slate, which has been crushed and infiltrated with free silica and pyrites, the latter being about 7% or 8% of the ore, and comprising pyrite, pyrrhotite and traces only of chalcopyrite and arsenopyrite.

The standards used in this discussion are: The United States gold dollar, the United States short ton of 2000 pounds avoirdupois, and the value of an ounce of fine gold, $20.67. Percentages are given by weight, and not by volume. Sizings are classed as coarse (that portion of the sample which will remain on a 100-mesh screen; diameter of wire, 0.00433 inches; size of opening, 0.00575 square inches); middles (the material finer than the opening of the above 100-mesh screen, und coarser than the opening of the commercial 200-mesh screen as given below); and fines (the material which will pass a 200-mesh screen; diameter of wire, 0.00216 inches; size of opening, 0.00312 square inches). A further subdivision of fines is also mentioned, which is based upon the granular, or angular, condition of one portion and the flocculent, or amorphous, condition of the remaining portion of these fines.

MILLING.—The ore receives its first crushing in rotary breakers at the hoists, and this product varies in size from that of a sea sand up to rock having an extreme dimension of 4 inches. From bins at the hoists at Lead the broken ore is trammed to the three mills, i. e., the Homestake and Golden Star, containing 200 stamps each, and the Amicus (formerly the Highland), in which there are 140 heads, making a total of 540.

From the mill bins the ore passes to the mortar, which is of the now celebrated Homestake narrow pattern, where it is crushed between cast iron shoes and dies, the weight of the stamp when equipped with new iron being 900 pounds, the drop 10½ inches and falling eighty-eight times per minute.

The screen is of the steel needle slot type No. 8, and the bottom of the screen opening averages 10 inches above the top of the dies.

The long drop, high discharge and small area of screen openings produce an extremely fine pulp, about 80% passing a 100-mesh screen, and it is to the writer a most remarkable fact that under these conditions such a high stamp duty is maintained, it being fully four tons per stamp per twenty-four hours.

This duty is possible only because, first, of the very favorable nature of the ore, the slate and pyrite crushing readily and the quartz being an excellent medium of attrition; secondly, of the large proportion of water used, being from eight to ten times the weight of ore crushed; and, thirdly, of the narrow mortar, which is only 12 inches wide at the lip.

This very fine and thin pulp is in the most excellent condition for amalgamating, which process is conducted both inside the mortar and outside, on full-size plates in series (each 54x144x⅛ inch) to each mortar. The first of these is a copper plate and the other three are silver-plated copper, the weight of plating being two ounces per square foot, and all silver plating being done at the works. The addition of the three silver plates to each stamp battery by Mr. Grier has proven one of the most valuable steps in the treatment of this ore and has brought about an additional profit amounting to, approximately, $250,000 during the year 1902, over and above what would have been realized from amalgamation had the outside plate surface been only that of the one copper plate, which, by the way, is considered ample in many of the large modern plants of the day.

In connection with amalgamation, the practice at

*Read at Trans. Am. Min. Congress, Lead City, S. D., and to be read at Oct. meeting Am. Inst. Min. Eng., New York City.

the Homestake conforms, as far as conditions will permit, to the theory that the maximum results are obtained when the temperature of the water used in the batteries is low enough to exert the minimum influence on the minerals of the ore, and it is contended that the plate yield proves the correctness of this theory.

It would be interesting to investigate the question of amalgamation and finer crushing in other gold-producing sections, particularly in South Africa, where the yield from this source is reported to be from 55% to 60%, as compared with 70% to 75% at the Homestake. Perhaps finer crushing would not only greatly increase their amalgam yield, but also reduce the values lost in their cyanide residues. This seems the more likely for that country, because their slimes have been proved to have value sufficient for secondary treatment, whereas this has not yet been proved at the Homestake, where the advisability of sliming such a large proportion of the ore has been a debatable point, because the slimes here contain only 85 cents to $1.10 in value per ton. But of this more will be said later.

The cost of milling in the 200-stamp mills at Lead is, approximately, 40 cents per ton.

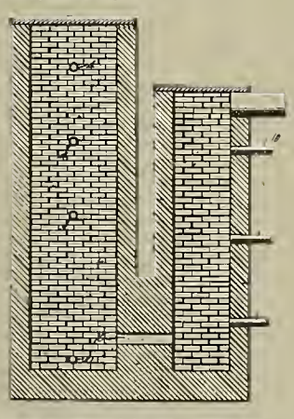
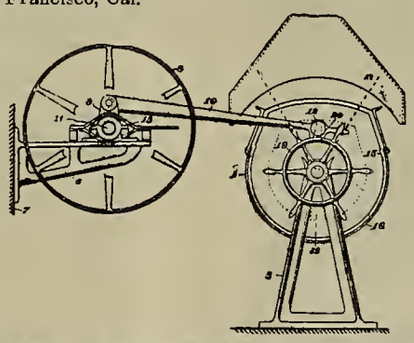
Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 22, 1903.



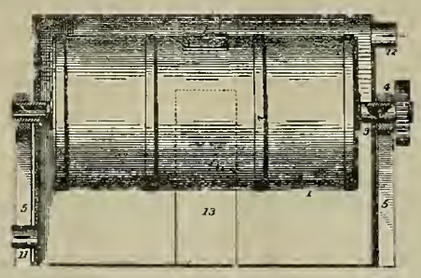
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

GOLD SEPARATOR.—No. 739,231; W. Snee, West Elizabeth, Pa.



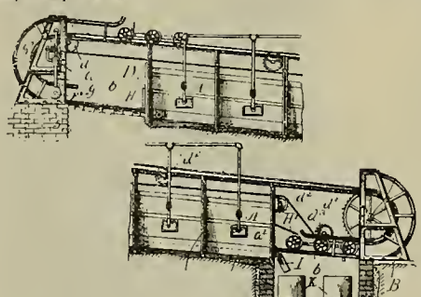
In pneumatic separator, combination of casing having closed hopper shaped upper portion and reduced lower body portion open at bottom, screen mounted in opening in side walls of hopper shaped portion, feed spout extending into upper portion of casing to point below bottom of screen, and nozzle extending into reduced portion in alinement with feed spout to direct blast of air against powdered ore entering through spout.

BLAST FURNACE.—No. 739,281; M. Blanchard and C. D. Williams, Dillard, Or.



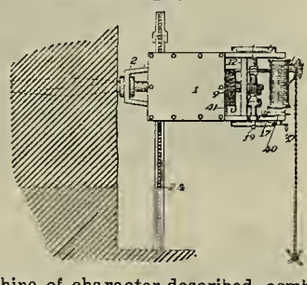
An apparatus comprising a primary furnace and secondary furnace, flue connecting lower portions of furnaces and constituting slag pit, tap pipes communicating with slag pit, tuyeres arranged at intervals in height of primary furnace, blast pipe communicating with upper portion of primary furnace, and escape pipe communicating with upper portion of secondary furnace.

MELTING FURNACE.—No. 739,340; J. B. Orbison, San Francisco, Cal.



A melting furnace mounted on trunnions, means to oscillate said furnace, and a longitudinally disposed barrier or dam at the bottom of the furnace, to cause mixing of alloys as the furnace is oscillated. Melting furnace mounted on trunnions, having longitudinally disposed barrier at bottom of furnace, in combination with rotatory gear and crank for operating furnace, crank pin connected with furnace, and pitman provided with hook for detachably connecting rotatory crank with crank pin, whereby furnace is mechanically oscillated.

PROCESS OF TREATING REFRACTORY COMPLEX ORES OF GOLD AND SILVER.—No. 739,374; C. E. Baker and A. W. Burwell, Cleveland, Ohio.

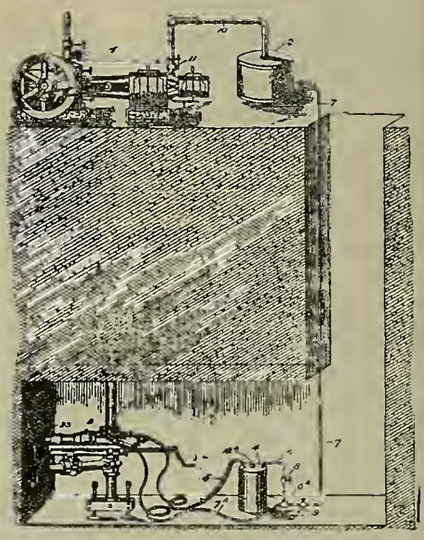


Process of treating ores of gold and silver containing base metal or metals and metalloid, which consists of combining metalloid with chlorine, vaporizing and separating metalloid chloride from base metals in ore.

ORE ROASTING FURNACE.—No. 739,485; C. A. Fontaine, Iola, Kans.

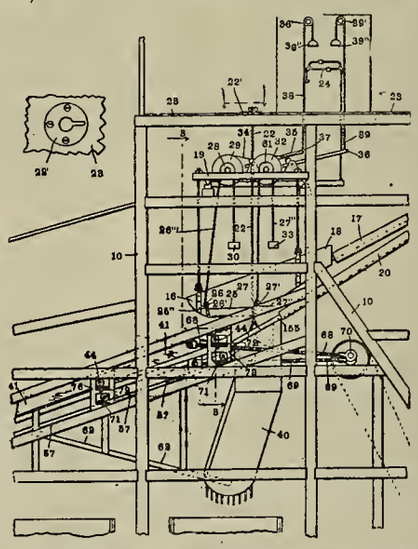
The combination with ore roasting furnace, of inclined guiding rails extending therethrough, and gravity rake car adapted to be propelled through furnace by gravity, and provided with stirring devices.

COAL MINING MACHINE.—No. 739,335; G. Muschweck and J. Tudas, Carnegie, Pa.



In machine of character described, combination of frame mounted on suitable truck, boring shaft rotatably mounted in frame and carrying series of adjustable cutters, shaft mounted in frame having at one end a toothed wheel adapted to engage some fixed surface for purpose of moving machine when shaft is revolved, other end of shaft having sprocket connected therewith through ratchet and pawl, chain adapted to be passed over sprocket, one end of same being anchored, thereby to retard movement of machine, motor mounted in frame and suitably geared to boring shaft, shaft for moving entire machine laterally and axle of truck.

SCORIFIER TONGS.—No. 739,419; J. M. Hyde, San Francisco, Cal.



Tongs comprising two limbs moving toward and from each other in determined plane, and furnished with holders on limbs, each extending from plane of movement of its limb to engage vessel, holder on one of limbs being furnished with opening through which material may be poured from vessel held by tongs.

ROCK DRILLING SYSTEM.—No. 739,551; J. G. Leyner, Denver, Colo.

In rock drilling system, combination with operative air compressor, air receiver or reservoir, air supply system and rock cutting drill bit, compressed air actuated rock drilling engine, operatively connected to compressed air supply pipe system, and containing water passage to cutting point of rock cutting drill bit, water passage being arranged to communicate with compressed air passages through rock drilling engine, portable water supply tank provided with a supply of water connected by flexible tube or hose to water passage through rock drilling engine, and provided with flexible tube or hose connection with compressed air supply system, and water inlet to tank, whereby compressed air actuates rock drilling engine, and forces water from tank through rock drilling engine, and air and water is commingled together and discharged from drill bit into bottom of hole being drilled.

MINE TIPPLE.—No. 739,341; G. W. Parker, Terre Haute, Ind.

Mine tipple, with retaining hopper and means for discharging material into hopper, of separating screens, mine run chute, bottom for hopper, and means for swinging bottom to discharge either upon screens or into mine run chute.

EXTRACTION OF PRECIOUS METALS FROM THEIR ORES.—No. 738,758; J. B. de Alzugaray, London, England.

The process of extracting precious metals from ores, consisting in first moistening crushed ore with alkaline solution, afterwards agitating it in solvent solution and blowing through it oxidizing agent of gaseous bromine and its acid and oxyacide compounds dissolved in air, and recovering metals from solvent.

Drift Timbering.

Written for the MINING AND SCIENTIFIC PRESS.

The requirements of drift timbering vary to a greater or less extent with the character of the ground to be timbered. Heavy ground, as well as that which swells upon exposure to the atmosphere, requires the most substantial kind of timbering, and experience has demonstrated that in many instances the heaviest timbers employed in such places are insufficient to sustain the pressure for long periods—several months—without reinforcement or renewal.

There is a material difference between ground which is simply heavy, dead weight and that which is known as swelling ground. The former is of somewhat local occurrence, and particularly in the case of drift timbering, for as the ground undercut in drifting has a tendency to fall, owing to the natural force of gravity, the timbers placed support a greater or less load, and the surrounding mass affords what may be termed lateral or adjacent support, and the timbers are thus relieved of much of the load. In the case of swelling ground, however, it is very different. Here the pressure is not wholly due to gravity, for it may be exerted from either side as well as from the top, and in some instances even from the bottom of the gangway, as in many drift mines, and also in quartz mines. In each case swelling ground must be timbered as the requirements demand. It is not infrequently the case that in slate a drift may show little or no evidence of swelling at the time the excavation is made, but in a few weeks this pressure, due wholly to swelling of the rocks, is very much in evidence, and reinforcement or renewal of timbers is necessary.

In many places where drifting top weight only has to be provided for, there being little or no tendency on the part of the walls to cave. The accompanying sketches will illustrate some of the principles of drift timbering under the conditions most usually encountered in mining.

Fig. 1 illustrates the framing and placing of a

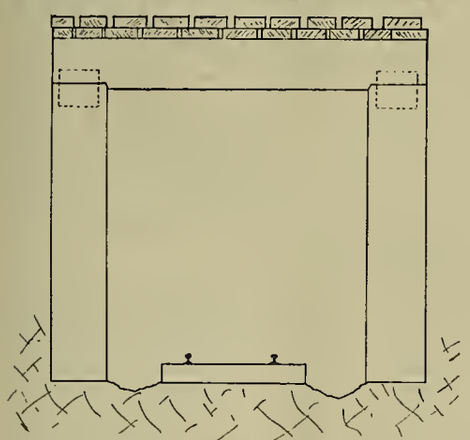


Fig. 1.

drift set of simplest construction, in which top weight only is contemplated. It will be observed that the lagging is driven under no unusual difficulties, no "bridge" being used. In the case of "bad standing" ground, where the back of the drift caves as fast as the cutting is made, it is often absolutely necessary to employ the bridge.

The framing of the timbers shown in Fig. 1 is of the simplest sort. The cap has a shallow "dap" ¾ inch deep—more or less, depending on the size of the timbers—cut in both ends on the under side. The right-angled cut along the inner edge of the dap is beveled, as shown in the cut. The function of this bevel is to reduce the tendency of the cap to split under pressure at the line where the cap rests upon the posts. The posts are also beveled on the upper inner edges to fit the bevels of the cap. The dotted squares indicate the position of the sprags, which extend from set to set, to keep them from "riding." These sprags are placed so as to catch both cap and post.

In Fig. 2 is shown a set intended for conditions somewhat similar to those just described. There are, however, two important differences in these sets. The cap is without framing of any sort, and the full strength of the timber is thus secured. To prevent the incrowding of the posts, a piece of plank of proper length is spiked to the under side of the cap before setting up. This resists any pressure from the sides. Its cost can readily be figured, the price of lumber being known. The posts set upon a sill, as shown. The object of the sill is to sustain the entire set from downward movement, and is used when the floor of the level is soft and offers poor support to the posts, as is often the case in wet ground. It will be noticed that the sill has daps cut at the end, similar to those in the cap shown in Fig. 1. It might be considered good practice to employ a spiked plank on the sill, as beneath the cap. In some instances this might be permissible, but if T rails are to be used for track the spikes would have a tendency to split the planks and thus render the track

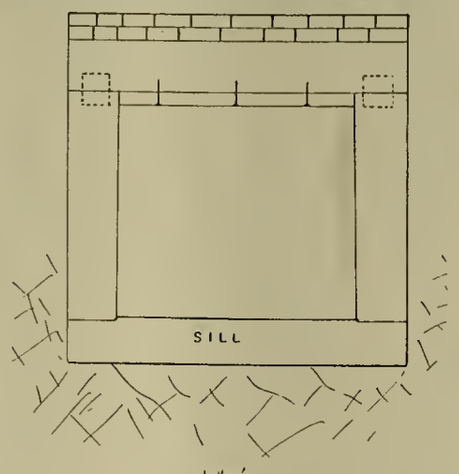

Fig. 2.

insecure. If a track be made of scantling, surfaced with strap iron, the plank may be used.

Concerning the sprags, some timber men cut daps for them in the posts and cap, and others simply secure them with a couple of wire spikes. The method adopted should be determined by the size of timbers necessary and the character of the ground. Where round timbers are used, suitable flat surfaces may be quickly made on the sides of posts and caps for the sprags at the time of framing.

Fig. 3 illustrates the manner in which some inex-

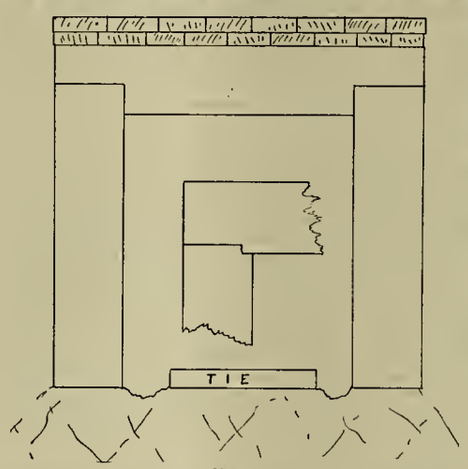

Fig. 3.

perienced miners frame drift sets. It will be noticed that nearly one-half of the strength of the cap is lost by this method, and if the top pressure be heavy the cap will certainly split horizontally along a line flush with the top of the post. The spiked plank is in every way superior to it and more economical in the end.

The small sketch occupying the center of Fig. 3 shows another method of framing the inner corner of post and cap, and is much employed. The tendency of either post or cap to split is checked by the shoulders on both timbers.

Fig. 4 illustrates the placing of a single stull, and

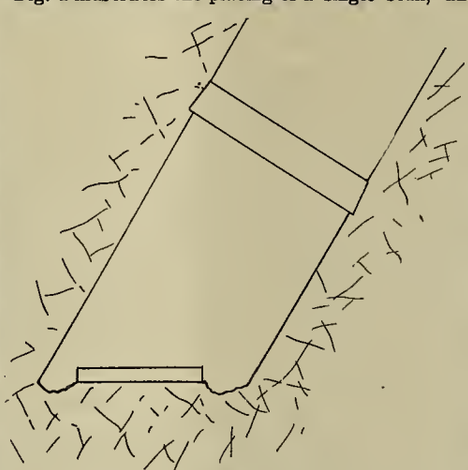

Fig. 4.

may be utilized where both walls are good. It is adapted more particularly to drifts on veins having more or less inclination than to drifts run through country rock. It is sometimes necessary to place a line of stulls in this manner, upon which may be laid poles for stoping above. In some mines stopes are started from raises, leaving a solid block of ore between the drift or gangway and the stope, but this is not always desirable, for financial reasons.

Fig. 5 illustrates another method of placing and

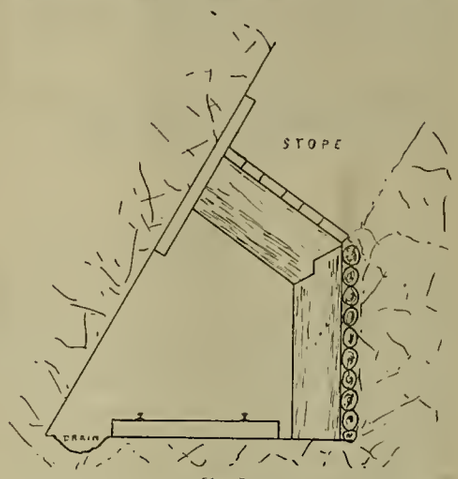

Fig. 5

supporting stulls where the foot wall is too soft to afford permanent support to a line of stulls. This method can be employed in drifts of considerable width. The poles placed behind the post will permanently hold either the soft wall or any filling which may be thrown behind them. It is a method of placing drift sets not commonly seen, but it answers admirably in places suited to the method. This scheme is not advised for swelling ground, as the post could not resist the thrust, and it would be promptly pushed into the drift. It can be made of large timbers and will be found enduring when properly placed in ground suited to it.

The question of drainage is always important, and should be provided for when running all level cuttings in wet mines, whether the quantity of water be great or small. The grade should be sufficient to permit the water to flow freely. It is obvious that a drain which is kept clear of debris admits of a lighter grade than one obstructed by muck, chips and other mine trash. The position of the drain should be determined by the character of the walls. In some cases it is advisable to construct the drain beneath the track, instead of at one or both sides, as is usually done. It is desirable to drain the water from soft walls, and the water drain should be placed as far from such walls as possible.

In Fig. 6 is shown a type of drift set which is, per-

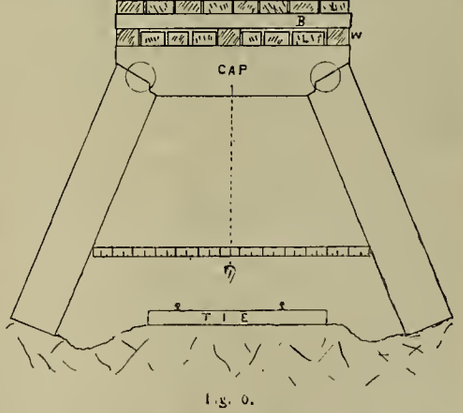

Fig. 6.

haps, in more common use than those above shown, for the reason that in most cases it is found necessary to meet more or less side pressure, as well as that from the top. Sets framed in the manner of Fig. 5 are the only ones which can be made to successfully resist swelling ground—that is, where simple drift sets are employed. In some cases a different form of drift set is used in large veins where the walls are heavy or the ground swells. One of these forms is that known as the square and half set. Where the post is set upright in the center of the drift and a cap reaches from the center post to the adjacent wall, sets of this kind permit of relieving the ground, which is the best way to maintain timbers in position in ground of this character. Fig. 5 illustrates the use of the bridge in driving lagging. This is a very useful method where the ground has a tendency to cave from the back as fast as cut out at the face. The position of the bridge is indicated by B. It is temporarily supported on the wedges W. As the cutting proceeds beyond the set in place, the ends of lagging are inserted between the top of the cap and the bridge and driven forward to the

face, keeping the ends pointed well upward. The upward direction of the lagging may be maintained by inserting a block of wood between the tail end of the lagging and the lagging already in place overhead. As the lagging is driven forward the front ends will gradually work down. It is almost impossible to keep them up, and when they have been driven as far forward as their length will admit the ends should rest on top of the bridge of the next set which has been placed in position to receive them.

Testing Methods in the Physical Examination of Portland Cements.*

NUMBER I.

Written for the MINING AND SCIENTIFIC PRESS by A. H. CEDERBERG.

This article has been prepared, not for the purpose of criticising co-laborers in this so very interesting field, but merely to give the public and the profession the result of methods pursued and observations, as they have appeared to me, in the 6238 tests of Portland cement samples that has been carried on more or less directly under my personal supervision for a period of four years. The domestic brands examined have been as follows: Atlas, Alpha, Dragon, Vulcanite, Lehigh, Medusa, Golden Gate, Standard, Whitehall, American Alsen, Star, A. A., Giant, etc. The foreign brands examined have been Alsen, Hemmoor, Condor, Schifferdecker, Josson and Germania. About 70% of the tests of the domestic brands were of unseasoned cement, and balance of tests of domestic, as well as foreign cements, were of seasoned cement, that is, a cement that has been stored thirty days or longer.

Numerous statements have been made from time to time by "would-be experts" on the West coast that no unseasoned Portland cement can stand boiling tests. If such experts would take the trouble and visit some of the laboratories of the big cement works in Pennsylvania, they would no doubt open their eyes and acknowledge their ignorance on the subject and return a good deal wiser. They would find that the manufactured product is submitted to testing as soon as it has left the pulverizing machines, and so up to date and self-reliant is the manufacturer that he refuses to even put on the market a "non-boiling" unseasoned cement and sell it as a Portland cement.

In the progress report of the special committee on uniform tests of Portland cement, appointed by the American Society of Civil Engineers, and which report is published in this year's January proceedings of the society, the order in which the tests are enumerated is as follows:

1. Specific gravity. 2. Fineness. 3. Normal consistency. 4. Time of setting. 5. Tensile strength. 6. Constancy of volume divided into: a. Normal or cold water test. b. Accelerated or boiling test.

As the last named is the most severe, as well as the quickest and most unerring in detecting any unsoundness in a sample, I prefer in this article to enumerate the tests in the same order as is found on page 154 in "Portland Cement; Its Manufacture, Testing and Use," by D. B. Butler, and which is as follows:

1. Constancy of volume or "test for soundness," as Mr. Butler very pointedly calls it, divided into—(a) cold water test; (b) boiling test. 2. Fineness of grinding. 3. Tensile strength. 4. Time of setting. 5. Specific gravity.

I believe that this order of testing admirably answers in proportion to the various tests relative importance which will henceforth be apparent.

SOUNDNESS TEST—COLD WATER TEST.—This test is the oldest test for soundness used and consists in making pats (neat cement and water + 65° @ + 75° F. in proper proportions), about 3″ @ 3½″ square and ½″ thick, with slightly beveled edges on a piece of glass 4″ x 4″. As soon as the pat is set hard it is immersed in water (+ 65° @ + 75° F.) for a limited period. The old rule was that if at the end of seven days the pat showed no signs of cracking or warping, or alteration from its original form, the cement from which the pat was made was pronounced sound. This test is nowadays applied to both natural and Portland cements, but it is in many laboratories dispensed with entirely, as being too slow to conclusively prove the good or bad qualities of the cement to be tested. Very often it has been found to be unreliable, inasmuch as pats of same cement, while showing sound qualities on, say, thirty days immersion, would at longer periods of immersion disintegrate. As a rule a cold water test is of benefit to the tester only in case the cement is very bad, and even then this test will not discover the fault unless a comparatively long period has elapsed. Of the domestic brands tested by me I have generally made one cold water test to every twenty-four of the boiling test.

BOILING TEST.—The test I have used has been the Michaelis boiling test, which in brief is as follows: On a 4″ x 4″ glass a pat of neat cement is made, about 3″ in diameter and tapering from ½″ or ¼″ in thickness in center to writing-paper thickness at the edge or periphery. The pat is generally allowed to remain under a damp cloth until it has obtained its final setting, when it is removed to a copper tank or suitable chamber containing two compartments, one upper and one lower. The lower compartment is partly filled with water in which a temperature of + 212° F. is maintained. The upper compartment is separated from the lower by means of wire netting in the form of a basket, and steam from the boiling water in the lower compartment is allowed to rise through this wire basket into the upper compartment, thus allowing a continuous testing operation. The cement pat, having obtained its final setting, can be immersed in either compartment first, as I have failed to notice any difference in the behavior of the pats, whether boiled and steamed or steamed and boiled. The general practice is to steam the pats first and boil them afterwards. They remain in either compartment generally five hours each, although some manufacturers keep the pats in for ten hours in each compartment before "letting them go." If after the end of ten hours or more of boiling and steaming the pat shows no sign of blowing, warping, cracking or alteration from its original form the cement from which the pat was made is pronounced sound.

As above stated, the pats are allowed to set hard, that is obtain final set, before being put into the boiling tank, and while for the sake of fair uniformity, this is but proper, I will state, however, that on numerous occasions I have, in order to save time, allowed the pats to obtain only initial set before being subjected to steam or boiling water, and without having noticed any difference in the behavior of the pat that was allowed to set hard. These tests have been with unseasoned cement with the exception of two, in which the cement was about eight months old and of foreign brand. If a cement is in any way unsound it will soon be discovered in this + 212° F. test, and from three to five hours is generally sufficient to develop even a very slight discrepancy. In a number of tests made of a domestic brand recently put on the market even thirty minutes boiling in + 180° F. water broke up the pat entirely, while seven days immersion in cold water had only succeeded in loosening the pat from the glass, and first after thirty-three days immersion did cracks commence to appear in the cold water pat. In conjunction with this I will state that whenever the boiling test was satisfactory no cold water pat showed any sign of alteration from original form even after having been observed for over sixteen months.

Great stress is laid upon the assertion that the pat should stick to the glass. While a pat in a perfect cement generally sticks hard, the fact that the pat loosens from the glass is no cause for worry. A perfect cement loosens from the glass only when not being put on properly by the tester. Too much air, more or less locally and mechanically compressed during the pressing of the cement dough against the glass, will naturally expand when subjected to heat, and being unable to force its way through the hard set cement, chooses the easier way of just lifting the pat bodily from the glass. If a pat loosened from the glass shows alteration in any form from the original then there is cause for worry. A small straight edge set against the bottom side of the pat will soon discover if the pat has warped or blown. If on the other hand the glass upon which the pat was laid did not have a perfect level, then the straight edge is less reliable, and another "trick" can be resorted to. Try and break off small pieces from the thin edges of the pat. If the sound produced by the cracking is sharp it is a good sign; if the sound is dull the cement is suspicious. Cracks as they appear in pats are either hair fine or very large, or both, and in each instance the cement is not safe in its present condition. The defects, such as described, which come to light by this excellent test are the result of the following causes, either singly or collectively:

First—Incorrect analyses of raw materials, resulting in incorrectly proportioned raw mixtures, i. e., overlimed and undersilicised, underlimed and oversilicised. This is the analytical chemist's fault entirely and should never be tolerated. The operation in the analyzing of raw materials is so concise and clear that only carelessness or ignorance can err against same. The resultant cement from such mixture is and will always be unreliable.

Second—Incorrect proportions of raw materials that have been properly analyzed. The fault is then purely mechanical and it is up to the man in charge of automatic scales or platform scales to give an account of himself. A chemist can easily check these mixtures by resorting to the so-called calcimeter test, which here is accurate enough for all practical purposes.

Third—Too coarse grinding of an otherwise perfect raw material mixture. The fault is due to overfeeding of the pulverizing machines, and hence is purely mechanical. Can easily be overcome if the fineness of the raw material was checked regularly during the operation of the plant.

Fourth—Underburned clinkers. The cause for this is, providing conditions in cases Nos. 1, 2 and 3 are complied with, carelessness on the part of the burner and should never be allowed. Underburned clinkers cause the falling down of Portland cement on the boiling test more often than any other defect.

Fifth—An overdose of plaster of paris or gypsum, due to carelessness entirely.

Sixth—Too coarse ground clinkers, thus preventing necessary chemical changes during the setting of the cement. Due to overfeeding or pulverizing machines.

The question may arise, What is to be done with a cement that refuses to stand the boiling test? My answer is, "Throw it out," or store it away and sell it for what it is. Don't call it Portland cement. If a cement is overlimed the chances are that seasoning—for which, however, no time limit can be set—will prove an effective cure in connection with extreme fine grinding. If, however, even finest of grinding, say 98% through a 100 mesh, would not in conjunction with due seasoning, say two or three months, accomplish the desired result, such cement is more or less unsound and should be sold as such.

Taking all in all, this boiling test, simple and effective as it is, may justly be called the forerunner of all other tests, and if this test shows a defective cement, a good deal of time, labor and money can be saved in as much as to the engineer or contractor, all other tests are and should be of no value, consequently useless.

Again I state that never in any of the 6238 tests have I record of an instance where a boiling test, if satisfactory, did not act as a safe guarantee for a sound cement, and of all the tests not conducted by me, but which have been brought to my notice, I know of only two instances when a guaranteed perfect boiling test resulted in disintegrated briquettes after several months. One of these two I traced and found as follows: The cement sample of which the tests were made was a "laboratory product." In the pat for boiling test no plaster paris was used, while the cement in the briquettes showed an overdose of Ca So_4. Hence the cause here was plain enough. In the other instance I was never allowed to get at the truth. I was only showed the disintegrated briquettes, but not the boiled pat, which, I was told, was perfect. A brand recently put on the market was tested under my direction on boiling and fell to pieces entirely. First four and a half months later did the same cement show any inclination to stand up on the boiling test, and only after thorough sieving. In the meantime some cement of the same shipment had been used in two engineering works, and in one of them, where the thickness of the concrete was about 12″, it resulted in complete disintegration, whereas in the other, where it was put in a heavy foundation wall, there is at this date no outward sign of cracking. This cement, although very fine, was heavily overlimed. Another brand also recently put on the market has shown the same troublesome symyptoms.

FINENESS OF GRINDING TEST.—While this test may be readily omitted if the sample stands up well on the boiling test, it is nevertheless of great interest to the experienced tester or engineer, and will often serve as a guide in estimating the value of the "cementing properties" of the sample submitted. The testing method in itself is very simple and consists in sieving a portion of the cement in a rather easy fashion through a 100 or 200 mesh sieve, with wire gauges of 0.0045 and 0.0024 respectively. Care should be taken that only dried cement is used, and in case of well seasoned cements (over three months old) the test sample should be evaporated before tested. The present commercial standard for fineness of Portland cement varies in various countries, with a slightly higher percentage in favor of the United States. Here the fineness of all first-class Portland cements are from 90% to 96% through a 100-mesh sieve and 74% to 86% through a 200-mesh sieve. If a cement not previously submitted to boiling test is ground finer than the maximum figures above quoted, one has in many cases reason to be a little suspicious, because no cement manufacturer, who has dollars and cents at heart, can deny the truth that the cost of increasing the fineness above 96% and 86% is so excessive that profits are materially reduced, and consequently there must be some reason for such excessive fine grinding (see causes for non-boiling cement). Any Portland cement that in its fineness corresponds to the figures above quoted is more than fine for all practical purposes. On the other hand, if a sample registers 98% on 100 mesh and at the same time stands up satisfactory on the boiling test, such cement is naturally of a superior quality, and which will generally display itself in an increased tensile strength on the sand test. Portland cements registering below 90% fineness on 100 mesh are also satisfactory for all ordinary purposes, and ten years ago even 88% fine was considered an unusually fine cement. The great number of cement plants, however, that have recently been erected all over the country, have created a spirited rivalry in the production of a higher grade of product, which chemically consisted in an increased percentage of lime and resulting physically in a necessitated increase of fineness. While these changes are not only satisfactory, but beneficial as well, and especially so to the engineer, the fact remains that we are getting closer to the danger limit (i. e., the maximum proportion of lime that a sound

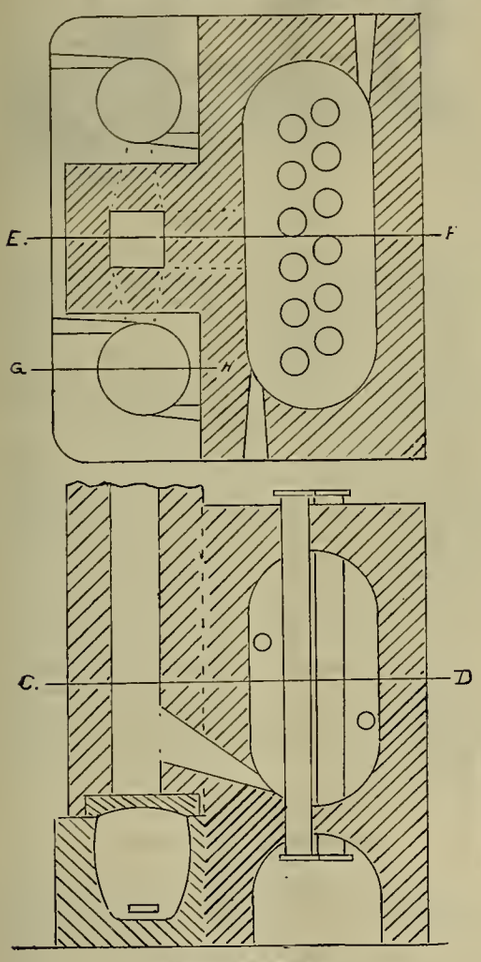
*Copyrighted.

cement can carry), than ever before, and in conjunction with this I may state that only in such plants where the most detailed care is observed in the manufacture of Portland cement, can gratifying results he obtained. From the above we find that extreme fine grinding (above 96% or 86%) is generally the result of two different causes:

First—A new manufacturer's desire to put on the market a superior product.

Second—A manufacturer's desire to shield as much as possible an overlimed or underburned product.

The first cause is very quickly abandoned owing to its being too expensive.



The second cause is a matter of necessity in order to save a product which is only the result of gross carelessness on the part of the heads in charge of the plant. The boiling test will soon set all doubts at rest on that score, hence its value.

(TO BE CONTINUED.)

Some Notes on the Use of Fuel Oil.

Written for the MINING AND SCIENTIFIC PRESS by SIDNEY ORVILLE BROWN.

Having had my attention called to an article, written by Mr. A. D. Barnhardt, of Prescott, A. T., in the MINING AND SCIENTIFIC PRESS of May 30, 1903, the writer has thought that some further observations along those lines might be of public interest. In the year 1888 the writer built, in Los Angeles, a circular crucible furnace, and applied an oil burner in

Oil Fuel Melting Furnace.

the reverse manner from that shown in Mr. Barnhardt's illustration; and in 1901 built, in Philadelphia, a combination furnace of much larger size, and wherein were incorporated some novel features. As shown in the drawings herewith, there were three furnaces leading into one stack, the larger one, "A," being for the production of nitrogen. But the purpose of the others it is not necessary to disclose. The furnace, "A," had a double row of thin wrought tubing, connected together, and having the capacity to hold 3000 pounds of cast-iron borings. It was ellipsoidal in shape, both vertically and horizontally, and the flue led out from the bottom, as it should always do, in oil furnaces, if due regard be had for economy in fuel. The burner, "a," was placed one-third, and the burner, "b," two-thirds of the distance up from the bottom; and it was remarkable how little fuel was required to maintain a most uniform and adequate degree of temperature. In twenty minutes from the time of firing up, the cast-iron could be melted—as was once actually done, owing to the inexperience of the attendant.

The other furnaces were circular in plan, and conoidal through their vertical sections. In furnace "B" was used the largest sized graphite crucible, capable of holding 1000 pounds of steel; and this was subjected to a very high degree of heat. One burner was placed 4 inches below and the other 8 inches above the center of the crucible; and the swirl of flame, which completely enveloped the crucible, heated it very uniformly throughout. In the construction of such furnaces, the avoidance of all angles is a matter of first importance. The melting furnaces, wherein the flames are made to impinge directly against the crucibles, are about as crude and irrational contrivances for the application of heat as could well be devised. Mr. Barnhardt's sketch suggests the remark that the burners should always be placed so that the flame may be deflected to the right. Under boilers, of the return-tubular type, at least three burners should be placed—concentrically to the boiler—instead of one; and if the owners would do this, they would find the life of the boilers to be materially lengthened.

In the locomotive firebox it is, of course, highly important to obtain the most diffusive flame. Desiring to accomplish this in a chemical apparatus of similar shape to a firebox, the writer arranged a burner at the four lower corners, and the flames were directed nearly to a common center, with the result that a perfect uniformity of heat was secured. Dependent upon the relative proportions of the firebox, the front burners should be placed at an angle of about 50°, and the rear burners at an angle of about 30°, or in such a way as to fix the common center of impact, at a point about three-fifths of the distance from the fire door to the tube sheet. If the burners be deflected slightly to the left of the lines of a common center, a swirl of flame will be induced and there will be no greater necessity for lining the firebox than if solid fuel were used.

Copper Production in 1902.

The recently issued bulletin of the United States Geological Survey on the production of copper in 1902, by C. Kirchhoff, shows that the manipulation of the market resulted to the disadvantage of the producers. The copper interests are too widely dissociated to make it possible to maintain copper at an artificially high price for any considerable period. The production during 1902 was heavier than in 1901, but the end of the year 1901 found many producers with contracts for large amounts of metal at low prices, the delivery of which covered a long period of time. During the greater part of 1902 most of the larger producers were in full operation and a number of new enterprises which had been a year or more in the preparatory stage entered the producing list. It is estimated that the production during 1903 will exceed that of 1902, unless stoppages due to labor troubles and other causes interfere. An increased production is anticipated from nearly all producing sections. The total production of copper in the United States during 1902 is stated to have been 294,423 long tons, of which the Lake Superior region furnished 25.9%, Montana 43.8% and Arizona 18.2%. It is estimated that during 1902 there were consumed in the United States 551,688,131 pounds of refined copper. The marked fluctuations of the market are largely due to the fact that the marketing of the metal is not under control. When prices are low large producers hoard their copper and accumulate large stocks, and when prices go up they unload great amounts of the metal, the rush to realize usually resulting in breaking down the price, which generally checks the sales. Small producers are in the market all the time, endeavoring to convert copper into cash as rapidly as it is produced, and in the aggregate the small producers are no small factor in the market. Owing to this unorganized manner of marketing copper, prices fluctuated during 1902 from 12 cents early in January to as low as 10⅞ cents later for Lake, and a still lower price for electrolytic. After a period of heavy buying prices were stimulated under it and rose to 13 cents, which resulted in large offerings, and this immediately checked the rising market and even depreciated it to 12 cents. During the latter part of the year prices ranged between 11 and 12 cents. The present year has seen an improvement on these prices, but the same influences are still at work, and there can be no hope that copper will ever have even an approximately fixed price so long as all the large producers act independently. Numerous attempts have been made at various times in the past to control the copper market, but no syndicate has yet been organized that has been sufficiently strong financially to accomplish this. Any attempt to secure this control must prove abortive that has not sufficient capital back of it to practically own all the great copper mines of the world. When the enormous value placed upon the copper mines of the United States alone is taken as a basis of estimate, the magnitude of a controlling power may be conceived from the following figures. All of North America produced 355,280 long tons of copper in 1902 (of which the United States produced 294,423 tons). All of Europe produced 88,407 tons, South America 39,020 tons, Africa 4450 tons, Asia 29,775 tons, Australasia 27,934 tons, a total of 544,866 tons. Of this total amount the United States produced about 54%.

Ore Deposits of the Northern Black Hills.*

NUMBER IV.—CONCLUDED.

Written by J. D. IRVING.

PRODUCTIVE AREAS.—The productive areas of refractory siliceous ore are five in number and have been severally designated Bald Mountain area, Yellow Creek area, Lead City area, Garden City area, and Squaw Creek area. The last-named area was at the time of survey little more than a prospect, but has since become an important producer. The Bald Mountain area is the most extensive and important. It is a northwest-southeast belt of about 1 mile in width and 4½ miles in length, and the width is limited by the annular exposure of Cambrian rocks that surrounds the Algonkian nucleus of the region. The ore-bearing strata dip to the southeast and pass beneath the Silurian and Carboniferous limestone, while they have been eroded from the Algonkian hills to the northeast, with one or two exceptions. Hence, on the north the ore bodies are exposed at the surface, but to the south shafts are necessary to reach them. At the southeast end this area is cut off from the Yellow Creek area by Whitewood creek. At the northern end the Cambrian rocks are present in nearly their full thickness. With relation to the ore bodies, the area may be divided into two portions, the Ruby Basin district and the Portland district. In the former the shoots are larger on the lower ore-bearing beds, in the latter larger in the upper.

The Garden City area is situated at the head of Blacktail and Sheeptail gulches and an east tributary of False Bottom creek. It is located on the northern—as the Bald Mountain area is on the southern—rim of the Cambrian outcrop. The beds dip to the northeast and the shoots so far mined have been on the lower contact. A rhyolite cap of great thickness and extent covers the country to the north and the Cambrian beds pass beneath it. The average trend of the ore bodies here is about north 55° east, much more nearly east and west than in any of the other areas.

The Lead City area is located on one of the Cambrian outliers that caps the hill south of Deadwood, and the ore bodies extend over the gold lode of the Homestake mine. A heavy sill of fine-grained rhyolite lies above the Cambrian on the tops of the hills. The ore bodies are exposed at the surface on the westernmost edge of this area, but lie beneath the shales in an easterly direction. The ore from this district was richer than that elsewhere mined and contained great quantities of barite, wolframite, and in several instances large amounts of free gold. The Hidden Fortune mine is an instance of this kind.

The Yellow Creek area is situated a little more than 2 miles, slightly east of south, from the city of Lead. The ore shoots are in a thin capping of Cambrian strata on the divide between Whitewood creek on the west and Yellow creek on the east. The shoots lie on the basal quartzite about 15 to 26 feet above the Algonkian. Much wolframite and barite are also found in the ore from this area.

The Squaw Creek area lies near the mouth of Squaw creek. Workings have been run upon some ore bearing beds which pass rapidly beneath the Carboniferous limestones that cover the country to the north. The horizon is just beneath the scolithus of "worm-eaten" sandstone. Ore bodies of considerable size have recently been opened here and the district has become a productive one.

VALUE OF THE ORES.—The gold contents of the ores in the Bald Mountain area run from $3 to $4 per ton to, in rare instances, $100. The general average for the ores in this district is about $17, and those containing from $10 to $20 are of the most common occurrence. Ore carrying $35 per ton is considened high grade. Some of the ore mined from the Ben Hur mine yielded upwards of $60 per ton in gold. As compared with the ores of the lower beds, those from the upper contact are slightly lower in grade, so that much of the ore is often left in the mines. They have also been reported to carry a higher relative proportion of silver, but, although this is true in individual instances, in general silver ores are as frequent in the lower as in the upper beds.

The three smaller areas of siliceous ore—Yellow Creek, Lead City and Garden City—lying over or to the west of the Homestake ore body or its continuation, produce ores of uniformly higher grade than those from the Bald Mountain country. The mineralization is probably later than the igneous activity, for the verticals which supplied the ores often cut all varieties of eruptive rocks.

As igneous rocks cut strata of the Fort Benton Cretaceous and pebbles of the same rock have been found in the basal conglomerates of the Neocene, it would seem, then, that the mineralization occurred somewhere between the Fort Benton and the Neocene, and it probably represents the final phase of vulcanism that was concomitant with the elevation of the Black Hills. This occurred while the Cambrian was still deeply buried beneath its covering of later formation.

ORIGIN OF THE ORES.—The refractory siliceous ores have been formed by a process which involved the

*Trans. Am. Min. Congress, Deadwood, S.D.; (Condensed.)

gradual removal of the original rock substances and the simultaneous substitution of the ore minerals. This is commonly known as replacement or metasomatic alteration, and has often proceeded with so little disturbance of the original rock material that both stratigraphic character and microscopic structure are preserved in the ore, although the original rock was carbonate and the ore is chiefly silica. The mineral which has been altered to form ore seems to have been exclusively dolomite, for where verticals pass through rocks of varying decomposition it is found that dolomite also has been appreciably affected. The ore minerals substituted are chiefly silica and pyrite, with which there are minute amounts of gold and silver. Smaller quantities of fluorite, barite, gypsum and several other accessory minerals are also of frequent occurrence. To the dolomite, whether present as comparatively pure beds or as cementing material of sandy and shaly rocks, the ore minerals have been transported by circulating waters. Such waters have found in the fractures trunk channels, by means of which they have been enabled to penetrate the encompassing and comparatively insoluble rocks and reach the more readily replaced material. The mass of evidence seems to show that these waters have ascended.

LEAD-SILVER ORES OF GALENA AND VICINITY.—The ores belonging to the fourth division of Cambrian ore deposits are similar in form and mode of occurrence to the refractory siliceous ores. They occur in the vicinity of the town of Galena.

At one time these ores filled an important place in the mineral production of the Black Hills. About twenty years ago a smelter was in operation and several mines were producing quite heavily, the Richmond or Sitting Bull mine especially having figured quite prominently in the silver production. After a brief period of activity, however, operations were rather abruptly discontinued and the district was idle until 1886, when operations were resumed, although upon a somewhat smaller scale. Work is now being conducted in a rather desultory manner. Mines that produced this character of ore are situated in and about the town of Galena. Most, if not all, of the ore bodies are in strata of Cambrian age. Some of the principal producing mines are the Richmond, Florence, Hester A, Coletta, Merritt No. 2, Cora, Carpenter, Alexander, Romeo and El Refugio.

The ore is of a more basic character than that found in the more westerly ore deposits, heretofore described. When unoxidized it consists chiefly of pyrite, which is either massive or disseminated more or less thickly through the body of the country rock. With the pyrite is associated argentiferous galena, and not infrequently small quantities of sphalerite. In many cases the galena occurs in seams in the pyrite, or as druses of minute crystals lining the interior of cavities. In all cases where they had not been oxidized those two minerals have been found associated in this manner. The galena is, therefore, of later origin than the pyrite. Occasionally the latter carries low values in gold, but these are unimportant. The values that render the mines workable are contained in the argentiferous galena. In most cases there is but little silica associated with the ores, but in the Florence and Richmond very considerable amounts of secondary silica are found in intimate association with the deposits.

ORES IN CARBONIFEROUS ROCKS.—In the heavy, gray limestones of the Carboniferous are found two distinct varieties of ore:

1. Gold and silver ores of a refractory siliceous type.
2. Lead-silver ores.

In general, the Carboniferous rocks have not figured largely in the mineral production of the region.

The refractory siliceous ores are in bodies of comparatively small size and are of less importance than those which occur in other formations. Two districts have been important as producers, the Ragged Top district and the Carbonate district.

The Ragged Top district comprises the country which lies to the northwest of the large mountain of phonolite known as Ragged Top. There is here a series of seven nearly equally spaced vertical fissures or veins, which have been termed the Ragged Top verticals. These are fractures or crevices in the heavy, massive limestone, which show at the surface a maximum width of about 10 feet. From this they range, as they pass downward, to extremely minute crevices. In the lower portions, where the surface alteration has not been extensive, the ore can be observed to pass laterally into the limestone walls without disturbance of the structure of the latter rock. It is of a light, uniform buff tint, which is so nearly the color of the surrounding limestone that it is difficult to distinguish it from the mineralized rock. It differs in its superior hardness and slight yellow color. Much of the ore is composed of angular brecciated fragments of what was once limestone, but now is completely altered to silica. Traces of tellurium have been detected in these ores. At some points in the limestone area about Ragged Top mountain flat, blanket-like beds of ore are found. These are either without distinct connection with the verticals or seem to have spread out from them. Some of the ore from these verticals was quite rich, and in general it carries higher values than the siliceous ores found in the Cambrian rocks.

The Carboniferous siliceous ores have not at any time been very heavy producers, but have yielded small amounts of ore for some years. The cyanide process has been used in their treatment with much success.

LEAD-SILVER ORES.—Lead-silver ores were in the earlier days of mining in the Black Hills a very important factor in the production of precious metals. They were found in the vicinity of the town of Carbonate. In 1886 this was a flourishing camp and produced considerable silver and lead. The product was almost exclusively that of the Iron Hill mine, but other mines in the neighborhood added a little to the total.†

The country rock that carries the ore is the gray Carboniferous limestone, in which sills, dikes and irregular masses of porphyry have been intruded. The ore bodies are of two kinds—large, irregular bodies of lead carbonate, which pass in places into more or less unaltered galena, and generally in close contact with porphyry masses, and partially filled crevices, which resemble in a general way the verticals of Ragged Top.

The first type of deposit is that which has formed the chief source of silver in the district, and this, as shown above, was largely obtained from the Iron Hill mine. In this mine the ore was a large mass of argentiferous lead carbonate, which extended down for 300 feet on the east side of a thick dike of fine-grained white porphyry. Much galena, also, was found, together with the carbonates, and after the ore was worked out a seam or vertical was detected extending downward from the main mass. Other pockets of ore were also found at different points, and in one place a pocket of vanadinite containing some four or five tons was encountered. Mr. Fowler reports the occurrence of the following minerals: Galena, cerrusite, cerargyrite, matlockite, wulfenite, pyromorphite, plattnerite, atacamite and vanadinite. This type of ore resembles in its general character and in its association with porphyry bodies the deposits described by S. F. Emmons from Leadville, Colo. Too little is known, however, regarding the details of the ore occurrence to afford any more definite idea of the manner in which it originated than the simple fact that it is probably a replacement of the limestone.

Of the second type of occurrence the most important case is that at the Seabury mine. This consisted of an irregular crevice striking south 85° west and running through the Seabury, Iron Hill, Segregated Iron Hill and Adelphi mines, with a possible continuation in the Spanish R, a mine in which some ore was obtained, but at too great a distance for its relation to the others to be clearly made out. This crevice varies from 1 to 20 feet in width. The sides consist of a ferruginous, jasperoid material, which replaces the limestone, often for 2 or 3 feet from the crevice, and contains at times galena, lead carbonate and horn silver in sufficient amount to be profitably worked. The latter mineral most frequently occurs as a thin film covering druses of fine quartz crystals which form linings to cavities.

The center of the crevices was loosely filled by a soft, ferruginous, gouge-like matter of a pinkish red color and containing gold. A large quantity of this ore is reported to have been mined from the Seabury, and also from the west side of the porphyry dike, in the Iron Hill.

Since 1891 there seems to have been but little work done in this district, no output being recorded for that period. Within the last year, however, a small (35-ton) cyanide plant has been erected to treat the tailings from the old smelter.

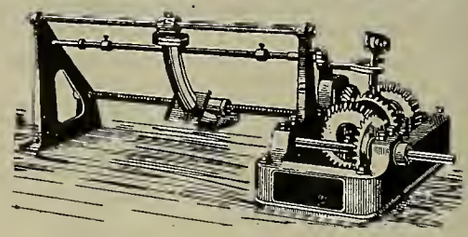
In concluding this brief review of the ore deposits of the northern Black Hills—a subject which it is difficult to treat satisfactorily in the space allowed—one seems warranted in dwelling a little on the future prospects of the region.

Mining communities are, from the limited nature of the deposits upon which their activity is based, generally short lived. That this is true one needs only to glance at the history of many Western mining camps. A few, it is true, have, like Leadville, been productive for many years, and will probably continue to be so in the future, but there are few, if any, which, if based wholly upon mineral production, will not in time cease to thrive as their economic resources become exhausted.

If the production of the region be prolonged sufficiently for the community's activities to be directed along other lines, what was once a mining camp may become a permanent settlement. In the Black Hills there are, perhaps, two features which may operate to give to the region a greater permanency than that which is generally seen in communities which are held together by mining interests. The first is the unusual size and the presumably long life of the Homestake belt. The second is the gradual decrease in the cost of treatment of other grades of ore and the consequent opening of the market to material previously known, but hitherto unworkable. The introduction of the cyanide process and the quantities of ore which may be treated by its use have done much to extend the life of Black Hills mining. It is not improbable that these two factors, working together, may so prolong the mineral production of the region that the population may never be less than it is. The other interests which grow side by side with the mining industry may then have become so important, and so little dependent on the mineral wealth of the country, that their existence alone will be sufficient to support the cities which have grown up in this mining country.

†The Sitting Bull mine at Galena also produced considerable lead and silver about 1879-81.

An Automatic Pulp Sampler.*



Written by JAMES HIGHAM.

Following is the description of a machine invented by myself, for the purpose of automatically sampling mill pulp and tailings. The accompanying drawing will convey an idea of the manner in which the device operates.

The sampler crosses transversely to and fro through the pulp stream, the direction of travel not being reversed until the sample pipe has passed out of the stream and clear of the sides of the launder. It can be given any travel up to a width of 30 inches to suit the width of launder.

The pulp is shot into the receiver from the upper launder and flows to the launder under sample pipe. The sample is delivered through the end of the pipe and conveyed to the sample tank.

If no running shaft is available for driving the sampler, it can be driven by a small electric motor, or by a small water wheel placed in the stream of pulp. The power required to run the sampler will

Automatic Pulp Sampler.

compare favorably with machines depending on a water supply for their operations, and particularly in cases where water has to be specially pumped. The speed is as nearly positive as possible and the sampler runs continuously.

In the case of a machine operated by falling weights or water boxes there is always a tendency to speed acceleration (if only slight), while the receiver is crossing through the stream of pulp.

The obtaining of an accurate sample is generally a more difficult matter than determining accurately the value by assay, and for this reason the sampler is kept running continuously. It will be evident that the sample taken running continuously will be large, though more reliable. This may be quartered down, or, if more convenient, a second sampler (smaller) may be introduced to automatically reduce the bulk taken by the first machine.

I have found the size of sample taken by this sampler from 100 stamps to be about 2000 pounds per diem.

The main objection so far raised to this machine is that the sample taken is too large for convenient handling. I have just (July 31st) been able to overcome this by a very simple dividing box that will reduce the bulk of the first sample to any required percentage.

*Journal Chemical, Met. and Mine Society, S. A.

Prices Paid for Silver-Lead Ores.

An interesting comparison is made by the Georgetown, Colo., Courier between the prices paid for silver-lead ore when silver was worth $1.18 per ounce and the quotations of the present time. The table was compiled by Manager J. H. Robeson of the Pelican-Dives mine at Georgetown, and was taken from shipping receipts of the Atlantic mine in the '70s.

It would seem from this statement that the treatment charges and the prices paid per ounce for silver were arbitrary, and that there was no fixed rule in either case. The prices paid for like ores to-day are not only much higher, but the cost of mining is at least 25% less than it was in the '70s. The attention of investors is called to these facts, and to the additional fact that ore that could not be mined twenty-five years ago yields a good profit to-day:

Date.	Ounces Silver Per Ton.	Per Cent Lead.	Price of Silver.	Treatment Charges per Ton.	Net Price Per Ton.	Net Price Per Ton, Sept., 1903 — Silver 57 Cents.
May 4, 1875..	683...40...	$1 19...	$23..	$374 69...	$379 35

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Juneau Record-Miner says the Juallu mines, near Juneau, have closed down temporarily on account of low water. Not only is southeastern Alaska dry, but Rampart, Circle and Forty-mile all report "no water." Miners from the Forty-mile say the river is so low that boats can not be poled up it. Transportation companies report the Yukon is so low that it is feared thousands of tons of freight that are waiting will not go down the river to Dawson before navigation closes.

C. R. Parmele, president of the York-Alaskan Tin Corporation, reports making shipment to New York of their first clean-up of tin. The result of the first two days of sluicing was a ton of clean tin ore. He says the ground in and about York prospects well. There has been little development. His company owns claims 18, 19 and 20 and the entire right fork of Butte creek, but can do little this year except to open up the mines.

ARIZONA.

GRAHAM COUNTY.

The Sierra del Oro Co., having taken over a number of claims in Greenlee district, between the Frisco river and the Clifton Con. Co. property, near Clifton, has begun a tunnel which will cut the first vein in 1000 feet at depth of 600 feet, and the second at 1000. The veins are prospected by open cuts for 6000 feet. The tunnel starts 2200 feet above the river, on which the company owns a patented millsite, to which the ore will be trammed. The tunnel is being run near the center of the claims, so that drifts can be run either way. D. M. Potter is manager and G. Reed of Cripple Creek, Colo., superintendent.

Two additional seven-ton converters have been set up at the smelter of the Arizona C. Co. at Clifton. They occupy the place of the old five-ton converters which were worn out. The A. C. smelter consists of three stands, each being supplied with seven-ton converters, and the output will average sixty-five tons of 90% copper per day, says the Clifton Copper Era.

MOHAVE COUNTY.

The Sorpresa M. Co. has men at work on the Granite Wonder mine, south of Kingman, and is opening up ore. The shaft is being sunk and drifting done. A mill is proposed.

PIMA COUNTY.

Near Arivaca D. Ball is developing the Columbus and Longarino claims. At the Oceanic mine the 3-stamp mill of 1000-pound stamps is running steadily, says Superintendent F. H. Veeder. Twenty-five men are employed. The ore is showing well at a depth of 500 feet.

PINAL COUNTY.

The Troy-Manhattan C. Co.'s smelter at Troy is again in full operation and shipments of copper bullion have been resumed. It was intended not to restart the smelter till the Phœnix & Eastern Railroad reached Riverside, but ore accumulated so fast they found it necessary to begin reduction to make room for the ore coming out of the mines daily in course of development work. A larger plant will be put in when the railroad is finished, says Superintendent T. Kavanaugh.

SANTA CRUZ COUNTY.

At the Old Oro Blanco mine at Oro Blanco men are developing a body of gold ore. At the Tres Amigos mine there are forty-five men working and a 10-stamp mill is being built by the company.

YAVAPAI COUNTY.

In Turkey Creek section, at the foot of the Bradshaw mountains, southeast of Prescott, Manager E. S. Campbell of the Hidden Treasure mine says the foundations are being made for machinery to be set up, including a 10-stamp mill, a hoist with capacity for 1000 feet depth, two 60 H. P. boilers, engine and a thirty-ton cyanide plant. Surveys have been made for a pipe line from a spring 4 miles distant.

The Oro M. Co., at Minnehaha, is putting in machinery, including a fifteen-drill air compressor and a compound engine. More men will be put on and the shaft sunk to depth of 1000 feet.

The International & Onyx Marble Co. of Denver, Colo., and London, England, men, have bought the Big Bug onyx fields, and made payment of $5000 on total of $150,000.

The Monte Cristo mine at Groom creek has been unwatered and more men are being put on. They are down 400 feet and running a crosscut to the ledge.

CALIFORNIA.

AMADOR COUNTY.

(Special Correspondence) — Arrangements were made by Manager John Ross Jr., while in the East a short time since, to resume operations at the Wildman-Maboney mine at Sutter Creek, which has been closed down for several months. It is the intention to explore the Wildman-Mahoney from the 1950-level of the Lincoln mine, which adjoins the Maboney on the north. The 1950-level of the Lincoln is about 600 feet deeper than the lowest level of the Wildman. The vein formation of both the Wildman and Maboney is much broken and disturbed between the 800 and 1400 levels of these mines, and it is thought that this region of disturbance may not have extended to the depth of the contemplated development.

Sutter Creek, Cal., Sept. 29th.

Drifting is in progress on the 2300 and 2400-foot levels of the South Eureka mine, near Sutter Creek. The drift is being driven north and south on the 2300 level and northward only on the 2400 level.

CALAVERAS COUNTY.

At the Royal mine at Hodson Manager Kemp Van Ee has the 120 stamp mill running steadily.

COLUSA COUNTY.

The lease of the Minor Oil Co., in Bear valley, has been absorbed by the Bear Creek Oil Co., with headquarters at Corning. A hole has been drilled 900 feet and is reported to be in oil sand. Drilling has been resumed.

CONTRA COSTA COUNTY.

R., H. & G. Mitchell, who own the Mitchell Con. copper mine at Cananea, Sonora, Mexico, are reported negotiating for the Copper King smelter at Bay Point, and it is said if they do not succeed in acquiring the property from the creditors of the Copper King Co. they will build a smelter on a site already secured near Antioch. The smelter will be operated in connection with the development of a number of Mexican copper mines owned by the Mitchells and their associates. All will be reached by the Kansas City and Orient railroad, being built to Topolobampo on the Gulf of California.

EL DORADO COUNTY.

(Special Correspondence).—The Lucero M. Co. at the Alpine mine, S. Collins foreman, is keeping the water out of the shaft, but no other work is being done at present. Water power is used, and a separate wheel for each drives the hoist, pump and mill. The mill contains a crusher, 5-foot Huntington, amalgamation tables and two concentrating tables. Internal troubles in company affairs is said to be the cause of shutdown.

The Oro Fino M. Co.'s California Jack mine has transferred all its holdings to S. L. Mitchell, of Los Angeles. The mine is idle. They have the main drift in 700 feet, with stopes and crosscuts showing ore. A 10-stamp mill is on the property, equipped with water power. This is the south extension of the Alpine mine.

Scher Bros. have put on a windlass, cleaned out the 80-foot shaft on the O. K. mine, east of Georgetown, and have ores in the bottom of the shaft. They propose to increase development during the winter.

Georgetown, Sept. 30.

Men are at work on the Cash Rock mine on the river below Josephine.——The El Dorado C. M. Co. will increase development work on its gold mines in Georgetown.

Duffy & Vestal of Forest Hill are reported to have leased the Daggett ditch and bonded the Phillips' gravel claim near Josephine. Preparations are being made for the winter's run.

FRESNO COUNTY.

The Esperanza Oil Co., near Coalinga, J. A. Bunting of San Francisco, president, has finished No. 3 well and started on No. 4. Development work will be continued on the Coalinga lease.

The production of Section Seven Oil Co.'s well necessitated the laying of a separate 6-inch line connecting it with the P. C. O. tank at Coalinga, says the Reporter. Thus far the production of the well has been increasing, and has yielded up to 2500 barrels in twenty-four hours. Grading for two 1200-barrel tanks is completed and as soon as they are up No. 2 well will be perforated.

INYO COUNTY.

G. Vornberg of Mt. Spring canyon, near Independence, has his 3-stamp mill, triple discharge, completed and began dropping the stamps this week. The mill is expected to handle eighteen tons per day.

KERN COUNTY.

(Special Correspondence).—The last carload of thirty-two men for the Yellow Aster arrived at Randsburg to-day. They now have about 200 men and have had the 100-stamp mill running since the 23d. They will start the 30-stamp mill this week. They will make their second shipment of bullion October 2d. There has been no violence and no damage done to the property.

Randsburg, Sept. 29.

The Gold Coin mine near Randsburg is in operation.——N. Johnson and P. Jensen have a lease on the Minnehaha mine and have begun work.

The Merced mine, near Randsburg, has been incorporated, and R. L. Owens of Saticoy, Ventura county, is president. The company will sink a shaft to open the Santa Ana lead.

The Baltic mine in Stringer district, near Randsburg, has started work.

The Lackawanna Oil Co. has been organized to operate in the Kern River fields, near Bakersfield, by T. Spellacy, E. E. Jones, J. E. Haworthy and A. H. Liscomb, all of Bakersfield.——The Teck Oil Co. has been incorporated with headquarters in San Francisco by H. & L. Rosenfeld, W. Walker, I. S. Lillich, of San Francisco, and A. H. McKay, of Santa Barbara.

The Bakersfield Californian says the number of new companies entering the Kern county fields within the last month show plans for increased development work. Those companies are the Lackawanna and Veteran, on Kern river; the Transport, at Sunset; the Argentine and the Teck, and several others preparing to incorporate. The amount of development work to be done by the old companies will also be increased.

The Exposed Treasure M. Co. at Mojave is enlarging its milling plant by putting in ten more stamps.

LAKE COUNTY.

Work is reported progressing at the Black Bear quicksilver mine, owned by Brush, Pinschower, Caldwell & Furber of Cloverdale. The Black Bear is 20 miles from Cloverdale, Sonoma county, and 1½ mile from the Culver-Baer quicksilver mines. During the past year they have tunneled in 400 feet and last week struck a ledge 14 feet wide carrying promising quicksilver values.——The Socrates quicksilver mine has bought the property of the Mercury mine and ore is being opened up.

MARIPOSA COUNTY.

L. De Perhacs, of the American Gold Eagle Co., Con., of New York, has bonded several mines in Bull Creek district, east of Coulterville. Besides the claims which they have bought in Bull Creek district, they have a bond on the Ontario, Clawhammer, Minnepah, Two-thirty and Gold Bank, and also a bond on the Democrat and Compromise claims. They also have an option on the Marble Springs and Eubanks patented claims. The claims are all adjacent. Machinery will be put in and development work started. Later, a mill will be built.

The Diana G. M. Co., operating on the North Fork of the Merced river near Coulterville, report development work progressing and showing high-grade milling ore. Sinking has been discontinued and Superintendent Soderberg has started drifting on the vein.

MONO COUNTY.

A tunnel is being run by Bell & Annear on the lignite deposit at Cottonwood, says the Bodie Miner-Index. The coal is 11 feet in width.

NEVADA COUNTY.

The New York-Grass Valley M. Co. is preparing to increase the capacity of the milling plant on its group near Grass Valley.

The work of laying 8000 feet of 24-inch pipe to connect the Empire mine at Union hill, near Grass Valley, with the South Yuba W. Co. reservoir on Banner hill was finished last week and connected with the reservoir. Heretofore the Empire has depended on the 22-inch pipe line of the Brunswick mine for its water supply.

Manager H. G. Brunnier, of the Conlin mine, Grass Valley, says it is proposed to build a mill. The mine will be run by electric power.

C. Gressweil and A. G. Harvey, of San Francisco, have bonded the Alta and Bingham mining properties at Washington. They adjoin those operated by the Yuba D. Co.

C. A. Poage, for Chicago men, has bonded the Independence mine, between Nevada City and Omega, and says he will start development work next week.

Manager G. Lezinsky of the Gold Tunnel M. Co. put men at work last week at the East Orleans mine on Gold Flat, near Nevada City, sinking a new shaft 150 feet east of the incline shaft. Work is going ahead in drifting east and west along the ledge from the incline at a depth of 100 feet. From the east drift a raise will be made to connect with the shaft.

At the Central mine of the North Star Co., 2 miles south of Grass Valley, a body of ore 6 feet in width was struck in the 3900-foot level last week. The ledge shows free gold. The raise which will put the Central in direct connection with the North Star will be completed this month. The work on the mill is in full blast, says Manager A. D. Foote.

The Rosey mine, near Grass Valley, has its 10-stamp mill in operation, says W. H. Bray, manager.

An electric cable, encased in lead, 2700 feet in length and weighing five and one-half tons, is being put in at the California mine at Gaston Ridge, having been hauled in from Emigrant Gap. The cable is for use in the tunnel and will transmit power to an underground hoist.

H. Huckins, manager of the Quartz Quarry gold mine, near North San Juan, says they are preparing to build a mill and also to put a bridge across the South Yuba river. Work is progressing at the mine.

At the Le Compton mine in Willow valley, near Nevada City, Superintendent Dunlap is wiring the incline shafts and the drifts for electric lights.

Superintendent Kaler, of the Grey Eagle mine, near Washington, is putting in a 5-drill compressor. Operations are temporarily suspended because of lack of water. During the shutdown, concentrators and an electric lighting plant will be put in. There is a 560-foot tunnel. The ledge has an average width of 3½ feet. The mill is of ten stamps. Superintendent Kaler proposes to enlarge the water system so as to give ample motor power the year around.

W. Wheeler says his locations on Big Canyon creek, 3 miles below Bowman's dam, including the Hawkeye, Ophir and Excelsior, will be consolidated and the Hawkeye Con. M. Co. incorporated. By extending the tunnel, from 1200 to 1500 feet of backs can be secured. The North Bloomfield ditch is high enough above the mouth of the tunnel to give ample power for machinery. The property is 10 miles from Emigrant Gap, on the main line of the C. P. railroad.

J. E. Poignedestre of Grass Valley, with San Francisco men, have incorporated the Western Pacific Mines Dev. Co. of California. They control the Gold Blossom mine on Union Hill, near Grass Valley, and will start operations this week.

The Phelps Hill mine near Nevada City has been sold to W. P. Ketcham and C. C. Poage of Chicago, Ill., and H. Benson of Reno, Nev. Besides operating the mine, the new owners will put up a sawmill and make use of the timber that covers the property.

PLACER COUNTY.

(Special Correspondence).—G. B. Knoff at the Eureka has ore for the Malmberg mill, Auburn ravine. This ore has averaged $11 per ton.

C. A. Reed is extracting ore on the St. Lawrence mine, cobbing the richest sulphurets for shipment to Selby's.

The Crandall has let a contract for a 100-foot shaft to A. Johnson and others.

A contract has been let by the Crater Co. for 100 feet of drift, to extend the 400-foot level.

The Boulder mine is unwatered and active operations are looked for.

The Bellevue mine owners contemplate sinking on and reopening the property.

Auburn, Sept. 30.

Superintendent E. C. Gaylord is putting in a Huntington mill at the Gaylord mine near Auburn, to be used in conjunction with the rotary mill now in use. As soon as the water company can furnish sufficient water, he expects to have forty men at work, says the Placer Herald.

PLUMAS COUNTY.

Superintendent Lawton of the Plumas G. M. Co. at Greenville says the machinery has been set up in the 15-stamp mill, and it is expected to be in full operation this month.

SHASTA COUNTY.

The Copper M. & S. Co. has a bond on the Graham group of claims, and the Allen & Alexon extension, on the western slope of Horse Creek mountain, 4 miles west of De Lamar. At one place a 75-foot shoot of ore is said to be blocked out. The bond is said to be for $30,000.

The Inca Treasure M. Co., operating a group of claims on Dog creek, near Delta, near Redding, is taking out ore and making shipments to the smelter. The returns show the ore averaged $37 in gold. The Inca Co. will build a milling plant on the property and the consolidation of several other adjacent claims is in contemplation.

SIERRA COUNTY.

Men have been put to work on the Kinselbach quartz mine, near Alleghany.

At the Sierra Reina mine, near Alleghany, twenty men are at work, and the stamp mill is in operation.

G. Rayburn, A. F. Kohlmeyer, W. W. Tiner, C. Fink and P. Berg, of San Jose, have bonded the Young America gravel mine near Forest City. They will begin development work.

SISKIYOU COUNTY.

C. W. Tyrer of the Tyrer & Co. quartz claim on Klamath river, below Klamathon, says the mine is working steadily and the mill is crushing ore.

The Siskiyou M. & Dev. Association of Etna is sinking a vertical shaft at the coal mine on the Herr ranch, 6 miles north of Moutague, between Yreka and Ager, which is down 150 feet. They expect to tap the coal vein that they followed for 800 feet with an incline shaft, by going into the valley and sinking this shaft, says Foreman L. S. Williams. At 150 feet they have cut several seams of coal but have not yet reached the main body.

TRINITY COUNTY.

The Trinity C. Co. is preparing to put in a 20-drill compressor at the Shasta King mine, near Kennett.

TUOLUMNE COUNTY.

L. J. Holland is reopening the mine on the Beardsley place below Sugar Pine, near Confidence, having bonded the half interest of W. T. Gurney, and will increase development work. The incline shaft will be sunk deeper and drifts run on the shoot. A whim will be used for hoisting until a steam hoist is put in.

The Kodak mine of W. Connelly and J. L. Gibbs on the North Fork of the Tuolumne river, near Carters, has been bonded to M. Walker of San Francisco for $30,000. A 10 stamp mill will be built this fall.

The mill on the Soulsby mine at Soulsbyville, is being run six hours per day on ore from No. 2 and No. levels. The drift north from the 200-foot level has been run 500 feet, and that from 300-foot level 360 feet. Another 300 feet from the face of the drift on the 300 level will connect the new works with the old. Considerable water has been struck in the mine, and Superintendent W. Sharwood thinks it is drained from the Platt mine on the south. An 8-inch Cornish pump with a 6-foot stroke is being put in to handle the water, and when finished a contract will be let to sink the shaft 100 feet deeper.

Work at the Mt. Jefferson mine at Groveland is going ahead, and ore is being opened up in the crosscuts. Sinking will be resumed as soon as a station pump is put in at the 500-foot level. The pump will lift 120 gallons per minute to 600 feet.

At the White Bear mine at Monte Cristo, near Downieville, they are in pay gravel, one week's cleanup amounting to 235 ounces gold, says the Messenger. Superintendent W. J. Belcher has thirty men at work.

Estey & Stanford, who hold the Doyle ranch gravel mine, near Columbia, under bond, last week made the second payment and will increase development work.

COLORADO.

BOULDER COUNTY.

At the Ragged Top mine, near Sugar Loaf, Superintendent C. Bonnell says heavier machinery will be put in and development work will be increased.

An air compressor will be put in by Manager C. F. Lake, of the Boulder County mine. A 100-stamp mill will be built on the site of the present mill. The mine will have a system of direct delivery to the mill from the mine at depth of 1000 feet. Work will be started on the crosscut tunnel this month, which will be started a short distance above the mill and will be driven 3000 feet to cut the 9-foot Cardinal vein at depth of 1000 feet below the present workings (1400 feet from the surface). The Boulder County mine is in Grand Island mining district, near Eldora, and is owned by T. F. Barnsdall, of Pittsburg, Pa.

A steam hoist will be put in at the Sparkling Jewel mine, near Wallstreet. The mine is 200 feet deep and has been worked with a whim. A pocket of ore showing free gold and tellurium has been opened in a crosscut. The whim will be used on the Florence mine.

The United States Gold Corporation at Arapahoe Mountain, near Eldora, is putting in machinery, consisting of boiler, compressor, etc., says Superintendent Rowell.

CHAFFEE COUNTY.

The Mary Murphy mine at Romley, near Buena Vista, has been closed for an indefinite period. The smelter has also closed temporarily. No action regarding resumption of operations at the mine will be taken until after the directors and stockholders meet. It is thought R. G. Hinkson will succeed Manager Morley, who died last week.

The smelter at Salida has completed its roasters, which will add largely to its sulphide capacity. The new stack is also completed.

CLEAR CREEK COUNTY.

C. Haselhine and A. W. Hille of Denver, with A. Anderson of Idaho Springs, have a lease and bond for $25,000 on the Ward and Ward Extension lodes, near Idaho Springs. The shaft is down 110 feet and sunk on the foot wall, and a crosscut started to get the hanging wall. Hoisting machinery will be put in and the shaft sunk deeper. The ore carries gold and silver.

The Continental Electric Power & Irrigation Co. of Idaho Springs will put in a 200-ton cyanide plant at Empire. The Continental Co. owns a damsite in Box canon above Empire, near Berthoud pass. The company has also located three reservoirs which will hold 60,000,000 gallons of water. A trench for the pipe line has been dug and the electric plant will be started this month.

A steady output of four loads (twenty tons) a day is being taken from the Shafter mine, near Idaho Springs, and milled. Fifteen men are employed. They are driving the fifth level east and stoping in the fifth and first levels. The mine is a wet one. It will be cut by the Central tunnel and the water problem then solved.

Boyd Bros, Straub & Huillet have a lease and bond on the Silver Ring tunnel and group of claims near Idaho Springs. They have sunk for 60 feet near the mouth of the tunnel and are drifting under the tunnel level, and have 20 inches of milling ore that will run $18 a ton. The property is owned by T. E. Schwartz of Denver.

T. J. Johnson, manager of the Specie Payment mine, near Idaho Springs, is arranging to put in a power plant and drive the tunnel ahead.

Eight men are remodeling the Alpine mill, near Idaho Springs, under Manager T. B. Craw. Additional machinery will go in. Pending completion of the mill no work is being done at the Con. Alpine mines.

Corundum is reported found by F. A. Maxwell on Saxon mountain, near Georgetown.

It is reported operations will be resumed at the Marshall tunnel at Empire station (Marshall Park postoffice). The company has been reorganized.

CUSTER COUNTY.

Work has been resumed by G. White on the group of the Grand Rapids M. Co., near the Baseick mine, near Silver Cliff. Work continues on the Dolomite shaft, which is 40 feet deep, at the bottom of which a 4-foot vein is showing. The Toledo mine has struck a large amount of water, which is being handled. A crosscut is being driven southward.——The Boulder mill of the Valley M. Co. is undergoing repairs and more concentrators are being added.——The striking of water in the First Colorado claim, near Custer City, has necessitated pumps.——The shaft of the Bull-Domingo mine is being unwatered.

The Bismuth mine of Querida, in which a strike of silver ore has been made, is sending out ore to the Salida smelter. The property has been absorbed by the Preston G. M. Co.

DOLORES COUNTY.

The Erickson-Holzner et al. lease on a block of the United Rico M. Co.'s ground (the Contention) is shipping high-grade gold-silver ore to the Durango smelter.

EL PASO COUNTY.

Work was resumed this week at the Standard plant of the United States R & R. Co. at Colorado City. The company uses 500 tons of ore daily when it is running full force, and ore is coming in at rate of over 200 tons per day.

FREMONT COUNTY.

Smith & Sons of Williamsburg, having opened a 5-foot vein of lignite coal at a depth of 80 feet by driving a 280-foot slope with an incline of 30°, have equipped the mine with coal chutes, tipples and rails. They have begun taking out coal for shipment.

GILPIN COUNTY.

The Quartz Hill M. Co. has been incorporated at Idaho Springs by J. A. Wright, J. F. Lilly et al. Contracts have been let for work on the Golden Dollar mine and timbering on the 100-foot vertical shaft started.

The Electric Spark G. M. Co. reports work of cleaning out and retimbering its Shamrock shaft at Russell Gulch finished. The shaft is down 350 feet. The 100 and 200-foot levels have also been cleaned out and retimbered, says Superintendent G. N. Rogers. W. A. Rogers of Omaha, Neb., is manager.

J. Lyng, R. Tresize and C. Hauser are working the east Missouri mine on Quartz hill, near Central City, under a lease, and they are down 180 feet and hoisting ore. Their milling ores are running one-half ounce gold per ton and their smelting ores $65 per ton. They expect to sink the shaft and will put in additional machinery.

GUNNISON COUNTY.

The West Gold Hill M. Co. has been incorporated by Eastern men to operate near Gold Hill, Tin Cup district. The company's main office is in Denver, with L. Cavnah president and manager. The holdings of the company cover 100 acres of mineral land, including the J. B. Sellers group, Queen of the West and Iron Hat lodes. Development will be increased. Tunnel No. 1 is in 160 feet and shows a vein 4 feet wide, carrying $12 per ton. Tunnel No. 2 is now in 140 feet. Three hundred feet north a shaft has been sunk on the vein. The company is planning to build a 50-ton milling plant, with a cyaniding and concentrating equipment.

The air line leading to the Yankee Blade tunnel, near Crested Butte, has been repaired and work resumed. This tunnel has reached the main Yankee Blade-Excelsior vein and cut a body of shipping ore. The larger ore shoots are said to lie nearer the crest of Caecade mountain, which the tunnel will reach at 500 feet farther in. The largest ore bodies of the Excelsior are under Baxter basin, which the vein crosses, and the Yankee Blade tunnel will cut these at depth of 600 feet below the lowest point of the basin, says the Elk Mountain Pilot.

The Augusta mine's sawmill is cutting lumber for buildings at the Yankee Blade tunnel. The drift is started on the main Augusta vein. A body of quartz is showing in this drift, which is being driven on the vein extending toward the Dark Canyon side. It is estimated it will require 1500 feet to reach Dark canyon, and several ore shoots will be cut along the line.

JEFFERSON COUNTY.

F. R. Carpenter, head of the Golden Smelter, says the smelter has closed down for lack of ore and will resume when the supply is up to the mark necessary to warrant operation. The company operates the Saratoga mine, in Gilpin county, but it does not produce enough ore for their purpose, as it requires 200 tons a day. He will not start up again until he has between 4000 and 6000 tons in the yard.

LAKE COUNTY.

There is no work being done on the R. A. M. shaft of the Small Hopes M. Co., near Leadville. The dry sulphide dump is being shipped to the smelter. It is not high grade, but the lead and silver contents are sufficient to make it pay. There are a few lessees working on the Small Hopes property north of the gulch.

The Bug G. M. Co. has resumed operations on the Mint mine in Lincoln gulch, near Leadville, says J. Robinson, superintendent. —— The Eclipse group on Breece hill has resumed operations, says Superintendent Hoskins. Development work will be increased.

The Keystone M. Co., composed of Denver, Leadville and Eastern men, has started by Superintendent J. A. Weber further development on the Keystone group in the north end of Leadville district. An engine and a hoisting plant are being put in, and it is intended to sink the shaft to the lime-porphyry contact.

SAN MIGUEL COUNTY.

The Butterfly-Terrible mine at Ophir was closed the 24th ult., and the miners and millmen are leaving the camp. The employes of the mine and most of those in the mill refused to obey the orders of the Miners' Union to strike, and would have continued to work had the company desired. No official explanation of the order to close has been made, but it is supposed the company was unwilling to risk the possibilities of trouble by continuing operations. Refusing to strike, the miners themselves posted an armed guard on the trail and refused to allow the union committee to approach the mine. F. J. Hobbs, secretary of the Butterfly-Terrible G. M. Co., says the mine and mill will remain closed indefinitely.

SUMMIT COUNTY.

Schauer & Co. have cleared out the third level on the Margaret mine, near Georgetown, and will sink on the ore streak to find the dip of the ore shoot. They have also let a contract on the No. 4 level to drive ahead. The ore in this property mills 240 ounces in silver per ton.

TELLER COUNTY.

Manager Parfet of the Streetor & Cripple Creek G. M. Co., operating on the Snowshoe claim, on Sheep mountain, near Gillett, is arranging to build a 50-ton cyanide plant. Men are timbering the shaft from the 200 foot level. A station will be cut and drifting on the vein started. On No. 2 shaft timbering has been done for 20 feet and sinking the shaft will be resumed.

A hoist and engine will be added to the equipment at the Findley mine on Bull hill, Cripple Creek. It will have capacity of hoisting ore from depth of 2000 feet. The property has one shift of forty men at work, says Manager Murphy.

The Gold Coin mine at Victor was closed down on Sept. 30, involving the closing of the Economic mill and throwing out of work 260 union miners. The properties belong to the Wood Bros., who have heretofore not been involved in the labor troublee in Cripple Creek district. Wood Bros. notified their employes that they must leave the Western Federation of Miners, and a strike on the properties was at once ordered.——Water is flowing from the portal of the Cripple Creek drainage tunnel at the rate of 1800 gallons a minute. In the meantime the main tunnel heading is being forwarded northeast from the El Paso workings. It is 500 feet from the El Paso workings. In addition to this bore, a drift is being run on the C. K. & N. vein, where more water is being released. The water is receding most noticeably in the Elkton mine and in the Mary McKinney workings. Several other properties also show a lowering of the water level.——W. Swanson, manager of the Abe Lincoln mine in Poverty gulch, near Cripple Creek, resumed operations last week with forty-three men on one shift. Shipments to the smelter have also been resumed.

There are at work in Cripple Creek camp, in disregard of the orders of the strike committee of the Western Federation of Miners, nineteen mines, three samplers and one electric plant. The total number of tons of ore being shipped out of the camp daily amounts to 360. There are nearly 1000 men at work in the so-called "unfair" mines and plants.

The output of ore from Cripple Creek district for month of September, while being less than at any time since the history of the camp, was greater than looked for, says the Cripple Creek Times, reaching 13 000 tons.

G. Jordan, who is treating the tailings of the Summit mill at Gillett, is cyaniding twenty tons per day. The ore is said to be yielding average returns of $7 in gold per ton.

O B. Finn, manager of the Cripple Creek & Colorado M. & M Co. at Cripple Creek (the Rittenhouse) has granted a lease on the White Elephant claim to R. O. Hanley for two years, with royalties of 20% and 25%. He will start work in shaft B, the most westerly one, at a depth of 300 feet.

The Cripple Creek Gold Temple G. M. Co., working a lease on the Gold Sovereign mine at Cripple Creek through the Lovett shaft, is again in operation with twenty-two men, after a temporary shutdown. Considerable lateral work will be done in the bottom of the 625-foot shaft. The vein averages 15 feet in width.

IDAHO.

BOISE COUNTY.

The Gold Hill mine at Quartzburg will be reopend by G. W. Grayson and W. C. Ralston of San Francisco, Cal. The ore is said to be a black quartz, carrying gold. The mine has been idle for six years, and the lower workings are flooded.

The Summit group of four quartz claims, the hoisting plant, pump, houses, etc., of the Colorado & Idaho M. Co., near Idaho City, were sold last week at Sheriff's sale to E. Strauss, says the Idaho World.

A larger hoist is being put in at the Washington mine, near Idaho City. The old hoist will be set up on the 400-foot level, and an incline sunk on the ledge from the drift that was run on this level to cut the ore shoot.

ELMORE COUNTY.

The Jericho mine at Atlanta has been bonded by C. D. Spaulding, manager of the Chink mine. A contract will be let for a 160-foot raise and continuous work in the drifts. This makes seven mines in operation at Atlanta.

R. P. Chattin, who has owned a two-thirds interest in the Franklin mine at Pine, has bought the remaining one-third interest for $100,000.

IDAHO COUNTY.

Last week the Jumbo mill at Hump again started dropping its fourteen stamps. The lower tunnel has been started and will give access to the mill directly from the mine, only 100 feet distant. Three hundred feet additional depth will also be gained. Electricity will be used for lighting purposes in all the buildings and also underground.

SHOSHONE COUNTY.

The Elgin M. Co. has been organized at Wallace by W. J. Bracking, J. L. Ragenovich, L. J. Columbus of Wallace and W. J. Herring and S. M. Mitrovich of Wardner, to operate a mine 7 miles west of Wallace and ½ mile from the O. R. & N. track.

The North Franklin M. Co. has been incorporated by J. F. and H. W. Ingalls of Mullan, J. P. Daily of Great Falls, Mont., L. J. Columbus and W. J. Bracking of Wallace, to operate a group of claims adjoining the Morning mine, near Mullan.

J. M. Jamieson and C. L. Mathews of Spokane, Wash., have an option on the Gold Hill mine, between the Mammoth and Standard mines, at Wallace, for $300,000.

KANSAS.

CHEROKEE COUNTY.

C. Bryan of Carthage, Mo., has a lease on 40 acres of the Clary & Shultz mine at Empire City, near Galena, and has begun prospecting with a drill.

MICHIGAN.

HOUGHTON COUNTY.

Fire was started in the new furnace at the Dollar Bay smelter last week. It is expected to take three weeks to make the sand and copper bottom ready for actual service. This will give the Lake Superior Smelting Co. four of these furnaces, all having been put up during the last three years.

The Tamarack mine at Calumet has bought 6000 acres of timber land in Ontonagon county, carrying mixed hemlock and hardwood and some pine, from the St. Mary's Mineral Canal Co. for $70,000. The mineral rights were reserved by the Canal Co.

The Osceola M. Co., near Calumet, reports the thirty-eighth and thirty-ninth levels of the old mine in good copper ground, and down to the fiftieth level in No. 6 shaft north and south the showing is also good. The company is shipping 4000 tons of rock daily to the mill.

An electric generator is being put in at the Quincy mine at Hancock, to be in operation by Oct. 15th, when four of the twelve additional electric locomotives ordered will supplant manual labor in tramming at some of the lower levels, and the others as soon as possible thereafter. The Champion mine management at Palmesdale is considering a similar introduction at the south end of the mine, where it may obviate the necessity of sinking at least one shaft. At the stamp mills several changes and improvements have been completed toward reducing the cost of stamping and the saving of copper in the waste tailings. The heads have been equipped with the coarse stamping appliances and improved mortar discharges, with the result that six stamps are now treating the entire output, says the News.

The new system of hoisting at the Red Jacket shaft of the Calumet & Hecla, near Calumet, has been adjusted and went into commission last week.

The Wolverine mine stope on the west vein, 80 feet west of the Kearsarge lode, is reported showing copper ground both in stamp and mass. Drifting south is in progress. The Kearsarge lode openings on the Wolverine, near Calumet, continue favorable. The run of mass is not as heavy as formerly, but stamp rock holds up. The deepest workings are at the twenty-fourth level of No. 3 shaft.

KEWEENAW COUNTY.

Ground was broken last week for a permanent inclined shaft on the Miskawabik mine, near Allonez. The air compressor and steam hoist are being set up. The shaft is 300 feet north of the northerly prospecting pit. Work in both pits has been suspended. Thirty men are employed, says Superintendent Scott.

The test pit at the Cliff mine, north of Calumet, is down 16 feet in the overburden. Fifteen men are at work.

MISSOURI.

JASPER COUNTY.

W. E. Newkirk, Statler Bros, J. Montgomery and W. A. Dumbauld have completed their mill on the McKinley lease, south of Carterville. They have nine lots and four shafts down into ore. Three of the shafts show a run of sheet ground with a face of 20 feet of lead and zinc ore, says the Joplin News-Herald.

Ford, Cowan & Co. of Joplin have sold a one-half interest in their mine on the Center Creek lease to Indiana men for $4000. They have been making eight tons of ore per shift, run on the custom mill since January. It is the intention of the company to build a mill.

J. W. Ellis, J. B. Gibson, A. B. Rawlings and Sours & Son have a 10 acre lease one-half mile west of Joplin, and in sinking their shaft at 55 feet cut a body of jack. Their lease runs for ten years at 10% royalty.

The Holy Smoke mine on the Aylor land, south of Carterville, reports putting out 300 tons of jack per week. J. Luke, B. Ash, J. Brown et al are owners.

The Williamsport Z. & L. Co., on the Creller & Young land at Sherwood, near Joplin, has unwatered the ground and put men to work in the drifts. They will sink the pump shaft from its depth of 125 feet to the 170-foot point.

VERNON COUNTY.

To the increasing lead and zinc mining interests in southwest Missouri is being added asphalt, says the Joplin News-Herald. In the southern part of Vernon county J. W. Layne of Carthage, of the Barton & Vernon County Oil & M. Co., says they have a lease on the ground where asphalt is being developed in paying quantities. In drilling for oil the asphalt was struck and it ranges from the surface down to 50 feet and in thickness from 6 to 24 feet. The earth above is soft, making it possible to strip the asphalt. The deposit has been shown by drilling to extend over a territory 2 miles in diameter.

MONTANA.

DEER LODGE COUNTY.

Reports from the Gold Coin mine, west of Anaconda, say a strike has been made. It is being worked under Superintendent J. R. Boarman, after having been closed down on account of litigation.

Since the new flues and the 300-foot smokestack have been in operation at the Washoe smelter there is a decided change in the color and variety of the smoke that issues from the top of the stack, and although all of the furnaces at the smelter have not been fired up as yet the draft is so great that it carries the smoke to a distance of 200 feet after it leaves the top of the stack, and then it floats away in the air instead of hanging to the ground, as it formerly did, says the Butte Miner. Tests have been made of the smoke as it comes from the stack and flues, and it is said not to contain anything of an injurious nature. The system was built with the idea of saving all of the arsenic and sulphur that were formerly carried away with the smoke, and which settled on the lands of the Deer Lodge ranchers. There are 1600 men employed in the works and this number will be increased.

FERGUS COUNTY.

J. C. Bates, of New York, has bought the Curran one-half interest in the Big Four, Wild Cat, Golden Crown and Snowflake claims in North Moccasin mountains. Gudgell Bros., of Lewiston, own the other half interest, says the Argus.

R. E. L. Townsend, of Colorado, has bought the Fields' one-third interest in the Reliance, Tom Boy, Wonder and Climber claims in Warm Springs district, near Kendall. Townsend has also bought the Stephens two-thirds interest in the Millsite and Columbia claims in Cone Butte district.——F. H. Hazard has bought the Stephens one-half interest in the Katherine, Marion, Little Hazel, Little Edna and Glendive claims in Cone Butte district.

The Mint and Yellow claims and the Norman group in Warm Springs district, near the Kendall group, near Kendall, have been bonded to W. G. Moore of Colorado Springs, Colo.

FLATHEAD COUNTY.

The Batcheler group of claims in West Fisher gold belt, 35 miles south of Libby, has been sold for $15,000 to the Michigan men who had an option on it, says Manager Burlingham. The group comprises eight claims.

JEFFERSON COUNTY.

The Minnesota, near Wickes, has resumed operations, says O. M. Holmes, who has bonded the mine. He will sink a new shaft and a tunnel will be driven at the foot of the mountain.

At the Crystal mine, being operated by the Cataract C. M. Co, near Basin, work is progressing. Smelting ore is being blocked out. The drift has been continued on the lead. The ore shows native copper, with values in gold and silver, says Superintendent Buckley. Work at the Bullion is progressing. The raise has been connected with the upper tunnel and a shoot of ore exposed. Work on the smelter of the Cataract C. M. Co. is going ahead and it is expected to be in operation in January, says smelter Superintendent Evans.

LEWIS AND CLARKE COUNTY.

The East Helena plant of the American S. & R Co. will be enlarged. Another stack has been blown in, and an independent copper stack is to be put in operation this month, because of the increased copper production in the district.

MADISON COUNTY.

Foreman T. G. Port, of the Hungry Hollw group, near Virginia City, under bond to a North Dakota company, says work is progressing. He has uncovered a vein of 7 feet of sulphide ore of good grade. Some water was struck. Manager Feetham of Grand Forks, N. D., has applied for a permit to build a road on the forest reserve, and as soon as it is completed and buildings put up, a 200-foot shaft will be sunk.

F. B Heardt, foreman at the Big Indian M. Co. plant near Helena, says work is being resumed on the Mohawk mine at Washington Bar, near Pony, and owned by the Big Indian Co.

SILVER BOW COUNTY.

The Boston & Montana C. Co. last week ceased operating a portion of its concentrator at Great Falls and will not start it again until the injunction granted by Judge Clancy, preventing the working of the Picalo mine, has been set aside. The section of the concentrator closed down was treating 500 tons of ore a day. One hundred and seventy-five men in Butte and Great Falls will be thrown out of work, also about 200 Butte miners, says the News.

NEVADA.

Articles of incorporation of the following companies have been filed with the Secretary of State: Tonopah Eagle M. Co., Tonopah; Bonancita G. & C. M. Co., Reno; Madelaine Tonopah M. Co, Carson; Mitchell Bros. S. & R. Co., Carson; Keyes-Grassler M. Co, Reno; F. E. & A. M. Co., Tonopah; Tonopah Reduction Co, Tonopah.

ESMERALDA COUNTY.

Arrangements are being made to begin work on the McNamara group near Tonopah next week, says Manager C. Peters. It is intended to crosscut from the 500 foot station for the ledges.

J. Dopp, manager, has begun operations on a group of three claims owned by the Tonopah Superior G. M. Co., 1 mile southwest of the Mizpah mine at Tonopah. The work being done consists of a tunnel, which is being driven to tap four ledges which show on the surface and which will be cut at depth of from 150 to 200 feet. A shaft 40 feet deep has been sunk on another ledge, 2 feet wide. The property is on one of the hills west of Brougher mountain.

C. Smith has a working bond on the A. Weber group of mines on Cat creek, 8 miles from Hawthorne. Smith says they are surrounded by timber and water sufficient for milling purposes can be obtained. The Nevada claim shows a 3 foot ledge of $10 ore, the Golden Nugget 2 feet of $12 ore and the Lakeview also pay ore.

EUREKA COUNTY.

J. P. Raine reports work progressing on his group, the Gray Eagle and Bald Eagle, 16 miles from Palisade, and in the Railroad mining district. On the Gray Eagle, a tunnel 250 feet has been run and winze sunk 50 feet on the vein in limestone, from which assays run 20 ounces silver and 20% lead. On the Bald Eagle a 30-foot shaft has been sunk on a ledge of copper ore, assaying 9% copper and 50 ounces silver. The ledge has a northeast strike with westerly dip, and is 3 feet in width, of sulphides. Near the shaft, an incline run 200 feet to tap the ledge struck a soft carbonate ore assaying 17 ounces in silver. There is wood and water within a mile of the mine.

LINCOLN COUNTY.

A strike is reported made in the Badger mine, which adjoins the Ida May, near Pioche. The Badger is owned and operated by the E. & F. Mining Co., A. Murphy manager. The company is driving a tunnel of 190 feet on the Ida May. Blower and air pipe have been put in, and it is expected to tap the ore body in the Ida May at more depth than was practical by sinking.

LYON COUNTY.

Manager E Boyle of the North Rapidan group of mines at Como, near Dayton, says the mill built by his company will start crushing ore from the Congress claims this week. The mill consists of two three-stamp batteries, the stamps weighing 1200 pounds each.

Manager Rae says work has resumed in the Como-Eureka mine at Como, and the stamps will be dropping on ore next week, as there will be ample supply of water in the Carson river now that the irrigation season is over, to keep the dynamo plant at Dayton running, which supplies power for the hoist and mill plants. Including work in other locations in Como and Palmyra, there are forty men at work in those districts, the monthly payrolls of which aggregate $4000.

The Brunswick mill on the Carson river, near Dayton, is ready for operations with the advent of water, says the Territorial Enterprise. Ore will be shipped from the Gold Hill mines.

NYE COUNTY.

The Tonopah Extension M. Co. at Tonopah, is putting in a 50 H. P. steam hoisting plant.

H. Crawford and M. Orvis of Buffalo, N. Y., of the Douglas-Lacey Co., have bought a group of six claims adjoining the Ray & O'Brien and the Ray Tonopah properties at Ray for $9000 cash and stock.

STOREY COUNTY.

The capacity of the C. Butters cyanide plant in Six-Mile Canyon, near Virginia, will be increased by the addition of several tanks 30 feet in diameter.

The work of retimbering the Forman shaft at Gold Hill on the Comstock, down to connection with the south lateral branch of the Sutro tunnel, is reported progressing and it will be put in condition for installing an air lift elevator and auxiliary electric plant to unwater the flooded levels of the Gold Hill mines. This, with proposed similar plant in the Ward shaft, will permit of recovery of all the submerged levels of the Comstock down to the 3300, and it is expected to make it possible to sink to the 5000-foot level, says the Virginia Report.

WASHOE COUNTY.

Sinking continues in the double-compartment shaft of the Desert King mine in Wedekind, near Reno, with three shifts at work. It is down 300 feet. The pumps are handling the water easily.

J. H. Sheehan, at Olinghouse, proposes to build a mill for treatment of Crown Point ore.

NEW MEXICO.

DONA ANA COUNTY.

The Continental M & D. Co. has been incorporated at Las Cruces by J. R. & S. V. Fulkerson, L H. Heil and J. Franklin, of El Paso, and A. B. Fall, of Las Cruces.

GRANT COUNTY.

The Santa Rita M. Co. is increasing development work on its properties at Santa Rita. It is crosscutting on the 400-foot level of the Hearst mine and cutting in three directions from shaft No. 7. The concentrating plant has resumed, four slimes tables having been set up. The monthly output of the company is 60,000 pounds of refined copper. Eighty men are employed. B. B. Thayer is manager.——There are 150 men at work on the ground leased from the Santa Rita M. Co. at Santa Rita.

Bean & Good of El Paso, Tex., say that they will have a smelter in operation on their group in Shakespeare district, south of Lordsburg, before next spring.

The E. C. Belt group of claims, near the Miser's Chest mine, in Virginia district, near Lordsburg, has been sold to S. W. Maltbie, who has put men to work to continue shipments.

The Shamrock M. & M. Co. has decided to put up another 40-ton furnace at its smelting plant at Pinos Altos. One furnace is in use with a capacity of 35 tons a day, while shipments received amount to 50 tons a day. The company has a lease on the Philadelphia, a copper-iron property at Hanover, and is receiving ore from this mine, which is owned by F. Bell. This is in addition to its Pacific lease from the Hearst estate, which is giving it 10 to 15 tons a day. The St. Louis, Samson and Alesandro groups in the Burros are also shipping to the Shamrock. The Shamrock mine was closed down temporarily, owing to an accident to the air compressor.

It is the intention of Manager C. R. Luton, of the Michigan-New Mexico C. Co., at Lordsburg, to go down 800 feet on the Dakotah-Pearl mine. A sinking pump with a capacity of 100,000 gallons daily has been set up. A contract to sink 125 feet from the 260-foot level has been let. The company will put up a 60-ton smelting furnace and a 50-ton concentrator and leacher. The Dakotah Pearl group comprises three claims, 4 miles from Lordsburg.

The Gold Gulch M. Co. has been organized at El Paso, Texas, to operate the Pactolus group, in Gold Gulch district, near Silver City, by O H. Baum, J. Ashcroft, L. C. Ryan, J. S. Dodge, J. S. Allen, J. S. Akin, W. G. Roe and E. L. Hawes. The company has started development work.

RIO ARRIBA COUNTY.

J. E. Scully, of Chicago, Ill, president of the Jaw Bone M. Co, operating in Bromide district, near Tres Piedras, says prospect work is going ahead with a diamond drill on the Jaw Bone.

Southwest of Tres Piedras 14 miles is a deposit of mica, three claims having been located, the Cribbenville, the Sandoval and the Petaca, and an option on these three claims has been given to L. G. Carpenter.

SANDOVAL COUNTY.

The Santa Fe Central railway will resume its work this month on the branch into the Hagan coal fields from Moriarty via Frost station. These coal fields, as well as the Pino Viltitas and Coyote fields, which lie between Hagan and San Felipe, are to be worked. Strikes of good cooking coal are also reported 2 miles north of Cerrillos, in Santa Fe county. A. Neis has found coal on the east side of San Marcos canyon and has driven a 50-foot tunnel which exposes a 3-foot bed. The Shaw Gibson M. Co. is developing a vein of coking coal on the other side of the canyon, and at depth of 40 feet has opened a 4-foot vein. These veins are thought to be continuations of veins that are being developed 2 miles north of Santa Fe and can be traced into the Hagan, O'Mara, Pino Viltitas and Coyote fields in Sandoval county, 35 miles to the south, says the Herald.

OREGON.

BAKER COUNTY.

(Special Correspondence).—In Cracker

Creek district, near Sumpter, a strike has been made on the Tahor Fraction mine. This fraction consists of 230 feet between the Excelsior & Eureka (E. & E.) and Columbia claims on the main lode. The ledge is 70 feet in width, and the pay shoot in this ledge has a width of 2 feet. One shipment of 100 sacks is reported to have yielded $1000 per ton. The work of overhauling and cleaning out the workings of the E. & E. is showing a high-grade ore body in the upper tunnel on the Eureka and is being shipped from this strike. The E. & E. has been idle for several yeare.

In the Greenhorn district, in the I. X. L. mine a shoot 6 inches wide has been cut, showing high values in gold. The producing mines on the so-called North Pole ledge are working full handed, from the Golconda on the south, the Columbia, E. & E., to the North Pole on the north, and the Cracker - Oregon on the east—300 men being employed. In the other sections near Sumpter, the Bonanza, Badger, Red Boy, Gold Pan, California and Midway are in operation.

Sumpter, Sept. 29.

A 93-ounce gold bar was shipped last week from the White Swan mine, near Baker City, says Superintendent W. O. Reynolds, the result of a ten days' run of ten stamps.

Operations at the Cornucopia mine, near Sumpter, are to be resumed with B. McDonald of Spokane, Wash, as superintendent, says the Blue Mt. American. The Cornucopia mine is equipped with a 20-stamp mill, concentrating tables, canvas tables, and has both water power and a steam plant. It has not been operated since Superintendent Dobler was killed by an avalanche last winter.

The North Pole mill, near Sumpter, has received four more concentrating tables, which are to receive the pulp after it passes from the plates.

The I. X. L. mine, near Greenhorn, is preparing to build a cyanide plant with a daily capacity of twenty-five tons.

H. B Compson of Portland, president of the Rockefeller G. M. Co., whose property is near Greenhorn, has arranged for reopening the mine, with F. Barker as superintendent.

The Cornucopia mines, near Baker City, formerly owned by J. E. Searles of New York, are reported sold to a New Jersey company for $600,000. The deal includes the Last Chance and Union Companion mines.

GRANT COUNTY.

A strike is reported made in the Copperopolis group, 6 miles from Prairie City. The company owns two claims of forty-two acres and a millsite. The main tunnel is in 675 feet where the ledge was crosscut, showing a width of 72 feet of ore. At this point a drift was run on the vein to the end line. The ore shows 15% copper, with gold values. The mine is equipped with air compressor and drills, and electric lighting plant.

W. C. Rutter of Seattle, Wash., president and manager of the Kittaning M. Co., says work is being resumed on their Big Four group, near Granite. The Big Four is composed of eight claims and a millsite ¾ of a mile west of the Cougar mine. In the past two years 700 feet of work has been done in the tunnels and shafts. The new development will be an 800 foot crosscut which will cut the veins at greater depth and be driven for a working tunnel, and will be driven to cut the contact hetween slate and granite which shows on the surface.

JOSEPHINE COUNTY.

The New York & Western M. Co. of Grant's Pass has bought a number of quartz properties in southern Oregon, and has made final payment on the Oregon Belle mine, honded last winter for $30,000. The Oregon Belle mine is on Forest creek. It is intended to open it up farther and put in more machinery. The ledges carry free gold and sulphides.

A Colorado company, under Manager J P. Murphy, is preparing to work the Queen of Bronze copper mine near Waldo. The same parties are interested in the mines of the Waldo S. & M. Co. A steam hoist is being set up at the Queen of Bronze, and will sink the main shaft to depth of 600 feet. The ledges of this mine are from 4 to 11 feet wide, carrying 12% copper, with gold. The Queen of Bronze is near the mines of tbe Waldo S. & M. Co.

Development work will be increased on the Wolf Creek group, near Grant's Pass, starting this month. It is expected water will be plentiful for working the placer properties in connection with the quartz ledge that cuts through the ledge, says M. B. Bozarth of Portland, secretary of the company. There is sufficient water for five to seven months in the year to work the placer, hut it is intended to work the quartz ledge hy tunnel. A 700-foot tunnel will he run.

WALLOWA COUNTY.

The Camp Carson placers on the Grand Ronde river, near La Grande, have been sold to the Carson Hydraulic M. Co., which had an option on the property, says W. H. Hazel, manager for the purchasing company. The high bars will he worked by hydraulic giants and the low ground by dredgers or hydraulic elevators. The company acquires 5 miles of ground along the stream, and they have men at work laying the pipes, etc.

SOUTH DAKOTA.

LAWRENCE COUNTY.

The shaft of the Oro Hondo M. Co., south of Lead City, is down 600 feet, and a station has been opened. The pump has been placed, and work of driving out from the shaft in the direction of the ore hodies started.

The Capital G. M. & M. Co. has been organized at Deadwood by R. W. McGinnis, R. J. Freeman, J. W. Wolf, J. Harrap, W. Lawlor and C. Nelson. The company owns a tract of ground near Texana station on the Northwestern narrow gauge, on which ore has been exposed in a railroad cut, the vein showing 70 feet in width and assaying $5 gold. They will sink a shaft. J. Harrap is manager.

UTAH.

BEAVER COUNTY.

The grading of foundations for two gasoline hoists on the Montreal mine, one of the groups of the Royal M. Co. of Milford, has been done, says J. Forgle, superintendent, and as soon as they are set up sinking will begin.

W. Thompson, who has a bond on the Jumbo mine, near the Cave mine, near Milford, put men to work last week.

BOX ELDER COUNTY.

The holdings of the Brooklyn M. Co. at Park Valley bave been sold to Monroe Bros. et al. of Pittsburg, Pa., and will be equipped with a stamp mill. Several hundred feet of work have heen done upon the 20-foot gold-bearing ledge, the ores showing $5 per ton.

Development work has been started by the Iona M. Co. on its group of twenty-one claims near Park Valley. The shaft, which is 40 feet deep, will he sunk another 100 feet before drifting.

The Century M. Co., operating near Park Valley, has bought a number of water rights, says P. W. Madsen of Salt Lake City, manager. The water rights involved are those of the Campbell ranch, which includes the streams flowing down Twin, Lone Tree and Carney canyons. Suit had been brought against the company for damages alleged to have been done to lands hy reason of tailings from the mill running on to tbe land and also for the befouling of the waters of one of the streams mentioned. The ranch, consisting of 290 acres, has been taken over.

EMERY COUNTY.

E. T. Merritt, at Green River, reports having secured 30,000 acres of land in that section which contain oil prospects, and has sunk a well to depth of 1700 feet, striking the oil shale. There are some producing wells in the vicinity, and more wells are heing driven at several points.

GRAND COUNTY.

Near Basin, in La Sal mining district, the Interstate M. Co. is preparing to build a mill at Gold Basin. The Interstate Co. is owned by Iowa men.

JUAB COUNTY.

The shaft at the Black Jack mine, near Eureka, is completed to depth of 1240 feet. Sixty feet farther will place the hottom even with the 1100 foot level of the Lower Mammoth mine.

The Signal Peak M. Co. has been incorporated hy D. I. Hanks et al. of Eureka, to operate on Gold mountain.

La Reine M. Co., in Tintic district, is preparing to resume. Their group is on Godiva mountain, near Eureka.

Excavation being finished, work is under way on the building for the concentrator at the Uncle Sam mine, near Eureka. It is thought a cyanide plant may also be added.

PIUTE COUNTY.

The Gold Vein M. Co., operating the Wedge group at Marysvale, put the Dalton mill in operation last week. The ore's values are in free gold and sulphides. The mill is under the superintendency of S. Colhath.

Salt Lake City and Eastern men have a nine months' lease and hond on the Advocate group of claims on Gold mountain, near Marysvale, says President A. J. Moore. There are six claims in the group, which is near the Miller mine, over the hill from the Sevier and on the Fish creek side of the Gold mountaln range.

SALT LAKE COUNTY.

Through an arrangement made with the management of the Mystic Shrine mine at Bingham, the development of the Erie group will be conducted through the Mystic Shrine tunnel, says J. W. Cairns of Salt Lake City, manager of the Erie. The Mystic Shrine tunnel cuts a fissure within 16 feet of the Erie side lines, and at this point drifting will be started.

The Fourth of March claim, near Bingham, has been sold to the Butler-Liberal M. Co. for $5000. This claim is said to present the most favorable millsite for the Butler-Lliberal group.

It is reported the Taylor & Brunton sampler at Salt Lake City will be enlarged, as consignments are daily increasing.

Tbe Superior-Alta M. Co. has been incorporated at Salt Lake City, Utah, to operate the Hellgate group of eight claims at Alta; the directors are J. A. Jacobson, W. L. Maas, T. Jacobson and L. A. Jeffs. The Hellgate group adjoins the Old Frederich mine on the north. Development work has shown two ledges, both carrying copper, with gold and silver, one being 10 feet in width and the other 8 feet. It is intended to sink a double-compartment shaft, says Manager Maas. A hoisting plant and pumps will he put in and arrangements have been made with the Columbus Con. M. Co. for power, to be supplied by its Little Cottonwood plant when completed.

SUMMIT COUNTY.

Superintendent J. Keetley of the Silver King Con. mine at Park City says the hoist is in place and three shifts are at work in the shaft pumping water. Sinking will be resumed.

At the Kearns-Keith mill, near Park City, preparations are going ahead for putting in the machinery. The pipe line has been laid from the tunnel, the hollers are in place and bricked up. The engine is being set up.

TOOELE COUNTY.

The annual report of the Con. Mercur G. M. Co., at Mercur, for the fiscal year, just issued, shows: Gross value of gold bullion produced from Golden Gate mill, $1,285,556 73, and from the Manning mill, $35,452 90. The operating expenses were: Mine, $450,298 52; Golden Gate mill, $547,-048.37; Manning mill, $27,064.42. The total number of tons milled during the year was 346,359; but of this 335,163 tons is represented by the bullion yield given above for the Golden Gate mill. Tbe tailings for the year averaged $1.21 per ton and the extraction $3 84 per ton. Tbe total operating costs for mining and milling 346,359 tons of ore were $997,346.89, or $2 88 per ton. (This includes all of the company's expenses, except the Manning mill costs, which come under another head.) The expense of mining was $1.30 and of milling $1 58 per ton. The Manning mill was operated on old Mercur tailings. The tonnage treated was 55,009, with extraction of 64 cents per ton and expenses 49 cents per ton. Operations were suspended for the winter season and have not heen resumed this year, pending completion of the slimes plant at the Golden Gate mill. The company's previous reports show the tailings for 1901 averaged 95 cents and for 1902 $1.19. For six months preceding May 1, 1903, they averaged $1.30. Since then they have been running on reduced tonnage and have used more care in mining, with view to keep out the more slimy ores. G. H. Dern of Salt Lake City is treasurer and manager.

At the Sacramento mine at Mercur, Superintendent of the Mill G. W. Cochler reports an average of 140 tons of ore going daily through the crushers and into the leaching tanks, while the retorts are producing mercury from 2400 to 3000 pounds daily of ore that averages 10% mercury, without reference to $8 in gold which is contained in each ton of slag. The capacity of the retorting plant will be increased next spring.

UTAH COUNTY.

At the Silver Dipper mine, at the head of American Fork canyon, near American Fork, Manager L. G. Hardy says a concentrator will he huilt in the spring. For 500 feet the tunnel has been driven on the strike of the ledge, showing 3½ feet of ore, carrying 15% lead, fifteen ounces silver and $1.50 gold per ton.

The Colton Wax mines Nos. 4, 5, 6 and 7 of D. B. Higgins et al., near Provo, have been sold to the Colton Wax M. & Oil Co.

WEBER COUNTY.

A milling plant will be built in the Sierra Madre mining district hy the Southern Pacific M. Co, of which J. W. Burnham of Salt Lake City is secretary and manager. In the meantime development will he increased. They are driving a tunnel which is to tap the ledges at depth. The company owns the Last Chance group of seven claims, four of which are located along the contact hetween quartzite and granite, says Burnham. Assays show values in copper and gold, with a little silver. The tunnel will have to be driven to a length of 700 feet, attaining a depth of 550 feet. The Sierra Madre district is north of Ogden.

——Manager D. Maguire is developing the El Dorado group, in the same district, and Burnham says it is already a big mine and says he has sufficient ore blocked out to justify the erection of a smelter.

WASHINGTON.

FERRY COUNTY.

C. Bolkin, J. O'Donnell and W. Hoffstedter are developing the Copper Key vein at Belcher camp, near Republic, and are negotiating with the smelter for treatment.

The Trade Dollar mine, near Republic, was closed temporarily last week, pending setting up a stationary pump on tbe 200-foot level.——The Curlew M. Co. will put in a compound duplex pump at the pumping station on Granite creek to supply their reservoirs and tanks with 20,000 gallons of water per hour, and the pump now in use at the station on Granite creek will be removed to the Trade Dollar mine.

W. H. Kells has men at work on tbe Nob Hill mine, near Republic, opening up the vein.

The Mountain Lion mine, at Republic, under control of A. E. Palmer, continues shipments of 150 tons of ore which is averaging $12 gold per ton. The ore goes to the smelters. It is expected to remodel the mill and resume treatment, crushing 120 tons of ore daily.

OKANOGAN COUNTY.

The W. O'Neill interests in the Pinnacle group of claims, near Loomis, have been sold to the Pinnacle G. M. Co. The company is working twenty-five men and intends building either an aerial or gravity tramway for taking ore down tbe mountain, and it will he 2000 feet in length. On the Bunker Hill claims of the group a vein 6 feet wide is shown on the surface. A tunnel on the ledge, 400 feet in length, is all in ore A crosscut on the Nevada claim is in 300 feet and has 150 feet farther to go to tap the vein at depth of 750 feet.

SNOHOMISH COUNTY.

The Federal M. & S. Co. is reported to have sold the Everett smelter, with $300,-000 worth of ore on hand, and the Monte Cristo mines, at Monte Cristo, to tbe American S. & R. Co. at over $1,000,000. The Wallace Sampling Works have been bought for $10,000 by the Federal Co. from the American S. & R. Co., which bought them a year ago from the Cœur d'Alene Mine Owners' Association. The Everett smelter was formerly owned hy the Puget Sound Reduction Co.

FOREIGN.

AFRICA.

TRANSVAAL.

The U. S. Consular reports show imports of cyanide of potassium into the Transvaal for the first five months of 1903 aggregated $560,000 value. Machinery imports (principally mining machinery) for the same period amounted to $5,000,000 value; and mineral oil, $135,000.

The Transvaal Chamber of Mines, Johannesburg, report the gold output for the month of August of the mines which have so far resumed working amounted to 262,569 fine ounces, value £1.115,325 for the Witwatersrand, being an increase of 20,499 ounces, as compared with the previous month, and 9349 ounces for the outside districts (i. e., outside the Rand proper), value £39,714, being a decrease of 224 ounces as compared with the previous month. The following table gives the output for 1903 to date as compared with 1902:

	Rand. Ozs.	Outside. Ozs.	Total. Ozs.	1902.
Jan...	192 934	6,345	199,279	70,341
Feh...	187,977	8,536	196 513	81,405
March	208,456	9,009	217,465	104,127
April.	218,900	8.971	227,871	116,589
May..	224,409	9,716	234 125	138,602
June..	228,161	10,153	238,320	142,780
July..	242,070	9,573	251,643	149.179
Aug..	262,569	9,349	271,918	162,750
Total.	1,765,482	71,452	1,837,134	969,773

The Transvaal Chamber of Mines, Johannesburg, under date of Sept. 10, report on native lahor on the Rand:

Natives distrihuted to mines during August by Native Lahor Association	6,649
Time expired and other wastage	5,083
Net gain during July	1,566
Total number employed at end of July	68,228

AUSTRALIA.

NEW SOUTH WALES.

Sydney reports of Sept. 5 show the New South Wales gold yield for month of August amounted to 14,636 ounces, valued at £53,149. The yield for the first eight months of the year was 176,441 ounces, valued at £647,087.

WESTERN AUSTRALIA.

The Great Boulder Proprietary G. Co., Kalgoorlie, report returns for month of August: At sulphide mill, 9349 tons of ore crushed; gold yield, 13,739 ounces; tailings (old), 2330 tons of ore crushed; gold, 764 ounces. Total estimated value, £47,759. —— Great Fingall Southern Blocks—September 16 report, will start diamond drill October 1st.

Kalgurli Gold report, Sept. 18: On 1050-foot level, at 100 feet, the north drive is in ore worth 26 dwts. per ton; 1000 foot level, at 220 feet, the north drive is in ore worth 19 dwts. per ton; in both places the width of the ore is 12 feet.

The Sons of Gwalia mine at Leonora report Sept. 12: No. 12 level, 203 feet from shaft, samples from face assay 2 ozs. 10 dwts gold per ton for width of 8 feet.

BRITISH COLUMBIA.

CARIBOO DISTRICT.

H. Jones, manager of the Gold Gravel & Drainage Co., owning ground at the Wingdam, near Barkerville, says he is arranging to resume on a larger scale, after a year's suspension.

EAST KOOTENAY DISTRICT.

The Silver-Lead Mine Owners' Association has been formed at Sandon and includes twenty-nine incorporated companies, being all the silver-lead producers in the Slocan, Lardo and Ainsworth districts. The purpose of the association is to pool the product so as to get the best rates available from the smelters, says the Fort Steele Prospector.

Fifty coke ovens are completed at the coal mines at Morrissey, twenty-five of which are in operation.

C. Kleinsmith, A. W. Bleasdell et al. of Fort Steele, have staked sixteen coal claims on Elk river.

Near Elko, two prospectors report finding a body of hematite on Sand creek. They are driving a tunnel on the vein, which is 6 feet wide.

Development at the Coal Creek coal mines of the Crow's Nest Pass Co. is progressing. At No. 4 the coal is being wasted on the dump as the tramway is incomplete, owing to delay in arrival of rails. In No. 5 three drifts have struck coal. Development work has been started on No. 9, which is near No. 1. Nos. 6, 7 and 8 will not be developed until next year. The haulage engines at the mines are being placed in position.

ROSSLAND DISTRICT.

The Elmore oil process plant at the Le Roi No. 2 mine at Rossland is in operation.

The Nickel Plate compressor, near Rossland, is in operation by the West Kootenay Power Co. The plant will supply air for forty drills and requires 600 electrical H. P. to run it. Le Roi mine will draw its compressed air from this source. It is expected the Spitzee Co. will arrange for air supply from the Nickel Plate compressor, laying a pipe line to the Spitzee head works.

SLOCAN DISTRICT.

Preparations are being made to put in a second tramway at the Idaho mine, near Sandon.

A. Cameron et al. have a lease on the Conductor, near the Idaho mine, near Sandon, and are driving on the lead.

A strike has been made on the Riverside mine, Ten-Mile, showing a 6-inch stringer containing argentite, ruby and native silver and sulphides.

J. Humphries, of the Rambler-Cariboo mine at McGulgan, says a body of good ore has been struck on the 700-foot level. Manager W. E. Zwickey, in drifting 200 feet on the 700-foot level, followed what appeared to be the top of a shoot of ore. It was cut in three places, has widened to 18 inches in drifting 20 feet. It carries 100 ounces of silver and 40% in lead. They will run a 4600-foot tunnel, starting half way between the mine workings and McGuigan. It will give depth of 1400 feet, and will be of two-track width. The mine is shipping eighteen cars of concentrates a month, which net $1300 a car from the smelter. The compressor is being moved to a point where more water will be available for power. The mine has seventy-five men at work.

VANCOUVER ISLAND.

The No. 4 coal mine at Extension, which has been closed for several months, has been reopened. This will give employment to 250 men and increase the output by several tons daily.

WEST KOOTENAY DISTRICT.

In Poplar creek section, near Lardeau, J. J. Young of Calgary and Cochrane Bros. of McLeod are reported to have bought for $3500 the E. Larsen claim, between the Swede group and the Lucky Jack.

The Lucky Jack claim on Poplar creek is under bond to J. J. Young and W. B. Pool of Calgary for $90,000. They are making arrangements to put in a stamp mill and are making other improvements. They have a tunnel in 60 feet.

J. L. Whitney & Co. of Rossland have bought the Home Run claim, adjoining the Lucky Jack to the south, on Poplar creek, in the Lardeau. They will equip and develop the property.

CANADA.

ALBERTA.

Mr. Bondonneau of Paris and M. Lefehre of Lisle, France, have men at work on their coal properties near Frank.

CUBA.

F. Steinhart, U. S. Consul General at Havana, in his annual report says the exports of mineral products (iron, manganese and asphalt) from the island for the four years, 1899-1902, inclusive, amounted to $3,909,300. The mineral resources of the island are represented by the following products: Gold, silver, iron, copper, manganese, lead, asphalt, petroleum, naphtha, graphite, amianthus, zinc, mercury and, it is stated, coal. These minerals are found in most of the provinces, but the richest mineral district is the Province of Santiago de Cuba, followed in importance by Santa Clara, Puerto Principe, Pinar del Rio, Matanzas and Habana. The following is a statement of the existing mining concessions in the different provinces:

PROVINCE.	MINES.	AREA.	
	Number.	Hectares.	Acres.
Santiago de Cuba	386	18,051	44,586
Santa Clara	59	1,736	4,288
Puerto Principe	27	2,106	5,202
Pinar del Rio	13	551	1,361
Matanzas	11	180	444
Habana	10	208	514
Total	506	22,832	56,395

Of this number of mines, very few of iron, manganese, and copper in the Province of Santiago de Cuba are in operation; and the others can be considered only as concessions waiting for funds for exploitation. The administration, according to the laws in force, can not compel the miners to operate their claims. The owner is in possession of his mine to perpetuity, and at his own will may work it or not. The only cause of forfeiture established by the law is the failure to pay the annual taxes. The applicants for mines can ask for one or several claims at the same time. A claim (pertenencia) is 300 meters (984 feet) long by 200 meters (656 feet) wide (6 hectares, or 14.8 acres), except when the mines are iron, coal, anthracite, lignite, turf, asphalt, or bituminous clays, when the pertenencia is 500 meters (1640 feet) long and 300 meters (984 feet) wide (15 hectares, or 37 acres). The taxes to be paid to the Government are $5 yearly per hectare (2 471 acres), when the mines are of precious stones or metalliferous substances. In the other cases the tax is $2 per hectare.

MEXICO.

CHIHUAHUA.

The Democrata mine in Santa Eulalia camp has been sold to A. C. Aiken et al. of San Francisco, Cal., who have also bought the O'Caliahan-McDermott group and the Inglaterra y Annexas of Dale Bros.

A bond has been given on the Inglaterra y Annexas group of thirty-eight pertenencias at Santa Eulalia to A. C. Aiken, Jackson et al. of San Francisco, Cal., for one year at $100,000 gold. A diamond drill will be put in operation. The group is between the Carolina and San Antonio mines, all of which adjoin the Potosi. It is understood a series of diamond drill holes are to be put down on the three properties named and near the Potosi line.

W. D. Pierce, manager of the La Luz G. M. Co., operating the La Luz mine at Maguarichic, says he has started foundation work for the 16-ton capacity mill and concentrator.

It is reported that most of the work on the San Jose mine (Los Angeles group) at Parral has been stopped until a larger shaft is sunk and connected with the present workings.

The Venture Corporation of London, Eng., is reported to have a short option for $500,000 on the Dolores group of mines, owned by San Francisco, Cal., men. E. A. Wiltsee is resident manager of the company. The ores carry gold and silver.

G. W. Boyce of Boston, Mass., says he will increase operations on a number of mining properties in which he is interested in Chihuahua, especially in Terrazas camp. He will also start work on the Victorino group, and on the Cruger silver-copper mine, 6 miles from Bustillos. Boyce is operating for himself and Boston and Providence, R. I., men several properties in Terrazas camp, the Josefina mine near Cusihuiriachic, and the Cahrisa copper mine over the line in Sonora.

The Torreon Smelter Co. has an option on the San Diego mine at Santa Barbara for $50,000, says the Chihuahua Enterprise.

DURANGO.

The Restaurador M. Co., operating at Guanacevi, has been making tests with the cyanide process at the Santa Cruz mine, which show satisfactory results, says Superintendent H. H. Hughes. The mine is owned by the Banco Nacional, which owns fourteen properties in that section with an average output of 14,000 tons monthly.

The New Australian M. Co. of Guanacevi are preparing to put in additional machinery.

The owners of the San Nacasio mines, 100 miles south of Torreon, Chihuahua, have built a railroad from the mines to Nacasio station, on the Mexican Central R. R. The mines are in the San Juan de Guadalupe district.

SONORA.

D. M. Heller and C. A. Overlock et al. of Douglas, Ariz., have formed a company to open up the Santa Rosa gold mine 20 miles south of Nogales.

ZACATECAS.

N. M. Dieffenbach of Mexico City, general representative of the American S. & R. Co., has an option on the Malanoche mines of the Compania Minera Gran Cuadra Prodigio y Anexas, near Zacatecas, for $500,000 gold.

NEW ZEALAND.

The export of gold for the first seven months is given as follows:

	Oz.	£
1903	313,100	1,194,399
1902	279,454	1,074,044
Increase for 1903	33,646	120,355

The export of gold for the first seven months of 1903 exceeds that of any one year from 1881 to 1898 inclusive.

There are seventy-one men at work on the Puponga Coal Co.'s property at Collingwood; fifteen men in mine development, forty-seven in construction of tram line, and nine in jetty construction. J. Bishop, consulting engineer, says the jetty on August 17th was completed 1400 feet, a further distance of 1000 feet is required to complete the contract, with the addition of breastwork for wharfage, coal bins and housing. These additions will not be completed till November, as there is difficulty in obtaining delivery of timber. A tunneled engine road is being driven to haul the coal from the present lowest levels to the screens, and to extend the dip heading into the dip section of the coal field, the Puponga Coal Co. having taken an option over the lands proved by boring by the Cape Prospecting Co., says the Mines Record.

The Cromwell Proprietary mine, at Bendigo, near Cromwell, Otago, has been sold, together with plant, water races and water rights, for £120, to D. B. Waters, of Dunedin, who will develop it at the lower levels.

The Cromwell and Bannockburn Collieries Co. reports development work progressing on its area of coal-bearing Crown lands. Sixty-four men are employed and the pay sheet is at the rate of £1000 per month. Recent additions to the plant include a 20 H. P. steam hoiler, duplex pump with capacity of 10,080 gallons per hour, also an engine and winding gear for the Shepherd's Creek mine.

PERU.

Thirty carloads of machinery and piping from the Arcadian copper mines, in Houghton county, Mich., have been shipped via New York to the Cerro de Pasco mines, at Cerro de Pasco, in Junin department, and owned by J. B. Haggin of New York.

RUSSIA.

Fire broke out on the 23d inst. at the Biliehat naphtha fountains, owned by the Nobel Co., at the oil fields at Baku, and has already caused damage estimated at $2,500,000. The works have been completely destroyed and the fire at last reports was still spreading.

TASMANIA.

The Briseis Tin Co.'s report for the period ending August 31 shows: Black tin cleaned up, 35 tons 9 cwts. (July output, 36 tons). Average total sluiceheads of water available from all sources, 175 (July, 173); rainfall during period, 804 points (July, 892); overburden removed, 46,900 cubic yards, in addition to 12,540 from No. 1 Co. (July, 41,600, No. 1 Co., 3565). They drift-sluiced 16,300 cubic yards (July, 23,500).

VENEZUELA.

Caracas reports state that the official gazette has published a government decree suspending the operation of the mining code for an indefinite period. This decree will render new acquisitions of mines in Venezuela impossible. The reason given is that certain politicians wish to monopolize all the mines in the district of Ciudad Bolivar, without meeting any competition, in order to afterward sell the mines to foreign companies. This action, taken without previous notice, will cause detriment to the American mining parties who are now engaged in surveying several mining claims in the district of Orinoco.

PERSONAL.

J. R. FERRIS has returned to Rawlins, Wyo., from Denver, Colo.

C. W. PURINGTON has returned to Denver, Colo., from Ely, Nevada.

W. L. WATTS, E. M., is in San Francisco, Cal., from Los Angeles, Cal.

S. T. MURCHIE is superintendent of the Phelps Hill mine, near Grass Valley, Cal.

L. N. FITTS, of Crestone, Colo., is in Old Mexico inspecting mining properties.

H. J. LOUGHRAN, of Tonopah, Nev., is in San Francisco, Cal., on mining business.

C. J. CARLSON has resigned as superintendent of the Golconda mill, near Sumpter, Or.

F. SMAILE is superintendent of the Portland G. M. Co., at Victor, Colo., vice Fitzgerald, resigned.

J. H. MACKENZIE has returned to San Francisco, Cal., from mine examination in Calaveras county, Cal.

M. BONDONNEAU of Paris and M. Lefehre of Lisle, France, are at Frank, Alberta, from Ottawa, Canada.

G. W. BOYCE is at Terrazas, Chihuahua, Mex., from Boston, Mass., to start work on the Victorino mines.

C. A. HOLLAND, of Carters, Cal., manager of the Georgiana mine in Tuolumne county, is in San Francisco, Cal.

H. G. VERCOE, of Fresno, Cal., superintendent of the Fresno copper mine, is in San Francisco, Cal., on business.

H. R VERCOE, of London, Eng., interested in several mining properties in California, is in San Francisco, Cal., on business.

A. M. WAGNER of Webb City, Mo., president of the Thames M. Co., has gone to Hermosillo, Sonora, Mex., to examine mines.

A. C. GIBSON, of the Pick and Drill M. Co., has returned to Vincennes, Ind., from their mines in Agua Fria district, Arizona.

W. C. THOMAS, superintendent of the Newhouse smelters, returned to Salt Lake City last week from a trip to New York and Boston.

J. A. BUNTING, of San Francisco, Cal., is president of the Esperanza Oil Co., operating in the Coalinga field, Fresno county, Cal.

A. E. BRYAN is manager of the North American G. M. Co., owning the Porcupine mine, Wind Creek district, near Sumpter, Or.

C. D. ROOKLIDGE returned to Salt Lake City last week from a trip East, where he has been several weeks on mining business.

V. C. OSMONT will return next week from Berkeley, Cal., to Hermosillo, Sonora, Mexico, near which place he is engaged in mining.

C. MILLER, formerly manager of the Amethyst mine at Creede, Colo., is superintendent of the Comstock mine near Idaho Springs, Colo.

MANAGER D. MCVICHIE of the Bingham Con. C. Co. is at the Balakiala copper mines in Shasta county, Cal., from Salt Lake City, Utah.

C. W. MILNE, of London, Eng., is at Ocampo, Chihuahua, Mex., in the interests of the San Ramon M. Co. and the Watterson Gold, Ltd.

D. J. DUNCAN, of New York, is assistant manager of the Hays Con. M., M. & L. Co. properties, at Camp Hays, in Sonora, Mex., near Nogales, Ariz.

ROBERT, GEORGE AND HENRY MITCHELL, who are largely interested in copper mines on the Pacific coast and in Mexico, are in San Francisco, Cal.

H. C. HOOVER, of Bewick, Moreing & Co., is at Victoria, Australia, from London, England, visiting mines of the London & Globe Deep Lead Assets, Ltd.

W. H. KRITZER, E. E., has resigned from the Risdon Iron Works, San Fran-

cisco, Cal., and will hereafter be associated with the Joshua Hendy Machine Works, San Francisco.

R. HAMILTON, president of the West Australian Chamber of Mines, and manager of the Great Boulder Proprietary G. M. of West Australia, is in California on a tour of inspection.

J. F. PARR has resigned as superintendent of the Esmeralda Con. M. Co., near Hawthorne, Nev., and will be succeeded by H. W. Nelson of the Alpine G. M. Co. of Sumpter, Or.

H. N. DEMPSEY, for the past two years with the Mine & Smelter Supply Co. of Denver, Colo., is located at 578 Mission street, San Francisco, Cal., representing that establishment.

GOVERNOR PARDEE of California has appointed J. E. Doolittle of San Francisco, Cal., a member of the board of trustees of the California State Mining Bureau, vice Ross E. Browne, resigned.

R. P. JARVIS, late superintendent of the Silver City G. & S. M. Co., New Mexico, has accepted the position of professor of mining at the Washington Agricultural College at Pullman, Wash.

W. F. SNYDER, president and manager of the Western Exploration Co., returned to Salt Lake City, Utah, last week, after an extended absence in the East in the interest of the Balakiala copper mines in Shasta county, Cal.

H. A. SALZER, A. PLATZ SR AND F. X. KREITLER, the two former from La Crosse, Wis., and the latter from Nebraska and Forrest county, Pa., who have been inspecting the mine and work of the Idaho Gold Coin at Black Lake, have returned to their homes.

Catalogues Received.

Catalogue No. 12, first edition, from Allis-Chalmers Co., describes in detail the Overstrom concentrator, the subject being given most extended notice. Full directions are given regarding erection and operation. Diagrams in colors are among the illustrations, the diagrams showing the action of the siliceous and other mineral particles on the table.

Catalogue No. 31 from the A. S. Cameron Steam Pump Works, foot of East Twenty-third street, New York City, N. Y., gives comprehensive showing of the various standard makes of pumps by that company. So fine a pictorial exposition of pumping machinery speaks well for the ability of the manufacturers to supply what is graphically depicted. The book is a work of art, and is deservedly copyrighted.

Catalogue No 58, from the Stilwell-Bierce & Smith-Vaile Co., Dayton, Ohio, is devoted to the Stilwell heaters, for heating and purifying water for boiler feed and manufacturing purposes, giving detailed figures showing the manifest economic value of the device, with testimonials to its efficiency and fully illustrated descriptions. The catalogue may be had from the home office, or the Pacific Coast manager, Geo. W. Ingils, 11-13 First street, San Francisco, Cal.

Commercial Paragraphs.

OTTO C. PLESSNER is in San Francisco, Cal., representing Arthur Koppel of 66-68 Broad street, New York, N. Y.

TO CONCENTRATE their business and have better factory facilities the Vajen-Bader Co. has removed from Indianapolis to Richmond, Ind.

THE Pelton Water Wheel Co. of San Francisco, Cal., report their plant working night and day to keep up with orders. Among the important contracts closed during the past few months for hydro-electric plants are reported the following, which aggregate 56,408 H. P.: American River Electric Co., Placerville, Cal., head 575 feet, two double Pelton units, each of 2500 H. P. capacity; Pike's Peak Hydro-Electric Co., Colorado Springs, Colo., head 2200 feet, three Pelton wheels, each of 1500 H. P. capacity; Columbia Improvement Co., Tacoma, Wash., head 850 feet, four Pelton units, each of 7500 H. P. capacity; Vancouver Power Co., Vancouver, B. C., head 390 feet, three double Pelton units, each of 3000 H. P. capacity; Northern California Power Co., Anderson, Cal., head 1150 feet, two double Pelton units, each of 3000 H. P. capacity; Rock Creek P. & T. Co., Baker City, Ore., head 960 feet, two Pelton units, aggregating 1760 H. P. capacity; Columbus Con. M. Co., one Pelton unit, 494 feet head, 660 H. P. capacity.

Obituary.

G. W. SEVERNS, a pioneer mining man of Cochise county, Ariz., died at Boston, Mass., Sept. 24th. Deceased went to Arizona in 1886 and entered the mining field, in which he held considerable interests at the time of his death. He owned considerable property in the Dragoon mountains and is said to have been the first man to erect a mill in those mountains.

CORNELIUS HAYWOOD, for twenty years a resident of Denver, Colo., and interested in Park county, Colo., mines, died Sept 21st, at the age of 82, from general debility. Deceased was born at London, England, in November, 1821, and came to New Orleans, La., in 1840, going from there to St. Louis, Mo. After the civil war he was in Chicago, Ill., going to Colorado in 1885, and interested himself in mining. He is survived by a sister and two sons and one daughter — Bryan, Charles and Lillian Haywood.

Books Received.

"Gas Engine Design, With an Introduction on Compressed Air," is the modest title of a treatise by E. J. Stoddard (for sale by Parker & Burton, 12 Hodge Blk., Detroit, Micb., $1), which contains formulæ and severely technical discussion of gas engine design, and work that is of unusual merit.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR THE WEEK ENDING SEPTEMBER 22, 1903

739,632.—TROLLEY CATCHER—J. V. Ainsworth, Los Angeles, Cal.
739,531.—FRUIT DIPPER—H. M. Barngrover, San Jose, Cal.
739,681.—FURNACE—Blanchard & Williams, Dillard, Or.
739,532.—GAS GENERATOR—F. M. Caler, Los Angeles, Cal.
739,647.—HARP—J. E. Childs, Spokane, Wash
739,294.—ROAD SPOOL—W. H. Corbett, Portland, Or.
739,590.—CATTLE GUARD—W. von Daake, Vancouver, Wash.
739,402.—STEREOSCOPE—T. B. Eastman, S. F.
739,662.—EXHIBITING BOX—Francisco & Martin, San Diego, Cal.
739,672.—ELECTRIC SWITCH—J. Harisberger, Seattle, Wash.
739,546.—OIL BURNER—W. F. Hogan, S. F.
739,676.—TREE SUPPORT—A. A. Hoyt, Watsonville, Cal.
739,419.—SCORIFIER TONGS—J. M. Hyde, S. F.
739,755.—WATER GATE—Martin & Ormond, Riverside, Cal.
739,701.—SEAL LOCK—D. E. McLaughlin, Tacoma, Wash.
739,337.—GAME—W. L. Newman, Pannca, Nev.
739,339.—PHOTOGRAPHIC PROCESS—P. Ny, Berkeley, Cal.
739,340.—FURNACE—J. B. Orbison, S. F.
739,340.—GRAIN SEPARATOR—W. M. Russell, Walsh Cal.
739,371.—DISK PLOW—Simeral & Wiggins, Salem, Or.
739,454.—CASING SPEAR—Stockton & Helfenstein, Bakersfield, Cal.
739,745.—OILING DEVICE—G. W. Thurston, Dunsmuir, Cal.
739,570.—RASP—G. K. Woods, Prescott, Ariz
739,530.—CASH REGISTER—W. A. Zimmerman, Los Angeles, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

AIR VENT CONTROLLER FOR BARRELS.—No. 739,058. Sept. 15, 1903. E. R. Charles, Petaluma, Cal. This invention relates to a device for controlling the ingress of air into barrels and like containers, so as to allow the liquid contents to escape freely; and to provide means whereby air may be admitted when required, and the opening hermetically sealed for transportation when not in use

OIL BURNER.—No. 739,546. Sept. 22, 1903. W. F. Hogan, San Francisco, Cal. One-half assigned to Wm. Matson of same place. This invention consists of concentric steam and oil inlet pipes, with discharge passages at the ends, a cylindrical mixing chamber into which the steam and oil are delivered, a return bend connected with the outer end of said chamber having a discharge or burner opening in its outer convexity, a return pipe or passage below and parallel with the mixing chamber contiguous to the oil and steam inlets whereby the heavy portions which may settle are returned continuously into the mixing chamber.

TREE SUPPORT.—No. 739,676. Sept. 22, 1903. Asa A. Hoyt, Watsonville, Cal. Assigned to Hoyt's Tree Support Co. of Watsonville, a corporation. The object of this invention is to provide a propless support for the limbs of fruit and other trees which shall be self-adjusting to any angle at which two limbs to be supported may stand. The device consists essentially of concaved blocks adapted to fit the curvature of tree limbs, and having swivel attachments which may be connected with the opposite support and which by raising of their swivel connection with the blocks allow the latter to take any position to fit the limb without chafing.

Dividends.

Bunker Hill & Sullivan M. & C. Co., $18,000; Oct. 5.

Latest Market Reports.

SAN FRANCISCO, October 2, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27 7/16d (standard ounce, 925 fine); New York, bar silver, 59½c, refined (1000 fine); San Francisco, 59½c; Mexican dollars, 47c @49c; San Francisco, 46c New York.

Silver hovers close to the 60-cent mark, but has not yet reached that figure. There is reason to hope, however, that a further advance in price will be made While the rise in price is a satisfactory item in the output of all mines producing gold-silver, copper-silver and lead-silver ores, no effort has as yet been made to open new mines producing silver only.

COPPER.—New York: Standard, $13.25; Lake, 1 to 3 casks, $13.25; Electrolytic, 1 to 3 casks, $13 25; Casting, 1 to 3 casks, $13.12½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £55 spot per ton.

Copper shows a slight falling off in price since last week's quotations The New York market is dull and the small amount of metal being bought makes the market quiet. It would not be surprising to see still lower prices than those quoted today, though no considerable decline is anticipated.

LEAD.—New York, $4 50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4½c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5½c; pig, $4.75. London: £11 per long ton.

SPELTER.—New York, $6.00; St. Louis, $5.00; London, £20 15s per ton; San Francisco, ton lots, 6½c: 100-lb lots. 7c.

In the United States for the year 1902 the total output of lead for the entire country was 220,000 short tons, and of zinc 156,297 short tons. The lead production was about the same as in 1901, but there was an increase of about 10% in zinc production.

TIN.—New York, pig, $25.82½@26 10; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29½c; less, 30c; bar tin, ℔ lb, 30c @32c. London, £115 2s 6d spot.

PLATINUM.—San Francisco, crude, $18.00 ℔ oz.; New York, ingot, $19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, $46 00@47.00; large lots; London, £8 7s 6d; San Francisco, local, $43@44 ℔ flask of 76½ lbs; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER.—Half-and-half, 100-lb. lots, 18 75c; San Francisco, Plumbers', 100-lb. lots, 15 50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 45@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300 to 500 lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16 85 @17.35; gray forge, $15 35; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27 00@29.00; open hearth billets, $28.00 @30 00; San Francisco, bar, 7c to 12c per lb.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, bd., $14.00; Scotch, $8; Cumberland, $13; Cannel, $8 50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13 in sacks; Sunnyside, $8 50, long ton.

For the first time in the history of the United States the annual production of coal has reached a total of over 300,000,000 short tons, the actual showing being 300,930,659 short tons, valued at $373,133,843.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28 00 @35.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $2.35; Roche Harbor, $2.35 per bbl.

CEMENT.—Imported, $2 50@2.75 ℔ bbl; California carload lots, $2 25 f. o. b. at works; small lots, $2 50 ℔ bbl. in sacks, 4 sacks to bbl.

GENERAL SUPPLIES.

POWDER.—F. o. b. San Francisco: No 1, 70% nitro-glycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2** 30% carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s, 11c ℔ set; 14 oz., 40s., 10c.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.: carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; byposulpbite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bbls., 10c; caustic potash, 10c in 40-lb tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3¼@3½c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2 50@2.75: sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 49c; cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil, boiled, bbl., 44c; cs, 49c; raw, bbl., 42c; cs, 47c. Kerosene—Pearl, per gal., 21c; Astral, 21c; Star, 21c; Extra Star, 25c; Eocene, 24c; Elaine, 27c; Water White, in bulk, 14½c; Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs, 24c; Mineral Sperm, cs, 26½c; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½ c: Lard Oil, E. W. S., bbl., $1.00; cs., $1.05; Neats-foot Oil, pure, bbl., 75c; cs.. 80c: Sperm, crude, 50@60c; Natural White, 70c; Bleached do, 75c; Whale Oil, cs, 50@55c.

BONE ASH.—Extra No. 1, 5@6c per lb. No. 1, 4@5c.

RED LEAD.—500 lbs. and over at one purchase, per lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8 @9c per lb.

BORAX.—Concentrated, 6@7c per lb powdered, 8@10c; fused, 20@25c.

BORAX.—Crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., $1.00.

BISMUTH.—Subnitrate, per lb., $1.75.

MERCURY.—Bichloride, ℔ lb., 90c.

PHOSPHORUS.—(American) ℔ lb., 75c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

Photography in Mining.

The facility with which excellent photographs may be taken, even by amateurs, has led to the employment of the art in illustrating mine descriptions, whether for popular publication or technical reports for commercial purposes. Some writers possess the faculty of description to such an extent that the reader can form a very comprehensive idea of the subject; others lack this "gift" of verbal or written description, and to these the camera and kodak are even of greater service than to the former. By the use of the camera the topography of the country can be distinctly shown, and in the case of new enterprises the difficulties or advantages of transportation and construction are made plain. The methods of working the mine, either on the surface or underground, can be shown in a manner that makes verbal description almost superfluous. On this page is a case in point. Here are seen three illustrations of a mining enterprise. One shows the general features of the country, the topography and drainage of the section, the timber and relative situation of the mining property. Another shows the method of working the mine. At a glance it is seen that it is worked by the open-cut system. The third illustration is an interior view of a well arranged stamp mill.

By use of the camera every phase of mining can be illustrated, even to securing a photograph of a blast

at the instant of the explosion. This has been repeatedly accomplished, though a near view is only obtained at considerable personal risk to the photographer, and also to the instrument. The camera is particularly useful in taking photographs of various types of construction, such as head frames, automatic dumping contrivances, motors, cars and other vehicles, and also in showing methods of timbering, shaft construction, caving workings, etc. The most difficult picture to secure satisfactorily is a rock surface where it is desired to get a photograph that will show the various physical characteristics as they appeal to the eye. The element of color is almost wholly obliterated in a photograph, and unless good judgment is used an exposure of a rock face will prove disappointing in the picture. Diffused light is seldom satisfactory in taking rock pictures. It requires direct sun or flashlight, at an oblique angle, which will throw small shadows and thus bring out the inequalities of the rock surface. Out-of-door rock pictures should be taken with a small aperture and sufficient time to secure detail. Flashlight pictures cannot be taken in this manner, of course. Pictures of machinery and other open construction, such as head frames, should be taken in diffused light—a cloudy day preferred—as it avoids confusing shadows. These may always be observed in photographs of the character described which have been taken in bright, direct sunlight, the deep shadows often making the subject indistinct and very unsatisfactory.

THE eighty-fifth meeting of the American Institute of Mining Engineers will be held in New York City next week, beginning on the 13th inst., in the rooms of the American Society of Mechanical Engineers. Among other features of the programme the members will visit and inspect the subway now in course of construction in New York. This is one of the most extensive engineering feats now being accomplished in the United States. A trip up the Hudson river to West Point Military Academy will form another interesting feature of the meeting.

THE production of pig iron has increased so enormously of late that overproduction is the result, and the large iron furnace managers of the East and South, with headquarters at Pittsburg, Pa., and Birmingham, Ala., respectively, have agreed to restrict the output by 25% to bring the amount of iron manufactured within the requirements of the trade.

THE labor problem is still a matter for serious consideration on the Witwatersrand, South Africa. Some of the mine managers and some of the merchandising interests favor the importation of Asiatic laborers, but this policy is stoutly opposed by others. At a recent meeting of prominent citizens representing several interests on the Rand a resolution was passed pledging those present to support the Labor Importation Association in its endeavor to secure the admission of unskilled Asiatic labor, subject to certain legislative restrictions.

The Bell Signal Code.

All miners realize the necessity of a uniform, comprehensive and common-sense code of bell signals in underground mines. On these signals their lives daily depend and a mistake is often attended with fatal consequences. There is at present no uniformity in the bell signals now in use throughout the United States, though there are two in most common use. One is that which has been legalized by legislative enactment in some of the States and the other is that suggested by the Western Federation of Miners. The latter has been given widespread publication, and there has been an effort made to have it universally adopted, but this code is deficient and one likely to result in the injury or death of men who work under it. It is unfortunate that some journals have published the code of the Western Federation of Miners with the editorial statement that "it has been universally adopted by all mines in the United States west of the Missouri river," for such is not the case. If the code of the Federation were revised in such manner as to make it free from objection, by reason of its present shortcomings, there would be no objection to its universal adoption. It is a subject of too great importance to be lightly disposed of.

The Basis of Mine Investigation.

A circular has been issued by the chief of mines and metallurgy of the Louisiana Purchase Exposition, to be held next year at St. Louis, Mo., urging each State commission into whose hands the collection of a representative mineral exhibit has been given, to make as complete and as representative an exhibit as possible. The circular says: "What the engineer desires to see—and it is on his information that the capitalist makes investments—is an exhibit which will illustrate not only the average richness of the deposit, but which will show the country rock contiguous to such deposits." It is true all mining engineers are interested in the kind and condition of the wall rocks of mineral veins and deposits, and all agree that these have a bearing on the economic working, if not the value of the deposits, but the circular goes further and says: "The country rock is the basis upon which the mining engineer makes his investigations," etc. That any experienced mining engineer places such importance upon the wall rocks of an ore deposit is extremely doubtful, and that he makes it "the basis of his investigation" is a flight of imagination. There are things of far greater importance than the wall rocks of a mine which is under investigation. The extent and value of the ore bodies are the real basis of mine examination, and the cost of extracting the ore and reducing it to a merchantable product are of equally great importance. The cost of extraction of the ore is influenced to a greater or less extent by the character of the wall rocks, but even an approximate idea of what particular influence the walls may have upon the economy of the proposition cannot be gained from an inspection of hand specimens of the wall rock.

It is important, however, that every mining State make as characteristic and complete an exhibit as possible at the St. Louis Exposition, for the more comprehensive and representative such exhibits are the greater the effect it will have in directing capital to the various districts represented. The mineral exhibit is no less a competitive display than that of the various arts and manufactures. Such an opportunity as this will be to display the mineral wealth of the United States only occurs occasionally, and it should not be lost sight of nor neglected. It is a duty each district owes to itself to see that it is represented in the best possible way by ores and minerals, and wall rocks as well, with such description as is necessary to render the exhibit intelligible to those who examine it in search of information.

California in 1902

The annual report of L. E. Aubury, State Mineralogist of California, has just been issued and appears on page 240. The report shows that the total output is in excess of that of any previous year, but it also shows a falling off in some of the metallic products, notably of gold and copper. This shrinkage is due mostly to labor troubles in various parts of that State, but has been offset in a measure by the production of new enterprises, which have helped to swell the total. The output the present year will undoubtedly feel the depressing effect of strikes, but still other new enterprises will add their quota and tend to keep up the average to a point near that of former years. The gold yield in 1902 was $16,910,320 and in 1901 it was $16,989,044, showing a small decrease for 1902. On the whole, the report shows what may be considered under existing circumstances to be a satisfactory condition of the mineral industry in California, particularly as there are several new mineral industries which are becoming of greater importance annually. Among these is noticed the production of gem tourmalines and of mica, the latter being included, for the first time, in the mineral output of that State. The manufacture of Portland cement is also increasing largely, as will be shown when the statistics for 1903 have been compiled and published.

Cheap Mining in Montana.

Elsewhere herein will be found an interesting description of a Montana gold mine and mill, the property of the Big Indian Co., near Helena, which will attract the attention and interest of all mining men who see it. The sketches and illustrations show clearly the method of mining by the open-cut and mill-hole system, and is an instance of mining and milling at low cost under the direction of a competent manager. The article is thoroughly practical, direct and complete.

Without going into the minutiæ of operations as conducted at this mine, the manager makes the entire proposition, with its methods, results and costs, so concise and comprehensive, that every miner can understand and appreciate the fact that good work is being done. While at first sight one is inclined to think that if the shoveling on the bench above the mill hole in the cut could be obviated by breaking the ore down directly into the mill hole, it would reduce the cost of mining, still, experience in this instance has evidently proven that it is inexpedient or inadvisable to make raises and build new chutes except at stated intervals, which would probably be determined by a distance which would bring the apex of the two adjoining slope angles to the surface, the intermediate block of ground being mined subsequently.

It is descriptive papers of the character of that here referred to of which the MINING AND SCIENTIFIC PRESS makes a particular feature. Papers of a general nature are always interesting to some, but those of a technical and practical kind are valued by every mining man to whose notice they may come. These columns are always open to those who will contribute something of their knowledge and experience. It is not so much abstruse theories that the miner and metallurgist demands as descriptions of practical operation of mine, mill and smelter. True, no paper descriptive of smelting, or some portions of the various wet processes of ore treatment, would be complete without going into the chemical reactions which take place, and these are essentially scientific and technical, but they are also thoroughly practical.

Such subjects as "the origin of gold" and "the depth within the earth at which rocks are molten and plastic" have a certain interest, but they are beyond the comprehension of most men who are actively engaged in useful pursuits. Subjects of this character are purely theoretical, and absolute knowledge regarding them is not within the present range of human possibility to obtain.

The geological description of a mine or mining district, the practical operation of a mine, with its mechanical features, methods of ore treatment, the result and its cost, new schemes in stoping, new designs in head frame and mill construction, experiences in foreign lands, drainage and ventilation of mines—these are a few of the subjects which all mining men find interesting and consider important, and to such as these the columns of the MINING AND SCIENTIFIC PRESS are always open.

An Object Lesson.

Several years ago a large dump of tailings at a gold mine in El Dorado county, California, was sampled, and considered sufficiently valuable to treat by the cyanide process. A plant was erected, and the dump was worked by that method. The result of the treatment was said to be satisfactory. The plant was removed and the incident passed out of the minds of those who were conversant with the circumstances. It is now stated that these tailings still contain sufficient value to make them susceptible of retreatment by the same process at an additional profit, and a plant is to be again built for this purpose. This is interesting as representing one of two conditions, or possibly both. The ore was originally crushed in a stamp mill and amalgamated. The treatment of the tailings several years later by the cyanide process either left values in the sands that it was not profitable to extract at that time, or the cyanide process was not applied with as perfect a knowledge of its various phases as that possessed at the present time. It amply illustrates the constant onward march of mining and scientific progress.

CONCENTRATES.

THE samples from La Grange, Stanislaus county, Cal., are talc schist impregnated with iron and copper pyrite.

"COSTEANING" is a Cornish term, meaning the prospecting of a mine by sinking pits through alluvium to bedrock.

IN roasting an argentiferous zinc blende there is always a loss of the silver by volatilization. This loss is often in excess of 10%.

COMPRESSED AIR is preferred to steam in driving rock drills. Steam is often employed in quarry work, or in a place where only temporary use is to be made of the drills.

MINERALS may be determined by the use of the blowpipe, but a knowledge of the fundamental principles of chemistry is necessary to successfully make use of the blow pipe in determinative mineralogy.

EIGHT-POUND RAILS are too light for mine cars carrying 1800 pounds or over, though in a double track tunnel rails of this weight may be sufficiently heavy for empty cars. Twelve-pound rails are heavy enough for most mine traffic where men do the tramming or the cars do not hold more than one ton each.

COVELLITE is a copper sulphide, CuS. It commonly occurs massive or in spherical forms, rarely in crystals. It has an indigo blue color, and is sometimes mistaken for blue carbonates of copper. At the Rambler mine in Albany Co., Wyo., with it is associated sperrylite, a diarsenide of platinum. It is cited as an unusual occurrence.

THE cost of transporting ore by narrow-gauge railroad depends upon the grade, capacity of motors, distance to be traveled, quantity of ore handled, management, and other things. The cost of a 7-mile haul in southern California was stated to be 12 cents per ton, coal being used as fuel. With oil it would probably be less. Three hundred tons were hauled daily.

BASALT is a rock of ultra-basic type, containing, according to classification, but 40% to 57% silica. The quartz-bearing basalt is an unusual variety which is rare. It is found at Cinder Cone in Lassen county, Cal., 10 miles east of Lassen peak. Here the rock is a fine-grained black basalt, through which occurs abundantly small white crystals of quartz. It contains, according to Didier, 57 25% silica.

IN the Joplin, Mo., district mining is carried on from the surface to a depth of about 250 feet, though bore holes sunk to a greater depth have encountered rich ore. Much prospecting is done by means of the "churn drill." The cost of drilling by this method on small contracts is stated to be $1.25 per foot. Shaft sinking is done at a low cost as compared with other mining districts. It is stated that a shaft 6x7 feet was sunk under contract 80 feet for $160. The shaft was in soft ground.

NO BATTERY BLOCKS are made for heavy quartz mills that are intended for permanent use by laying timbers horizontally. The best practice is to place them on end. Either large single blocks or two blocks of proper size are used. A battery block may also be built up from 2-inch planks, spiked together, and some mill men believe this to be superior to solid blocks, as the built up block permits repairs to be made, and mortars to be replaced without removing the block.

THE distinction between granite and syenite is in the occurrence of hornblende in excess of mica in the syenite. In each rock the predominant feldspar is alkaline (orthoclase), though plagioclase soda-lime feldspar may also be present. The syenite of Werner is simply orthoclase and hornblende. Granite, syenite and diorite pass by transition from one to the other, grano-diorite representing an intermediate stage in which the essential constituents of both granite and diorite are found.

THE mean tractive force of a locomotive engine in pounds is ascertained by dividing the square of the diameter of one piston in inches, times a single length of stroke in feet, times the average steam pressure in the cylinders in pounds per square inch, by the diameter of the driving wheel in inches. From the tractive force must be deducted 20% to 30% for internal friction. The effective tractive force cannot be greater than the adhesion of the driving wheels, or about 25% of the weight on the drivers.

RAILROAD TUNNELS are so much larger than mine tunnels that the method of excavation is somewhat different. In railroad tunnels a heading (which is an excavation about the size of the average mine tunnel, which is afterward enlarged) is usually driven ahead of the main work. Such headings usually cost about twice as much per cubic yard removed as the balance of the tunnel. Large railroad tunnels in hard rock are usually driven in benches, and in mine tunnels the entire face is carried at once.

THE cost of powder per ton of ore broken in mining varies greatly, like almost every other factor in mining costs. In some mines the cost is about 3 cents per ton, in others still less. In still others, where rock is hard and has a tendency to "break big," a much larger amount is used in order that the rock may be shattered, thus dispensing with the cost of breaking the large masses by "buildozing" and by the use of rock hammers. In such cases the cost of powder may reach 15 cents per ton of ore broken.

THE method of estimating the horse power of a boiler, as adopted by the American Society of Mechanical Engineers, is based on the evaporation of thirty pounds of water per hour from a temperature of 100° F., as it comes from the feed water heater, into steam at 70 pounds gauge pressure, which is considered equivalent to 34.5 pounds of water evaporated from a feed water temperature of 212° F. into steam having the same temperature. So, if a boiler evaporates 1800 pounds of water at 100° F. into steam at 70 pounds pressure, the boiler is rated at 60 H. P.

IN a case where veins cross, each owned by separate locators, the senior locator takes not only the vein upon which he has made his location, but also all other lodes or veins found within his surface boundaries, including the cross lode subsequently located by another. A junior cross-lode locator has no right to any ore found upon the cross vein within the boundaries of a senior claim. The owner of a junior tunnel site cannot by means of a crosscut tunnel penetrate within the bounding planes of a senior location for any purpose. Where two lodes cross in dip, the ore in the intersection of the veins belongs to the senior locator, and the junior has right of way through the vein to the continuation of his own vein beyond.

THE structure of minerals is an important factor in their determination. The various types of structure are the columnar, granular and lamellar. The columnar is divided into several varieties—fibrous, as in crysotile; reticulated, when the crystals or fibers cross in various directions; stellated, when the fibers are arranged in star-like forms, radiating from a center, as in some varieties of pyrophylite, an aluminous silicate resembling talc; radiated, when the fibers radiate from a center, but without producing star-like shapes, as is often seen in stibnite. The granular structure may be from microscopically fine to coarse. The lamellar structure is found in such minerals as mica, selenite, etc. The leaves or plates may be flat or curved.

SKIPS are generally replacing cages in shafts, both vertical and inclined. A skip can run on any angle of inclination. Where the angle of dip of the shaft is less than 80° it is advisable to have the skip built with wheels, and the shaft to be also supplied with guides to prevent the skip overturning in the shaft. Where the angle of inclination is less than 70° no guides are necessary, though it is advisable to put in a guide rail if very rapid running is to be done, as a slight inequality in the surface of the rails has a tendency to derail the skip when moving rapidly. Water skips are built having a capacity of 1500 to 2000 gallons. Skips can be arranged to dump automatically, and when properly adjusted rock may be loaded and dumped by the use of skips much more rapidly than in any other manner.

IN the desilverization of lead, zinc is employed, the latter uniting with the silver or gold, if any be present, and from these the zinc can be readily removed. The ultimate atom of silver may be removed from lead in this manner, but in metallurgical practice about 0.1 ounce per ton of silver still remains in lead bars recovered from mines containing silver with the lead. The zinc also combines with any copper or tellurium present in the lead. Lead is refined by the use of zinc, by what is known as the Parkes process, in which zinc in the form of slabs is stirred into the molten gold and silver-bearing lead, in a large iron vessel. The zinc combines with the gold and silver, forming a mushy alloy which is removed by skimming, the lead being treated in this manner several times. The quantity of zinc required varies with the amount of silver present in the lead.

THERE are cases where it is not advisable to attempt to hold a group of claims by doing assessment work on one of them, ostensibly for the benefit of all. One instance where it would be unwise to assume the risk which this might involve is where an individual or company secures from a number of independent owners a group of claims, under bond, and proceeds with the development by confining the work to a single claim. This is the more likely to lead to complications if these several claims are on several separate veins. If, however, the bond is taken up, and the properties come under a single ownership of either an individual or company, the new owner may confine assessment to one claim without danger of having the other claims "jumped," if the work so done can be shown to be for the benefit of all the claims of the group, which claims must be contiguous.

BRASS is an alloy of zinc and copper. The relative proportion of the metals varies greatly with the use to which the alloy is to be put. An alloy containing 80% copper has a reddish-yellow color; and with less than 48% copper it is gray to white. In intermediate stages the alloys are various shades of golden yellow. The hardness of these alloys is greater and the melting point lower than those generally calculated as the mean of the two metals. The ductility of zinc-copper alloys increases with the percentage of copper. There is but one definite alloy of zinc and copper, containing about 33% copper and 67% zinc, which corresponds to the formula $Cu\ Zn_2$. All other alloys of zinc and copper are stated to be solutions of this definite alloy, in an excess of one of its constituents. Muntz metal contains 40% zinc and 60% copper. It is occasionally employed for mill plates and are said to be satisfactory amalgamators.

AN overshot water wheel should be so placed that the buckets will not be immersed to a depth of more than 1 foot in the tail race. The water should enter the buckets at a point 16 to 27 inches lower than the head water level. The velocity of the water at the point of impact with the wheel is from 9 to 12 feet. The water must have a greater velocity than the periphery of the wheel. If the velocity of the wheel be too great the water will be dashed out of the buckets quickly. The depth of the buckets is usually about 10 to 16 inches, depending on the size of the wheel. The diameter of an overshot wheel may equal the available height of fall of water less about 2½ feet. The number of buckets which may be put on a wheel is determined by the diameter of the wheel and the distance between the buckets. To lessen as far as possible the loss from spilling, the buckets must have the proper form, and the water supply should be restricted to the extent that the buckets be not over one-quarter to one-third full. Overshot wheels have an efficiency of about 75%.

IN many mines the first step in concentrating the ore is the sorting of the ore in the underground workings. This is easy where there is a marked physical difference between the ore and the waste, but in many mines this difference is not always apparent, as the ore and waste may bear such a resemblance to each other that hand sorting is impracticable, at least underground. In other mines the difference in appearance between ore and waste is so difficult to determine that sampling of the face is the only reliable guide. In some portions of the gold mines at Hedges, San Diego county, Cal., the miners who are acquainted with the mine can distinguish between pay rock and waste by simply passing the fingers over the face of rock in the workings, and yet the difference to the eye is scarcely noticeable. The difference is wholly physical and lies in the fact that the gold-bearing rock is more siliceous than that which is barren, the latter containing innumerable grains of decomposed lime feldspar, which disintegrates under the touch, while the more siliceous rock remains firm. Of course this is no index of value, but the harsh feeling rock seldom contains more than a trace of gold.

THE Washoe process is the name given to the amalgamation of gold-silver ores, as practiced on the Comstock lode, Nevada. It consisted essentially in crushing the ore in the stamp mills and grinding it in pans with mercury in the presence of salt and bluestone, together with water and steam. The bluestone dissolves, freeing sulphuric acid which assists in decomposing the sulphides and at the same time, uniting with the sodium chloride, frees chlorine, which unites with the silver to form silver chloride. The gold and silver are then amalgamated by the mercury and drawn off into a well by means of a so-called "syphon." The pulp after several hours' grinding and subsequent amalgamation is discharged into a settler where it was thinned by the introduction of additional water and a further amount of amalgam recovered. As flouring of the mercury is not of infrequent occurrence, a third pan, called the agitator, was usually provided to catch the amalgam and mercury escaping from the settler. The process is more particularly adapted to silver ores containing sulphides. Chloride silver ores are treated by this process or by hyposulphite of soda. Frequently ores treated by the Washoe process require previous roasting. There are many modifications of the process.

THE lack of uniformity in the names and numbers of mill screens makes comparisons difficult. A screen may be called a 30-mesh, meaning thirty holes to the linear inch or ninety to the square inch. Two screens may be made having this number of apertures per square inch, but if made of different gauge wires these holes will not have the same superficial area, and consequently a different capacity for discharging pulp through them. In the selection of a mill screen it should be the aim not only to get a screen which will wear well but one suited to the ore. The ore should be crushed no finer than necessary to free the greatest value at least expense. The economy of saving may easily be carried too far for economical results. When known to what degree of fineness the ore should be crushed it is not good mill practice to employ a screen which, though it endures well, will wear by the attrition of the rock until the holes become enlarged to such an extent as to pass particles of ore twice the size of those which pass it when the screen is new. If fine crushing is necessary to free the values it will generally be found that tailings will run higher through an old battery screen than through a new one. The life of a screen depends upon the kind of screen; amount of water used in the battery; height of discharge, and, largely, upon the character of ore as to hardness. A flinty ore will discharge more rapidly through a slotted screen than through a woven one, and a granular ore is best treated with a wire cloth or round punched screen.

The Metallurgy of the Homestake Ore.*

NUMBER II.

Written by C. W. MERRILL, B. S.

CLASSIFICATION.—We have now a pulp containing eight or ten parts of water to one of ore, and much of the latter is so infinitesimally fine as to cause a visitor, who had watched an attempt to filter the slimes on a large scale, to say that, for an exemplification of the size of a molecule, he would advise the study of Homestake slimes.

The tailings as they leave the mill are sized with the following result: Coarse (remaining on 100-mesh), 22%; middles (between 100-mesh and 200-mesh), 18%; fines (passing a 200-mesh screen), 60%. That is, 60% of the particles issuing from the mortar have less than 0.00001 square inch of cross-section.

When the erection of the cyanide plant had been determined upon, the question of a tailings wheel to elevate the pulp and permit the location of the plant nearer the mills being under discussion, it was calculated that to elevate the tailings at a cost of about 2 cents per ton would cost the company, approximately, $140,000, on the proportion of the material then blocked out in the mine which would be available for leaching. In other words, for every cent per ton which could be saved in the secondary treatment of the leachable material, the company would profit ultimately to the extent of at least $70,000. Consequently the plant was located, as shown in Fig. 1, about a quarter of a mile below the Lead mills, and the problems of transportation and of such classification as would permit the pumping plant to return its former percentage of water to the mills presented themselves. The latter has been met by the installation of the upper cone house, where twelve gravity settling cones, 7 feet in diameter and with 50° sides, throw off about half the water and, perhaps, one-fifth of the solid matter, which latter is the very finest slime, of the following sizing, during 1902: Coarse, 0; middles, 1.76%; fines, 98.24%. The thickened slimes are subsequently settled out of this pulp, and a part of the water is returned to the mills.

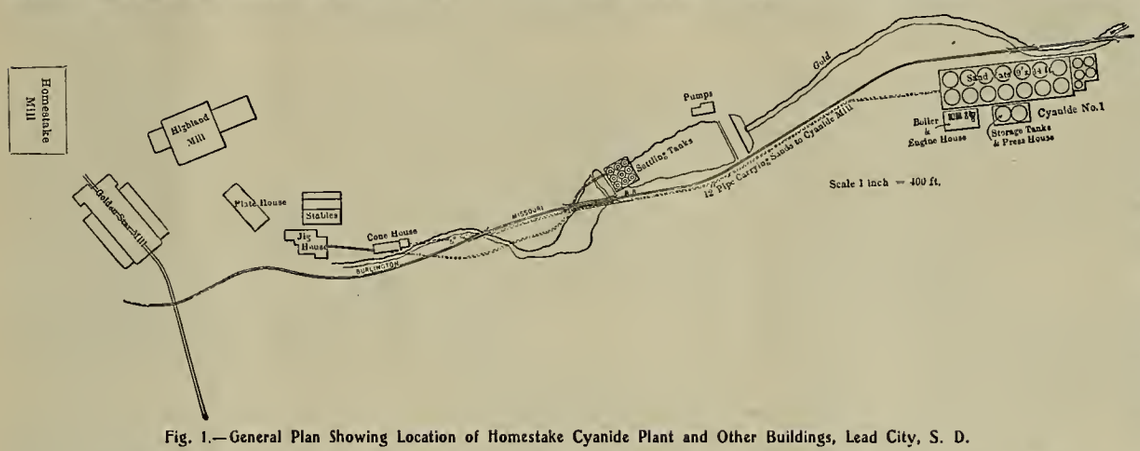

Fig. 1.—General Plan Showing Location of Homestake Cyanide Plant and Other Buildings, Lead City, S. D.

From the bottom of the cones is drawn the thickened pulp, containing all of the leachable material and some of the slimes. This portion is transported by means of a 12-inch cast iron flanged pipe on a minimum grade of 2.5%, and with as few turns as possible, to the cyanide plant.

The second step in the classification is carried out in the plant proper by means of six more gravity settling cones, the overflow from which, of a like composition to that of the first twelve cones, is conducted to a collecting tank, whence it is drawn for the purpose of sluicing out the leachable material after its treatment has been completed. The average sizing of this second settling-cone overflow for 1902 was: Coarse, 0%; middles, 1.38%; fines, 98.62%.

The underflow from the second set of gravity-settling cones, which is now quite thick, passes to twenty-four sizing or hydraulic classifying cones, which carry a device for discharging the sand and introducing the water, patented by the writer. By its means the admission of water does not result in currents of varying velocity, which latter always interferes with uniform separation of slimes from granular material.

These sizing cones complete the classification, which has been a difficult problem—first, because of the extreme fineness of the pulp, and, second, because the writer was determined to avoid double treatment, which entails a largely increased installation and operating cost, but which is necessary, unless a product be obtained practically free from slime.

The slime overflow from hydraulic classifiers had the following sizing average for 1902: Coarse, 0%; middles, 1.46%; fines, 98.54%. As regards all slimes referred to, they will practically pass the 200-mesh screen, the middles being largely wood pulp.

In fact, there is little doubt but that the importance of the most perfect classification possible will be recognized shortly as a vital consideration in the cyaniding of wet, crushed ore; and metallurgists will not follow the old German practice of spitzkasten and spitzlutten, which are very imperfect machines as compared with a cone classifier or sizer for separating granular from flocculent material. The writer's judgment is that a scientific classification system, by which all the granular or angular material may go to the leaching vats, and all the amorphous portion to the slime plant, will in the future be a feature in designing a plant on which the greatest care and experimentation will be put and the highest grade of technical skill utilized.

CYANIDE TREATMENT.—By these three steps in the classification we have separated the pulp into non-leachable slimes, comprising about 40% of the ore crushed, and practically all passing a 200-mesh screen and a direct leachable product, amounting to, approximately, 60% of the tailings, which, although very clean and free from mud, is still of a very fine texture, as the following sizing test (the average for the year 1902) will show: Coarse, remaining on 100-mesh, 40.5%; middles, 100 to 200 mesh, 30.8%; fines, passing 200 mesh, 28.7%.

While this fineness is notable, we find that, as the proportion of lower level ore increases, we can treat an even finer product. A recent charge, containing as high as 40% fines, maintained our normal leaching rate of 3 to 4 inches per hour throughout the treatment. This is undoubtedly due to the fact that the fines from the lower level rock contain a greater proportion of angular or granular, and a smaller proportion of amorphous, hydrated or flocculent, material.

The leachable pulp, which contains 10% to 12% of pyrite, is now ready to go to the vats, and, on the way, lime is added in quantities varying from three to five pounds per ton. At first we tried adding this lime in the mills, as is done in Africa, but found that the amalgamation was most seriously affected thereby. Not only was the plate completely coated, weeks being required to get it back in proper shape, but the tailings values were largely augmented. This result only emphasizes the fact that the process must fit the ore, and that attempts to make an ore fit a process are useless. This practice of adding lime to the battery is, according to the writer's information, unanimously pronounced to work the best results in Africa, and to reduce the values in the slimes lost from amalgamation to half of what they are when no lime is used in the battery. In our case, however, we have demonstrated that the best results follow from crushing the lime wet into a running pulp which joins that from the sizing cones, whereby there is less slacking and less loss of flocculent lime in the vat overflow—i. e., in the water which overflows the vat, the sand having settled out. Not only is it of distinct advantage to have our lime go into the tank in unslacked granules, but recent investigations are proving that the average size of these granules has an important bearing on the subsequent cyanide decomposition and gold extraction. This seems to be due to the fact that a low alkalinity, but one approximately constant throughout the leaching, is an important desideratum with the Homestake ore, on account of its considerable content of easily decomposed sulphides. We are not as yet prepared to say what is the very best mesh screen to use on our lime stamp battery, but at present we are using a wire screen, the opening of which is $\frac{1}{64}$ square inch. In this connection it should be said that only the purest lime should be used, the magnesia in the ordinary domestic (Black Hills) limestone being objectionable for several reasons.

The classified pulp and the lime having commingled, the mixture passes to the distributor, which is of the garden-sprinkler or Butters & Mein type.

There are two distributors, one for each row of vats, hung from a carriage, which travels on a track, and the step of which rests on the top of the center-bottom-discharge gate of each vat, when the distributor is in operation. There are fourteen vats, each 44 feet in diameter, 9 feet deep inside and holding 610 tons of sand. To fill one of these requires from eleven to eleven and one-half hours, which, with our equipment, permits of about five days' contact with solution before it is necessary to recharge the vat. After filling, the drain valve is opened, the top leveled and the stronger of the two stock solutions, of a strength of 0.14 of 1% KCN, is run on. The contact with this solution, including frequent drainages for the purpose of drawing in air, is maintained for about three days. The air contact is very important in Homestake ores, owing to the presence of pyrrhotite or subsulphide of iron, which absorbs oxygen with great avidity, and which would greatly retard the dissolving action of the cyanide solution were not large quantities of the essential oxygen introduced. The effluent solution during this period, having normally a strength of 0.10 of 1% of cyanide, is run to the weak precipitation tanks, of which there are two, each 26 feet in diameter by 19 feet deep, and holding 300 tons of solution.

After the three days' contact with strong solution, the weak solution (normally of a strength of 0.10% KCN) is brought into the charge, and this contact is maintained for the remaining two days. The effluent solution from the charge during this period is run to the strong precipitation or rather collecting tanks, which are of the same size and number as the weak precipitation tanks.

Fig. 2 shows the interior arrangement of the works.

After contact with the weak solution has been completed, wash water is brought into the charge, and the washing continued until the effluent solution is down to 0.03 or 0.02 of 1% in KCN and from 5 to 7 cents per ton in value.

The charge is now ready for sluicing, which operation is accomplished by two men, with 3-inch hose, in about four hours, using the slime water from the overflow of the second settling cones. The four side gates and one center gate afford ample facilities for the discharging. The last inch or so of the sand is sluiced with clear water under seventy-five pounds pressure through 1¼-inch hose, and the eight-ounce duck filter, under which is another of cocoa matting, is washed clean. The vat is then filled with water, and is ready for the next charging.

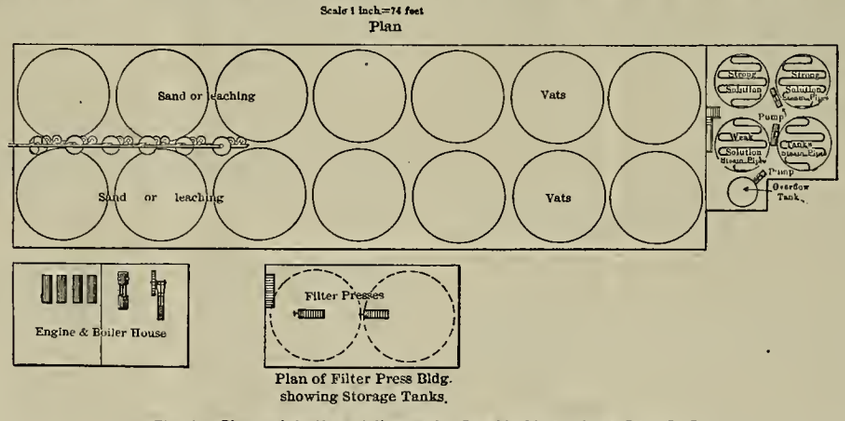

Fig. 2.—Plan and Section of Homestake Cyanide Works, Lead City, S. D.

(TO BE CONTINUED.)

THE haphazard experimenter of the past no longer has a place in the field of metallurgy. He has been supplanted by the expert chemist and analyst, and investigations in the realm of chemical metallurgy are now carried on along scientific lines, and the results are gratifying, for higher percentages of the values are being saved, and the costs of treatment are being reduced.

Identity and Continuity of Veins.

One of the most interesting features of mining law is that dealing with the extralateral right, which often includes, as a prerequisite to the exercise of this privilege, the establishment of the identity and continuity of the vein. This only becomes necessary when the right of an apex proprietor to follow the dip of his vein beyond the side line of his claim is challenged. In such event he is required to show that an apex actually exists within the boundaries of his claim to an extent sufficient to cover that portion of the vein in dispute. He must also establish the identity and continuity of his vein from the croppings (apex) within his claim boundaries to the point in dispute.

It is not essential that the outcrop of the vein pass through both end lines of his claim, or even one of them, but its course within the claim should be of such a character as to entitle the claim holder to the extralateral right, to the extent of covering that portion of the vein in dispute.

In following his vein on its downward course the owner of the apex must keep within his vein, for he cannot crosscut underneath the holdings of another to reach the vein.

The legal establishment of the identity and continuity of a vein on its downward course, as well as along its strike underground, and beneath the surface of adjoining lands, is often oue of the most difficult questions the courts are called upon to settle. The very wide difference of geological occurrences make it impossible to lay down arbitrary rules for the determination of questions involved in the identity and continuity of veins and the exercise of the extralateral right. The irregular deposits in the limestones of the Eureka district of Nevada, the blanket veins of the northern Black Hills, South Dakota, the fissure veins of the gold belt of California, and the complex vein system of Butte, Mont., are each of widely different geological structure. These illustrations might be made to include many others of still different type. So various are the structural conditions found in the development of mines, that previously decided cases wherein the extralateral right has been involved, may scarcely be assumed as establishing a precedent in another case where geological conditions differ.

FIGURE 103

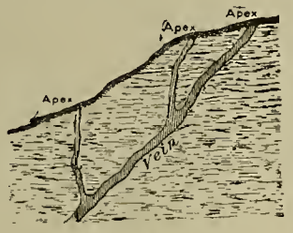

FIGURE 104

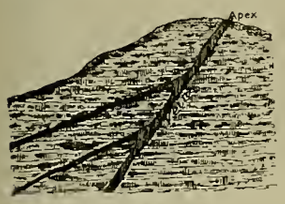

FIGURE 105

FIGURE 106

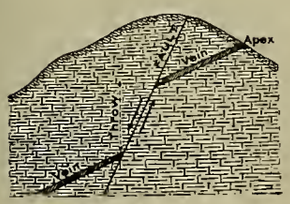

FIGURE 107

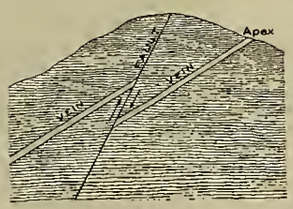

FIGURE 108

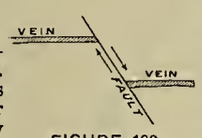

FIGURE 109

The new edition of "Lindley on Mines" contains a valuable chapter devoted to this interesting and important feature of the mining law. Concerning the complicated cases arising from the extralateral right the author says: "The best that can be done in discussing this branch of the law is to present such cases as seem to clearly enunciate principles which may be considered of general application. Of all the decisions of the courts which deal with the subject under consideration, that rendered by the Supreme Court of Montana in Butte & Boston M. Co. vs. Societe Anonyme des Mines de Lexington, speaking through Justice Hunt, is the most instructive and valuable."

Following is an extract from the opinion of the court in the case cited:

"The right of an apex proprietor to pursue a vein passing from his side lines is dependent upon whether or not as a fact the part or mineral body of vein matter which lies outside of the perpendicular of the side lines of his surface claim is so preserved in its identity with the lode inside that it is part of the same vein, the apex of which belongs to the surface owner.

"On principle the identity of the apex of a vein with its spurs or extensions must be the crucial test by which are to be fixed the proprietary rights to that vein and the mineral therein.

"The pursuit of the vein on its dip being, then, the right to be guarded, the identity of the vein pursued must be proven to make the right availing where it is contended the vein, after passing beyond the vertical planes drawn through the side lines of the surface boundaries of the location in which rests the apex, penetrates soil the surface of which is embraced within another location. Identity must always exist. Were there any departure from this rule the miner might secure the benefit of more than he discovered, which was never contemplated by law. Identity in mineral deposit should have no significance not usual to identity of many other material things. It means the same thing or the same vein. It may be said to include a vein that is incessant. But a vein that is incessant or identical in its parts is not necessarily a vein which is continuous in the sense that the continuity or union of its parts is absolute and uninterrupted. In other words, though a continuity of vein does not preclude identity of vein, yet identity does not necessarily include continuity in the exact sense just referred to. 'Law of continuity,' says Webster's dictionary, 'the principle that nothing passes from one state to another without passing through all the intermediate states.' Speaking exactly by this definition, it would often be very difficult, if not impossible, for the challenged proprietor of a mineral vein to convince a jury of the continuity of the vein from one part to another, for there might not be continuity by actual contact of the parts or contiguity which the precise word may literally mean must exist. Were such a rule inexorable a failure of proof would not infrequently be brought about by the inability of the miner to prove continuity without transmission through intermediate states. The miner, therefore, might fall short of that exact measure of evidence required to establish a continuity of vein which excludes interruption between one and another part of the identical vein, and, judged by too closely interpreted significations the continuity would be lost; yet if he prove the identity of his vein by some incessant feature, in our judgment, the right to pursue the lode on its dip is his, and there should but remain the necessity of going to the surface limits to accurately adjudicate the lines defining the right to the vein so identified.

"In this discussion, however, we do not mean to exclude the need of continuity sufficient to preserve identity. The application of the rule of identity of vein should always be made so as to require the miner to trace his lode continuously if he depart beyond his extended side lines."

The court quotes with approval the charge of Judge Hallett in Iron Silver M. Co. vs. Cheesman, upheld by the Supreme Court of the United States, and the following from the opinion of the latter court in that case:

"Certainly the lode or vein must be continuous in the sense that it can be traced through the surrounding rocks, though slight interruption of the mineral bearing rock would not be alone sufficient to destroy the identity of the vein. Nor would a short partial closure of the fissure have that effect if a little farther on it occurred again with mineral bearing rock within it."

The Supreme Court of Montana then continues:

"The true sense in which there must be a continuity of vein is therefore a qualified one and not an unqualified exact one, irrespective or independent of physical conditions found in mining. It may be said as a paraphrase of the decision cited, that identity is essential and the vein must be continuous, but its continuity may be interrupted, even to a closure of the fissure without destruction of the identity, provided the extent of the interruptions or closure does not prevent the tracing of the lode or vein through the fissure to be identical in its parts as a geological fact."

Identity may, of course, be proved by continuous development, says Judge Lindley, although this is not always practicable. It may be deduced from observed facts in different portions of the mine. The incessant features of a given vein as exposed in underground works may ordinarily be presumed to continue throughout undeveloped sections, within reasonable limits, unless there is something in the exposed conditions which negatives such presumption. In regular fissure veins, in the absence of faulting, there is but little room for speculation on the subject of identity. All veins have their individualizing characteristics, and when these are shown to be persistent by actual development their recurrence in undeveloped sections may within reasonable limitations be inferred or established by correlation.

The accompanying illustrations* are in themselves suggestive in connection with the discussion of the identity and continuity of veins.

If a vein "splits," or "forks," either on its strike, as shown on Fig. 103, or on its upward course, as shown on Fig. 104, the forks beyond or above the points of union may form distinct apices, subject to separate location, and thus constitute separate veins in the eyes of the law.

If the forking is downward, as shown on Fig. 105, there is but one controlling apex for all the branches, and, according to our view, the whole must be regarded as a single lode.

In connection with a large complex lode it is sometimes difficult to determine whether or not the various points of outcrop taken together constitute a single apex, and whether included masses of barren rock constitute "horses" belonging to one vein, or country rock in place separating distinct vein apices.

Most veins have small spurs and offshoots. Just where to draw the line or make the distinction between "spurs" and separate branch veins in a legal sense is a matter difficult to determine. Certainly no inexorable rule can be prescribed in advance of some authoritative decision on the subject, and we are aware of none.

In the tracing of a vein there are two important elements—the continuity of vein matter and the continuity of wall boundaries.

"With either of these things well established, very slight evidence may be accepted as to the existence of the other." A vein to be followed must be continuous only in the sense that it can be traced by the miner through the surrounding rocks. Continuous ore is doubtless the best evidence, but it is not essential. Many veins carry only small "shoots" of ore, and the intervening spaces are represented only by a continuous fissure with or without gangue or gouge material.

"A vein is by no means always a straight line, or of uniform dip, or thickness, or richness of mineral matter, throughout its course. The cleft, or fissure, in which a vein is found may be narrowed or widened in its course, and even closed for a few feet and then found further on, and the mineral deposit may be diminished or totally suspended for a short distance; but if found again in the same course, with the same mineral, within that distance, its identity may be presumed."

But as pointed out by the Supreme Court of Montana in the case heretofore referred to, identity is not necessarily destroyed by intrusive dikes, faults, or casual displacements. Certainly in the case shown on Fig. 106 the intruding dike does not destroy vein identity, although it interrupts its continuity in a physical sense.

So in the case illustrated on Fig. 107, representing a very common occurrence, viz., a "normal fault," the fault fissure having been formed after the vein, the hanging wall of the fault plane has slipped or has been thrown downward relatively to the foot wall, and has carried with it a part of the vein; or a "reversed fault," as represented on Fig. 108, where the hanging wall of the fault plane has been thrust upward relatively to the foot wall; or a fault with horizontal displacement, a "lateral heave," as shown in plan on Fig. 109.

*The illustrations accompanying this article are from "Lindley on Mines, Edition 1903," and are published through the courtesy of C. H. Lindley.

Drift Timbering.

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by W. H STORMS.

The use of a transit is often resorted to for the purpose of keeping the alignment of a tunnel. It is desirable to keep tunnels straight where practicable, but often it is not expedient to do so. Miners, when developing their own claims, often run very crooked tunnels, when not on ore, swinging from side to side in an endeavor to follow the softer ground, or to take advantage of "slips" to "break to." This may seem economy, but it is economy of rather a doubtful character. The subsequent difficulties, loss of time, and extra power required at the various turns, after a time render the economical crooked tunnel a more expensive one than had it been driven straight.

It is an easy matter to keep a tunnel or drift in perfect alignment without use of an engineer's transit. By reference to Fig. 6 a plumb line will be noticed, suspended from a nail driven in the cap, exactly half way from either end. The carpenter, when framing the cap, should make a small score at the center, to be used by the miners as a guide when setting up the timbers. When the direction in which it is desired to run the tunnel or drift has been determined, some stationary object directly in line should

be selected, such as a prominent tree or other natural object, if outside, or a drill hole with a plug and center nail, if underground, from which the alignment may be taken and kept. The first set having been accurately placed (the line from the fixed point

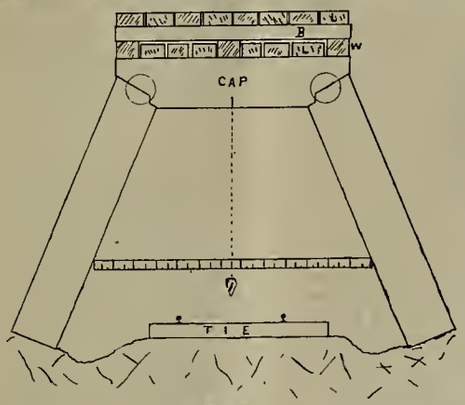

Fig. 6.

to the plumb line being directly in the alignment of the tunnel) the miner may safely proceed. When the second set is in place a second plumb line is dropped in like manner from it, and the set is wedged so that the first and second lines are directly in line with the previously arranged or determined fixed point. When the third set is placed in position the plumb line is removed from the second to the third set, and this set lined up with No. 1 and the fixed point. Underground, candles are often necessary. These are placed directly in the alignment.

The cap may be centered accurately, but the "legs" of the set may not have the same slope, which would make the cap out of level. This may be remedied by utilizing a measuring stick of the proper length, reaching from post to post to post, as shown in the sketch, having a plainly marked center point. The legs should be shifted by wedging, if not "true," until the plumb line is directly opposite the center of the measuring stick. In this manner a drift or tunnel may be run for thousands of feet in perfect alignment. The grade is a matter to be determined by the character of the traffic through the tunnel. Heavy cars hauled by motors are usually run on a light grade, while tunnels where it is intended to tram single cars with men should not exceed 5 inches raise per 100 feet.

In drifting and tunneling, occasionally the material through which the work must be driven caves so badly that not only must top and side lagging be employed, but also "face boards"—that is, the face of the drift must be covered with boards, which are securely held in position either by upright posts and back braces, or in the manner shown in Fig. 7.

In some cases the ground caves so badly that the

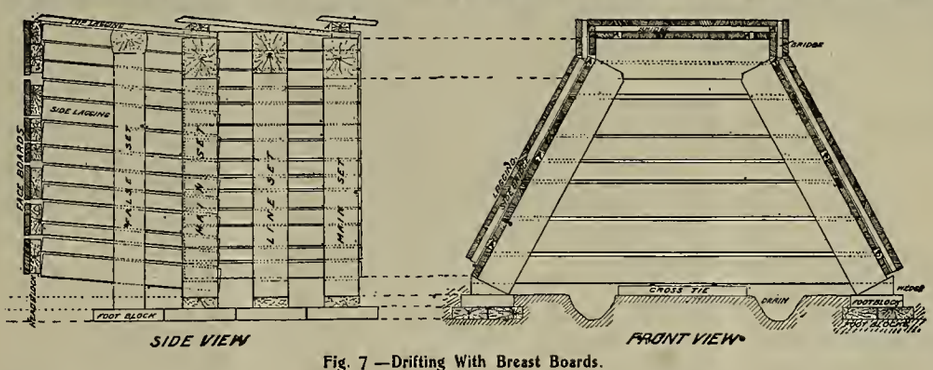

Fig. 7.—Drifting With Breast Boards.

full length between two sets of timber cannot safely be excavated without the use of a "false set," shown in Fig. 7. This set is for temporary use only, and is higher than the regular sets, purposely made so in order that the lagging as driven forward may be kept pointed sufficiently high to catch the bridge on top of the next permanent set.

Electrolytic Refining of Copper.*

Written by W. D. BANCROFT.

In determining the best conditions for the electrolytic refining of copper, we must consider the cost of the power necessary to precipitate a tankful of copper under different current densities and at different temperatures; the cost of heating the tank; the deterioration of the electrolyte; the interest charge on the copper in the tank; the cost of pumping, and the quality of the copper deposited. Good adherent copper can be obtained at almost any current density, provided the rate of circulation be sufficient. The question of the cost of pumping has not been taken up, and is supposed to remain constant while the conditions are varied. The watt-hours necessary to precipitate a gram of copper increase with increasing current density, and decrease with rising temperature. The cost of heating increases with rising temperature, and the interest charge on the copper in the tank decreases with increasing current density. With increasing current density, we have to strike a balance between the increasing power and the decreasing interest charge. With rising temperature, we have to strike a balance between the decreasing cost of power and the increasing cost of heating. The object of this paper is to furnish data bearing on these points. Two of my students, Messrs. Schwab and Baum, have heretofore determined the relation between voltage, current density and temperature for pure copper plates set a definite distance apart in four solutions. By expressing the voltages in terms of the voltage at 20°, the effect of the distance between the plates is eliminated, and the percentage variations hold for any set of plates in the same solution. Data have been obtained showing the relations between current efficiency, current density and temperature for pure copper plates in four different solutions. These experiments were necessary because Foerster and Seidel had found a marked falling off of the current efficiency above 50°. These runs also give the degree of neutralization of the acid by copper. Incidentally, some experiments have been made on the effect of iron salts. The cost of heating tanks similar to those used by the Baltimore Copper Co. has been determined, Messrs. Schwab and Baum having calculated the variation of the cost with varying conditions of temperature and current density for the case of all power costing at the rate of $20 per horse power year, and for the case in which steam heating costs only one-thirtieth of electrical heating.

TEST No. 1.—The object of this test was to determine the variation of voltage with variation of temperature, current density and solution. In commercial copper refining two standard solutions are used, each solution containing 16% copper sulphate crystals. The refineries using the Hayden system make up their electrolyte to contain also 6% sulphuric acid, while the plants operating with the multiple system use a 9% acid solution. It has been claimed that the addition of a small quantity of sodium chloride produces a more coherent form of copper at the higher densities. Experiments were, therefore, made with the following solutions:

SOLUTION A.—16% $CuSO_4 5H_2O$ and 9% sulphuric acid.

SOLUTION B.—16% $CuSO_4 5H_2O$ and 6% sulphuric acid.

SOLUTION C.—Solution A + sodium chloride (1 : 2,000,000 of solution).

SOLUTION D.—Solution B + sodium chloride (1 : 2,000,000 of solution).

Pure copper plates, 5 centimeters wide and dipping 10 centimeters into the solution, were used as electrodes, one cathode and two anodes. The plates were held 1 centimeter apart, and arrangements were made for efficient stirring. The four solutions were placed in four beakers, and the measurements made under practically the same conditions by means of Weston instruments, which had been compared with a standard. The four beakers stood in a large water bath.

The voltage required to obtain a given current density is materially less with the 9% acid solution than with the 6% acid solution. The addition of sodium chloride to the solution increases the voltage at the lower temperatures, while the effect is scarcely noticeable at the higher temperature.

TEST No. 2.—Current Efficiency Run: The object of this test was to determine the variations of the current efficiency when operating with the different electrolytic solutions at varying temperatures and different current densities. Heretofore it has been claimed that the current efficiency drops off rapidly when working at temperatures above 50° C. It was to verify the correctness or prove the incorrectness of this claim that this test was made.

The apparatus used in this test was practically the same as was used in the voltage test (test No. 1), with the addition of a copper voltameter run in series with the four other cells.

The electrolytes used for this run were the same as those of the voltage run, viz., solutions A, B, C and D.

This test showed that the current efficiencies for temperatures below 70° C. fall off but very little, and are practically 100%. Even at a temperature of 90° C. and a high current density of 4 amp. per qdm., the efficiency runs as high as 98% and 99% for the 9% and 6% solutions, respectively, while a current density of 1 amp. per qdm. gives an efficiency of 90% and 91%. While this result is apparently in flat contradiction with that of Foerster and Seidel, this is not really the case. These authors find 47% efficiency with 0.3 amp. per qdm. and 83% efficiency with 1 amp. per qdm. at 100°, while we find, at 90°, 91% efficiency with 1 amp. per qdm. and 99% efficiency with 4 amp. per qdm. The highest current density of Foerster and Seidel is our lowest. Since no refinery in this country runs at as low a current density as 1 amp. per qdm. (except, perhaps, the Calumet & Hecla), the conclusions of Foerster and Seidel are not applicable to American practice. Between 50° and 70° the efficiency in some cases runs a trifle above 100%. This is, no doubt, due to the formation of cuprous sulphate in small quantities in the electrolyte.

The deterioration of solution is proportional to the ratio of anode loss to cathode gain, since pure copper plates were used and there was no sediment or copper scrap at the bottom of the beakers. The solution deteriorates more rapidly at the higher temperature and at the lower current densities. This deterioration of solution probably more than offsets the advantage of decrease in voltage which the higher temperatures give, but only when operating at the lower current densities. The ratio of anode loss to cathode gain, when operating at 70° C. and 4 amp. per qdm., is hardly any higher than this ratio for operating temperatures between 20° and 50°.

EFFECT OF IRON IN ELECTROLYTE.—Frequent statements have been made that the presence of iron in the electrolytic solutions cuts down the current efficiency. To investigate this, solutions containing iron were electrolyzed between weighed copper electrodes at a temperature of 45° C. and a current density of 2 amp. per qdm., with a voltameter in series. The results obtained show that there is no falling off in the current efficiency. After the test the precipitate on the cathode was dissolved in nitric acid, and the solution was tested for iron. None was found, thus demonstrating that iron was not precipitated.

TEST No. 3.—Radiation Run: One of the important items in electrolytic copper refining is the cost of maintaining the electrolytes in the vats at operating temperature. To form some idea of the relative costs of operating at various temperatures was the object of this test.

The vats in a plant using the Hayden system are 9 feet long, 2 feet wide and 2½ feet deep, and are filled with copper plates ½ inch apart. Accordingly, there was constructed a small tank out of ½-inch stock, with the inside dimensions of 9x2x2½ inches, and filled it with copper plates ½ inch apart. The joints of the tank, as well as the inside, were lined with tar, thus effectually preventing leaks.

As a means of heating up a tank, a platinum coil was placed on the bottom and connections brought out to binding posts on the sides of the tank. Next the tank was filled up with electrolytic solution (solution A), and its temperature brought up to near the boiling point by passing an alternating current through the platinum coil. When the solution had reached a temperature of about 95° C. the current was turned off and the run started.

A standard thermometer was placed in the electrolyte, and readings of its temperature taken at varying intervals of time, until the temperature had dropped to about 40° C. Two radiation runs of this sort were made—the first with the tank uncovered and the second with a cover over the top.

The tank was again heated up to 90° C., and the current so adjusted that the temperature of the solution was maintained constant. The power required to overcome radiation at 90° was determined both for covered and uncovered tanks. The power required at several different temperatures was computed both for covered and uncovered tanks, and the data are given in the following table:

CONSTANT TEMPERATURES—POWER DATA.

TANK COVERED.				TANK UNCOVERED			
Degrees Temperature...	Watts.....	Degrees Temperature...	Watts.....	Degrees Temperature...	Watts.....	Degrees Temperature...	Watts.....
90	44.0	65	25.2	90	145.0	65	42 0
85	40.1	60	21.7	85	110.0	60	34.4
80	36 6	55	18.8	80	90.4	55	26.4
75	33 5	50	14.5	75	67.3	50	20.6
70	28.8	.....	.....	70	50.6	.....	.....

Since the radiation of any two similar bodies is directly proportional to the area of their radiating surfaces, these values of power as determined for the small tank can be easily translated to figures for a tank of commercial size by multiplying by 100.

*Abstract Transactions American Electrochemical Society, Niagara Falls, N. Y., September 18, 1903.

Testing Methods in the Physical Examination of Portland Cements.*

NUMBER II.

Written for the MINING AND SCIENTIFIC PRESS by A. H. CEDERBERG.

TENSILE STRENOTH TEST.—The objective points in this test are:

First.—To ascertain the cementing properties which a cement will develop within a given period.

Second.—To ascertain the quality in general of the cement hy watching the results of the periodical increases in strength, either tensile or crushing, from minimum to maximum time of exposure or immersion.

The methods pursued in manipulating the details in this test are so many and at such a variance that it is next to impossihle to find good checking tests on same sample of cement, if done hy different testers. The principal difference is in the method of moulding the hriquette itself. A good, up-to-date tester will use his fingers and trowel alone, while others, lahoring under antiquated ideas, hased upon quality of cement in years gone hy, will use hammers, moulding or ramming machines, etc. The method recommended hy the committee, ahove referred to, and which should he in use in all first-class lahoratories, is as follows:

"The hrass moulds should he filled at once, the material—that is, the mixed cement—pressed in firmly with the fingers and smoothed off with a trowel without ramming; the material should he heaped up on the upper surface of the mould, and, in smoothing off, the trowel should he drawn over the mould in such a manner as to exert a moderate pressure on the excess material. The mould should he turned over and the operation repeated."

With this detailed description in mind, the test is as follows:

1. NEAT TEST.—Take ahout two pounds of cement—larger quantity at any one time is not to he recommended—and put the same, "cone-fashion," on a large plate glass or polished marhle slah. Form a small crater in the center and pour here the proper percentage of water, which should he as clean as possible. The necessary proportion of water to cement is difficult to determine on paper, without having seen the sample to he tested, or knowing room temperature, etc. Basing the average room temperature at +70° F., I would say that water, in which the temperature lies hetween +65° F. to +75° F., to the extent of 18% to 20% of the weight of the cement, is fairly accurate for a normal and fresh cement, whereas the older the cement the more water is necessary. A percentage of 19.2% water has given excellent results with some of the domestic cements tested hy me. Fineness of cement also affects the proportioning. Thus a cement showing only 92% fineness does not need the same amount of water that a 96% fine requires. A six months' old cement needs more water than when only thirty days old, and so forth.

The water having heen poured into the crater is quickly ahsorhed hy the cement, and the tester now commences to knead the mixture into a dough in a regular hiscuit-haker's fashion for a short period—say, 1½ to 2 minutes—after which the dough is ready to he put into the hrass moulds, preferahly so-called gang moulds, hy the detailed operation as ahove stated.

This neat test is now heing rapidly superseded hy the so-called sand test. As the manipulations in either test are the same, I will at this juncture take up:

2. SAND TEST.—This test originated in Germany and is, from a constructing engineer's standpoint of view, of far greater value than the older "neat test." Like a good many innovations, it met with constant scorn from the outset, and, strange to say, the well-known Faija was one of its worst antagonists. But time has demonstrated its usefulness, and, as stated, to the up-to-date engineer it is the more valuahle of the two, inasmuch as the admixture of the sand to the hriquettes corresponds more closely to the conditions under which the cement is apt to he used, and hence the information gained hy such testing is more in conformity to what might be expected from its cementing properties. No other proportion than three sand to one cement (weight, not volume) should he used, and, if other proportions are used, such should he explicitly stated or given. Any clean silica or quartz sand can he used, and should he of such fineness that all will pass through a 20-mesh screen, hut all to he retained on 30-mesh. (This is also recommended hy the committee above referred to.) Right proportions of sand and cement are mixed together very thorough and in dry state.

A sample lot thus mixed should weigh ahout thirty-six ounces, which would mean nine ounces cement and twenty-seven ounces sand. Put this mixture, cone-fashion, on a plate glass, form a small crater in center of same and put in proper percentage of water, generally half of what is required in neat test. Knead this mixture in same manner as described in the neat test and put it in the mould as quick as possible, as per details given ahove. From this on the treatment of either neat or sand moulds is the same.

The neat hriquette and sand hriquette moulds should now all he weighed, and if there should appear any great discrepancy in weight, say, 3½% or more, of any one hriquette in particular, throw same out entirely.

During the first twenty-four hours the moulded and weighed hriquettes, which, after having ohtained their final set, are removed from the moulds, are put either on a glass plate or polished marhle slab and covered with a damp cloth, or else put into a special moist air chamher. Initial and final set of every hriquette should he taken and recorded in minutes, and for all practical purposes the time thus recorded is amply sufficient. When the twenty-four hours are up, the hriquettes to he suhjected to long-time tests are immersed in water, kept in zinc-lined wooden trays, or, what is still hetter, porcelain-lined cast iron trays. The water should have an even temperature, say, +65° to +75° F. In the tray the immersed hriquettes should he turned over every other day.

For practical purposes the testing machines in use to-day, such as the Fairhanks, Riehles, Adies, etc., are all good. To the less expert, the Fairhanks is prohahly the most reliahle, as it works ahsolutely automatically after once adjusted. The only precaution necessary to ohserve in using the Fairhanks is to see that the "shot" is not discharged too rapidly, i. e., the rapidity of discharge should not register any faster than at the rate of 550 to 600 pounds in one minute. Nothing is more important than the maintaining of uniform rapidity of discharge, especially when comparing different hrands, and in the hands of an unscrupulous or "fixed" tester the disregard of this uniformity can easily lead to unwarranted discriminations.

The idea of running the shot through very slow in testing A's hrand and very fast in testing B's brand is as unfair to A as it is advantageous to B and should never he tolerated.

The time tests to which the neat and sand hriquettes are suhjected, in order to ohtain "the commercial value of the cementing properties," are for—

Neat Briquettes.	Sand Briquettes.
24 hours in air.	7 days (1 day in air, 6 days in water).
7 days (1 day in air, 6 days in water).	28 days (1 day in air, 27 days in water).
28 days (1 day in air, 27 days in water).	

To the contractor or engineer these time tests, together with the all important hoiling test, are amply sufficient for all practical purposes. For municipal or puhlic works, the engineering departments of which generally maintain a permanent tester at a regular salary, long-time tests should he carried on, covering as much as twelve months, and the records of such long-time tests should he open for inspection to any contractor or engineer in charge of construction where cement is used. It is not fair to expect a contractor to pay a large sum of money for testing cement covering long periods and to have these long-time tests repeated every time he uses a new shipment of cement. The tests ahove enumerated are amply sufficient and can he done at a comparatively low figure, and the city engineering department should give all the other necessary data free of charge, if it possesses same.

These municipal long-time tests, or "checking tests," as they may properly be called, should he recorded as follows:

Neat Briquettes.	Sand Briquettes.
24 hours	
7 days	7 days.
28 days	28 days.
2 months	2 months.
4 months	4 months.
8 months	8 months.
12 months	12 months.

The proportional increase in tensile strength per square inch a first-class, modern, domestic Portland cement hriquette, treated as above described, should develop on neat test and sand test during the first twenty-eight days is as follows:

	Neat.	Sand.
24 hours	250 lbs. @ 400 lbs.	
7 days	500 lbs. @ 800 lbs.	200 lbs. @ 300 lbs. or over.
28 days	700 lbs. @ 1,000 lbs. or over.	300 lbs. @ 400 lbs. or over.

A Portland cement that increases in tensile strength in the ahove time limits, and in a proportion that is more or less in conformity with the ahove quoted, will always he considered a more normal acting Portland cement than one that tests as follows:

	Sample No. 4231 Neat.	Sample No. 4978 Neat.	Sample No. 6131 Neat.
24 hours	262 lbs.	119 lbs.	365 lbs.
7 days	906 "	764 "	796 "
28 days	864 "	765 "	921 "
30 days	865 "	701 "	905 "
Boiling test	Fair.	Pat warped.	Pat cracked and warped.

It is seen the hoiling test will soon ferret out the trouhle.

Cement representing such samples should he rejected, not on account of an ahsolute unsoundness, which in sample No. 4231 might he unwarranted, hut hecause a manufacturer has no husiness to palm off such cement as a true Portland cement. Any chemist, any engineer, who is in charge of cement works can, if he is the least hit careful, and has the necessary practical experience, prevent the making of such cement, and the public at large may as well know that a manufacturer can, even under adverse circumstances, always produce a cement that will conform in all main details to the most exacting requirements. This fact ought to he enough reason to induce the careless "experts" to change their methods and he fair and square towards their competitors, that is, meet a first-class cement with first-class, and hoth tested alike.

Cement manufacturers, as a rule, puhlish pamphlets advertising the excellence of their product, and in most instances they are intimately fair. Notahle exceptions are, however, found now and then. Thus for instance:

A well-known cement works in the East, whose product is widely advertised and is known to test lower than any other hrand, either neat or sand, in the same locality, defends this with the following remarks:

"Cement giving tensile strength neat hetween 300 and 350 pounds per square inch at seven days, shows the highest ultimate results and the highest percentage of increase per annum, while cements showing strains of 500 and 600 pounds per square inch at seven days show no ultimate gain, hut an actual loss, and a very slight percentage of annual gain."

This pamphlet also gives the following comparative analyses:

Time.	Brand I.			Brand II.			Brand III (the advertised)		
	Neat, lbs..	Fineness on 100..	Sand, lbs..	Neat, lbs..	Fineness on 100..	Sand, lbs..	Neat, lbs..	Fineness on 100..	Sand, lbs..
24 hours	373	89.6	137	389	93.9	141	293	92.4	103
7 days	682	.....	253	668	.....	258	456	on 200	186
28 days	756	on 200	29	748	on 200	292	542	.....	261
60 days	806	76.7	320	754	81.8	311	568	82.1	299
90 days	829	.....	331	806	.....	321	579	.....	329
120 days	837	.....	350	836	.....	332	615	.....	335
180 days	869	.....	362	870	.....	382	625	.....	337

A careful study of the ahove three hrands would indicate that the advertised hrand heing finest on 200 mesh shows up the poorest on the sand test, hecause according to experience the finer the cement the higher the sand test.

Trautwine gives the following interesting data on page 437 (page 923 eighteenth edition):

CONCRETE OF PORTLAND CEMENT—CRUSHING LOAD PER SQUARE FOOT IN TONS.

Proportion—1 cement, 3 sand, 7 broken stone.

When 1 month old.....12 to 18 tons.
" 6 months old.....48 to 72 "
" 12 " " .....74 to 120 "

Which cement is then to the constructing engineer the hest, providing hoiling test is satisfactory?

There can he only one answer and that is, "The cement that ohtains its ultimate tensile strength in the shortest time limit," that is what the engineer wants.

The same pamphlet gives the following long-time sand tests: 1 to 3 in pounds—Seven days, 230; one month, 275; two months, 275; three months, 267; four months, 296; five months, 329; six months, 325; seven months, 351; eight months, 286; nine months, 304; ten months, 300; eleven months, 308; twelve months, 327; twenty-four months, 342; thirty-six months, 336. (Test made hy Eng. Dept. District of Columhia). I consider this test not only erratic, hut rather poor. I will say that I have myself used nearly 11,000 harrels of this cement in construction work, hut of all the tests I have made of same, which numhered eighty-nine, I got the following average results:

Neat.		Sand 1 to 3.	
24 hours	181 lbs.		
7 days	334 "	7 days	143 lbs.
28 days	418 "	28 days	209 "
6 months	618 "	6 months	307 "

Here on the Pacific coast manufacturers' pamphlets have recently been issued, hut a glance of these pamphlets show their utter disregard of fairness. They compare tests of their own modern hrand ground and tested according to modern requirements with tests of foreign as well as domestic hrands which were made and tested ten years ago, under less exacting conditions, as well as requirements, and especially taking good pains to talk ahout the extreme fineness, hut never mentioning one word ahout the all important hoiling test. The expert chemist, as well as engineer, can at a glance tell, hy looking over such publications, which cement

*Copyrighted.

is the best, the advertised new brand or the despised old braud. If these pamphlets had shown comparative tests of all brauds under equal conditions the results would probably be published in somewhat different form, if at all.

What a modern American cement can show is strongly illustrated in the following test made by the writer:

Time—	Boiling Test.			Neat Test in Lbs.			Sand Test in Lbs.		
Aug. 14, 1901— Aug. 14, 1902.	Alpha.....	Whitehall.	Dragon ...	Alpha.....	Whitehall.	Dragon...	Alpha.....	Whitehall.	Dragon...
24 hours .	O.K.	O.K	O.K.	349	393	421	...	...	...
7 days ..				679	721	702	291	321	289
28 days ..				821	881	816	384	449	395
2 months				896	906	860	472	483	764
6 months				904	910	891	523	521	509
12 months				over 1,000	926	894	611	604	599

Fineness on 100 mesh — Alpha, 94.8; Whitehall, 95.7; Dragon, 94 2

Any number of domestic brands, such as "Atlas," "Vulcanite," "Lehigh," "Medusa" "Star," etc., can show up similar excellent results, and so can any manufacturer if he has the right kind of raw materials and the right kind of men in charge of his works.

The writer has made preparations for comparative long-time tests, etc., of the brands in use on the Pacific coast, and will in time publish the result of same.

(TO BE CONTINUED.)

Cyanide Poisoning---Its Cure and Prevention.

Several months ago the Chemical and Metallurgical Society of South Africa sent circulars broadcast throughout the mining regions of the world, the purpose of which was an investigation of cases of poisoning by means of cyanide of potassium in any form around metallurgical works.

From a large number of replies sent in answer to the questions asked on the original circular the following has been deduced by the committee:

1. That cyaniding, per se, is a healthy occupation.

2. Considering the large amount of cyanide used at the mines, the number of fatal cases of cyanide poisoning is very small.

3. The few fatal cases are to be attributed to carelessness on the part of the deceased, or to pure accident. In one case only was the accident to be attributed to the mine authorities.

4. The most important disease attributable to cyanide is cyanide eczema.

5. Many cases of "gassing" occur among those who are working the zinc-dissolving tanks, on account of the hydrocyanic acid gas and arsenuretted hydrogen given off.

PREVENTIVE MEASURES.—Your committee is convinced that very little in the way of expenditure will result in the prevention of practically all the evils attendant upon working with cyanide. The following is a categorical account of the evils and the suggested preventive measures:

1. The danger of death from cyanide poisoning lies almost entirely in the cyanide testing rooms and assay offices. Familiarity breeds contempt or carelessness, and all the accidents which have been brought to the notice of your committee have been caused by the imbibition of cyanide solution in mistake for water.

Your committee is strongly of opinion that it is necessary that there shall be an adequate supply of wholesome drinking water provided in each testing room and assay office, and that the supply shall be distinctly labelled "Drinking Water." Your committee feels that if this is not done the mine management can hardly be held blameless should an accident occur.

2. Cyanide eczema is confined entirely to those who have to handle the zinc shavings in the precipitation boxes.

From the evidence that has been brought before your committee cyanide eczema is unknown on those mines where the cyanide solution is replaced by water previous to the zinc shavings being handled, and your committee therefore recommends that it should be the duty of the cyanide manager to see that the cyanide solution in the precipitation boxes is so replaced before the zinc shavings are handled.

Your committee is of opinion that this simple precaution will result in the disappearance of cyanide eczema from the mines.

3. When the zinc shavings and gold precipitates which contain arsenic and cyanide compounds are brought into contact with sulphuric acid, hydrocyanic acid gas and arsenuretted hydrogen are evolved, the former always, and the latter frequently, in dangerous quantities. Both these gases are very poisonous, and were it not that the majority of the extractor houses are lofty and well ventilated, the danger arising from the evolution of these gases would be serious. Notwithstanding the good ventilation, however, your committee is of opinion that this is a source of real danger, as is evidenced by the number of cases of "gassing" which occur.

Your committee therefore recommends that these dissolving vats in which the gold precipitates are treated should be hooded in some manner, in order that the gases may be carried into the open air.

It is also desirable that some form of mechanical agitation should be used, in order to do away with the necessity of raising the hood for the purpose of stirring the contents of the vats.

Although only remotely connected with cyanide poisoning, among the replies received mention was made of salivation produced by the calcining of gold precipitates from the zinc boxes. This salivation is, of course, due to the inhalation of mercury vapors, and can be prevented by a proper construction of the calcination furnace, which insures that the vapors shall be completely removed to the outer air.

Practical Results of Irrigation.

From an address by HON. JAMES WILSON, Secretary of Agriculture, at the National Irrigation Congress.

Up to the present time a large part of the field work of this department has been measuring the quantities of water used in irrigation. Measurements have been made at the heads of canals, at the heads of laterals and at the margins of fields. The great differences between the quantities diverted by some canals and the quantities delivered by them led to a series of measurements to find out where the water taken from the streams, but not delivered to farmers, went. Such measurements, made up to and including the season of 1901, show that canals on an average lose 6.75% of the water entering them in each mile of their length, some small canals losing in a single mile as high as 64% of the water diverted by them. The general average of the volume lost by canals in their entire length is usually given as one-third of the volume diverted, although our measurements would indicate that it is even greater. The saving of these losses from canals means an increase of a third in the area which can ultimately be reclaimed. The measurements made show that in many canals the larger part of the losses occur in short sections of the canals, and the measurements locate these conditions. Where this is the case, the losses can be stopped by lining the canals or putting in flumes for these short distances where the losses are greatest. The measurements show another fact: The percentage of losses from small canals are much greater than those from large canals. Averages of our measurements show that:

WHAT THE FIGURES SHOW.—Canals carrying 100 cubic feet per second or more lose .98% per mile.

Canals carrying from 50 to 100 cubic feet per second lose 2.67% per mile.

Canals carrying from 25 to 50 cubic feet per second lose 5 22% per mile.

Canals carrying less than 25 cubic feet per second lose 7.48% per mile.

These figures show that the percentage of loss from small canals is more than seven times that from large canals. Great savings can, therefore, be made by running water in large canals, rather than in a large number of small ones.

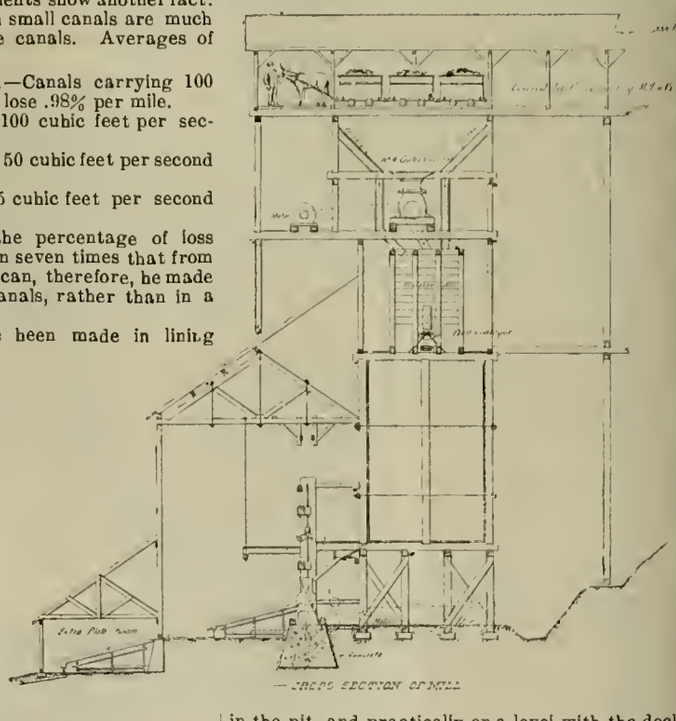
Various experiments have been made in lining ditches to prevent loss, and the department is collecting all available information on this subject. The problem is not to find a means of conveying water without loss, but to find a cheap means of doing this. As the demand for water becomes greater, larger expense will be justified. What is needed is a cheap but effective means of stopping the losses from canals. We are working on this problem. Its solution means, as has been shown, an addition of at least one-third to the area which can be reclaimed.

Production of Monazite in 1902.

In his report to the United States Geological Survey on the production of monazite in 1902, J. H. Pratt says that the Brazilian Government has granted to a German, for a period of ten years, the exclusive right to develop the monazite sand deposits along the coast of Brazil, and this, he thinks, will tend to increase the interest in the monazite deposits of North Carolina and South Carolina. The Consul General at Frankfort has informed the Department of State that a company has been formed in Berlin to acquire control of this privilege. During 1902 a number of inquiries were received from German importers for information regarding the occurrence of Carolina monazite. Satisfactory replies were made in all cases, except with regard to the price of monazite sand. This is held at a higher figure delivered in Germany than the Brazilian monazite, but, with the latter deposits controlled by one company, the price of the sand will probably be much increased, and a considerable demand for the Carolina sand for export to Germany is likely to arise.

The production of monazite in the United States is confined exclusively to North Carolina and South Carolina, by far the larger amount being obtained from the former State, and in 1902 this amounted to 982,000 pounds, valued at $69,580. This is an increase of $10,318 in value and of 233,264 pounds in quantity over the production of 1901, which was 748,736 pounds, valued at $59,262. The price received by the miners per pound of the monazite produced in 1902 varied from 2½ cents to 5½ cents, according to the percentage of thoria. The nearer the sand is brought to a pure monazite, the higher its relative value, and this is accomplished by closer concentration and the use of the electromagnet in separating the higher minerals.

Only 190 pounds of monazite sand and thorite were imported into the United States during 1902. There is no record of any export of monazite, though in 1903 there will probably be a considerable export of this mineral to Germany.



Big Indian Mine.

Written for the MINING AND SCIENTIFIC PRESS by COLIN MCINTOSH.

The Big Indian mine is situated at the head of Big Indian gulch, about 4½ miles south of Helena, Mont., and at an altitude of 5300 feet above sea level.

The formation is granite, cut by several porphyry dikes. The ore is a heterogeneous mass of metamorphic quartz, granite and porphyry, forming a dike about 250 feet in width, unknown length and an average height of the oxidized ore of 80 feet. For the past ten years the ore has averaged in value $3 per ton. This ore is mined or quarried in an open pit, as shown by the accompanying sketch and illustrations.*

Holes of an average depth of 12 feet are made by hand churn drills. These are "sprung" with giant powder, after which black blasting powder is used. As the ore is very friable it is broken into sizes which can be readily handled. The cars are loaded by hand and then dumped into the different loading chutes—but one handling being necessary. The loading chutes are operated from a working tunnel, which is about 55 feet below the deck of the trestles

CROSS SECTION OF MILL

in the pit, and practically on a level with the deck of the crusher house.

Each chute contains three pockets, each of which is fitted with iron ore bin gates, rack, pinion and hand wheel. The gates are spaced so as to accommodate a car opposite each one. The cars are of the gable end style, of about three and one-third tons capacity each, three cars being a load for one mule. But one man is employed in this work. As high as 510 tons of ore have been handled in one shift of ten hours, the ore being hauled from mine to mill and unloaded into the crusher, the distance from mine to mill being about 450 feet. The mining force usually employed consists of one foreman, two drill hands, one car man in working tunnel, one blacksmith and twelve laborers. Drill hands, blacksmith and car man are paid $3.50 per day and laborers $3 for ten hours' work.

The average daily output with this force is about

*See Illustrations front page.

310 tons, the amount milled. The total cost per day is $64.50, equivalent to 20 1/3 cents per ton, including supplies, tools, etc.

At the present time the ore is handled for much less than this amount, owing to the favorable weather.

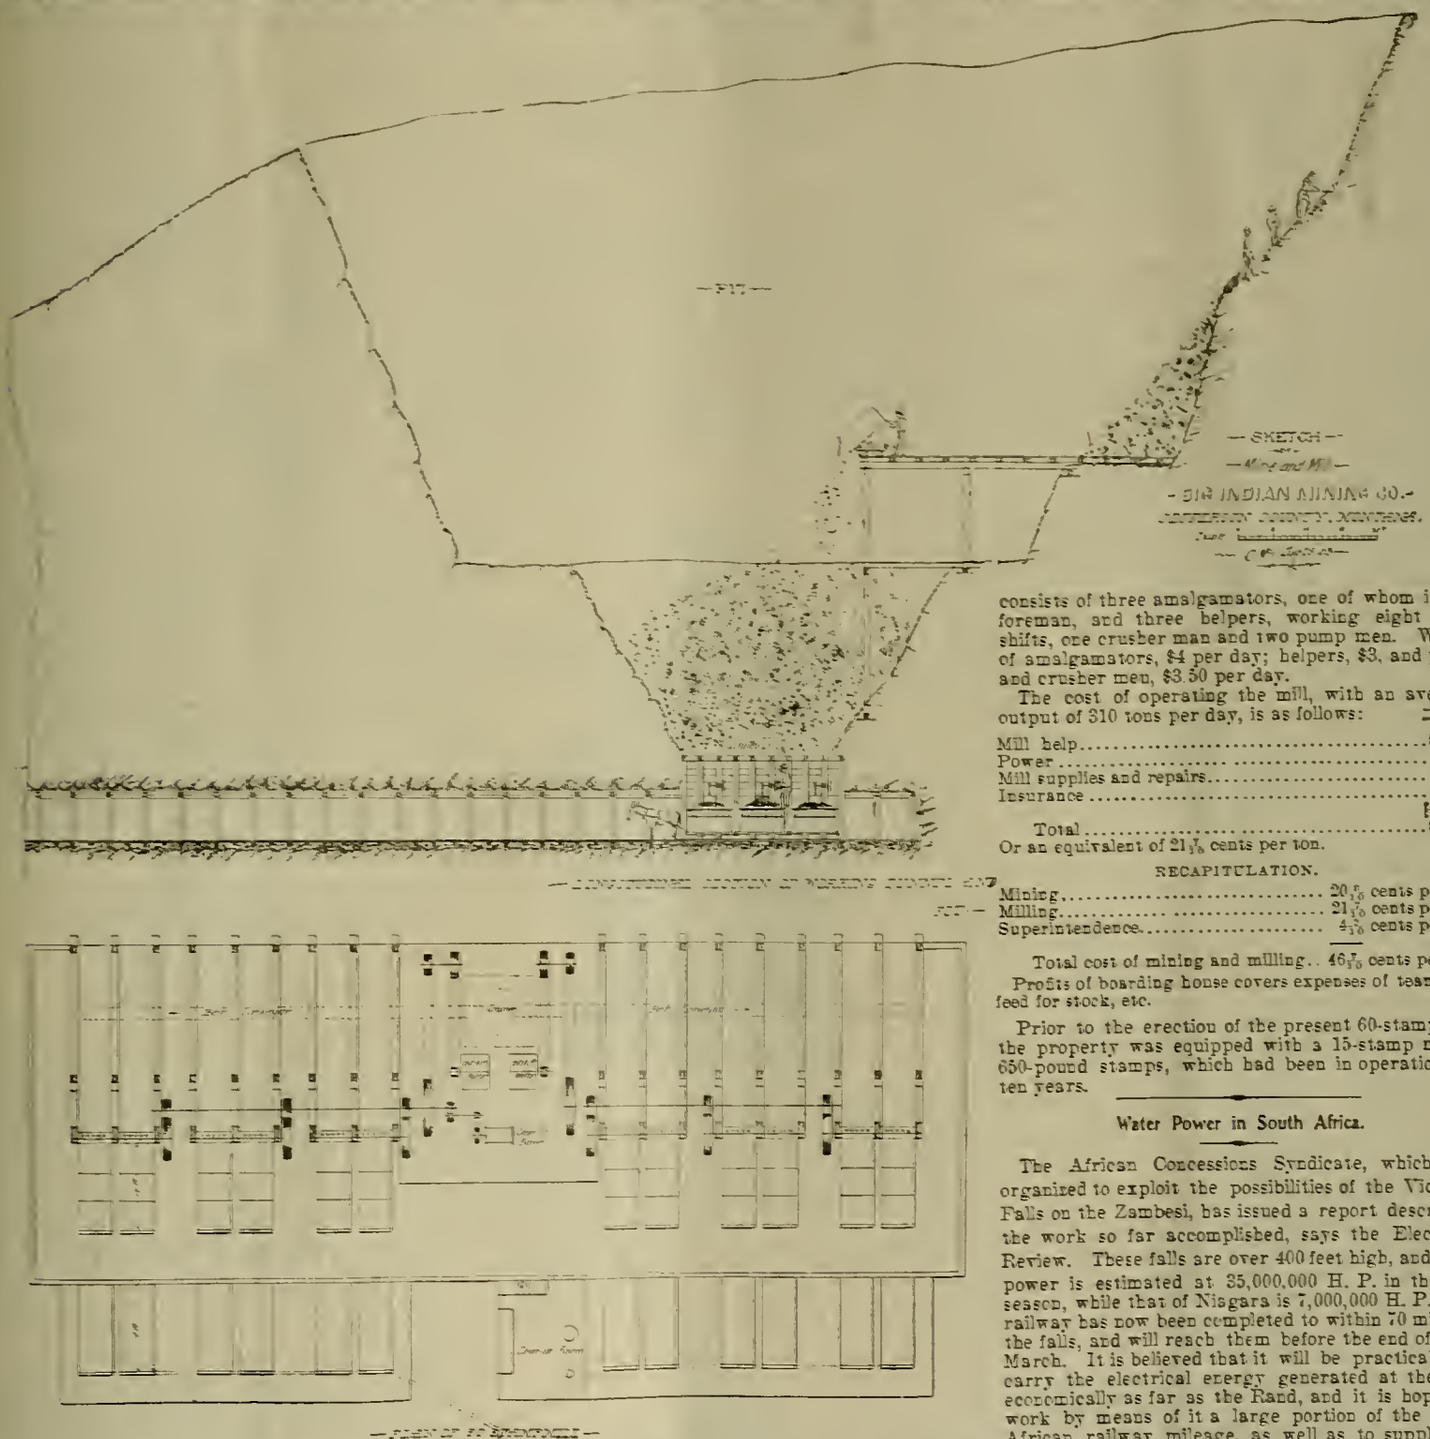
The question may arise, "Why are not the loading chutes placed directly under the ore body?" The answer to this question is, That the lower working tunnel is below the oxidized ore in hard rock. As the working tunnels are necessarily large, the cost per foot is about $16, to which must be added the cost of building the chutes. Further, the ore which could be mined into these chutes is equivalent only to the amount between the lines of natural slope from the chutes. This method was tried and discarded for the one now in use, which is more economical, and has the further advantage of enabling the sorting of ore.

Of course, when the haul from the present chutes to the face of the pit gets to be excessive new chutes will be put in directly under the ore body.

During the winter months but little trouble is experienced, as the chutes are covered up to the level of the trestle, affording storage room for ten to fifteen days supply of ore for use in stormy weather.

The entire plant is operated by electricity, including lighting of mine and mill. The power is obtained from the Missouri River Power Co. at a yearly rental of $50 per horse power. The current, three-phase, alternating, is received at 11,500 volts and transformed to 440 volts.

By referring to the accompanying sketch it will be seen that the mill is divided into two units of thirty stamps each, driven by separate motors. Crusher and pumps are also operated by independent motors. The mill is equipped with chrome-steel cams, tappets and shoes, and cast iron dies. Each stamp head weighs 850 pounds, has a drop of 5 inches, 100 per minute. The mortars are of the narrow Homestake, low-discharge pattern, and are bolted to cast iron anvil blocks, each weighing about 13,000 pounds. A piece of sheet rubber 1/8 of an inch in thickness is placed between the mortar and anvil block. The latter is secured to the concrete piers by six bolding down bolts built in the concrete.



The ore is dumped from the cars over the grizzlies and into the No. 4 Gates crusher—the fines passing through the grizzlies into chutes and thence to the crusher bin. From this bin it is fed onto two flat belt conveyors (one on each side of the bin), from which the ore is distributed to the different pockets in the ore bin. These belts have been in use and show but very little wear, considering the amount of ore handled.

The conveyor rollers are of hard wood, set in an adjustable yoke, which permits the roller to be tilted to an angle of 45°. By this arrangement any pocket in the ore bin can be filled. Some trouble was at first experienced by wet ore sticking to the belts. This difficulty was overcome by screwing to the roller, for its full length, a half round piece of hard wood, ¾ inch diamter, imparting to the roller a vertical shaking motion. But one man is required to attend the crusher and belt conveyors.

Suspended ore feeders are used, which give excellent satisfaction. Numerous experiments were made with screens of different styles and sizes. A 24-mesh wire screen is now used, from which the best results were obtained. Straight outside amalgamation is practiced. At first 4x12 feet silvered copper plates were used to each battery. This area has been doubled, as it has been found advantageous to do so. Plates are cleaned once in twenty-four hours. The average saving is about 87½% of the assay value of the ore.

The tailings cannot be worked profitably. They are conducted to a system of settling tanks, from which the clear water is drawn off and pumped back to the mill for re-use.

The average life of shoes and dies is about 150 days. But one stem has been broken since the mill has been in operation, a period of ten months. The mill force

consists of three amalgamators, one of whom is mill foreman, and three helpers, working eight hour shifts, one crusher man and two pump men. Wages of amalgamators, $4 per day; helpers, $3, and pump and crusher men, $3.50 per day.

The cost of operating the mill, with an average output of 310 tons per day, is as follows:

Mill help	$32.50
Power	20.14
Mill supplies and repairs	12.00
Insurance	2.70
Total	$67.34

Or an equivalent of 21 7/10 cents per ton.

RECAPITULATION.

Mining	20 5/10 cents per ton
Milling	21 7/10 cents per ton
Superintendence	4 3/10 cents per ton
Total cost of mining and milling	46 7/10 cents per ton

Profits of boarding house covers expenses of teamster, feed for stock, etc.

Prior to the erection of the present 60-stamp mill the property was equipped with a 15-stamp mill of 650-pound stamps, which had been in operation for ten years.

Water Power in South Africa.

The African Concessions Syndicate, which was organized to exploit the possibilities of the Victoria Falls on the Zambesi, has issued a report describing the work so far accomplished, says the Electrical Review. These falls are over 400 feet high, and their power is estimated at 35,000,000 H. P. in the wet season, while that of Niagara is 7,000,000 H. P. The railway has now been completed to within 70 miles of the falls, and will reach them before the end of next March. It is believed that it will be practicable to carry the electrical energy generated at the falls economically as far as the Rand, and it is hoped to work by means of it a large portion of the South African railway mileage, as well as to supply the power in the gold mines. American estimates are that with conditions similar to those in Rhodesia it will be possible to convey the current 330 miles and deliver it there at a cost of $22 per kilowatt per year,* the load being on the whole twenty-four hours of the day. Within a radius of 300 miles of the falls there are important gold fields, coal fields, copper fields and about 900 miles of railways, while a transmission of 600 miles would take in the whole of the South African gold fields. The site of the falls is said to be healthy throughout the year, and the whole region is thought to be more richly endowed in mineral wealth, including copper, iron, gold and coal, than any similar area on the surface of the globe. At present only preliminary survey work is in progress, but it is expected to complete this very shortly, and work will then be begun on the building of a hydroelectric generating station, much on the lines of that at Niagara Falls.

* Equivalent to about $1.50 per horse power per month.

The Ventilation of Deep Levels.*

Written by THOS. JOHNSON.

The efficient ventilation of the deep level mines is a matter of great importance. The term ventilation may he defined as the constant exchange of a current of fresh air for a current of foul air, circulating in certain definite directions, so that all the different parts of a mine may he kept in a healthy condition, and, therefore, free from all accumulation or mixtures of dangerous gases.

That there is a proper supply of air to a mine is a point that should he attended to hy every one in charge. It really pays to have good ventilation, as men are not only capable of doing more work, hut do it with greater comfort and are more contented.

Mine regulations require that every mine must he constantly supplied with an adequate supply of fresh air. Not less than 70 cubic feet of such air per minute shall he supplied in the intake for each and every person employed underground, and as much more as circumstances may require.

Should the Inspector of Mines deem it necessary, a register of the quantities of air circulating through the mine shall he kept.

The ventilating current shall be suitahly split where necessary, and the air conducted to and along the face of each and every working place throughout the entire mine, in sufficient quantities to render harmless and sweep away the smoke produced hy hlasting, or any other noxious gases, so that all working places and traveling roads shall he in a fit state for persons to work and therein travel.

The rules also require at least two shafts or outlets to the surface, with which every reef or mineral hed for the time heing worked in the mine shall have a communication of not less than one meter wide and one meter high, so that such shafts or outlets shall afford separate means of ingress and egress availahle to all persons employed in such mine, whether the shafts or outlets helong to the same mine or to more than one mine.

Now, although the law provides that there shall he two shafts or outlets, it is silent as to upcast and downcast shafts, which leaves every one in uncertainty as to whether a company would he within its rights in using one shaft for hoth upcast and downcast; anyway, there must be upcast and downcast.

The necessity for ventilation is understood at once when it is remembered that the breathing of every person in a mine, the comhustion of lights and explosives and the numerous chemical changes constantly taking place in the mine all rob the air of its oxygen, and contribute toward the production of an impure atmosphere.

The average composition of the atmosphere is as follows: Nitrogen, 77.95 volumes; oxygen, 20.61 volumes; carbonic acid, .04 volume; watery vapor, 1.4 volumes; also, traces of ammonia, ozone, nitric acid, Marsh gas and several newly discovered gases, argon, neon, krypton, xeon.

Oxygen, the chief supporter of life and comhustion, is the most important. If by any means the oxygen is reduced hy 1%, the remaining air is no longer fit to he hreathed; if reduced by 2%, it is only just capahle of supporting the flame of a candle, and if 4% is taken away, a lamp will refuse to hurn, while air with 5% less oxygen than is contained in the ordinary atmosphere can not be breathed.

Authorities differ as to the amount of air necessary for efficient ventilation.

The Transvaal mine regulations of 1898 require not less than 70 cubic feet per person per minute.

The hituminous mine law of Pennsylvania specifies for not less than 100 cuhic feet per person per minute in any mine.

The anthracite mine law of Pennsylvania specifies for not less than 200 cuhic feet per person per minute.

Each of these laws contain modifying clauses, specifying that the amount of air in circulation shall he sufficient to dilute, render harmless and sweep away smoke or noxious gases.

The first general rule of the English coal mines regulation act states that an adequate amount of air shall constantly he in circulation to dilute, render harmless and sweep away noxious gases to such an extent that all working places, traveling roads, etc., shall he in a fit state to work and travel therein.

Belgium calls for from 64 to 106 cuhic feet per person per minute in mines not giving off fire damp.

Warrington Smythe recommends 100 cubic feet, T. J. Taylor 160 cubic feet, Mr. Mackworth 100 cuhic feet and Mr. Lloyd 100 cuhic feet per person per minute in mines free from fire damp.

The quantity of air required for efficient ventilation can not properly be fixed at so much per person for each and every mine, as the conditions at different mines and in different parts of the same mine vary so much.

A mine or part of a mine with a small stoping width could he hetter ventilated with a certain amount of air than a mine with a greater stoping width, as good ventilation depends greatly on velocity.

Take, for example, a stope of 3 feet width, quantity of air 1500 cubic feet per minute, the velocity equals 1, and a stope of 6 feet width, quantity of air 1500 per minute, the velocity equals 0.5.

Now, in a case like this, if the smaller stope was only getting sufficient air to keep it clear and in a fit state, then it is probable that the larger stope would not he sufficiently ventilated hecause of the lower velocity, although the volume would be the same; air and other gases have weight and require a force to move them, and if the velocity is reduced to 0.5 through the increase of area, then the pressure would he reduced to something less than 0.5.

As with stopes so with mines, the greater the stoping width and the greater the area worked out the greater amount of air per person would he needed for efficient ventilation. It is my opinion that any standard based on the numher of men in a mine is not sufficient to meet the different conditions existing at different mines.

As mentioned before, the mining laws of this colony call for 70 cubic feet per person per minute and as much more as circumstances may require, which is not very definite. The quantity of air going into a mine is not a measure of the efficiency of the ventilation. There may be thousands of cuhic feet of air per minute more than is necessary going into a mine, still it may be a hadly ventilated mine if the air is not conducted to the required points.

I helieve it would be much hetter to fix the quantity of air according to the quantity of dangerous gases allowahle in the air of any working place; this is what the modifying clauses of the different mining laws aim at; but they do not define any danger point, which leaves the management of the mines in great uncertainty as to what is required from them.

UNDERGROUND TEMPERATURE.—F. G. Meachim, in a paper recently read before the South Staffordshire and East Worcestershire Mining Engineers, gave the results of some experiments made by himself and others tending to show that in the south Staffordshire district the rate of increase of temperature is 1° F. for every 110 feet increase of depth. Some recent American experiments seem to show that the rate of increase of temperature is 1° F. for every 101 feet increase of depth. He also stated that recent experiments proved that the temperature of the rock was much less than that of the mine workings. (This is in coal mines.)

Mr. Agassiz and P. C. F. West, in their experiments carried on at the Calumet and Hecla mines, found that the increase of temperature averaged 1° F. for every 223 7 feet increase of depth. At a depth of 105 feet the temperature was 59° F. The greatest depth was 4580 feet vertical and the highest temperature of rock 79° F.

Negretti & Zamhra's slow-registering thermometers were used and were placed in holes 10 feet deep, the holes being then plugged up with wood and clay and left for a period of from one to three months.

In England the increase of depth for every rise of 1° F. is variahle, ranging from 56 feet at Tresavean mines, Cornwall, to 86 feet at the Dukinfield colliery.

It would he of benefit to many if the different companies concerned would get the temperatures of the different deep hore holes and the deep shafts and have a list compiled and published.

Mr. Truscott, in his hook, "Banket and Mining Practice on the Rand," gives a tahle of M. Francke's from which he deducts that on the Rand the rate of increase of temperature is about 1° F. for every 250 feet increase of depth. This would give for a shaft 5000 feet in depth a rise in temperature of 20° F.

In summer this increase of temperature would give a ventilating pressure of, say, about eleven pounds per square foot under the following conditions: Downcast temperature, 80° F.; upcast temperature, 100°, shafts 5000 feet in depth, barometer 25 inches in height.

This ventilating pressure would give a motive column of 179 feet of the density of the downcast. In winter a greater ventilating pressure would be produced for a difference of 20° F.

Say downcast temperature 40° F., upcast temperature 60° F., shafts 5000 feet in depth, mercury column 25 inches as before, the ventilating pressure in this case would equal thirteen pounds, or 195 feet motive column. These results are found by using the following formula:

$$\frac{1.3253 \times H}{459 + t.} = \text{Weight of 1 cubic foot of air.}$$

Where H = Height of barometer in inches,
t = Temperature in degrees F.

Or $\frac{.73437 \times H}{273 + t}$ T = Temperature in degrees C.

Motive column is generally taken to mean the height in feet of a column of air of the same density of the air in the downcast shaft, which is equal to the difference of weight per unit of area of the downcast and upcast columns, and is found hy dividing the ventilating pressure per square foot of area by the weight of 1 cubic foot of air of the same density as the downcast column, or multiply depth of upcast shaft by difference of temperature and divide by 459 plus temperature of upcast shaft for motive column in terms of upcast shaft.

POSITION OF SHAFTS.—It is generally accepted that mines should he ventilated on the plan known as ascentional ventilation; this is right for a mine giving off fire damp or other light gases, hut it does not suit so well for a mine giving off hlack damp (CO_2).

For fire damp (sp. grav. .559) the ideal manner of ventilating would be to have the upcast shaft at the extreme rise of the property and the downcast at the extreme dip. The fire damp would tend to rise toward the upcast because of its lightness. In case of a mine giving off black damp (CO_2) instead of CH_4, the upcast should be at the dip houndary and the downcast at the rise houndary, the sp. grav. (1.529) of CO_2 causing it to sink.

Given two shafts of approximately the same surface level, it must he apparent to all that the height to which the CO_2 has to he lifted is the same whether the upcast is at the rise side or dip side. There is nearly as good a reason for the upcast to he on the dip side for a mine giving off CO_2 as for the upcast to he on the rise side for a mine giving off fire damp. To carry CO_2 to the rise through the workings of a mine would require a much greater current velocity in every working place than would be necessary to carry it to the dip, because of its weight, as stated before. Once at the shaft the trouble will he over, as the velocity there is much greater than in the working places.

I do not think that the amount of noxious gases given off in the gold mines of the Rand is sufficient to cause ventilation to he a determining factor as to the position of the shafts. Other and more important considerations, such as surface facilities, drainage, hauling and faults will decide.

NATURAL VENTILATION.—What is termed natural ventilation is that quantity of air which circulates through a mine without the aid of artificial means, the motion depending entirely upon the difference of temperature ahove and helow ground, direction of the wind, surface level, motion of skips, cars, etc. In natural ventilation the ventilating motor or air column exists in the downcast shaft by virtue of the greater weight of the air in the downcast shaft. This air column acts to force the air through the airways of a mine. No matter what the respective sizes of the downcast and upcast may he, so long as there is a difference of density of the two columns of air, a current will he set up, provided the difference of density is great enough to overcome the resistances.

For example, take a mine with two shafts, each 5000 feet in depth, 30x7-foot inside timbers, six drives, each a mile long, and of 7x5-foot section, what quantity of air would prohahly he put in circulation if downcast temperature is 60° F. and upcast temperature 80° F., harometer 27 inches?

$$\text{Weight of a column of air, 1 square foot area, in downcast shaft} = \frac{1.3253 \times 27}{459 + 80} \times 5000 = 344.73 \text{ lhs.}$$

$$\text{Weight of a column of air in upcast shaft} = \frac{1\,3253 \times 27 \times 5000}{459 + 80} = 331.93 \text{ lhs.}$$

Ventilating pressure, P, = 12.8 pounds. Then the quantity required would be 83,600 cubic feet per minute.

With a temperature of 60° F. in the downcast and 100° F. in the upcast, other conditions remaining the same, the ventilating pressure would he 24.67 pounds per square foot and the quantity would equal 115,920 cuhic feet per minute.

These quantities would be greatly reduced if the mines gave off any great quantity of CO_2. Take a mine where the upcast air is charged with 5% CO_2:

The downcast column would weigh 344.73 pounds; temperature, 60° F.

The upcast column, temperature 80° F., would weigh 315.34 pounds for the 4750 feet of air and 25 38 pounds for the 250 feet of CO_2 = 315.34 + 25.38 = 340.72 pounds.

Downcast pressure—Upcast pressure = ventilating pressure, substituting figures 344.73 — 340.72 = 4.01 pounds, which, under the conditions stated, would give 46,784 cubic feet per minute—a difference of 36.816 cuhic feet, due to the CO_2.

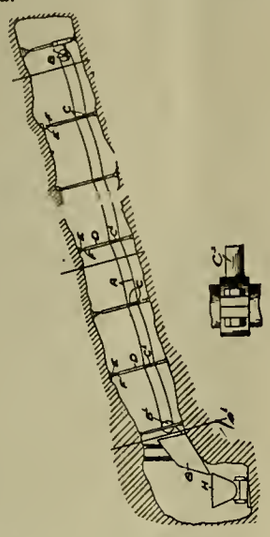
In this example I have taken 5% CO_2, which I think is more than any one would knowingly allow in the main current; hut at times there are odd working places that do not contain this much CO_2 in the air.

This example serves to show the bad effects of the heavier gases on the ventilation; it shows how it is that there is so much divergence in the results of tests of furnaces and fans, when the composition of the air is not taken into account.

In these examples I have taken the co-efficient of friction at .005 pound per square foot of rubbing surface and a velocity of 1000 feet per minute, which I think is a fair value for the size of shafts and airways in use here.

Natural ventilation is very unreliahle; in cold weather the ventilation may be good and on warm days very had; in some cases the direction of the current may he changed. To keep the direction constant and the quantity up to what is necessary, artificial ventilation will be necessary inmost deep mines.

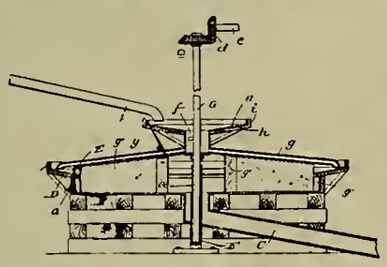
(TO BE CONTINUED.



*Trans. Chemical, Metallurgical and Min. Society, S. A. (Condensed).

Mining and Metallurgical Patents.

PATENTS ISSUED SEPTEMBER 29, 1903.



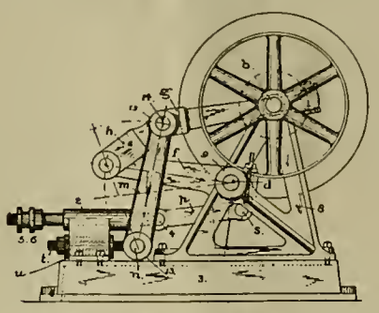
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

BELT OR LIKE CONVEYOR.—No. 739,884; W. R. Laurie and T. H. Wilson, Johannesburg, Transvaal, South Africa.

In portable conveyors, combination with flexible carrier, of terminal drums, groups of idly-running pulleys, brackets or holders for pulleys, standards to which holders are adjustably secured, means consisting of wedges and extension pieces whereby standards are fixed in position.

COMBINED ORE CONCENTRATOR AND AMALGAMATOR.—No. 739,971; D. W. Almond, Leadville, Colo.

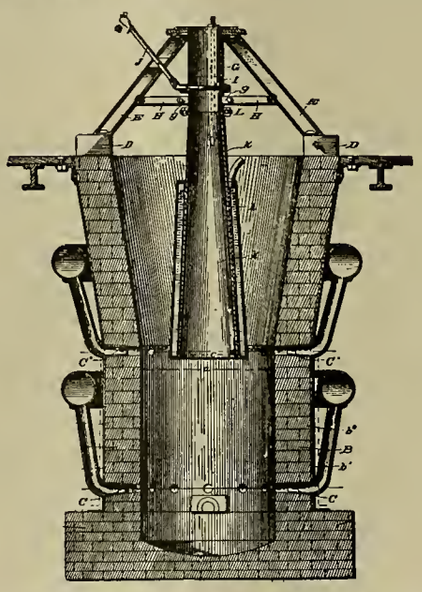
Ore concentrator and amalgamator, having hed or support, stationary receptacle arranged thereon, and made up of pan, annular, downwardly and inwardly inclined wall D, mounted on upper edge of side of wall and arranged to discharge into pan, and equipped with means for catching and holding gold and silver, wall b extending upwardly from outer edge of wall D, and a discharge conduit leading from center of hottom of pan, fixed hearing F extending through conduit and hottom of pan, vertical shaft journaled in hearing, rotary tray fixed on shaft, above center of pan, comprising receptacle, an annular downwardly and inwardly inclined wall h, mounted on upper edge of side wall of and arranged to discharge into receptacle, and equipped with means for catching and holding gold and silver, and wall i, extending upwardly from outer edge of wall h, radial pipes connected to receptacle of tray, and arranged to discharge on wall D of stationary receptacle, means for supplying pulp and water to inclined wall of tray, and sweeps connected to and carried hy radial pipes, and movable in stationary receptacle.



PROCESS OF EXTRACTING ZINC FROM SULPHIDE ORES, ETC.—No. 740,372; C. Rogers, Kew, Victoria, Australia.

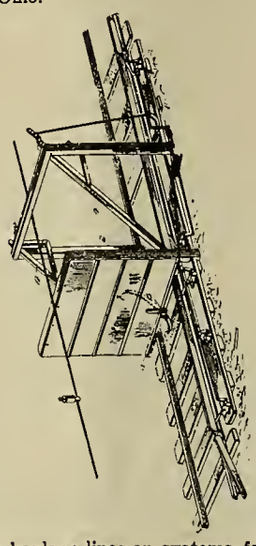
Process for extraction and recovery of zinc from zinc containing sulphide ores or tailings, hy subjecting same to a partial sulphatizing roast, discharging same while hot into water, leaching same with water and with dilute sulphuric acid, subjecting leached ores or tailings to second sulphatizing roast, releaching same with lixivium from former leaching, and repeating operations until sufficient zinc and sulphur are removed.

PROCESS OF TREATING ORES.—No. 740,014; J. Herman, Lincoln, Neb.



Process of extracting copper from ores hy treating ores containing iron, with chlorine containing compound to produce ferrous chloride, utilizing chloride and free acid to dissolve carhonates and oxides of copper, free acid heing adapted to neutralize interfering suhstances, and to attack surface of particles of copper oxide or carhooate, and leaching ore thus treated with ferrous chloride and salt.

DRIVING MECHANISM FOR ORE CONCENTRATORS.—No. 740,027; M. S. Leve, Fruitvale, Cal.



In driving mechanism for converting uniform rotary motion into varying reciprocating motion, comhination with a part to be reciprocated, of a crank, relatively long connecting rod, link having one end connected to rod, means operating to guide point of connection in arc of definite length, means connecting other end of link with part to be reciprocated, and arranged to guide that end of link in an arc approximately at right angles to arc in which opposite end of link attached to connecting rod travels, means also operating to confine link within last mentioned arc.

METALLURGICAL FURNACE.—No. 740,360; W. F. Hannes, Deming, N. M.

In metallurgical furnace, lower chamher having tuyeres at lower portion, upper chamher merging into lower chamher and decreasing in area from upper end, tuyeres located at merging portion for supplying oxidizing hlast, fuel casing located in furnace with its discharge end located slightly helow zone of oxidizing tuyeres, and means for removahly supporting fuel casing in furnace.

MINE GATE.—No. 739,978; N. K. Bowman, North Lawrence, Ohio.

In electric haulage lines or systems for mines and in comhination with trolley line and mine gate, bridge for spanning gate or like part to carry trolley wheel therehy without necessitating interruption of electric circuit or power.

Mineral Output of Canada.

E. D. Iogall, head of the mioers' hureau of the Canadian Geological Survey, reports the mineral output for the year 1902 as follows:

METALLIC.

Gold:		Value.
Yukon		$14,500,000
All other		6,241,245
Total		$20 741,245
Product.	Quantity.	Value.
Copper, lbs., @ 11 626c ℔ lb	39,168 202	4,553,695
Iron ore, tons (exports)	428,901	1,065,019
Pig iron from Canadian ore, tons.	71,655	1,043,011
Lead, lbs., @ 4 069c ℔ lb	23.000,000	935,870
Nickel, lbs., @ 47c ℔ lb	10,693,410	5.025,903
Silver, ounces, @ 52 16c ℔ oz	4,373,000	2,280,957
Zinc, lbs	166,700	8,068
Total metallic		$35.653,768

NON-METALLIC.

Coal, tons	7,639,255	$15,538,611
Coke, tons (oven coke, all from Nova Scotia and British Columbia)	506,466	1,538,930
Gypsum, tons	332,045	356 317
Limestone for flux, tons	293,108	218,809
Petroleum, harrels	521,485	934,740
Salt, tons	63,056	288 581
Total		$18.875,988
All other non-metallic		2,369,106
Total non-metallic		$21,245,094

STRUCTURAL MATERIALS AND CLAY PRODUCTS.

Cement, natural rock, harrels	124,400	91,870
Cement, Portland, harrels	594,594	1,028,618
Total		$7,771,870
Estimated value of mineral products not returned		300,000
Metallic		35,653,768
Non-metallic		21,245 094
Total for 1902		$64,970,732

The figures for copper, lead, si ver, nickel and zinc include contents of ores, mattes, etc.

Alloys of Gold.

Following are some of the alloys of gold made use of hy jewelers, says the Pacific Goldsmith:

Color.	Gold.	Silver.	Copper.	Cadmium.	Steel.
Blue	250	...	...	...	250
Blue	500	...	...	...	250
Gray	800	...	...	...	200
Gray	857	86	...	...	57
Gray	725	275	...	...	...
Green	750	125	...	125	...
Green	750	166	...	84	...
Green	746	114	97	43	...
Red	666	67	268	...	...
Red	750	104	146	...	...
Red, pale	600	200	200	...	...
Red, very	583	42	375	...	...
Yellow	583	250	167	...	...
Yellow	666	194	139	...	...
Yellow	750	146	104	...	...
Yellow, dark	583	125	292	...	...
Yellow, pale	666	333	...	...	...

The alloys of gold should not he overheated aod ought to be poured immediately after the proper fusion has taken place. The mixture should be well stirred from time to time after it has commenced to melt, using a cherry-red iron rod or a stick of very dry poplar or other slow hurning wood. This serves two purposes—it makes the metal homogeneous in its composition and it enables the operator to judge hy the feeling when the mass is thoroughly melted. As long as the metal feels curdy or cloggy it is unfit to pour. When the stirred mass feels thin and watery it should he thoroughly agitated, fresh charcoal added, and allowed to stand for a minute, then poured.

In melting silver alloys, great care and strict attention to the points given helow are necessary in order to secure homogeneous alloys of the proportions required. Especially is this the case when the alloys contain the more readily oxidizahle metals, such as zinc and tin. The weighing of the metals, the arrangement of them in the crucible, the management during the time they are in the furnace, all are points requiring steady care and constant attention to produce accurate results.

When the alloy consists only of copper and silver they should both he put in the crucible hefore putting it into the furnace. Put the copper at the bottom and the silver over it, as copper has the highest melting point and the heat is greatest at the bottom. Then, too, the silver, heing the heaviest, will descend through the copper when melting, thus producing a more perfect mixing than when the copper is placed on the top.

Mining Summary.

Specially compiled and reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

Nome reports say the weather is unusually good in the north, no storms of any consequence being reported up to September 24th. Mining operations are in full blast, and it is estimated 2000 people will winter in Nome this year.

The Mt. Drum platinum deposits will be developed next season, say White & Thorp of New York, who have bought a controlling interest in thirty-four platinum claims. These properties are 12 miles from Copper Center, which place will be headquarters, says the Valdez News.

A drilling outfit is being put in by the Cudahy Oil Co., which will operate in the Kayak district. The plant includes a triplicate set of tools and an oil pump. It is to be used on lands owned by the company and J. A. Ritchie, being tracts on Lake Chilcat and on Martin river, aggregating 1600 acres. The Cudahy Co. also operates in Indiana, Indian Territory and in Oklahoma.

G. W. Otterson, superintendent of the Windfall hydraulic mines at Windfall, near Juneau, says he has closed down the mines for the season for lack of water. Next season the company will put in a steam shovel and work the property on a larger scale.

ARIZONA.

COCHISE COUNTY.

The Mountain View D. Co. has been incorporated at Bisbee. The company owns a group of claims 1½ miles north of Bisbee. Assays of the croppings show copper values. G. Bennett, I. E. Holmes, G. S. Crockett, G. Walker, C. Trottman, H. M. Woods and J. F. Sinclair are directors.

MARICOPA COUNTY.

(Special Correspondence).—R. E. Humphries is working eight men on his property, east of Morristown.

Donofrio & Eddy, who have a number of claims 8 miles west of Frog Tanks, are doing development and assessment work. They have an incline shaft down 50 feet and will sink to 100 feet.

B. Ford has a deposit of asbestos in the White Tank mountains which he is developing.

The parties, who are interested in the deposit of bismuth ore in the eastern part of Maricopa county, have a shaft down 60 feet on one of the claims.

The Arizona M. & D. Co., which recently purchased the Ryland lead property, or what is better known as the Black Jack mine, 3 miles west of Morristown, contemplate the erection of a concentration plant for working the old dumps; meanwhile, extensive work will be carried on. This property in the past has been a large producer of silver-lead ores.

Burson & Langley, of Buckeye, have their stamp mill in operation again.

Considerable development work is being done in the Cave Creek district. Several properties in that section of the country have been sold recently, and a number of other deals are under way.

Phœnix, Oct. 5.

(Special Correspondence) —S. W. Haines has men at work on his mines 6 miles north of Buckeye. A shaft is down 300 feet with drifts and crosscuts on every 50-foot level, showing the extent of the ore bodies. The ore is free milling and will mill on an average $30 per ton. W. Dunn and H. Welch are working their gold claims in the White Tank mountains, taking out ore which is to be milled at Buckeye.

It is reported that a deal is being closed with the present owner for the Vulture mine, near Wickenburg.

Wickenburg, Oct. 5.

T. J. Morrison of Martinez, manager of the United Verde Jr. M. Co., 9 miles from Harqua Hala and 35 miles from Wickenburg, reports development work being increased. Their group comprises five gold claims known as the Sunset group. H. J. Ailen and T. E. Campbell of Jerome are also interested. The claims have been developed by two 175-foot shafts connected at the 125-foot level. The 5-stamp mill on the property will be started next week.

MOHAVE COUNTY.

The deal for sale of the Dempsey-O'Dea group of mines, near Chloride, is reported off, and Dempsey & O'Dea, the owners, are preparing to continue development themselves.

Machinery for the milling plant at the Great West mine, near Kingman, is on the ground. The plant will treat fifty tons of ore daily by cyanide process.

PIMA COUNTY.

At Quijotoa, the Producer M. & S. Co. have about completed their smelting plant and will build a concentrator, says Superintendent F. Brownell.

The Twin Buttes copper mines at Olive Camp, near Tucson, have been incorporated as the Twin Buttes M. & S. Co., with G. Baxter, J. Ellis and M. Irish as directors, and S. Rose of Milwaukee, Wis., as president, and M. Blakely as manager. The workings consist of a 250-foot shaft, a 90 foot shaft and several drifts. A gasoline hoist and drills are being put in.

PINAL COUNTY.

(Special Correspondence).—Forty men are employed at Superior copper camp, near the Silver King mine.

Superior, Oct 5.

SANTA CRUZ COUNTY.

At Oro Blanco J P. Owens, superintendent, says the Tres Amigos and Sorrel Top mines are being worked under one management. The ore in the Tres Amigos yielded by mill test $21 per ton; and the ores of the Sorrel Top gave $14 They are putting up a mill on the Tres Amigos. Hoists have been put on both properties, and concentrating tables are on the ground for the Tres Amigos. They have 100 men at work.——E. C. Pearce has thirty men at work on the Oro Blanco mine. They are unwatering the main shaft.

R R. Richardson is sinking a shaft on his Irish Lord mine, in the Harshaw district, near Patagonia.

J. Baker & Son, of Michigan, who have a lease and bond on the Old Glory mine, near Oro Blanco, have the 30-stamp mill running steadily and fifty men are at work, says Superintendent Finch.

YAVAPAI COUNTY.

At the Iron King mine, on Equator hill, near Jerome, work on the smelter is about completed, and is expected to be producing bullion before Nov. 1st.

At the Chicago mine at Groom creek, while cutting the station for 300-foot level an 18-inch streak of gold ore was struck, says E. M. Clark, principal owner and manager. The shaft is vertical and crosscuts have been run to the main vein. Sinking to the 500-foot level will be continued and at this depth, in order to drift for the gold-bearing porphyry dike, a larger pump and an air compressor will be put in. Eighteen men are employed.

Superintendent J. B. Tomlinson says he has the machinery for the Yaeger Canyon Copper Co. (the Sloan group) in place. There are three 80 H. P. boilers, one 140 H. P. hoist and a 10 drill air compressor. This property was explored by diamond drills before development work was started. There is a shaft down 830 feet.

CALIFORNIA.

State Mineralogist Lewis E. Aubury reports the yield and value of mineral substances of California for 1902 as follows, as per returns received at the State Mining Bureau, San Francisco:

	Amount.	Value.
Asphalt, tons	34,511	$ 349,344
Bituminous rock, tons	33,490	43 411
Borax and boric acid, tons	17,202	2,234,694
Cement, bbls	171,000	423,600
Chrome, tons	315	4,725
Chrysoprase, lbs	50	500
Clays—		
For pottery, tons	67,933	74,163
For brick, M	169,651	1,306,215
Coal, tons	68,460	246,622
Copper, pounds	27,660,162	3,239,975
Fuller's earth, tons	967	19,246
Glass sand, tons	4,500	12,225
Gold	.....	16,910,320
Granite, cubic feet	257,650	256,239
Graphite, tons	42	1,680
Gypsum, tons	10,250	53,503
Infusorial earth, tons	422	2,532
Lead, pounds	349,440	12,230
Lithia mica, tons	822	31,680
Lime, bbls	446,664	369,616
Limestone, tons	71,422	90,524
Macadam, tons	500,939	418,546
Manganese, tons	670	7,140
Magnesite, tons	2,630	20,655
Marble, cubic feet	19,305	37,616
Mica, tons	20	2,500
Mineral paint, tons	589	1,533
Mineral water, gallons	1,701,142	612 477
Natural gas, M. cubic feet	129,966	99 443
Paving blocks, M	3,502	112,437
Petroleum, bbls	14,356,910	4,692,189
Platinum, ounces	39	466
Pyrites, tons	17,525	60,306
Quicksilver, flasks	29,552	1,276,524
Rubble, tons	1,555,076	830,961
Salt, tons	115 206	205,876
Sandstone, cubic feet	212,123	142,506
Serpentine, cubic feet	512	5,065
Silver, (commercial value)	.....	616,412
Soda, tons	7,000	50,000
Slate, squares	4,000	30,000
Soapstone, tons	14	266
Tourmaline	.....	150,000
Turquoise, pounds	510	11,600
		$35,069,105

In the previous year the total product was valued at $34,355,981, the increase for 1902 being $715,124.

The total value of the metallic substances, including precious metals, for 1902 was $22,052,796, which includes gold, silver, mineral paint, quicksilver, copper, lead, manganese, platinum and chrome. The silver is given in commercial value, or amount received for it by producers; if given in coining value, the sum would be about doubled. The Bureau has never independently collected statistics of precious metal output, but has used totals and distribution by counties as obtained at the United States Mint, San Francisco, where they have the advantages of verification by figures of receipts at United States Mints and Assay Offices, and private refineries and smelters throughout the country.

The total value of non-metallic substances was $3,706,368, which includes borax, coal, chrysoprase, mineral waters, salt, asbestos, infusorial earth, gypsum, magnesite, pyrites, lithia mica, fullers' earth, quartz crystals, mica, soda, tourmaline and turquoise.

The total value of hydrocarbons and gases was $5,184,387, an increase of $1,651,678, including asphalt, bituminous rock, natural gas and petroleum. The gas is given in value of that commercially utilized. The petroleum price is the average per barrel f. o. b. at the wells or stations in each county. The number of barrels of oil produced was 14,356,910. valued at $4,692,189, as against 7,710,315 barrels in 1901, valued at $2,961,102. The increase in value has not kept pace with increase in amount, owing to prevalence of low prices in the oil fields, especially in the valley counties.

The total value of structural materials was $4,109,023, an increase of $1,161,748 over the previous year. This includes brick and pottery clays, Portland cement, lime and limestone, macadam, rubble and concrete rock, paving blocks, marble, granite, sandstone, serpentine, slate and glass sand.

The relative value of the principal mineral products of the State is as follows: First, gold; second, petroleum; third, copper; fourth, borax; fifth, clays and their products; sixth, quicksilver; seventh, silver. In the previous year the copper values were more than those of petroleum, quicksilver was fourth and borax sixth.

The relative rank of the counties of the State, in point of mineral production, is given in the following table. In each case the value given includes that of all the mineral substances combined produced in the respective counties for the year. Some counties, in addition to gold and silver, produce five, six or seven other substances, while other counties which produce little or no gold or silver produce in large quantities quicksilver, mineral oils, copper, lead, asphalt, structural materials, etc. The figures include aggregate value of all mineral products, including precious metals. These latter are based, as stated, upon United States Mint returns for the year. The term "unapportioned" includes the total value of such substances as are grouped to avoid disclosing private business, as in the case of single operations in a single county. In the table just published in Bulletin No. 28 by the State Mining Bureau, from which these figures are taken, the amount and value of each substance in the respective counties are set forth. It is, therefore, necessary in some cases to place the figures in the "unapportioned" column:

RELATIVE RANK OF COUNTIES.

Shasta	$ 3,730,049
Kern	3,461,926
San Bernardino	3,316,102
Calaveras	2,371,013
Nevada	2,155,839
Tuolumne	1,690,229
Los Angeles	1,697,932
Amador	1,679,113
Siskiyou	1,094,745
Placer	1,016,487
Butte	926,251
Orange	824,742
Trinity	731,261
Fresno	670,056
Alameda	666,836
Mariposa	647,296
San Diego	562,730
Sacramento	555,136
Mono	549,296
Ventura	463,966
Santa Clara	411,112
Napa	410,966
San Francisco	395,100
El Dorado	361,576
Plumas	361,203
Riverside	334,622
Sierra	332,466
San Mateo	330,745
San Benito	326,231
Santa Barbara	312,550
Lake	286,231
Marin	206,600
Santa Cruz	205,296
San Luis Obispo	200,391
Sonoma	196 603
Colusa	194,500
Inyo	184,414
Solano	170,140
Yuba	155,632
Madera	121,151
Humboldt	79,555
San Joaquin	70,596
Tulare	62,396
Contra Costa	55,141
Monterey	39,253
Lassen	23,754
Stanislaus	19 026
Kings	19,000
Alpine	14,129
Mendocino	9.696
Del Norte	5,450
Tehama	3,500
Merced	1,656
Yolo	450
Unapportioned	73,619
Total	$35,069,105

It is to be noted that for the first time since these detailed statistics were gathered, three counties show a product of over $3,000,000. Shasta county, while showing a very material falling off in its total, is still in the lead. The decrease from the year previous is $3,007,522, which is owing to the lower prices for copper, and the prevalence of miners' strikes at the leading producing mines, causing them to close down part of the year. Shasta owes its precedence to copper; Kern to petroleum and San Bernardino to its borax. While gold is still the leading mining product, its yield no longer puts the greatest gold-producing country in the first place. Nevada county still leads in gold and silver ($2,149,564), though closely followed by Calaveras ($2,119,173); but when total mineral products are considered, Calaveras takes rank above Nevada county, the difference being caused by the value of copper produced in Calaveras. As usual, Shasta county still makes the largest yield of silver, owing to so much silver-bearing quartz being used as flux in the copper smelting operations.

Asphalt was produced in 1902 in the counties of Kern, Los Angeles, Santa Barbara, San Luis Obispo, Santa Cruz and Ventura, most of it now being derived from the refining of petroleum. Bituminous rock was quarried in San Luis Obispo and Santa Cruz counties. Most of the borax came from San Bernardino county, though some was produced in Inyo. Brick clays were utilized in the counties of Alameda, Butte, Contra Costa, Fresno, Humboldt, Kern, Kings, Los Angeles, Madera, Marin, Mendocino, Riverside, Sacramento, San Bernardino, San Diego, San Francisco, San Luis Obispo, Santa Barbara, Santa Clara, Shasta, Sonoma, Tehama and Tulare. Clay for pottery, sewer pipe, etc., came from the pits in Amador, Los Angeles, Placer, Riverside and San Mateo counties. Cement was manufactured at quarries in San Bernardino and Solano counties, the latter producing this for the first time in many years, and in considerable quantity. All the chrome mined was in Shasta county, and all the chrysoprase was derived from Tulare county.

Coal was mined in Alameda, Amador, Contra Costa and Riverside counties, most of it being from Alameda. Copper was produced in the counties of Amador, Calaveras, Contra Costa, El Dorado, Fresno, Inyo, Kern, Madera, Mariposa, Merced, Nevada, Placer, San Bernardino, Shasta, Siskiyou, Stanislaus and Tuolumne. The total product was 27,860,162 pounds, as compared with 34,931,785 the previous year. The valuation in 1901 was $5,501,782, as compared with $3,239,475 in 1892.

All the fullers' earth produced in the State came from Kern county; and the glass sand came from the "sand ranches" near Monterey bay. Granite for building purposes, curbing, etc., was quarried in the counties of Los Angeles, Madera, Nevada, Placer, Riverside, Sacramento, San Diego, Santa Clara, Sonoma and Tulare. Graphite came from Sonoma county only; and gypsum from Los Angeles, Kern and Riverside.

Gold is more widely distributed than any other mineral substance thus far mined in California, thirty-five counties out of fifty-seven in the State showing a gold yield in 1902, and it is known to exist in several others. According to the returns received from producers at the San Francisco Mint, the gold yield for 1902 was $16,910,320, and was derived from the following counties, which are named in the order of their respective gold product for the year: Nevada, Calaveras, Tuolumne, Amador, Kern, Butte, Siskiyou, Shasta, Placer, Trinity, Mariposa, Mono, Sacramento, San Bernardino, Plumas, San Diego, El Dorado, Sierra, Yuba, Inyo, Humboldt, Fresno, Riverside, Madera, Lassen, Tulare, Alpine, Los Angeles, Monterey, Del Norte, San Luis Obispo, Ventura, Colusa, Orange and Santa Barbara.

Infusorial earth was produced in the counties of Los Angeles and Santa Barbara. Lead was produced in Inyo, Los Angeles, Mono and San Bernardino, with small quantities from Alameda and Tuolumne counties. All the lithia-mica was from San Diego county. Lime was quarried and burned in the counties of Butte, El Dorado, Kern, Monterey, Riverside, San Bernardino, Santa Cruz, Shasta and Mono; and limestone in the counties of Napa, San Bernardino, Santa Cruz and Shasta. Macadam quarries were operated in Alameda, Los Angeles, Marin, Monterey, Sacramento, San Benito, San Mateo, San Francisco, Solano and Sonoma counties.

All the manganese was from Alameda, and the magnesite from Alameda, Napa, Sonoma and Tulare counties. Marble was quarried in Amador, San Bernardino and Tuolumne counties. Mineral paint came from the counties of Calaveras, Los Angeles, Sonoma and Stanislaus.

Mica was produced only in Ventura county and is a new industry there. Min-

eral waters were commercially utilized by being bottled and sold from the counties of Butte, Colusa, Contra Costa, Fresno, Humboldt, Lake, Mendocino, Monterey, Napa, San Benito, San Diego, San Luis Obispo, Shasta, Santa Barbara, Santa Clara, Sierra, Siskiyou, Solano and Sonoma. This is a business which is increasing rapidly every year, both in amount and valuation. Natural gas was utilized in the counties of Sacramento, San Joaquin and Santa Barbara. Paving blocks were quarried in Placer, Riverside, San Bernardino, Solano and Sonoma counties.

Petroleum was produced in the counties of Fresno, Kern, Los Angeles, Orange, Santa Barbara and Ventura. Thus it will be noted that only six counties are producing this substance, notwithstanding the wide range of prospecting and drilling in numerous counties, both north and south, during the past two years.

All the platinum which could be traced was from Trinity county, though its presence is noted at other points. Pyrites were mined (for sulphur contents) in Alameda and Shasta counties only, most coming from the former.

Quicksilver came from the counties of Colusa, Lake, Napa, San Benito, San Luis Obispo, Santa Clara, Solano, Sonoma and Trinity. There were 2832 more flasks (of 76½ pounds each) produced in 1902 than in the previous year, but the total valuation is less, owing to prices.

Rubble was quarried in the counties of Los Angeles, Madera, Marin, Monterey, Napa, Placer, Sacramento, San Bernardino, San Diego, San Francisco, San Mateo and Ventura. Over one-quarter of the 1,555,076 tons came from San Mateo county and was used in railroad construction work on Mission bay. The class of work on San Francisco bay and San Pedro harbor uses up the larger part of the rubble quarried.

Salt comes from the counties of Alameda, Colusa, Los Angeles, Marin, Riverside, San Diego and San Mateo. It is the product of solar evaporation of the sea water and more than three-quarters of the total is made in Alameda county from San Francisco bay water.

Silver was produced (mainly from gold ores carrying silver) from the counties of Alpine, Amador, Butte, Calaveras, El Dorado, Fresno, Inyo, Kern, Lassen, Madera, Mariposa, Mono, Nevada, Placer, Plumas, Riverside, Sacramento, San Bernardino, San Diego, Shasta, Sierra, Siskiyou, Trinity and Tuolumne. In distribution, silver takes second rank to gold, having been produced in twenty-seven counties in 1902

As far as the "banner" counties are concerned in the different mineral products, the following is the record for 1902, with the values of the material in which the county leads:

Alameda county leads in coal ($203,550); macadam ($182,295); manganese ($7140); pyrites ($53,301), and salt ($160,000) Calaveras leads in mineral paint ($778); Colusa in sandstone ($87,456); El Dorado in slate ($30,000); Inyo in lead ($9013), and soda ($50,000); Kern leads in fuller's earth ($19,426), and petroleum ($1,955,585); Los Angeles in asphalt ($171,904), and brick clay ($335,670); Monterey in glass sand ($12,225); Nevada county leads in gold ($2,142,740); Placer in granite ($105 377); Riverside in pottery clay ($38,920); San Benito in quicksilver ($306,081); San Bernardino leads in borax ($2,043,600), cement ($272,600), limestone ($51,578), marble ($15,600) and turquoise ($11,600); San Diego leads in lithia mica ($31,880) and tourmaline ($150,000); San Joaquin in natural gas ($67,868); San Mateo in rubble ($300 000); Santa Barbara in infusorial earth ($2172); Santa Cruz in bituminous rock ($41,084) and lime ($161,302); Shasta county leads in copper ($2,496,731), chrome ($4725) and silver ($616,412); Siskiyou in mineral waters ($187,500); Sonoma in graphite ($1680) and paving blocks ($82,227); Trinity in platinum ($468); Tulare in chrysoprase ($500) and magnesite ($19,250); and Ventura in mica ($2500).

It will be noted that two counties lead in five substances—Alameda and San Bernardino; one leads in three—Shasta; seven lead in two—Inyo, Kern, Los Angeles, San Diego, Santa Cruz, Sonoma and Tulare; and fourteen lead in one substance — Calaveras, Colusa, El Dorado, Monterey, Nevada, Placer, Riverside, San Benito, San Josquin, San Mateo, Santa Barbara, Siskiyou, Trinity and Ventura.

AMADOR COUNTY.

The 60-stamp mill at the Fremont-Gover mine, near Drytown, near Amador City, is expected to be ready for operation October 15th. The batteries are in place, the stamps are hung and the ore feeders up. The concentrators are being set up.

At the Argonaut mine at Jackson the shaft is being repaired preparatory to resuming operations.

CALAVERAS COUNTY.

To operate the Shepherd group on Six Mile Creek, near Murphys, the New Deal M. Co. has been incorporated by D. C. Shepherd of Stockton, W. & A. Garland, J. M. Shepherd of Murphys and J. S Shepherd of Hodson. Considerable development work has been done on the mine under J. M. Shepherd.

The Mayday mine, near Murphys, has resumed work.

J. T. Thompson, superintendent of the Kenross mine, near Mokelumne Hill, reports having bought the Leota ranch, in Fischer's district, near Jesus Maria. This property has been secured by the company to develop the gold-bearing quartz ledges on it.

EL DORADO COUNTY.

(Special Correspondence). — W. E. Everson, superintendent of the El Dorado C. Co., has sunk a new vertical shaft on the Woodside-Eureka mine.

Georgetown, Oct. 5.

(Special Correspondence) — The Hart Consolidated is not working at present. The Esperanza Co. have had several new sets put in at the top of the shaft and the shaft has been cleaned out. Some work is being done on the Rosencrans, preparatory to sinking a new shaft.

Work has begun clearing out the brush, getting ready to cyanide the tailings from the Taylor mine. This will make the second time these tailings have been through cyanide treatment.

No work is being done on the Ford copper and asbestos claims near Georgetown. This property is owned by the El Dorado C. Co. of San Francisco. This company has begun work on a three-compartment shaft on the Eureka mine in Georgetown.

The Ohio and Argonaut, near Greenwood, are idle. Lewis Sites, owner of the Short Handle, at Spanish Dry Diggings, is doing some work on this claim, which was a big producer some years ago. Most of the mines around here are closed on account of lack of water.

The Fowlers are making preparations to resume work on their claim on Bald mountain. They have a good lead in the serpentine, which prospects well in free gold.

Georgetown, Oct. 6.

The Peyton Chemical Co. of Oakland has men at work in the Noonday copper mine, near El Dorado, and regular shipments of ore are being made to the company's smelter at Oakland.

The mill on the Del Monte mine, on the American river, 4 miles below Coloma, is completed and the Del Monte M. & M. Co. expect to begin crushing ore next week. The mill is a 2 stamp triple discharge mill and will be operated with a twelve H. P. gasoline engine, says the Placerville Nugget. B. McBeth is superintendent.

A. Schenck is reported to have bonded the Cooley mine in Mount Echo district, near Echo, and will start sinking

The Mt. Pleasant M. Co. has sixteen men at work at the Mt. Pleasant mine, near Grizzly Flat. Development work is being done on the 500-foot level.

W. E. Everson, of Elk Grove, superintendent of the El Dorado C. M. Co. at Georgetown, says sinking the three-compartment shaft will be started as soon as the necessary machinery can be set up. Steam power will be used for hoisting.

The Union mine, which was closed down owing to the organization of a union at El Dorado, has resumed with C. Cantrell as foreman.

KERN COUNTY.

F. S. Jones and B. Summers are working the Wedge and Kinyon mines, near Randsburg, under lease for one year —— The Gold Flint mine in Stringer district, near Randsburg, has been leased to A. E. Sanderson for one year at 10% royalty, with an option to purchase for $5000. It is intended to sink and crosscut.

LOS ANGELES COUNTY.

The holdings of the Puente Oil Co. and the light oil territory of the Columbia Oil Producing Co. have been consolidated. It includes 4700 acres of oil lands; the Puente company's oil refinery at Chino with refining capacity of 800 barrels daily; 15 miles of 3 inch pipe line from the wells at Puente to Chino; eighty-five producing wells; six pumping plants; ten drilling outfits, and steel tanks of 100,000 barrels capacity. The present output of light oil from this district is estimated at 20,000 barrels per month. The oil produced by the lands of this combine is of 32°–34° Baume specific gravity. The consolidated company will be the Puente Oil Co., with W. R. Rowland, president, and W. B. Scott, vice-president and general field superintendent. The Columbia company retains its heavy grade oil territory on which it has nine wells producing 4000 barrels per month. The new company will increase its capacity both in the field and at the Chino refinery.

NEVADA COUNTY.

Work has been resumed on the Cassidy mine, 1 mile southeast of Grass Valley, by P. & J. Feeny, J. Irish, H. Stewart, P. Cassidy and P. Cannon. The mine is between the Empire and Pennsylvania mines.

The Fountain Head M. C. Co. of Nevada City has bonded its holdings to the Phelps Hill M. & Dev. Co, of which C. A. Poage is local manager. Poage also has an option on the Cold Spring mine, adjoining.

The Red Cross and Huron mining companies, near Nevada City, have been consolidated, says Superintendent W. H. Bray of the Posey and Huron mines. The 20-stamp mill on the Red Cross will be used to crush ore from both the Red Cross and Examiner properties. A tramway will be built to transport the ore from the Examiner shaft to the mill, while the Red Cross will be worked by tunnel. W. H. Bray is manager and vice-president of the consolidated company.

PLACER COUNTY.

The Sacramento Dredging Co., which has a plant on the American river near Colfax, reports work progressing, and they have completed the flume and put in a water wheel on the east side of the river, which is to operate the pump that supplies water for washing out the gold, says the Colfax Sentinel.

The company that attempted to unwater the Chicago mine at Penryn has abandoned the operation, having found the pump insufficient, and the prospects did not warrant more machinery, says the Auburn Herald.

PLUMAS COUNTY.

J. C. Rasmussen and H. C. Brown of San Francisco are preparing for development of the Hope mine in Nelson Point district.

SHASTA COUNTY.

The Calumet mine on Quartz Hill, near Redding, is being reopened by the Quartz Hill G. M. Co., with W. O'Donald as superintendent, says the Redding Free Press.

SISKIYOU COUNTY.

(Special Correspondence) — Manager Brokaw, operating the Golden Eagle mine on Indian creek, 6 miles from Fort Jones, reports work progressing. On July 12th he began work of putting in an engine, boiler and hoists, and on Oct. 1st had sunk a two-compartment shaft 150 feet, and drifted 100 feet, both being partially timbered. This work was done with one baby machine drill, operated by steam (in the drift, the exhaust was carried back to the shaft), and three shifts, two men per shift, underground. The formation is slate. ——At the Brokaw mine in Hull Gulch, Manager Brokaw has six stamps dropping. The shaft is down 150 feet and sinking continues. The compressor is run by water power, and the mill, hoist, pumps, drills, etc., are all operated by air.

Morrison & Carlock, in Quartz valley, 7 miles from Fort Jones, are dropping five stamps on high-grade ore, crushing nine tons per stamp per day. They are working seven levels (50 feet apart), all hand drilling, and have sixty-five men on the payroll.

At the Sheba mine, on Pattison creek, operations have resumed after an idleness of two years. Ten stamps are dropping. ——The Schroeder mine, at head of Deadwood gulch, is hung up temporarily.

The H. J. Diggles Estate Co. is opening up the Big Ledge mine in Quartz valley. The tunnel is in 30 feet on a 16-inch stringer, and is expected to cut the main ledge at 150 feet and depth of 250 feet. The main ledge is 4 feet wide, and assays $4 in free gold, with 0.7% sulphides. The 16 inch stringer assays $24 in gold.——The same company is also preparing to reopen the Hoboken mine on Cherry Hill, and will cut the ore bodies with a 500-foot tunnel, giving 250 feet of backs. Ore from this vein milled $10 per ton free gold, with 6% sulphides, which assayed $80. Cherry Hill is near Fort Jones and 8 miles from Yreka.——At the Cherry Hill mine, on Cherry Hill, preparations are being made to put in electrical power.

The power plant on Fall creek (tributary to Klamath river) is furnishing electric lights and power to the Scott mine on Indian creek, Scott valley, near Fort Jones, and 12 miles from Yreka. They have a 10-stamp mill in operation.——Several other mines are preparing to put in electric power.

Yreka, Oct. 7.

TRINITY COUNTY.

R. Hicks, superintendent of the Mountain Boomer mine at New River, near Junction City, reports shipping last week a $3000 gold bar, the product of eighteen days' run with a 3 stamp mill. There are twenty-two men at work, and a Huntington mill is being set up. The Bohs Farm M. Co. is owner. The ledge is 20 inches in width. A tunnel will be started from the mill level, which will tap the ledge at a depth of 800 feet.

TUOLUMNE COUNTY.

Tyer and Watson are taking out ore from the Jewel mine, near Big Oak Flat.

The Black Hawk mine on the Davis ranch, near Soulsbyville, has been bonded to C. H. Glines and E. M. Cavanaugh. They are unwatering the shaft, after which development will be resumed.

A company consisting of W. H. Richardson and G Bartlett of Kings county, and Walter King of Sonora, has bought a group of three quartz claims on Turnback creek, near Carters, being the Monitor, Mountain Chief and Turnback; also the Grizzly mine on the Berger ranch. A 10 stamp mill will be built and one battery will be dropping stamps by December 1st. The properties will be worked by tunnel.

Operations have resumed at the Doyle gravel mine, near Columbia, under bond to W. S. Estey after a temporary suspension.

J. Barry and E. Sharpe have taken over the Hughes interest in a bond on the Josephine quartz mine, near the Jones and Brown Bird claims, below Algerine.

J. P. Beckett of Oakland has bought a one-sixth interest in the Golden Thread quartz mine, near Algerine.——B. Kolich of Columbia has bought forty acres near Yankee Hill, being the southern portion of the Gold Nugget placer claim.——V. Gianella of Carters has bought the Wild Duck quartz claim, 7 miles southeast of Carters.

The California Consols, Ltd., an English company, has bought the Leviathan quartz mine, the north extension of the Louisiana quartz mine; also the Park & Mason mine, near Coulterville, says the Independent.

S. W. Blakely of San Joaquin for $6500 has bought the John Royal quartz mine on the Day ranch, near Columbia.——T. F. Temple of Boston, Mass, for $3500 has bought the Porto Fino quartz mine, near Cherokee and south of the Carlotta mine, near Carters.

The Manderville shaft at the Don Pedro mine, near Chinese Camp, is being sunk 200 feet deeper, says President W. H. McClintock.

A few men are at work in the Hard Tack mine, on Hunter creek, near Carters, preparing to resume operations. The property is equipped with a 2-stamp mill

At the Providence mine, near Carters, ore is being sent to the mill from the third level, which is 400 feet below the surface. It is from the north drift which has been run on a shoot. The diamond drill is still on exploration work. The mine is 1200 feet deep.——At the Garfield mine, which adjoins the Providence on the north, a vein of ribbon rock is being developed. The property is being worked by a tunnel, in 400 feet. A raise to the surface at a point 350 feet from the mouth of the tunnel affords ventilation. Ten men are at work in the mine, and ore is being taken out in the face of the tunnel. A tramway 900 feet in length has been built from the tunnel to the Grizzly mill, and the stamps began dropping this week.

YUBA COUNTY.

Manager Hill says preparations are being made to reopen the Paddy Campbell mine (the Blue Point mine) at Smartsville. A change of plans has been made necessary on account of the refusal of the California Debris Commission to grant a permit to remove by sluice process the waste material in the bed of the claim. Several miles of flume and ditch will be built.

W. P. Hammon, operating gold dredging plants at Oroville, in Butte county, is preparing to put in two dredgers which will cost $100,000 each, to be used on the Yuba river near Marysville.

COLORADO.

(Special Correspondence).—While mining, on account of labor difficulties in several parts of the State, is practically at a standstill, yet it is the opinion of many that within thirty days, perhaps less, everything will be running smoothly. At Telluride, in San Miguel county, the situation is unchanged. Ouray county miners have decided not to go out on strike. At Cripple Creek, Teller county, the operators claim to have 1000 men at work in the different mines and putting more on daily.

Denver, Oct. 5.

CLEAR CREEK COUNTY.

The Silver Plume M. & T. Co. has been incorporated by H. L. and L. L. Roberts, W. H. Stephens, H. H. Noyes and W. A. Roberts to operate the Mary Etta group of claims on McClellan mountain, a few miles above Silver Plume. The ore developed shows values in gold and silver. It is intended to drive a tunnel to cut the lodes at depth.

The Wisconsin mine, near Silver Plume, will resume shipments, as the raise from the lower to the upper level has been completed, opening up the ore shoot.

CUSTER COUNTY.

The owners of the Franklin mine at Ilse are making a resurvey of their boundaries, and operations will be resumed.

G. Avery reports opening a body of sil-

ver ore in the Evening Star, north of Robinson hill, near Custer City. O. W. Murphy has bought the Silver Bow group and will begin development work.

The cyanide plant of the Bassick mill, near Silver Cliff, has resumed.

DOUGLAS COUNTY.

The West Creek & Council Grove M. & M. Co., which owns twenty-four claims in northern Teller county and southern Douglas, reports opening up a body of ore 20 feet wide on Thunder butte, near Pemberton, near the Teller county line. Five feet are of zinc ore. The shaft on the Bald Eagle has been sunk to a depth of 200 feet and lateral work is under way. Mill tests gave returns of $21 in gold to the ton. It is proposed to build a 50-ton cyanide mill.

EL PASO COUNTY.

The Telluride reduction mill at Colorado City, which was forced to cease operations seven weeks ago by a strike of its union employes and subsequent shortage of ore occasioned by the Cripple Creek strike, will resume operations next week with non-union men, says Superintendent Groves. The mill is receiving ore daily.

Because of a demand for an eight-hour day and a 20% increase per ton for mining coal, the miners in the principal coal mines north of Colorado Springs are reported out on strike.

GILPIN COUNTY.

The Mont d'Oro M. & M. Co. has bought for $1000 the New Century, Fatty Felix and Smuggler lodes, in Quartz Valley district, a mile north of Central City. Machinery will be put in.

GUNNISON COUNTY.

Near White Pine, the Akron M. Co. has struck a body of carbonate ore in its tunnel which is mined at 700 feet depth. The company has three four-horse teams hauling coal and timber.

The Anna Silver M. Co. will resume work on its group, near Tin Cup, which has been idle for several years. It consists of the Anna Dedricka mine, on Anna mountain. The values are in gold and silver, with enough lead to make it a desirable smelting product. It is intended to resume shipments as soon as the railroad reaches Tin Cup. The principal stockholders are E. A. Nash of Avon, N. Y.; J. V. Farwell & Co. and F. McVeigh & Co. of Chicago, Ill.; I. E. Blake of San Francisco, Cal., and W. L. Beardsley of New York.

JEFFERSON COUNTY.

The Diamond Match Co. reports preparing to develop a discovery of placer gold deposits near Golden. While digging wells near the creek it was found that at depth of 300 feet bedrock was struck, and panning the gravel showed gold. The company has taken over the land and will put in five steam dredgers.

LAKE COUNTY.

(Special Correspondence). — Preparations are under way for driving a tunnel, ¾ of a mile in length, through Mosquito range, connecting Horseshoe gulch on the Fairplay side with Leadville. J. A. Shinn is manager and a company has been organized.

Leadville, Oct. 5.

The Rio Grande Railroad has completed a spur to the Diamond mine, near Leadville, and shipments are being increased. The average daily output is 150 tons.—— The Two Bit M. Co. has closed down temporarily, but plans are under way for resuming operations with increased development. A vein of gold-copper ore has been opened.

J. Shinn and W. F. Deaner, for Illinois men, have taken up their option on the La Plata mine on Rock Hill, near Leadville. A new shaft will be sunk on the south end of the property to a depth of 350 feet. The holdings cover fifty-two acres.

Leadville reports say the improvement in the price of silver is being felt in the district. It will affect first the large silver producers which have large reserves of ore blocked out, which did not pay to ship with silver much below 60 cents. This is particularly the case in the oxidized iron properties. The increase in price of silver by 10 cents an ounce makes a difference of 60 cents to $1 a ton on average iron ore. On the lowest grades of iron the margin of profit is 25 cents a ton, so that the present improvement means an increase in iron tonnage.

LA PLATA COUNTY.

B. N. Freeman of the Durango Oil Co., operating near Durango, says after drilling a number of holes with varied success, they are now in the first oil sands at a depth of 800 feet and a steady flow is being obtained. In addition to the oil well they have acquired coal lands which they are also working.

OURAY COUNTY.

A strike of gold ore is reported made by R. Porteus in the Floyd claim in Mount Sneffels district, 4 miles southwest of Ouray. The ore is 14 inches in width and runs high in gold, with good values in silver and copper. The strike was made in crosscutting the vein at breast of tunnel, 260 feet from portal. The owners of the Floyd are Porteus, Henry & Sigfrid of Ouray and D. Floyd of Denver. One of the group, the Queen Bee, has shipped ore that ran 800 ounces in silver and $16 in gold to the ton. Development work will be increased. Ample water supply is at hand for power purposes.

SAN JUAN COUNTY.

It is reported that the Bandora–Little Todd group, near Silverton, will resume.

SAN MIGUEL COUNTY.

The one-half interest in the Calvenite–Sylvanite–Patzite group, near Ophir, has been sold to F. Maumey of Telluride.

SUMMIT COUNTY.

W. Mitchell, manager of the Breckenridge branch sampler of the Chamberlain-Dillingham Ore Purchasing Co. has a lease on the Double-Standard lode on Mount Baldy, near Breckenridge. There are several tunnels on the group from which lead ore has been shipped. It also carries gold and silver values.

The Graff mine, on the lower end of Copper mountain, near Wheeler, is being reopened under lease to Hogan & Keogh, who have exposed a body of lead ore at the surface. They are driving a tunnel 300 feet to gain depth on the vein.

Near Kokomo the Iron Mask mine is putting in machinery, says D. M. Masters, who has a lease and bond. The workings will be unwatered.

A bond has been given on the Victoria-Eureka group, near Frisco, and the Masontown M. & M. Co. has been organized to operate it. The group of claims covers an area of 115 acres. The incorporators are J. V. Hoover of Masontown, Pa., S. R. Provins of Greenshorough, Pa., and A. E. Reables of Denver. About 2000 feet of work has been done in the mine and a body of low-grade free gold ore has been opened. A stamp mill will be placed at the mouth of the tunnel this fall. The concentrates from the mill will be cyanided.

TELLER COUNTY.

The following table gives the amount of ore treated from Cripple Creek district for month of September, and its value, by the mills and the smelters:

	Tons.	Total Value.
Magna Charta	150	$600
Globe	1,500	6,000
Jordan	600	4,200
Other cyanide mills	500	2,500
Ingham	1,500	6,000
Smelters	2,200	132,000
Portland	9,000	270,000
U. S. R & R	1,500	40,500
Dorcas	1,800	68,400
Economic	3,400	72,000
Total	22,150	$601,200

The total value was $381,275 less than for month of August.

The plant of the Chicken Hawk mine on Guyot hill, near Cripple Creek, has been placed in position and is expected to be in operation this week. It has capacity of 180 H. P.

The El Paso mine on Beacon hill, Cripple Creek, is making average daily production of 35 tons of ore running $50 per ton. Manager Bainbridge, in addition to breaking this ore, is doing development. The drainage tunnel is being driven on into the hill. Drifting in the third level (475 feet from surface), and on the C. K. & N. vein, is progressing in both directions.

The Portland mine at Victor, operated by the Portland G. M. Co., J. F. Burns president and manager, is outputting daily an average of 300 tons, all of which is treated at the company mill at Colorado City. The ore is broken in the levels from the 1000-foot point up to the surface. A large number of men have been put on development work, and the payroll of the Portland now has the names of 530 men. The Times says the mill at Colorado City will be doubled in capacity, and also that the acreage the company owns is to be added to.

The Cripple Creek Sampling & Ore Co., owners of the Black sampler at Goldfield, resumed operations with twenty men last week. The major portion of the ore treated by this plant comes from the Stratton's Independence. There are 180 men at work on the Independence, and a night shift will be put on next week, adding 60 more men, says Manager Cornish. —— There is being shipped out from the three samplers—Eagle, Rio Grande and Taylor & Brunton—400 tons of ore daily.

The number of men given out by the Mine Owners' Association on the 2d inst. as being employed on mines in Cripple Creek district, now under ban of Western Federation of Miners, is 1160. This number is being added to daily. A number of Cœur d'Alene miners from Idaho have been brought in.

IDAHO.

BLAINE COUNTY.

The Minnie Moore M. Co., near Halley, is increasing its output. Its manager intends to ship an average of 1000 tons a month of ore averaging $100 a ton.

Negotiations are reported under way whereby the Hercules M. Co. at Burke will buy the Frisco mine and mill. The Hercules Co. has no mill.

BOISE COUNTY.

G. W. Dorsey of Pearl says the stockholders of the United Gold Ledge M. Co., which owns the Blue Bucket mine, the Idaho G. Dev. Co., owning the Osborn mine, and the Pearl G. M. Co., will jointly build a custom mill with capacity of 100 tons of ore per day. It will be built on the Payette river and ore conveyed to it on aerial tramways operated by electricity. It is said the ore can be taken from the mines to the mill by this means for 8 cents per ton. Work will be started this month.

A 100-ton reduction plant will be put in on the Osborne mine at Horseshoe Bend, and work on the buildings began this week, says Manager M. E. Hopkins of Idaho City of the Idaho G. M. Dev. Co., which owns the property.

KOOTENAI COUNTY.

Copper ore is being opened up on the Little North Fork of the Cœur d'Alene river, 10 miles above Cataldo, by the Little North Fork M. & M. Co., says the Spokesman-Review. There are six claims in the group. A tunnel is being driven on one and is in 220 feet. In the face of the tunnel there are 5 feet of copper ore showing, 15% copper, $11 in gold and four ounces silver. This ore was taken from the face of the tunnel at depth of 100 feet. The tunnel will be driven on the ledge 500 feet farther, reaching depth of 300 feet. H. L. Aiward is superintendent. The property is owned by Wardner men.

LEMHI COUNTY.

The enlarged mill of the Kittie Burton M. Co. will be in operation by November 1st. The fifteen additional stamps have reached the mine at Ulysses and are being set up.

OWYHEE COUNTY.

A. Muntzing of Colorado, president of the Imperial M. Co., operating near Silver City, says they have discontinued sinking the shaft the second hundred feet until a hoist is put in. In the meantime drifting will be continued south at the 100-foot level. Superintendent Stoddard has this drift in 75 feet.

SHOSHONE COUNTY.

At the King mine, near Murray, Lessees Bacon, Schmidt & Lesher have unwatered the shaft. They repaired the flume which supplies water power. They will reopen the 5-stamp mill.

H. E. Ginter of Dubois, Pa., president of the New Jersey M. Co., operating near Wardner, says their 10-stamp mill is in operation, and they propose to increase the capacity next spring to forty stamps. A flume 8000 feet long carries water power to the mill, and a 2000-foot tramway conveys ore from the mine. A body of free milling gold ore has been opened up to a depth of 200 feet with shafts and tunnels.

ILLINOIS.

The Ohio Valley Zinc, Lead & Spar Co. has been organized in New York City to operate a group of properties near the Lavendar, Montgomery, Roslclare and other mines in the Ohio river valley, in Pope and Hardin counties, which carry zinc, lead and fluorspar, the latter predominating. A. Greig, F. B. Lord, G. J. Nicholson, M. Abbott, T. F. Goodrich, N. McPhatter, C. Sykes, H. A. Lloyd, C. S. McKenzie and R. M. Nugent are incorporators. F. B. Lord of Roseville, N. J., is vice-president and manager.

LOUISIANA.

CALCASIEN COUNTY.

Manager R. H. Childs of the Central Oil & R. Co. of Welsh says one unit of their refinery will be ready for operation by Nov. 15, with capacity of 250 barrels per day. The entire plant will be in operation by Jan. 1, with total capacity of 4000 barrels per day.

MICHIGAN.

HOUGHTON COUNTY.

The Baltic mine of the Copper Range Con. C. Co., north of Painesdale, is being further opened up to secure a larger monthly production. It is expected the Octoher output will reach 47,000 tons, which is 2000 tons better than for September. The Trimountain openings, when continued, will afford a connection with the south drifts at Baltic, thereby opening considerable undeveloped territory. The September output of the Baltic mine yielded 674 tons refined copper.——The output of the Champion mine for month of September was 734 tons refined copper.

During September the Atlantic mine, south of Houghton, maintained a yield of twenty pounds of mineral to the ton of rock stamped. The burning of the shaft house reduced the rock supply so that the milling capacity was reduced one-tenth, yet the mine gave a yield of 345 tons 1000 pounds copper, exceeding its best previous record by twenty tons.

The September product of the Wolverine mine at Kearsarge amounted to 522 tons 638 pounds of copper. Operations were interfered with during the month by trouble with logs at the pumping station.

The Septemher product of the Winona mine at Winona amounted to 41 tons of copper. The management is concentrating work on No. 3 shaft, which is being opened up.

The Michigan Smelting Co. has started work on the superstructure of its power house and machine shop near Houghton, says the News. Foundations for the smelter building are completed.

KEWEENAW COUNTY.

The Phœnix mill, near Phœnix, is in full operation with satisfactory results, says the News.

ONTONAGON COUNTY.

A 45-drill compressor is being set up at the Michigan mine at Rockland and is expected to be in commission by the time rock shipments start from the Michigan to the Mass mill.

MISSOURI

JASPER COUNTY.

T. F. Coyne has begun work with a drill prospecting the southwest forty of the Missouri zinc fields tract, near Joplin, says the News-Herald.——The Ishpeming M. Co., operating 2 miles south of Reeds, is planning to build a 100 ton mill ——The Scotia mine on the Missouri zinc fields has started up again after a temporary shutdown on account of recribbing the shaft.

The Lester tract of eighty acres, 2 miles southwest of Carthage, is being developed. Three drill holes have been put down on the west forty acres, and mineral found in all of them at depth ranging from 190 to 210 feet. The drillings from the last hole sunk show both lead and zinc ore. The land is owned by G. B. Allen and B. Parkell of St. Louis.

The Basch-Scogin M. Co. and the Thames M. Co. have consolidated under name of the Midway Con. Co. The Basch-Scogin M. Co. has a sub-lease from the American Z, L. & S. Co. on the Midway tract, near Joplin. The Thames M. Co. has a sub-lease from the Basch-Scogin M. Co. The object is to operate the two mines and mills and pumping plant under ore management. Power for both mills is furnished from the boilers that furnish power for the pump. The consolidated company will put in three steam drills. With the pump they expect to control the water during the wet season.

MONTANA.

BEAVERHEAD COUNTY.

Molybdenum is reported found on the upper lake in Birch creek, 35 miles from Dillon, and locations have been made by A. French, J. McKay et al. of Dillon. It is proposed to organize a company to develop the prospects and build a concentrating plant, says the Dillon Tribune. L. D. Graeter of Dillon is manager.

Manager A. J. Noyes says he is preparing to put in a 10-stamp mill at the Ajax mine, near Dillon. The mill is to be ready for work November 1st. The stamps weigh 1050 pounds each.

GRANITE COUNTY.

Certain litigation having been settled, the Hope M. Co., of St. Louis, Mo., will resume work in the Hope mine, and start up the Hope mill, near Phillipsburg. Men are at work on the mill. By the terms of the settlement Boyd & Ringling relinquish all claim to the ground covered by the Fraction lode, for a consideration of $2800.

JEFFERSON COUNTY.

The Pennsylvania & Montana M. Co. has been incorporated by H. Maskrey and C. White of Mercer, Pa., J. H. and M. S. Hildebrand of Basin, and J. Pearson of Butte, to operate a group of claims in Cataract district near the Eva May mine, near Basin.

SILVER BOW COUNTY.

The Green-Campbell Con. G M Co has been incorporated, with principal place of business in Butte. The following are directors: A. D. Field of Waterbury, Conn.; J. McBarron of Whitehall, Mont., and T. T. Baker, W. F. Davis and E. B. Howell of Butte.

NEVADA.

ELKO COUNTY.

The smelter of the Latham mines at Spruce mountain, near Clover, south of

Wells, will be remodeled and operations resumed, says the Nevada State Journal.

ESMERALDA COUNTY.

Crocker & Salsberry have an option on the Jaggers & McAffee mines, in Tuia Canyon district, 18 miles west of Tokop, southeast of Silver Peak. There are eleven claims in the two groups and a 5-stamp mill is on the property. On the Jaggers the vein has been tapped by a tunnel at a depth of 170 feet from the surface, the vein showing from 6 inches to 3 feet in width. The ore is free milling. There is plenty of wood and water near by, and the mill will be running next week, says A. J. Crocker of Tonopah, who has put twelve men to work on the group.

The first shipment of ore to the smelters from the copper mines north of Sodaville has been made. Assays show 11% copper, $12 in gold and a small percentage of silver.

EUREKA COUNTY.

(Special Correspondence). — Fletcher Bros, while doing assessment work on their Snowbound claim in the Diamond range, near Eureka, report opening up 25 feet of ledge matter, carrying 35% zinc, 8% lead, with traces of silver and gold. They are negotiating with Eastern men for working the prospect.

The mines in Eureka district will continue ore shipments throughout the winter season.——At the Keystone mine, northwest of Eureka, they are running a 700 foot tunnel to tap ledge on contact between shale and quartzite. The Keystone is under $35,000 bond to Salt Lake City, Utah, men, and is taking out ore from shaft, which is reduced in small furnace on the ground.

The Diamond mine is being opened up by new tunnel, and ore shipments running $40 per ton (values carried by lead carbonate) are being made to Salt Lake smelters. ——T. V. Matthews, leasing the Rossi and Siri mine at Hamilton, will put in a table concentrator.——The cyanide mill at Tuscarora, north of Palisade, is working successfully on ore from the dumps.——A new tunnel is being run on the Silver Connor mine, near Eureka.

Eureka, Oct. 6.

LINCOLN COUNTY.

The superintendent of the Quartet mine at Searchlight reports there arrived from the East on the 5th inst. thirty-five strike breakers. Their coming had been reported to the union men at Searchlight, and 100 walked from Searchlight to Manvel, Cal., 26 miles, to intercept the new men. The Eastern men were surrounded, but refused to break their contracts, and appealed to the sheriff for a guard. A sheriff's posse accompanied them. The Quartet mine is working steadily under guard.

The Chiquita and Jumper groups, in the Newberry district, near Searchlight, have been bonded to the Providence Exploration & Development Co. of Providence, R. I., for $35,000, and first payment made.

NYE COUNTY.

The Tonopah-Utica M. Co. has been organized at Salt Lake City, Utah, to develop a group in the Liberty Bell mining district. The officers are E. E. Jones, F. B. Stephens and P. Schulte.

STOREY COUNTY.

The Butters Cyanide Co. will move the four Kinkead crushers in the Best & Belcher mill at Virginia City to the upper floor of the mill, where five are set up, and will add another, making a total of ten, with a daily ore crushing capacity of 100 tons, the pulp from which will be flumed to the company's plant in Six Mile canyon, without passing over the concentrating tables, says the Virginia City Report.

WASHOE COUNTY.

The Springfield-Nevada M. Co.'s mill at Olinghouse is in operation, the water supply having increased.

WHITE PINE COUNTY.

The Giroux Con. M. Co. will build smelting plants, both at Ely and on its properties in the State of Sonora, Mexico. A 500-ton plant will go up at each point, says Manager J. L. Giroux. At their Ely properties sinking is in progress at the Morris, and development work under way in the Giroux.

NEW MEXICO.

The following is the copper production of New Mexico for the past ten years, says the Santa Fe New Mexican:

Year—	Pounds.
1893	280,742
1894	31,884
1895	143,719
1896	2,701,664
1897	701,892
1898	1,592,371
1899	3,935,441
1900	4,169,400
1901	9,629,884
1902	6,614,961

GRANT COUNTY.

The Gold Gulch M. Co., operating the Pactolus and six other claims at Gold Gulch, has development work under way. The shaft of the Pactolus has been unwatered and will be put down another 60 feet. A steam hoist is being placed. The Pactolus has a 20-inch shoot of ore.

At the Superior mine, in Shakespeare district, south of Lordsburg, it is reported work will be resumed.

SOCORRO COUNTY.

Operations are again under way at the Rosedale mine, on the east side of the San Mateo range, near Socorro, under the W. H. Martin Co., after a shutdown of two years. They have a 10 stamp mill and cyanide plant. The mine has a depth of 740 feet, at which point the water level was struck. From the shaft fourteen levels are run north and south. The ore above water level is free milling. There are thirty men at work. It is proposed to enlarge the mill.

TAOS COUNTY.

(Special Correspondence) —J. K. Turner, consulting engineer of the San Cristobal C. Co., operating mines at Arroyo Seco, has started construction of a 200-ton cyanide mill to treat the gold ores that are free of copper. The Pueblo Chieftain M. Co. and the Rio Grande M. Co., for which Turner is also consulting engineer, propose to build cyanide mills of 100 tons capacity.

Arroyo Seco, Oct. 3.

The Mining Reporter, at Tres Piedras, says preparations are being made to work the Lower Flat placer by hydraulicking. M. J. Gill is manager. The company proposes to raise the water from Eureka creek.

OREGON.

BAKER COUNTY.

B. MacDonald of Spokane, Wash., has a bond on two undeveloped prospects near the Cornucopia mines, at Cornucopia, for $2000. The claims are the Champagne Charley and the Companion.

P. Basche of Baker City and O. D. Taylor of The Dalles have taken a working bond and lease on the Connor Creek mine at Connor creek, on Snake river, 10 miles below Huntington. They are making a test run of ore through the 35-stamp mill on the property.

The Baker group of mines in Bald Mountain district, 10 miles above Sumpter, has been bonded for $43,000 for a year to G. G. Eltel et al. The group lies between the headwaters of McCully fork of Powder river and the head of Umpqua gulch.

H. Gillis and E. Hayes are reported to have a bond on the Oneta group of claims near Greenhorn for $3000.

The Fortune M. & S. Co. has put men to work on the Red Lion mine, near Sumpter, says W. Brady, superintendent.

Excavations for the Blue Bird mill, near Sumpter, are being made, says President O. C. Wright. The machinery is on the ground.

Sinking below the 1000-foot level at the Bonanza mine three-compartment shaft, near Sumpter, has been started. When this contract has been completed the Bonanza shaft will have a total depth of 1400 feet.

The Oregon Blue Gravel M. Co. has been organized at Sumpter to work placer ground on the Sumpter townsite. N. C. Richards, E. S. Topping, A. J. Stinson and C. S. Warren are officers, with Topping as manager. They control fifty blocks on Sumpter townsite. In addition to this, they have placer holdings in the John Day valley. Operations will be begun this month.

A. E. Bryan, superintendent of the North American G. M. Co. of Seattle, operating the Porcupine group in Wind Creek district, near Sumpter, says he will put in an air compressor. He has men at work putting up buildings. A road is also being built up Wind creek. To the Porcupine holdings the company has added three claims—the Eldon, Last Dollar and the Oro Fino. Work was started last week on a 1200-foot crosscut, which will cut the five ledges of the group, and will attain a maximum depth of 1000 feet.

DOUGLAS COUNTY.

Operations are being resumed on the Gold Bug mine, on Mount Reuben, southwest of Glendale, says Superintendent W. S. Haskins. Additional machinery has been put in, the lower levels cleaned out and retimbered. The mill will also resume.

The Stocks and Harlow group, near Bohemia, is in operation again. Miners are at work blocking out ore for the winter's run.

D. F. Letsinger, interested with N. F. Wyatt in five claims on the ridge near Cottage Grove, reports development progressing, and 1000 feet of tunnel have been driven. The Golden Rule claim shows width of ledge 18 feet. Ledge on Rambler No. 2 gave surface assay of $6. The Puzzle claim is the one on which the main tunnel is being driven, and this is in 170 feet, and will tap Rambler No. 2 ledge at depth of 150 feet. A millsite has been located, with abundance of water and wood.

GRANT COUNTY.

Work will be resumed at the Big Four mine in Red Boy district, near Granite, next week, says W. C. Rutter of Seattle, Wash., president and general manager of the Kittanning M. Co. They propose to drive a 1000-foot crosscut tunnel which will give a depth of 700 feet on the vein. The Big Four is between the Red Boy and the Cougar, on the same vein system. There is a 300-foot crosscut to the main lead with 300 feet of drifts and two shafts of 40 and 60 feet on the vein. There are three veins on the location, the main one of which averages 15 feet wide.

JACKSON COUNTY.

F. Kalh of Amsterdam, N Y, and treasurer of the New York & Western M. Co, reports making final payment on the Oregon Bell mine on Forest creek, 7 miles west of Jacksonville, which his company bought for $30,000. W. C. Kitto is superintendent. It is intended this winter to put in a quartz mill, the power to be electrical.

JOSEPHINE COUNTY.

The Waratah Minerals Co, a department of the Welshach Gas Fitting Co. of Philadelphia, Pa, is preparing to put in a platinum mining plant at the Old Channel mines on Galice Creek, near Grant's Pass, says J. R. Harvey, manager of the Old Channel mines. W. F. Smith, manager of the Waratah Minerals Co., has begun putting in the machinery. These placers will hereafter be operated under lease by J. R Harvey, and will be known as "The Royal Group Mines." Platinum occurs in these placers both free and with rhodium, osmium, iridium and palladium. The saving of the platinum concentrates does not interfere with the gold mining operations The sands and concentrates are drawn from the sluice boxes through a ½ inch grizzly, then spread out over a broad riffle table to catch the flour gold, and later drawn through a ¼-inch screen and spread over cocoa mat riffles, where the concentrates settle and are gathered up. This system of undercurrents and riffles is so arranged that a part of them can be cleaned every day during the mining season. The concentrates are finally milled and run over a concentrating table, and they are valued at $160 a ton in gold and platinum, says the Telegram.

MALHEUR COUNTY.

Manager J. F. Meikle of the Black Eagle M. Co., near Malheur City, reports that they propose to increase their milling plant at the Black Eagle mine, says the Democrat. They have twenty stamps dropping. Either water or electric power will be added.

MORROW COUNTY.

Tunnel No. 5 of the Willow Creek coal mine, near Heppner, is producing. There are twenty men at work and several teams are on the road hauling the coal and placing it on the local market. Arrangements are being made to ship to Pendleton and other points on the main line of the O. R. & N.

SOUTH DAKOTA.

LAWRENCE COUNTY.

W. T. Beane of Deadwood, manager of the Golden Empire M. Co., in western Lawrence county, says he is putting on more men and will increase development work. He has thirty men, mostly on the Eureka and Troy claims, where former work has shown promising vein matter. The Eureka is over the line in Wyoming.

The Columbus M. Co., near Deadwood, has decided to build a milling plant on Sawpit gulch, a short distance above the main shaft. It will be necessary to pump water a considerable distance. The plant will use a combination of amalgamating and cyaniding processes—crushing with stamps in a solution of cyanide of potassium, leaching and finally amalgamating, says President Mayham. The mill will contain 240 stamps.

The Rex M. Co. is putting in a heavier pump at its shaft at Kirk, south of Lead City. The company has had considerable trouble with water. The pump has a capacity of 1800 gallons a minute.——The Lucky Strike G. M. Co. has replaced its shaft house which was destroyed by fire a few weeks ago, and work has been resumed with a temporary shaft house and whim until the permanent structure can be built and a steam hoist put in. The Lucky Strike has its own sawmill.

TEXAS.

HARDIN COUNTY.

The seventy-five producing wells in the oil field at Sour Lake are said to have a total capacity of 100,000 barrels of oil daily. There are 100 new wells drilling. Present facilities permit of moving but 50,000 barrels daily.

UTAH.

September in the ore and bullion market closed on settlements aggregating $1,956,912, as compared with $1,658,800 for the same month in 1902, says the Salt Lake Tribune. During the same period the copper producers, independent of the Murray plant, operated by the American S. & R. Co., marketed bullion that brought $835,059. While approximately 100,000 tons of ore was reduced at the valley furnaces during the month, the capacity of hut one was on trial, and the requirements of October are expected to exceed this total. The advance in silver and other conditions favorable to production are doing more to stimulate the efforts of the producer than has any other incentive during the past two years.—— The output of copper bullion carrying gold and silver during the month attained a total of 3,669,513 pounds, of a value exceeding $1,000,000, with the valley furnaces not at their full capacity. The output was distributed as follows:

	Pounds.
Bingham Con	720,263
Highland Boy	1,203,720
United States	852 530
Total	2,786 513
American S. & R	883,000
Grand total	3 669,513

During the previous month the output of copper bullion from the same sources amounted to 2,573.580 pounds, a gain for September of over 200,000 pounds at the independent smelters.

GRAND COUNTY.

The Clara C. Co. is planning to put in a copper leaching plant at its property, 20 miles south of Thompson's Springs. W. C. Tracy of Alta is superintendent.

JUAB COUNTY.

The management of the Carisa C. & G. M Co. during its past fiscal year reports having marketed 3239 tons of ore, of which 839 was forwarded from the dump for "trial" purposes, from which was smelted 660 820 pounds of copper, 8260 ounces of silver and 445 ounces of gold, of total value $59,477.63. In addition to this the report of the managing director and vice-president, H. S. Joseph, showed that during the same period 4315 feet of development work was done with satisfactory results. On the 700-foot level 4 feet of ore, averaging 15% copper, 12 ounces silver and $2 gold per ton, has been opened up, while on the 100-foot level and 400 feet below the surface a body of copper oxide was cut, shipments from which give an average of 18% copper. On the 700-foot level one important piece of work was completion of connection of workings with the Sioux-Ajax tunnel, giving an easy mode of egress and good ventilation; also means of transportation of ore direct into railway cars. An important factor in the development work is the leasing system, says Manager Joseph. There are fourteen separate leases in operation in the old surface tunnels, old stopes and shallow workings. These lessees mine considerable ore from bodies too small to be profitably worked by the company.

The shipments from Tintic district for month of September amounted to 499 cars, showing an increase over August. The shippers and output during September were: Centennial Eureka, 112 cars; Grand Central, 107; Carisa, 10; Mammoth, 40; Victor, 14; Black Jack (iron), 15; Dragon (iron), 55; Bullion-Beck, 27; Gemini, 52; Yankee Con., 18; and 14 others, a total of 50 cars. Seven cars of concentrates were shipped from the May Day jigs.

Smoke from an unlocated fire in the abandoned workings of either the Eureka Hill or the Bullion-Beck mine is reported to have put a stop to all underground work in those mines, and also the mines in the Tintic district. Miners were driven out of the Centennial-Eureka and the Gemini mines on the 6th inst. Several hundred miners are idle. Nine men were overcome by the smoke in the Centennial-Eureka, but were rescued.

Work has been resumed at the Joe Bowers mine near Eureka, with W. Conley as superintendent. As soon as the shaft is unwatered a crosscut will be run to the vein. The ores carry galena with silver.

The Utah M. Co, at Fish Springs, during the month of September shipped four carloads of ore (100 tons) which netted $9478. The ores carry lead and silver.

The Neho M. Co., of Salt Lake City, has been incorporated by J. J. Sears and F. H. Hyde. The company owns a group of claims in Mt. Neho district.

PIUTE COUNTY.

Final payment has been made on the Elephant group, near Marysvale, by the Gold D. Co., of Salt Lake City. They

also have taken an option on the L. & N. (or Lammersdorf) group and have absorbed the Silver King and Golden Queen groups. These mines are near the Annie Laurie mines and mill. P. A. H. Franklin is manager and D. E. Rohlfing consulting engineer. On the Elephant group, the tunnel of which is in 260 feet, a contract for 500 feet of more work bas been given, although its destination is 2400 feet from its portal, where it will connect with the main Franklin tunnel, which is approaching from the south and which will cut through the gold-bearing zone 8000 feet in length. At the same time on tbe strike of the vein the Log Cabin tunnel is in 300 feet and headed for the Sunshine. Supplies are being sent in, to continue operations this winter.

SALT LAKE COUNTY.

An average of twenty-five 50-ton cars of ore are being shipped from Bingham daily, says the Bingham Bulletin. The amount is expected to be increased this month, when the Boston Con. begins output, and the Yampa changes from wagon hauling to the Copper Belt railroad.

A branch of the Copper Belt road will be run to the Boston Con. C. Co.'s upper tunnel in Muddy gulch, near Bingham.

UTAH COUNTY.

The Park City Co-operative M. & D. Co., of Park City, has been incorporated by M. J. Daily, J. E. Hartman, W. H. West, N. B. Dresser and W. Byrne. The company owns the Iron Master Nos. 1 and 2 lode claims, in Utah county. W. H West is manager.

The Garden City M. Co. has been incorporated at Provo City to operate the Monarch and the Monarch Nos. 1 to 6 inclusive, in Rock canyon, near Provo City. The following are directors: J., S. H., J. W , G. H. and E. Buckley. They are drifting on the ore body.

The Sygnet M. Co., which has a group of four claims in American Fork canyon, near American Fork, has been incorporated by C. E. Steward, M. C. Moyer, A. D. Beaman and C. I. Berger. The property is developed by a tunnel 140 feet in length, which has struck ore.

WASATCH COUNTY.

The Gold Dust M. & M. Co., of Heber City, has been incorporated by J. R. Murdoch, W. Van Wagener and J. C. Jensen. The company owns four claims in Snake Creek district.

WASHINGTON COUNTY.

Manager C. H. Doolittle of the Dixie mine and smelter, near St. George, says the smelter is treating an average of fifty tons of ore daily, producing 12,000 tons of copper bullion.

WASHINGTON.

FERRY COUNTY.

Work was resumed at the Mountain Lion mine, near Republic, last week, after a shut down of two years. Machine drills will be put in to stope ore. The pumps are unwatering the shaft.

WYOMING.

CARBON COUNTY.

Blister copper ingots are being shipped to New York from the North American C. Co.'s plant at Grand Encampment. The bullion is hauled 40 miles to the railroad.

UINTA COUNTY.

The American Con. Oil Co. at Spring Valley has lumber on the ground to build seven rigs, as they expect to complete that number of wells by December 1st. They have also a rig going up on a section outside what is considered the proven field.

FOREIGN.

AFRICA.

The total gold output of companies making returns to the Rhodesian Chamber of Mines at Bulawayo for month of August amounts to 19,187 ounces, a decrease of 4384 ounces as compared with July, and an increase of 3440 ounces as compared with the corresponding period of 1902 The monthly returns for 1902, and for 1903 to Sept. 1 have been as follows:

	1903. Ounces.	1902. Ounces.
January	16,245	15,955
February	17 090	13,204
March	19,626	16,891
April	20,727	17,559
May	22,137	19,698
June	22,166	15,842
July	23,571	15,226
August	19,187	15,747
September	.....	15.164
October	.....	16,849
November	.....	15,923
December	.....	16,210
Totals	160,749	194,268

AUSTRALIA.

WESTERN AUSTRALIA.

The annual report of the Lady Shenton G. M. Ltd., near Kalgoorlie, J. W. Rayfield, mine manager, shows a reduction of 2s. 5d. in the cost per ton for mining, 2s. 6d. for milling, 8.3d. for cyaniding, and also reductions in cost of recovering and treating concentrates. Although the tonnage of ore mined and treated was larger and the general operations of the company more extensive, the aggregate expenditure is below that for the previous period. The final quarter of the year was affected by the heavy general increase in wages awarded by the Arbitration Court to employes on this and other mines throughout the district. To minimize the extra expense thus entailed one-man machine drills are being introduced at the company's mine, and those already obtained have resulted in saving of labor and consequent reduction in amount of wages paid per month. In addition to stoping and general underground operations, 977 feet of sinking and raising, 2020 feet of crosscutting and driving and 618 feet of boring, beside costeaning, have been done.

BRITISH COLUMBIA.

BOUNDARY DISTRICT.

The Hesperus group on Hardy mountain, 4 miles from Grand Forks, has begun shipments of ore. Smelter returns give values, principally in copper, of $16 per ton. The properties are owned by the Hesperus G. & C. M , Ltd., of Chicago, Ill.

R. Plewman, manager of the Winnipeg mine, at Wellington, says the tramway that was destroyed by fire has been replaced, also the gallows-frame. Ore is being extracted from the 100-foot and the 50 foot levels.

CARIBOO DISTRICT.

So much rain, in amount not exceeded since 1862, has been falling in Cariboo lately, that hydraulic mines, which made light returns early in the season, and had to close down as a result of the shortage of water in the mountain streams, have resumed operations, says the News-Advertiser. However, all the hydraulic mining must close down for winter in a few weeks.

CASSIAR DISTRICT.

The gold output of Atlin's section totals $1,500,000 this season, says J. T. Wilkinson of Vancouver.

LILLOOET DISTRICT.

The dredger for the Iowa Lillooet G. M. Co. has been floated and the machinery is being set up.

NELSON DISTRICT.

P. E. Sharpless and H. L. Gilmour of Pennsylvania have organized the Morning Star M. & M. Co. to work the Star mine, on Eagle creek, near Nelson. Manager Gilmour will remain in Nelson. A stamp mill will be built at the mine. Men have been started on preliminary work. A wagon road will be built from the Poorman-Granite mine to the millsite, and it is expected a tramway will connect the mine with the same.

SLOCAN DISTRICT.

The Wakefield mine, near Silverton, has its concentrator running and has forty men on its payroll. It is turning out two products—a lead concentrate (65% lead and 100 ounces silver) and a zinc concentrate (45% zinc and seventy ounces silver) to the ton. There are 100 tons of zinc concentrates on the wharf ready for shipment. The management is holding it for better terms of treatment. The lead product is shipped to the local smelters as fast as produced ——The Bosun mine is keeping up its output of 120 tons per month and works thirty men.

MEXICO.

AGUAS CALIENTES.

Two 300-ton furnaces will be added to the American S. & R. Co.'s plant at Aguas Callentes.

DURANGO.

The San Acacia M. Co. has finished construction of a line of railway from a point on the Mexican Central to the San Acacia mines, in the district of San Juan de Guadalupe.

OAXACA.

The Natividad M. Co. of Oaxaca is preparing to put in an electric plant to give at least 350 H. P. from the present water supply, which will double the present capacity, says E. Girault, consulting engineer.

SONORA.

At La Bufa, in Sahauripa district, the concentrating and smelting machinery of the Bufa M. & R. Co. is expected to be ready to start up Nov. 1.

The Cananea Herald says tbe Yaqui River C. Co. has closed down all work at its mines at Campo Santo Nino. No reason is given for the shut down.

PHILIPPINE ISLANDS.

Though several of the islands of the archipelago are considered to have extensive mineral deposits, says the Manila Bulletin, the inadequate transportation facilities and the obstacles imposed upon the prospector by heat of the lowlands and by dense tropical vegetation (which usually covers and to great extent conceals the rock formations) have restricted systematic development up to the present time. There have been found in Benguet and Lepanto small bodies of rich gold ore, but the veins are narrow and irregular. Quantities of low grade, free milling ores have been found, but they are for the most part in the interior; and their successful development involves considerable outlay in building roads and putting in machinery.

SPAIN.

The Espana Economica y Financiera says Spain's exports of gold and silver for the first six months of 1903, as compared with same period of 1901 and 1902, was:

	1901.	1902.	1903.
Gold, ingots and coin...$	19,300	$ 28,950	$ 5,790
Silver, ingots and coin. .	2 659,540	928,330	2,171,250
Total.....	$2,678,840	$957,280	$2,177,040

PERSONAL.

J. L. BUTLER of Belmont, Nev., is in San Francisco, Cal.

J. T. ARUNDEL of London, England, is in San Francisco, Cal.

S. I. HALLET of Colorado is examining mining property in Idaho.

H. ALTMAN of Salt Lake City, Utah, is in Montana on mining business.

H. T. BURES, a mining engineer of London, Eng., is in San Francisco, Cal.

C. H. WILDMAN, formerly of Cottage Grove, Or., is now at Placerville, Cal.

F. FARISH AND C. W. PURINGTON have left Denver, Colo , for Sonora, Mexico.

D. CRAELIUS has resigned his position with C. A. Luckhardt & Co , San Francisco, Cal.

E F. FLOYD of San Andreas, Calaveras county, Cal., is in San Francisco, Cal , on mining business.

H. K. WHEELER of Los Angeles, Cal , is examining a copper property at Encampment, Wyo.

W. S. HASKINS is superintendent of the Gold Bug mine on Mt. Rueben, southwest of Glendale, Or.

P. KARTSCHOKE, interested in mines near Nevada City, Cal., is in San Francisco, Cal., on business.

W. E. EVERSON of Elk Grove, Cal., is superintendent of the El Dorado C. M. Co , at Georgetown, Cal.

T. H. TRACY is now general superintendent of the North American Copper Co., Encampment, Wyo.

C. A. ROSS, president of the Standard copper mine, near Clifton, Ariz , is at Clifton from London, England.

W. C. RALSTON has returned to California from an inspection of Idaho and Oregon gold mining properties.

J. B. WARNER, manager of the Silver Ledge mill, Red Mountain, Colo , has returned there from Denver, Colo.

E. D. BOYLE, manager of the North Rapidan M. Co , Como. Nev., has returned from a visit to California.

G. E COLLINS has returned to Denver, Colo., from an extended trip to the Colorado river, near Kingman, A. T.

W. SHARWOOD, superintendent of the Soulsby mine, at Soulsbyville, Tuolumne Co., Cal., is in San Francisco, Cal.

R W. RODDA left Seattle, Wash., the 1st for southeastern Alaska on mining business, and will return Nov. 1st.

A. B. CALL is in Guanajuato, Mexico, examining mining properties for W. C. Bennett & Co. of Springfield, Mass.

F. E. ABERCROMBIE of the Boston Con. and other Bingham, Utah, mines, is in Salt Lake City, Utah, from the East.

MANAGER J. F. MEIKLE of the Black Eagle M. Co., near Malheur, Or., is in Houghton, Mich , on company business.

SUPERINTENDENT S. TARBET has been appointed manager of the Estella mine, near Milford, Utah, vice Penrose, deceased.

SUPERINTENDENT A. B. HODGES, of the Granby smelter, returned to Grand Forks, B. C., last week from a trip to California.

G. W. OTTERSON, superintendent of the Windfall hydrulic mines at Windfall, near Juneau, Alaska, is visiting in Placer county, Cal.

C. D. GALVIN, who is interested in mining properties in the United States of Colombia, South America, has returned to California.

HARRY M. ROCHE has resigned as assayer and metallurgist for the Fannie Marie G. M. Co. of Glencoe, Cal., and is in Oakland, Cal.

G. A. EASTON is mine superintendent for the Gold Gulch M. Co., operating the Pactolus group at Gold Gulch, Grant county, N. M.

M. J. LIDSTONE, of San Francisco, Cal., has gone to Shasta county, Cal., to rebuild the mill at the Niagara mine, near French Gulch.

J. F. BRANDES accompanies Count Ward of London on mining business to Salt Lake City, Utah. The latter has returned to London.

FRANKLIN LEONARD, president of the Comstock Tunnel Co., returned to Sutro, Nev., this week from a business trip to San Francisco, Cal.

W. A. CLARK of Butte, Mont., principal owner of the United Verde copper mines at Jerome, Ariz , is visiting in southern California.

L. MORRIS, president of tbe United Bingham M. Co. and Avondale of Park City, Utah, is in Salt Lake City, Utah, from Cincinnati, Ohio.

A. J. MCMILLAN, managing director of the Le Roi M. Co., Ltd., returned to Rossland, B. C , last week, after an absence since May in England.

MANAGER ROCKWELL, of the Minnie Moore and Idaho Con. mine companies, near Hailey, Blaine county, Idaho, is in Chicago, Ill., on business.

G. Z EDWARDS, who has been connected with the Con. Mercur G. M. Co., at Mercur, Utah, since 1894, has resigned as general superintendent.

W. J. ADAMS has returned to San Francisco, Cal., from a month's visit on mining business at the copper mines at Copperopolis, Calaveras county, Cal.

M. L REQUA, vice-president of the Pacific Wire & Steel Co. of San Francisco, Cal., has returned to San Francisco from New York and other Eastern cities.

SUPERINTENDENT DENTON of tbe Baltic and Trimountain copper mines, near Houghton, Mich., has resigned as assistant superintendent of the Atlantic mine.

J. GORDON is general superintendent for W. E. Hurd, of Portland, Or , on the Granite Boulder group and Smuggler mines, near Greenhorn, Baker county, Or.

T. COLE, a former superintendent of the Butler-Liberal mines at Bingham, Utah, has accepted a similar position at the Silver Shield mine, in the same camp.

E. MCCORMICK is superintendent of the American Cornfield M Co , near Joplin, Mo., vice W. R. Crandall, who will give his entire time to the Missouri Zinc Fields Co.

PRESIDENT J. E. BAMBERGER of the Daly West mine, Park City, Utah, returned to Salt Lake City, Utah, last week from inspecting his oil interests at Los Angeles, Cal.

W. C. TRACY, recently superintendent of the Wheeler & Wilson mine, near Alta, Utah, is superintendent of the Clara C. Co , south of Thompson's Springs, Grand county, Utah.

W. H. BRAY, superintendent of the Posey & Huron mines near Nevada City, Cal , has been elected vice-president and manager of the consolidation of the Red Cross M. Co. and the Huron M. Co.

R. N. DIGGLES, assayer for the Melones M. Co., has retured to Melones, Calaveras county, Cal., from a trip to Siskiyou county and San Francisco, Cal., on mining business for the H. J. Diggles Estate Co.

G. A. BAST, of Springfield, Mo., is superintendent of the Boston-Get There mine, near Joplin, Mo., vice T. Chapman, who will take charge of the Chapman mine, near Prosperity. Chapman is also superintendent of the Mt. Ararat M. Co.

J. K. TURNER, consulting engineer of the San Cristobal C. Co. at Arroyo Seco, Taos county, N. M., has been appointed consulting engineer for the Rio Grande M. Co. and the Pueblo Chieftain M. Co , both operating in northern New Mexico. He returned last week from a business trip to New York.

Commercial Paragraphs.

THE Western Supply Co., manufacturers' agents, bave opened offices at 578 Mission St., San Francisco, A. Norman Dempsey, manager.

THE Brown Corliss Engine Co., Corliss, Wis., is in receipt of an order from tbe Lorain Steel Co. of Lorain, O., for a 30 and 60x60-inch cross compound Corliss engine.

THE Trenton Iron Co, tbrough tbeir Denver, Colo., agent, R. D. Seymour, have an order for 1000 feet of tramway at the new mill of Lundberg, Dorr & Wilson, to tbe mine at Terry, S. D.

THE Bouse Hydraulic Machinery Co. bas opened a business at 503 Mission street, San Francisco, Cal., witb a complete line of bydraulic and mining macbinery. Estimates or information along these lines will be furnisbed promptly upon application.

L. P. HAMMOND, manager of tbe Denver branch of the Crocker-Wheeler Co, Ampere, N. J., reports among recent sales made by his office: Two 15 K. W. generators; two special motors to develop 90 H. P. at 150 revolutions per minute and standard motors, aggregating 340 H. P., to Portland Cement Co; two 7½ H. P. motors and one 15 H. P. motor to Nock & Garside; to Copper Queen Con. M. Co, Bisbee, one 12 H. P. electric hoist; United Globe mine, one 12 H. P. electric boist; one 8½ K W. dynamo to Fairbanks, Morse & Co; to Allis-Chalmers Co. one 23 K. W. dynamo and switcbboard; one 9 K. W. direct connected dynamo; to Eaton Sugar Co one 30 K W. direct connected dynamo, with 9½x10 Erie ball engine; one 15 H P. motor and centrifugal pump; to Victor Fuel Co. one 14 H. P. specially compounded motor direct connection to box car loader; to Mine & Smelter Supply Co. one 25 H. P. motor; to Locke Drill Co. two 4½ K W. dynamos for electric drills.

THE Fred. M. Prescott Steam Pump Co., Milwaukee, Wis., reports the following among their recent shipments of pumping machinery: Oce triple expansion mine pumping engine to the Buffalo & Susquehanna Iron Co., Hibbing, Minn., and one triple expansion mine pumping engine to the Iroquois Iron Co., Hibbing, Minn., each with a capacity of 1200 gallons per minute; part of a large order, which includes two triple expansion pumping engines of large capacity, to the El Oro Railway & Mining Co., Ltd., El Oro, Mex; a deep mine triple expansion pumping engine to the Penn Iron Mining Co., Vulcan, Mich., with a capacity of 1000 gallons per minute against a 1200-foot bead; a triple expansion high service pumping engine, with a capacity of 1,500,000 gallons per day against 175 pounds water pressure, to the New Castle, Pa, Water Works; a compound and condensing mine pumping engine, with a capacity of 500 gallons per minute against 1200-foot head, to the Calumet & Arizona Mining Co, Bisbee, Ariz Among recent orders, they report having hooked tbe following: One vertical heam condenser for tbe Denver Tramway Power Co., Denver, Colo., with a capacity of 70,000 pounds of steam per hour; two triple expansion mine pumping engines for the Mesabe Iron Range in Minnesota, each with capacity of 2000 gallons per minute; one triple expansion pumping engine for the East St. Louis, Ill., Water Works, capacity 6,000,000 U. S. gallons water per day.

Catalogues Received.

The Temple Pump Co. note their 50th year hy a 1903 description of their gasoline engine, of which three sectional views are given, beside additional detailed illustration and description of the "Master Workman" gas engine, which they make and furnish from Meagher and 15th Sts., Chicago, Ill.

"Balances and Weights of Precision," finely illustrated, from Christian Becker, whose factory is at New Rochelle, N. Y., his New York City office being at No. 7 Malden Lane. These goods are guaranteed by the maker, and are for assaying, analytical and scientific uses, where accuracy is required, each instrument heing described and the price plainly stated.

"Jeffrey Power Drills for Rock and Coal" gives a clear cut description of the Jeffrey Mfg. Co.'s new line of coal and rock drills. The Badger, rotary, electric, air-power, pin, and hand-power drills are illustrated in detail. Other of the Jeffrey Co.'s manufactures, such as the water elevator, coal mining machines, electric locomotives, conveyors, screening plants and labor-saving appliances are given attention. This fine trade treatise is issued by tbe Jeffrey Manufacturing Co., Columbus, Ohio.

Obituary.

PATRICK RYAN, a former mining man, stock raiser and member of tbe first Legislature of Montana, died at San Bernardino, Cal., Oct. 5th.

S. HASKINS, a pioneer miner of Calaveras county, Cal, and one of the original owners of the Champion mine at West Point, died Sept. 30th. Deceased was a native of New York, aged 71 years, and leaves a widow and a son.

HUGH ASBURY, a pioneer miner of Baker county, Or., and wbo is said to have given the town of Sumpter its name, died at Baker City, Sept. 28th, from paralysis. Ashury was one of a party of West Virginians who, in 1862, discovered the placer diggings where Sumpter now stands. The log cabin which they built after panning the sands and gravel of McCullay's Fork of Powder river and finding they contained gold, still stands, 1 mile west of Sumpter.

Books Received.

"Data Concerning Platinum" is a dainty little volume from the Baker Platinum Works, Newark, N. J, with illustrated description of articles made from platinum and data of general interest to anyone having anything to do with that precious metal. Accompanying it, as a separate leaflet, are stated sizes of platinum rivets for use as contact points in telephones and other electrical apparatus. Baker & Co. are authority on platinum and its uses, and their publications thereon are of standard value.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific coast inventors:

FOR WEEK ENDING SEPT 29, 1903

739,973.—LAMP MOUNTING—S. H. Anderson, Los Angeles, Cal.
740,080.—BASEMENT DOOR—Berry & Gale, Los Angeles, Cal.
740,082.—OIL BURNER—G. W. Boyd, S F.
739,981.—RAILWAY—W. P. Bryant, Corona, Cal.
739,827.—TRICK BASS VIOL—G. H. Britzbach, S. F
739,883.—THRESHER FEEDER — F. A. Colwell, Oakesdale, Wash.
730,990.—BED AND TABLE—J. F. Cook, Oxnard, Cal.
740,006.—ARTIFICIAL TEETH—C. A. Davis, Pasadena, Cal.
740,104.—IRONING BOARD—I. M. Dillman, Oakland, Cal.
740,107.—TOOL HOLDER—G. H. Dworzek, S. F.
740,008.—CAN HEADER—J. A. Gray, S. F.
740,272.—TROLLEY POLE—C. Harter, South Pasadena, Cal.
740,130.—WIRE GRIP — H. D. Hazard, Yakima, Wash.
740,015.—WINDOW—E. Hipolito, Los Angeles, Cal.
740,019.—HORSESHOEING STAND—J. C. Hutton, Jr., Waterloo, Or.
740,145.—SAFETY GAS PIPE—F. W. Krohn, S. F.
740,026.—RATCHET SWIVEL—H. H. Krohn, Los Angeles, Cal.
740,027.—CONCENTRATOR—M. S Leve, Fruitvale, Cal.
739,923.—OIL BURNER—C. Petrini, Bakersfield, Cal.
740,318.—HAY LOADER—Romwall & Pitt, Lovelock, Nev.
740,048 —VEHICLE GEAR—C. O. Sohmand, Winlock, Wash.
740 057.—VOTING MACHINE—St. Louis & Jackson, Colusa, Cal.
740,058.—VOTING MACHINE—St. Louis & Jackson, Colusa, Cal.
740,059.—VOTING MACHINE—St Louis & Jackson, Colusa, Cal
740,064.—TIRE HEATER—F. Thomson, Santa Ana, Cal.
740,205.—TROLLEY CROSSING—O. Vanorman, Los Angeles, Cal.
739,953 —FRUIT PEELER—C. J. Vernon, Los Angelee, Cal.

Notice of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SAFETY GAS SUPPLY PIPE ATTACHMENT —No. 740,145. Sept. 29, 1903. F. W. Krohn, San Francisco, Cal. This invention relates to improvements in means for preventing gas escaping from the jet in case the gas is turned off at the meter or its flow through the mains otherwise interrupted while the jet cock is still open and then turned on again before the jet cock has been closed. The object of the invention is to provide a safety device of simple construction which is adapted to be interposed in the supply pipe between the meter and the gas jet whereby the flow of gas through the pipe will be controlled by the gas pressure.

HYDROCARBON BURNER —No. 740,082. Sept. 29, 1903. G. W. Boyd, San Francisco, Cal.; one-half assigned to J. O. Low and L. M Bourhand of same place. This invention relates to improvements in oil burners in which the steam necessary for effecting volatilization and combustion is generated by and within the burner itself. Its object is to provide a simple practicable burner adapted for use in stoves or furnaces, and particularly wherever a source of steam supply is not generally available Experience has shown this burner to be well adapted for use in continuously operating furnaces, and once the necessary amount of oil and water is ascertained and regulated by proper valves the burner practically requires no further attention.

Latest Market Reports.

SAN FRANCISCO, October 9, 1903.

METALS.

SILVER.—Per oz., Troy: London, 27⅞d (standard ounce, 925 fine); New York, bar silver, 59⅝c, refined (1000 fine); San Francisco, 59½c; Mexican dollars, 47c @49c; San Francisco, 45½c New York.

COPPER. — New York: Standard, $13.25; Lake, 1 to 3 casks, $13.25; Electrolytic, 1 to 3 casks, $13.25; Casting, 1 to 3 casks, $12.87½; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 17s 6d spot per ton.

A slight falling off is noticeable in copper, but these small fluctuations are always a feature of the market, at whatever price prevails. One authority thus expresses the situation: "The copper business, like every other business, must necessarily feel the ups and downs of the general conditions. People just now are in a somewhat depressed frame of mind and inclined to await developments. Under the circumstances it is only natural that the copper market should be very slow, that consumers should hold off on their orders until the outlook is clear, and that prices should show a slightly weakening tendency. As to the future, it still, as we regard it, has a reasonably satisfactory outlook. In due season the demand for copper is likely to show itself as other lines of industry shall improve, and it needs only this stimulus to advance prices to a higher level. Inquiries for copper at the present time are light; but, on the other hand, we, in common with other lines of business producers, are not making much of an effort to sell the metal. The time for a change for the better in the demand is, however, not far off."

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco $4.50, carload lots; 4¾c 1000 to 4000 lbs.; pipe 6½, sheet 7, bar 5¾c; pig, $4.75. London: £11 6s 3d per long ton.

SPELTER. — New York, $6.00; St, Louis, $5.00; London, £20 10s per ton; San Francisco, ton lots, 6½c; 100-lb lots, 7c.

In the United States for the year 1902 the total output of lead for the entire country was 220,000 short tons, and of zinc 156,297 short tons. The lead production was about the same as in 1901, but there was an increase of about 10% in zinc production.

TIN.—New York, pig, $26.00@26 35; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29½c; less, 30c; bar tin, ℔ lb, 30c @32c. London, £114 spot.

PLATINUM.—San Francisco, crude, $18.00 ℔ oz.; New York, ingot, $19.00 per Troy oz. Platinum ware, 75@80c per gram.

QUICKSILVER.—New York, $46.00@47.00; large lots; London, £8 7s 6d; San Francisco, local, $43@44 ℔ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.— San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c; extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots 18.75c; San Francisco, Plumbers', 100-lb. lots, 15.50c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb., .04c.

NICKEL.—New York, 50@60c ℔ lb.; ton lots, 45@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30c to 34c.

ANTIMONY.—New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300 to 500 lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.85 @17.35; gray forge, $15 35; San Francisco, bar, 3c ℔ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $27 00@29.00; open hearth billets, $28.00 @30 00; San Francisco, bar, 7c to 12c per lb.

ELGIN WATCHES

run alike

Every Elgin Watch is adjusted to all conditions of heat and cold before leaving the factory.

An illustrated history of the watch sent free upon request to

ELGIN NATIONAL WATCH CO. ELGIN, ILL.

SITUATIONS WANTED.

ASSAYER, EXPERIENCED IN CYANIDING, desires position. References. Address "Assayer," care of Mining and Scientific Press.

BY A THOROUGH PRACTICAL ALL ROUND mining and mill man of wide experience, with modern ideas, pushing and energetic, with first-class testimonials. Address "Quartz," care of Mining and Scientific Press.

BY EXPERIENCED ALL ROUND MINE SUPERINTENDENT who is also a PRACTICAL UNDERGROUND FOREMAN, and will act as both, if necessary. Expert in catching up badly caved workings, and speedy air-drill work Understand all ores—silver, lead and copper; gold amalgamation and concentration. Set hollers, machinery, repairs, remodel bad arrangements. *Salary reasonable.* Responsible references. Address "Confidence," care of Mining and Scientific Press, San Francisco.

COPPER SMELTERMAN IS OPEN FOR ENgagement. Experienced blast furnaceman, metallurgist, assayer, sampler, etc. Good references. Address "Furnace," care of this office

CYANIDE CHEMIST AND ASSAYER, AT present in charge of a cyanide plant, will be open for engagement Nov. 1st Practical experience with different systems, and excellent references. Permanency more desired than high salary. Address K. C. N., care of this office.

POSITION DESIRED AS DRAUGHTSMAN, Surveyor, Assayer or Bookkeeper. Good references. Address H.W.K., Box 74, Long Beach, Wash.

MINING ENGINEER AND METALLURGIST, with sixteen years' of practical experience as manager, superintendent and consulting engineer of mines and mills, desires position on or after November 1st Speaks Spanish fluently. Address P. O. Box 77, Durango, Mex.

SITUATION AS MILLMAN OR CHARGE OF small mine, after November 15th, by middle-aged man. Over twenty years' experience in mine and mill. All round worker. Nine years with present company. Wish to make change Good references. Address "Millman," care of Mining and Scientific Press.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

YOUNG MAN WHO HAS COMPLETED TWO years' work in good mining school desires position. Good chemist and assayer Salary not so much of an object as to gain practical knowledge. Speaks and writes Spanish. Will go anywhere. Address Box 32, this office.

About Roofs

The more you know about roofings the more thoroughly you will believe in the efficiency of P. & B. Ready Roofing.

P. & B. Ready Roofing causes less annoyance, less trouble, less bother and less expense than any other ready roofing manufactured. It is a ready roofing that you can depend upon at all times and it does its work thoroughly and well. It is a ready roofing that will protect your building against all the injurious agencies that are likely to bother it. It is a roofing you can well afford to use it.

Mine, near Forest Hill, Placer County, Cal., draining into Volcano Canyon Creek which reaches Middle Fork of American River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., Oct 19, 1903, at 1:30 P. M.

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, El Dorado County, near Placerville, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 2 st day of September, 1903, an assessment (No. 15) of two and one-half (2½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold c in to the secretary, at the office of the company, 112 Main street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of October, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before will be sold on MONDAY, the 16th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

N. F. REMINGTON, Secretary.

Office—112 Main street, San Francisco, California.

WILLIETTA MINING AND MILLING COMPANY. —Location of principal place of business, San Francisco, California; location of works, near Jacksonville, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of September, 1903, an assessment (No. 7) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 233, Crocker Building, corner Post and Market streets, San Francisco California.

Any stock upon which this assessment shall remain unpaid on the 27th day of October, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 17th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

E. McALLISTER, Secretary.

Office—Room 233, Crocker Building, corner Post and Market streets, San Francisco, California.

☞ Prompt payment is requested.

GOLDEN WEST MINING AND MILLING COMpany.—Location of general place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of September, 1903 an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, 123 California St., Room 423, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 18th day of November 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

CHAS. BOVONE, Secretary.

Office—123 California St., Room 423, San Francisco California.

EUREKA CONSOLIDATED DRIFT MINING Company.—Location of principal place of business, San Francisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1903, an assessment (No. 33) of one-half (½) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of October, 1903, will be delinquent and advertised for sale at public auction; and unless payment is made before, will be sold on SATURDAY, the 7th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.

GEO. W. DIXON, Secretary.

Office—214 Pine street, Room 31, San Francisco, California.

Forms of Mine Shafts.

There are various ideas concerning the arrangement, size and shape of mine shafts, with a view to securing the greatest economy, not only in sinking, but in subsequent utilization for hoisting, ventilatiou and maintenance. The usual form is rectangular, and the greater number of shafts probably have two compartments, though among the deeper shafts three compartments are more commou. In the very deep modern shafts, which mark a new era in mining, there are five, six and even a greater number of compartments. Formerly shafts for metal miues were provided with two compartments—one for hoisting and one for manway, pipes, etc. Sometimes hoisting is done through the manway compartment, which is a dangerous practice and should not be permitted. In better arranged and larger shafts two compartments were provided for hoisting and one of them, somewhat larger than the others, was reserved for manway and pipes for air and water. Ore, waste and mine trash, as well as water, timber and men, were handled in the hoisting compartments, and in mines where a tonnage not exceeding 400 to 500 tons daily through a single shaft was required, such an arrangement has been found satisfactory, but in mines requiring a much larger output, and where very large amounts of timbers in addition to the men must be haudled, it has been found advisable to divide the shaft iu a mauner which will most conveuiently accommodate the traffic through it. Some of the larger shafts are divided into six compartments, in two parallel rows of three each, a portion of these being equipped with hoisting eages or skips, the others reserved for men and pipes. A still later idea is the subdivision of the shaft into several compartments of varying size, the largest being for timbers, whieh are loaded flat ou the car, instead of being stood on eud and lashed to the eage or dumped into the skip to be hauled out with a "snateh-bloek." The uext smaller sized eompartment is for manway and pipes—ventilator, water aud compressed air, pump rod and also electric wires. In some large shafts, a separate small eompartment is fitted with a eage for the special use of foreman, pump men and others whose duties require them to frequently go down and up the shaft. This arrangement is fouud to be a great eonvenienee and time saver. The serviee eage, as it is called, is operated by a small separate engine, and is entirely independent of the other eages or skips.

In Mexieo several large eireular shafts have been sunk in past years by native labor. Some of them are about 2000 feet deep and 16 to 20 feet in diameter, and they eonstitute some of the best and most extraordinary of the engineering feats found in that Republie. These shafts are divided into reetangular compartments, and the hoisting in the past has been done in buekets.

In the early days of mining on the Comstock lode, at Virginia City, Nev., an "L" shaped shaft, known as the Foreman shaft, was sunk, the "L," whieh was extended out from one end, being utilized for manway, pumps, etc., but it did not meet with favor, for it has not been duplicated ou the Comstock, nor, as far as known, elsewhere. A shaft constrneted in the form of an "L" or in any other irregular shape, is certain to give trouble in ease heavy pressure results aud the ground shifts. It is mueh easier to keep a reetangular shaft squared up, under sueh conditions, than one of irregular form. The daily capaeity of a large modern shaft varies with the vehieles employed to handle the roek, and upon the arrangements underground to load the skips, or to plaee loaded ears on the cages. Skips are geuerally recognized as superior to cages, affording a larger capaeity for hoisting, beside being more eeonomieal. With eages there is always more or less loss of time in coming to a state of rest upon the ehairs, and running the ears upon the deek, and this diffieulty is usually inereased by reason of each eage being provided with several deeks. The loss of time inereases with inereasing depth, the spring of the cable interfering eonsiderably with loading. In the case of skips the earmen dump the ore-laden cars into the ore poekets beneath the station, and the skip can be loaded immediately upon its arrival at the loading chute. In the South Africau diamond mines, at one of the shafts the skip is lowered 1700 feet or more, and the signal is often given to hoist the loaded skip before it has fairly eome to a stop. The round trip, from the surface to this level, is made in less than one minute, ineluding loading below and dumping of the skip at the surfaee. The ore poeket holds oue skip load and it is loaded automatieally. At a shaft of this eharaeter it is not uncommon to hoist over 3000 tons in twenty-four hours.

FOR the first time in many months bar silver has been quoted in New York and San Francisco at over 60 cents; in London, England, 28⅛d. This pleasing advance over recent quotations is largely due to the large purchase by the United States Mint for Philippine coinage, the government paying 60.125 cents per ounce for 1,000,000 ounces. This is the highest price paid for silver by the Government under the present conditions. The slow but steady advance in price is also partly due to the large demands for the metal in India. Whatever the cause which induce a rising price for the white metal, it is viewed with satisfaction by every miner who produces silver, whether as a by-product with gold or copper, or from silver ores.

An Incentive to Invention.

The New Zealand Government is still offering a bonus of $10,000 to any one who, before January 1, 1904, will invent such appliances as will successfully extract gold from black sands in New Zealand. This is a proposition that has doubtless interested many American miners of inventive turn of mind, and particularly those who have experimented on the black sand proposition and either completely or partially succeeded in their efforts. There appears, however, to be a string attached to this $10,000 bonus, if one can judge by the requirements of the Minister of Mines. Some of the pre-requisites to carrying off the reward are that the invention shall differ from all those now in use; it shall be easy to transport from place to place, and shall be capable of utilizing local water in all of its requirements; it must be capable of treating not less than 30 cubic yards per hour of black sand or coarser material up to 4 inches diameter, and must treat it profitably where it does not contain in gold more than 6 cents per cubic yard, saving not less than 80% of the gold; no bonus to be paid until the invention shall have been in use for not less than six months, having treated no less than 100,000 cubic yards of material working three shifts per day; and no less than twenty persons must be making individual use of the invention. These few restrictions will probably prove no great incentive to the inventive faculty of the miners who read the offer, and the Minister of Mines is fairly safe in making it.

Rationale of the Fumes Nuisance.

Sulphurous fumes are incidental to the operation of the fire treatment of sulphide ores the world over. If ores are roasted in heaps, or in stalls, sulphurous fumes result. If the ore be smelted and matted in a reverberatory or stack furnace, sulphurous fumes are a natural result. How to control or prevent the escape of these fumes into the atmosphere has been a vexed question for many years. The operation of reduction works in some instances has led to expensive litigation, and in some cases to the closing of the works. There are several places where complaint is being made against the so-called "smoke nuisance," but what can be done to stop it, aside from discontinuing the smelting of ores, is still an unsolved problem. If the fumes are allowed to pass without restraint up the stack, the gases pour out into the air and settle on the land, drifting away with the wind, and more or less damage to vegetation usually results. If the fumes are passed through a spray of water much of the gas is absorbed, and this would afford a solution of the difficulty if the acid-laden water could be disposed of at a nominal expense; but, as it cannot, it flows into the nearest natural stream and pollutes its waters for miles, killing vegetation and sometimes stock. Numerous large concerns, like some of those of Butte, Mont., have expended great sums of money in experimenting in various ways to devise a method to abate the contamination of the air by sulphurous gases, but without complete success as yet. The one peculiar thing in connection with the complaints against sulphurous fumes from reduction works is that the complaints are most bitter on the part of those who are directly benefited. When great reduction works are built they are usually located in a sparsely settled section, and their operation results in the establishment and maintenance of a town. The inhabitants are composed largely of the workmen in the smelters, merchants, and others, who depend wholly upon the operation of the reduction works for a livelihood, or for business resulting from trade with those thus employed. Should the smelters be closed down, the town, having no other support, would quickly be deserted by the greater portion of its inhabitants, who would seek more active fields, the reduction company would lose heavily on its investment, and no one would be benefited. The majority of the town have little they cannot remove with them, and yet they do not realize that to abate the smoke means the closing of the smelters, the loss of occupation, and still no gain. In some instances it looks as though there were something besides "smoke" back of all the opposition to the fumes, for, after having endured them for years without serious damage or complaint, it is suddenly discovered that the fumes are disagreeable, unhealthy, etc., and active steps are taken to tie up or discontinue a great industry.

New Use for a Mine Model.

At the Alaska-Treadwell mine, Juneau, Alaska, the manager has introduced a novel plan as a help in the development and working of the mine, in the form of a model made of wood, constructed on a scale of 30 feet to 1 inch, being the scale of the mine maps. The model is sectional, made of pine blocks, each representing 100 feet in width on the vein, and the distance between levels. The stopes and drifts are carved out of the wood monthly, from the notes of the mine surveyor, the model being in this way kept up to date. One of the practical results arising from its use, it is said, is in showing where pillars and buttresses of rock should be left standing to support the hanging wall, and also where ore may be removed with safety to the surrounding workings. The model is studied carefully by the foreman and shift bosses, and it is said to have proven of great value in the operation of the mine. The employment of mine maps is not new, in keeping close watch of development, but the use of models for this purpose is novel. Heretofore mine models have usually been employed for the purposes of illustrating mine development in the event of litigation; but this new use of the mine model can not fail to be of practical value. It affords a comprehensive idea of the relative position of levels, stopes and other cuttings and the relation of the various ore bodies to one another. Possibly a model made of plaster of Paris would prove easier to carve out than pine wood, but the idea of a model of any material is suggestive, and practical men will approve such an innovation in mine development and operation.

The Result of Improved Methods.

The dump, and even the ore which a few years ago was commercially valueless, can often be made to-day a source of profitable income by reason of a more perfect understanding of methods of ore treatment.

Among other branches of ore treatment that of concentration is advancing, and taking an important place. In Europe ore dressing has been an art for decades past, but in the Western United States the low grade ores had been neglected because the advantages and practice of concentration were not well understood, but it is finding a constantly widening application. Still in many districts too little attention is given this important matter. Ores are shipped in bulk or rudely hand-sorted and the best portion sent to the smelters, at a profit, it is true, but at a greater cost than would be necessary if concentration by mechanical means were first employed. The second grade ores remain on the dump in many cases, practically waste, though containing good values. In some mines the ores are so distributed through the gangue that hand sorting can be carried on rapidly and economically, but this is only the case where the ore occurs in considerable masses. Hand sorting is not economically practicable when the mineral occurs in the form of disseminated grains.

Concentrating machinery is designed for specific purposes, but has considerable range of application. Most ores are easily concentrated at low cost, but some complex ores, such as those containing an intimate mixture of pyrite, galena and blende, afford unsatisfactory results. Fortunately the latter class of ores do not occur universally, though found in large quantity in some mining regions, but even this class of ore is now successfully treated by the electro-magnetic separator. Generally a plant consisting of rock breakers, rolls, trommels, jigs and concentrating tables, buddles or belt machines are better adapted to concentrating ores than stamps and concentrating machines alone, for the reason that a large percentage of the mineral is obtained in the first parts of the operation, the particles being comparatively coarse, the fine material being collected in the latter part of the process. Stamps crush all portions so fine that the subsequent recovery of the smallest particles, which in some ores crushed by stamps form the largest portion of the valuable mineral, becomes a matter of great difficulty. In the treatment of this character of material the hydraulic sizing cones and boxes are invaluable. Rolls usually make a more uniform product, as they have a tendency to crack and not to grind the ore; and as most sulphide minerals break along the lines of their natural cleavage when subjected to crushing force, the small grains have angular faces which seem to facilitate their separation from the gangue. It is the aim of the successful concentrator to make as few slimes as possible.

When ores high grade enough to ship without sorting are concentrated by machinery, the gangue, if containing values in gold and silver, may be separately treated subsequently by amalgamation or some leaching process. If they will not pay for this subsequent manipulation they certainly will not pay the transportation and reduction charges when shipped to the smelter. It is a mistake which many miners make to send poor ore with rich, even though the average be high, for if the poor ore alone will not pay, it pays no better when mingled with the high-grade ore. This is a simple proposition which seems to be lost sight of in the desire to secure quantity. In shipping ores the aim should be to get as high a value in as small a bulk as possible.

CONCENTRATES.

An alloy resembling silver is made from 100 parts copper, 70 parts nickel, 1 part aluminum and 5 parts iron tungstate.

The dark blue mineral on the rock specimen from Newport, Or., is iron. It occurs as a thin film on the rock, and has no value.

The smallest blast furnace generally in use is 20 inches in diameter at the tuyeres, but a 30-ton furnace is the smallest that can be successfully and continuously operated.

The size of reverberatory furnaces has increased greatly since they were first introduced. Modern furnaces are 14 to 15 feet wide and some of them 65 to 80 feet in length.

Occasionally water ditches are walled up on the sides (revetted) and paved on the bottom, for the purpose of preventing caving of the earth and the rapid cutting of the banks and bottom by the stream.

Native gold frequently occurs in the granite wall rocks of the veins in Soulsbyville district, Tuolumne county, Cal. It is not unusual to find gold in the wall rocks of rich veins, in any kind of rock formation.

The peripheral speed of two pulleys of different diameter, if running with the same belt, will be identical if there be no slipping of the belt. The number of revolutions in a stated time will vary as the diameters of the pulleys.

The white silvery mineral in No. 1 of the rock samples from Liscom, Ariz., is mica. The same mineral may be seen in No. 2, but is less prominent, not having been burned. The rock is metamorphic, evidently of eruptive origin.

In sloping the sides of open cuts, if the material be earth, the slope should not be greater than 45° (1 in 1), and less is better; but in rock the sides may be made much steeper, from 75° to 90°, according to the character of the rock.

Quicksilver is produced in the United States in California, Texas and Utah. It is also known to exist in Oregon, Nevada and Arizona. Austria, Australia, China, Brazil, India, Italy, Mexico, Peru and Spain also have quicksilver deposits.

The discharge column of a piston pump is always made smaller than the suction. On the other hand the discharge of a centrifugal pump is usually larger than the intake, but the height to which the latter can lift a column of water is limited.

Black prints of drawings may be made from blue prints by using the thin brown print paper instead of the blue. The light passes through the white lines on the blue print, and makes the black or dark brown print desired on the brown print paper.

About 30,000 cubic feet of natural gas was consumed in making one ton of iron from ore, in the reverberatory process, employed by the Carbon Iron Co. in Pennsylvania some years since, in making iron direct from the ore, without use of the blast furnace.

In seeking for a reservoir site for the head of a water system it is important that the site drain a watershed of sufficient area to insure a permanent flow of water. If the reservoir is supplied by a ditch, the area of watershed tributary to the auxiliary reservoir is unimportant.

Iron matte smelting is a phase of pyritic smelting and consists in smelting "dry" sulphide ores containing not less than 15% iron sulphide, with from 10% to 20% coke, a cold blast being employed. It is necessary that a small amount of copper be present to obtain clean slag.

The percentage of antimony in hard lead may be determined by the specific gravity method. The percentage of each metal can be determined only approximately, as the density of these metals is not absolutely constant. The specific gravity of lead is 11.35 to 11.37 and that of antimony from 6.65 to 6.72.

The melting point of pure lead is 334° F. and that of tin 230° F. All alloys of lead and tin have a lower melting point than that of either of the metals. An alloy of one tin to two lead melts at 226°, and one part lead to one of tin melts at 180°. Solder made of these two metals is much harder and stronger than either of them alone.

Careful experiment has shown that water-soaked timber has the same strength as green timber, even though the timber had once been thoroughly dried. Green timber has about 55% to 60% of the strength of timber having about 12% moisture. Yellow or long-leaf pine will stand an endwise crushing load of 8000 pounds per square inch, and 1180 pounds per square inch across the grain. This is for timber containing 12% moisture. Pine timber of this class weighs about thirty-eight pounds per square foot; when green it weighs from one-fifth to one-half more than dry timbers.

In various localities more or less successful attempts are being made to treat raw concentrates by various modifications of the cyanide process, but in few instances has it been found possible to extract a high percentage of gold and silver from coarse material, nothing but the finest concentrates, like that from canvas tables, giving high returns.

In the refining of metals by electrolysis, not only a high grade of metal is produced, but the slimes formed during the process contain nearly all of any gold or silver that may have been present in the original metal. It has been estimated that about 27,000,000 ounces of silver and 346,000 ounces of gold are annually obtained in the United States by this method.

When aluminum is alloyed with gold in the proportion of one part aluminum to one gold the metal assumes a green color. The alloy is very hard but brittle. An alloy of five parts aluminum and ninety-five parts gold makes a metal as brittle as glass. An alloy of five to seven parts aluminum, ninety-five parts copper and two and one-half parts gold makes a metal that resembles gold.

Ores containing oxidized copper ores (carbonates, silicates and oxides) and fine gold may be found amenable to the cyanide process if the copper first be leached from the ores and the tailings subsequently cyanided. The cyanide process is frequently an experiment. Because one ore is easily treated by it is no indication that another similar ore can as readily be made to yield its values.

In the construction of mill foundations on a terraced hillside, the alluvial may be removed by hydraulicking with a pipe before the rock work begins. It has the advantage of cheaply removing the earth from the bedrock, and also exposes all of the underlying rock surface and furnishes information to the engineer which is of use to him in locating the several terraces of the mill to best advantage.

Where a vein gradually thins out and comes to a wedge-like edge in a fissure, in the presence of heavy clay-like walls, it is often found that another ore shoot has formed in either the foot or hanging wall, at no great distance. Often when this is the case the two shoots will be found to develop, and this condition is often observed both longitudinally and downward on the pitch of the vein.

Barrel chlorination is a process by which ores are treated in a closed revolving lead-lined barrel. The ore is charged with bleaching powder (chloride of lime), water and sulphuric acid. The action of the acid on the "bleach" frees chlorine gas and considerable heat is generated in the process. The chlorine attacks the gold and silver present in the ore, which is subsequently recovered by precipitation.

Various kinds of earthy materials do not shrink uniformly when excavated and dumped in an embankment or elsewhere. An embankment requires considerable time to shrink to its most compact volume. When first excavated, earth makes a much larger volume than the original measurement. Earth contracts to the extent of 10%, and rock, when broken, fills from 40% to 60% more space than it did originally.

Where fumes were given off from boiling sulphuric acid a jet of steam was introduced into the pipe which led the fumes to a stack. This was done to condense the fumes, but the fumes were absorbed by the steam forming sulphuric acid, which attacked the heavy iron pipe, destroying it in a few hours; a lead-lined pipe was then substituted for the one corroded by the acid, which proved proof against attack.

Sheet mica, of good size, is used for stoves, and smaller sheets in electrical work. The price of mica sheets during 1902 was about as follows: 2x4 inches, 30 cents per pound; 3x3 inches, 80 cents; 3x4 inches, $1.50; 4x4 inches, $2; 6x6 inches, $3. Larger sheets sell at much higher prices. Clean refuse mica is worth from $20 to $30 per ton. It is either used for insulating purposes or in the manufacture of lubricants.

An adjustable speed regulator for concentrating machines can be provided by using two cone-shaped pulleys and providing the belt with a shifter. Belt concentrators should be run at 180 to 220 revolutions per minute, depending on the size and make of machine; and shaking tables are usually run at 240 to 260 revolutions per minute, 240 being the minimum at which good work can be accomplished. The speed is increased with increasing fineness of material being treated.

Blasting compounds are of two classes—slow-burning and detonating. Black blasting powder belongs to the first class and nitro powders to the second class. Black powder is ignited by heat and is comparatively slow burning, the ignition proceeding from grain to grain, the heat and pressure developed being relatively low. The nitro compounds—powders, as they are called—explode by detonation, and the process of explosion is instantaneous, the force developed being much greater than in an equal bulk or weight of black powder. It is not necessary that nitro powder should be accompanied by the fulminate cap detonator to effect its explosion. It can be exploded by a blow from a pick or hammer, and even by atmospheric shock.

According to the B. and S. standard gauge, No. 20 wire is 0.031961 inch in thickness, and No. 25 is 0.0179 inch in thickness. In ordering wire for specific purposes it is always better to give the thickness of the wire required in thousandths of an inch instead of by number. This avoids the trouble incident to the numerous gauges. The size of wire used in brass wire mill screens varies with the mesh of the screen. A 30-mesh screen is usually made of No. 30 wire.

The junior tunnel site locator has no right to penetrate by means of a crosscut tunnel the claims of a senior locator for any purpose whatever. In other words, a tunnel site owner can not drive his crosscut tunnel through a claim previously located, to reach his own claims which lie beyond. Nor can a tunnel be started on ground owned or claimed by another without his consent, and the property can not be condemned for such purpose. Mining is not generally recognized as a public utility, except in some of the older Eastern States, as New York, where all mineral is owned by the State. The question of right of way over or through the property of others for mining purposes is determined to a great extent by the special legislation of the several States. The rights of a senior locator, however, can not be cut off by a junior.

Cobalt is rarely found unassociated with other minerals. It is usually accompanied by arsenic, nickel, copper, manganese, iron and bismuth. It is obtained in the form of metal by treating at a high heat cobalt oxide with charcoal. It resembles iron in many of its properties, but is said to possess a greater tenacity than iron. Smalt is a blue color formed by the association of cobaltous silicate with potassium silicate. It is prepared by roasting the cobalt ore so as to convert the bulk of the cobalt into oxide, leaving a considerable quantity of arsenic and sulphur still in the ore. The residue is fused in a crucible with ground quartz and carbonate of potash, forming a blue glass containing cobalt silicate and potassium silicate. The iron, nickel and copper combined with arsenic settle to the bottom of the crucible, as speiss, which is subsequently treated for nickel. The blue glass is poured into water, which granulates it.

Metallic lead may be hardened by the addition of 0.118% to 0.352% of bismuth. This makes lead hard, somewhat crystalline, and more readily fusible. The addition of tin also hardens lead, but lead containing tin is more easily affected by sulphuric acid than pure lead. Small quantities of antimony give lead a grayish white color, making it harder and less malleable than ordinary lead. A bar of lead containing a very small amount of antimony will show fern-like forms near the center of the bar, 0.25% of antimony makes lead hard, but it is still malleable, a larger percentage of antimony will destroy the malleability of the lead. Antimony and arsenic each act much the same when associated with lead. Zinc can be alloyed with lead with difficulty, as, although they blend readily enough when molten, part of the zinc separates on cooling. Zinc gives lead a silvery color, and renders it so hard it cannot be rolled. Cold and hot sulphuric acid attack lead-zinc alloy readily.

The noted "bracket flume" was built in Butte county, California, by the Miocene M. Co. The bracketed portion was hung to the face of a vertical cliff 118 feet above the bed of the ravine and 232 feet below the top of the cliff. The brackets were made of 30-pound railroad iron, bent into the form of the letter L, the longer arm, 10 feet in length, was placed horizontally for the bed of the flume to rest on, the end being secured in a hole drilled into the rock. The shorter end is upturned 2 feet and has at its upper end an eye, into which is inserted a ¾-inch iron rod having a hook at its end. The opposite end is secured to a ring bolt fastened into the rock. These brackets were placed 8 feet apart and were calculated to withstand a load of 14½ tons. The flume is 4 feet wide and 3 feet deep, inside measurement, with a capacity of 3000 miners' inches of water. On this same ditch line one trestle was built 80 feet high and another 136 feet high. The portion of the flume on brackets is 486 feet long.

Sheet copper coated with quicksilver and immersed in water containing carbonic acid will quickly become discolored. A copper plate which had been treated with nitric acid and mercuric chloride, and immersed in water containing carbonic acid and organic matter, were tarnished in a very few minutes. Cleaning with potassium cyanide did not prevent their prompt discoloration. Plates amalgamated with the aid of potassium cyanide, without the use of acid, remained bright in the same water for more than an an hour, but afterward were the same as those used in the first test. A quantity of slaked lime added to the water lessened the tendency to tarnish, and tarnishing was permanently prevented by placing an iron nail in contact with the amalgamated copper. A strip of zinc accomplished the same result. The admixture of a little cadmium with the mercury used in amalgamating copper plates will greatly retard the tendency of the plates to tarnish.

Identity and Continuity of Veins.

NUMBER II.

Wheu a veiu has been faulted it is often difficult to establish the identity of the vein beyond the fault plane. There are various conditions, however, which may lead to the identificatiou of the vein. A number of such hypothetical cases are given in "Lindley on Mines." For example, says the author, a portion of the vein material may be "dragged" along the fault fissure, as illustrated in Fig. 110, aud furnish a continuous ore tracing. Again, the foot and hanging walls of a vein may be of different material, as shown iu Fig. 111, thus furnishing a definite indication of the fault; or there may be complex structure of the vein at the point of faulting, as shown in Fig. 112, so as to identify the part thrown; or there may be changes of formation near at hand and disclosed in the workings, as shown iu Fig. 113, furnishing the information for the recoustruction of the section.

In all of these illustrated cases the continuity may be said to have been interrupted, but the identity of the part separated by faulting is easily established.

Occurrences of the character illustrated iu the foregoing figures seem to follow certain rules recognized not only in treatises on dynamic geology but by the practical miner, who finds but little difficulty in ascertaining the position of the faulted part of the vein. But there are other conditions encountered which are much more complex, presenting complications which follow no definite rule, where it is more difficult to determine the vexed questiou of ideutity.

We may select as an illustration of complexities in vein structure without faulting the case of Pennsylvania Consolidated Mining Co. v. Grass Valley Exploration Co., tried before and decided by Judge Morrow in the Circuit Court of the Unitcd States, ninth circuit, northern district of California.

The Pennsylvania Co. owned the Pennsylvania quartz mine, part of which is shown in Fig. 114, within which it claimed the apex of the Pennsylvania vein, to the extent, at least, as shown by the heavy black line in the figure. Ou its downward course the vein passed uuderueath the surface of the patented agricultural land and townsite lots, held under a junior title by the Grass Valley Exploration Co. That company also owned the W. Y. O. D. mine and numerous other mining claims, which, with their agricultural and townsite holdings, practically surrounded the Pennsylvania quartz mine. The Grass Valley Exploration Co., by means of underground works extending from the W. Y. O. D. shaft, reached ore bodies underneath the Pennsylvania shaft, and the works of the two companies came together. Suits were brought by both parties to determine the ownership of the ore bodies uuderneath the agricultural and townsite lands. The burden of proving apex aud ideutity aud the conditions essential to the establishment of an extralateral right rested with the Pennsylvania Co.

Judge Morrow describes and analyzes the physical conditions at considerable length, and his opinion is comprehensively illustrated with diagrams. As heretofore observed, Fig. 114 shows the Pennsylvania location to the extent uecessary for present purposes. The heavy black line indicates the vein apex as claimed by the Pennsylvania, crossing the north eud line and extending southerly as far as developed. The Pennsylvania eud lines are parallel. The vein is a gold-bearing quartz vein in grauo-diorite, dipping about 30° to the west.

Fig. 115 illustrates the contention of the Grass Valley Co. to the effect that the above claimed apex does not represent a single vein, but is composed of a series of apices of intersecting veins, indicated in the diagram by heavy dotted aud solid black lines; that these apices prolouged would cross the side lines of the locatiou aud convey no extralateral right to the ore bodies in dispute. This contention is specially illustrated in Fig. 116.

The court, in speaking of the contentions claimed by the Grass Valley Co., says:

"In my judgment, the evideuce demonstrated nothing more than a main vein with projected seams or spurs at these points. These seams or spurs were not traced for any distance, aud were not found crossing auy side line of the Pennsylvania claim. Whatever these seams or spurs may be called, or to whatever extent they may have been found, they did not destroy the coutinuity of the main vein.

The court then found that the apex was, as claimed by the Pennsylvania Co., continuous "lengthwise of the vein to the extent and in the direction necessary to embrace within exteuded end liue planes the vein or lode in controversy."

"The remaining question is, Has this vein or lode such a continuity or persistence iu its dip or downward course as to iuclude the ore deposit in dispute?"

The position of the "ore deposit in dispute" is indicated by the network of underground workings to the west of the Pennsylvania location, as shown in Fig. 114.

The vein is comparatively simple at the surface, and so extends downward 300 or 400 feet on the incliue. Thence downward it becomes more complex, consisting in certain sections of west and east dipping branches, as claimed by the Pennsylvaiia Co., or of a series of independent veins, as claimed by the Grass Valley Co. It was at these points of complication that the asserted continuity of the Pennsylvania vein was most strongly disputed.

These complications, as described by the Pennsylvania Co.'s wituesses, consisted in a stepping down of the vein from an overlapping to an uuderlapping west dip fissure through a system of subordinate east dip fissures, as illustrated in Fig. 117.

This is a vertical cross-section of one of the complications—west being from the right to the left side of the figure.

The court cites the testimouy of oue of the witnesses describing this section as follows: "If we follow the main fissure downward on its westerly dip we find it flattening, weakening, and pinching out; but before pinching there fall from it a series of east dip fissures which connect below with au underlapping west dip fissure. This underlap flattens, weakens, and pinches out on its upward course, but on its downward course it strengthens and becomes a strong ore-bearing vein. . . . The channel . . . is simply complicated by this network of fissures. Its continuity . . . is not disturbed."

The most important of these complicatious is shown in the so-called Horseshoe winze section (Fig. 118).

Here some of the east "dippers" have been stoped for ore. In the complications elsewhere the "stepping down" is through 6 or 8 feet, but in the Horseshoe section it is through 50 feet or more of transversely fissured ground.

Fig. 119, taken from oue of the exhibits, gives a more complete vertical cross-sectien of the vein.

The Grass Valley Co. contended that there is no continuity of the Pennsylvania vein through the above complications; that these east dip fissures intersect the west dip fissures, and, extending in their own directions, coustitute independent transverse veins, as illustrated in Fig. 120.

FIG. 119.

FIG. 120.

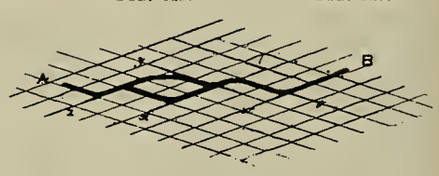

FIG. 121.

The theory was advanced that the country rock was divided into rhombohedral blocks by means of a subdivisioual joint plane system, and that distinct veins were formed upon the various faces of the rhombohedrons. As to this rhombohedral theory, the court was of the opinion that it might account for some of the irregularities in the course of the vein shown in the underground workings. For the purpose of illustration, let us assume the subdivision of the earth's crust by means of a rhombohedral joint plane system aud add to it the assumption that there must be a great break or line of fissuring across the country to form an important vein. If the direction of the deep-seated forces were such as to produce the great fissure continuously along the line of one of these joint planes, we might have ultimately a fairly straight line fissure vein. But if strains were such

as to give the great break a general course not so conforming, as in Fig. 121, there would doubtless occur a line of fissuring such as A-B, partly following joint planes, partly cutting across the rhombohedral blocks. Let there be a subsequent filling of the opening by a mineral stream coursing through it. In such case what constitutes a vein? Certainly not an original joint plane, but the filling of the main break from A to B.

(To be continued.)

The Ventilation of Deep Levels.*

NUMBER II.—CONCLUDED.

Written by Thos. Johnson.

Furnace Ventilation.—In furnace ventilation the action depends on decreasing the density of the upcast air, by increasing its temperature; the heat from the fire expands the air, rendering it lighter, and the colder and heavier air of the downcast displaces it.

The furnace should be set a few yards away from the bottom of the upcast, and connected by a rise drift to the upcast. As the furnaces in the gold mines would all be in rock, only one arch would be necessary, they would be much less expensive to construct than in coal mines. As the amount of explosive gases is small, the whole of the return air could go through the furnace chamber.

In very deep shafts furnaces should prove as ecouomical as fans.

By placing boilers underground for haulage, pumping, etc., veutilation would be most ecouomically produced.

If the mines prove to be too warm for comfortable working, ventilation will probably be produced by increasiug the density of the downcast air by cooling.

The efficieucy of a furuace increases the greater the height of the column of air above it; the quantity of air produced varies as the square root of the difference of temperature; the quantity also varies as the square root of the height of column above the furnace. A furnace would produce twice the amouut of air at 4000 feet as it would at 1000 feet. The amount of coal burned in the furnace would vary directly as the quantity of air, the temperature remaining constant.

With fans, increase of depth would probably meau a smaller quantity, owing to the increased amount of rubbing surface, aud to double the quantity would mean eight times the consumption of coal.

At the first glauce there appears something wrong in saying that the furnace would only need twice the coal for twice the quantity of air, and that the fan would ueed eight times the coal for twice the quantity; the reason is the increased efficiency of the furnace at the greater depth, more of the heat being used.

With fans there is no increased efficiency with depth—quite the contrary.

No rule can be given to determine the size of furnace necessary to produce a given quantity of air, as there are so many circumstances that exercise an influence preventing the formulation of any rule from which the quantity of air a furnace will produce can be calculated.

The British Royal Commission appointed to inquire into accidents in mines, in their final report of 1886, say, with reference to the dimensions of furnaces: "For deep shafts the special ventilating furnaces which are used either simply or in combination with fire grate, area of from 50 to 200 square feet, and are fed by fresh air, or that derived from the purest of the return air, are capable of circulating volumes or air ranging from 200,000 to 400,000 cubic feet per minute."

It is probable that the amount of coal necessary for ventilation in shafts 5000 feet deep will be about 4 to 5 pounds per horse power per hour with fairly dry shafts, also that one square foot area of grate surface will be equal to 2000 cubic feet per minute.

In collieries there are several great objectious to furnaces, "although there are many furnaces still in use," objections which are not so applicable here; for instance, the presence of fire damp, setting fire to the strata, tubbing iu shafts. Less heat will be required here because of the small quantities of air in circulatiou; a temperature of 120° to 130° F. in the upcast will be about as high a temperature as will be needed.

Mechanical veutilation may be effected by definite volume machines, centrifugal fans, or other ventilators.

At shafts where the hoisting is doue by skips, mechanical ventilation would be more difficult than where cages are used, as iu collieries, because of the difficulty of closing the shaft top.

Amongst mechanical veutilators centrifugal faus hold first place, and I expect will be generally used here for mechanical ventilation. The action of a ceutrifugal fan depends ou the first law of motion, which embodies the principle that bodies in motion will travel in straight lines unless acted upon by external forces. When a fan commences to revolve, the air within it begins to move toward the circumference and teuds to create a vacuum in the center of the fan into which the air from the upcast rushes (the fau being at the surface), the air in the downcast moving towards the upcast, a current thus being produced.

Fan on Surface.—When using exhaustiug fans the top of the upcast must be closed by some arrangement that will prevent the air entering and still allow the skips to travel. A good arraugement would be to surround the top of the shaft with a chamber in which the dumping could take place; doors should be provided communicating with the shaft and outside. In the dump a swinging door could be arranged so as to allow the rock to pass through to the boxes, and then close itself; this could be easily effected. With forcing fans the downcast would have to be enclosed and the swinging doors would need to be heavier (Fig. 2). In either case an arrangement, as sketched in Fig. 7, may suit.

This is a self-closing door which has been adopted at Hetton colliery for mechanical haulage roads, and I think it could be arranged to suit shafts. It consists of two doors lying between two sets of rollers. In the center are two iron bars. The cage, ascending or descending, forces the bars back and with them the doors. The doors move back on the rollers into a space provided for them in the shaft side. I have here assumed that buckets or cages will be used for hoistiug, and not wheeled skips.

In case of a mine using cages and cars a light bouuet for each compartment would be sufficient.

Placing fans underground will recommend itself to some to avoid the disadvantage of closing the shaft top. The arrangement of the fan would be different in different mines, according to the manner of opeuing out. One way that would suit is shown in Fig. 6. Here the shaft is sunk below the reef far enough for a crosscut to the reef and for box room below the crosscut; double doors would be necessary in the crosscut. In placing the crosscut in the position shown, I was thinking of the secondary hoisting being done by endless rope and the cars coming to the main box. When the secondary hoisting is done with incline skips the incline shaft would start from the vertical shaft, doors being fixed between the dump-

Amongst mechanical veutilators centrifugal faus hold first place, and I expect will be generally used here for mechanical ventilation. The action of a ceutrifugal fan depends ou the first law of motion, which embodies the principle that bodies in motion will travel in straight lines unless acted upon by external forces. When a fan commences to revolve, the air within it begins to move toward the circumference and teuds to create a vacuum in the center of the fan into which the air from the upcast rushes (the fau being at the surface), the air in the downcast moving towards the upcast, a current thus being produced.

Fan on Surface.—When using exhaustiug fans the top of the upcast must be closed by some arrangement that will prevent the air entering and still allow the skips to travel. A good arraugement would be to surround the top of the shaft with a chamber in which the dumping could take place; doors should be provided communicating with the shaft and outside. In the dump a swinging door could be arranged so as to allow the rock to pass through to the boxes, and then close itself; this could be easily effected. With forcing fans the downcast would have to be enclosed and the swinging doors ing place and the entrance to the vertical shaft.

The fan should be placed in a chamber prepared close to the shaft; if the reef passes through this chamber, so much the better; then the connectious from the workings to the chamber eau be on the reef.

Medium sized fans running at a fairly high speed are best; they are less expensive to make; do not get out of order so soon; do not waste so much power in driviug, and require less foundations aud smaller engine houses than the larger sized fans.

Closed fans should have spiral casings and expanding chimueys, so as to lower the velocity of discharge.

Fans should be constructed for the quantity aud water gauge they are expected to work at. There is more loss working a fan at a lower water gauge than it was designed for, than there is in working it at a higher water gauge than it is designed for.

Fans should be designed for a medium speed, so that in case of emergency they could be speeded up.

As regards fan tests, I do not remember having heard of or read of any reliable ones. Any fan dealing with the maximum quantity of air that it was designed for will do better thau if dealing with a greater or less amount of air.

To get a fair test of different faus they should be of equal capacities and tested under the same conditions; that is, they should be placed on the same mine.

Coursing the Air.—To get the greatest quantity of air with the least expenditure of power under same conditions as regards size of air roads, splitting must be resorted to. Splits should start as near the downcast as possible, and finish as near as possible to the upcast. To cause the air to keep in the desired

*Trans. Chemical, Metallurgical and Min. Society, S. A. (Condensed).

course, doors, brattices, stoppings, regulators, and air crossings will be necessary.

Wooden doors should be used where the ventilating pressure is strong. Doors are necessary where a current has to be deflected from one road into another. It is much better to keep them off haulage roads if possible; but, as under the conditions of mining here, both intakes and returns are, and will be, used for haulage purposes, it would be better policy to use heavy cloth doors instead of heavy wood doors, where conditions will enable this to be done.

BRATTICE.—In a narrow place, such as a shaft, drive, rise, or winze, if artificially divided for ventilation purposes, it is said to be bratticed; such brattice may be either:

First—Wood sheeting, as often seen in sinking shafts, consists of boards a half inch or so thick, of suitable width or length. In shafts it is generally fastened to the dividers; in drives, etc., posts would have to be set at suitable distances to nail the sheeting to.

Second—Cloth: The ordinary brattice cloth consists of a coarse canvas, tarred to prevent decay and to fill up the mesh to prevent the air leaking through. Oilcloth is sometimes used for the same purpose. In drives this is fixed like any ordinary canvas screen on posts. At regular distances apart, a strip or lath of wood is nailed to the posts, as close up to the top as possible—the top edge of the cloth being nailed to the lath. Any irregularities in the roof are filled with old cloth, etc.

Third—Pipes: Iron, wood, cloth or clay pipes are sometimes used instead of bratticing. Iron pipes are made from sheet iron or steel, tarred or galvanized and the joint riveted. They should be made with one end a tapered spigot, the other end being of the usual diameter, and strengthened by an outside hoop, as shown in Fig. 4. The joint of the two pipes as a rule fit very close; if not, a little clay will prevent leakage. Iron pipes are of round section.

Wood pipes are generally of rectangular section and should be fitted with a spigot and socket joint.

Cloth pipes are very handy, but will not ventilate so far as iron pipes will. They are of circular section. Iron or wood rings keep the pipe distended when stretched out. They are hung up by the rings.

Clay drain pipes have been used for ventilating in drives, etc., in England, but I cannot see any opening here for using them for the same purpose.

Fourth—Brickwork: Brick walls have often been used as bratticing. I have known a case, a tunnel 1700 yards long, being driven and a new seam being opened out, the tunnel being divided into intake and return by putting in a brick wall brattice. For long distances it is the best thing that can be done, except driving two separate roads. Brick walls make a very substantial brattice, but would only be used in long crosscuts for exploring purposes.

Stoping will be very necessary in the ventilation of deep levels, and may be brick walls, wood, brattice cloth, or heaps of waste rock.

Air crossings will be necessary to carry one current of air over another to prevent intermixing. The crosscuts to shaft boxes in inclines will make good air crossings over the shafts, as shown in Fig. 3.

Regulators will be necessary to prevent too large a quantity of air going into certain districts. On haulage roads a regulator can be made by putting in a wooden door and arranging it so that it could only close so far as to allow the required amount of air to pass; or short brattice cloths may be hung from the roof the required quantity passing underneath; or a wood door having a sliding shutter could be put in. If the road was not wanted for haulage purposes, it could be partially closed with waste rock or boarding.

The mines of the future should be laid out so that the haulage, drainage and ventilation harmonize as much as possible. In the deep level mines large areas will be in operation at one time to provide rock for the large mills that are sure to be put up, which means that in all probability more men and machines will be employed on a given length of face than at present; also, more air will be required.

To get the best effects from the air supplied it should be guided close to the faces, and the best way to do this will depend on the manner of working the stopes.

The general plan of ventilation would be as follows, (see Fig. 3):

The air would enter by the downcast shaft, pass down the incline to the bottom level, there split one part traveling east and upwards to the top level, passing over the incline shaft and on to the upcast shaft. The other part travels westward, part going through the stopes between the shafts and so on to the upcast. Part goes over the shaft into the western part of the mine and is coursed back to the upcast. The air is conrsed through the stopes, as shown in Fig. 3.

In ventilating shafts, drives, etc., I think it best to make the smaller division the intake, except where compressed air machines are used—the air would be cleared sooner after blasting.

Of course the smoke would linger at some distance from the face, but that would not matter so much, as it would be partly diluted.

It would be much different if we were dealing with explosive gases. In such cases it is often better to make the smaller division the return, so that the gases if moved from the face would be taken right out of the place with the swifter current.

So long as compressed air machines are used for driving work, the exhaust air will be a great help to the ventilation.

In driving street or narrow work with compressed air machines, it is best to ventilate with iron pipes, as shown in Fig. 5, fixing a small jet to blow into the pipes which would induce greater current in them. In this case the pipes would be the return.

In drives there is very little room for ventilating pipes of any size, but if an extra hole were put in at the top of the drives, the pipes could be put in the channel formed, and would be in a measure protected, as shown in Fig. 5.

In this paper only one reef has been dealt with. With two or more reefs close together it would be very much the same, the necessary air for the upper seam passing through the box holes or crosscuts to the upper seam.

With reefs a good distance apart each reef could be treated as a separate mine, having its own intake and return.

In this paper I have not been able to do justice to the subject, but as I expect a fair amount of discussion on it, in which many important points will then be raised, I may be able to supplement it in my reply.

Death of J. F. Parks.

On Saturday, the 10th inst., James F. Parks, superintendent of the Kennedy and South Eureka mines,

near Jackson, Amador county, Cal., died at his home from a complication of serious ailments, after a protracted illness. Mr. Parks was one of the noted and successful miners of California, to which State he came from Missouri in the early days across the plains. After an experience in mining in California he went to the Comstock lode in Virginia City, Nev., and gained a large experience there. Returning to California, he was for many years foreman of the Keystone mine at Amador City, and became superintendent of the Kennedy mine February 1, 1887. This mine has grown under his management to be one of the largest, deepest and most thoroughly equipped mines of the West. He also organized the South Eureka Mining Co. in 1890, and developed that property to the depth of nearly 2500 feet.

He had rare executive ability, and with every phase of modern mining he was thoroughly familiar, and there was no work about the properties under his direction he did not understand and which he could not have done himself had occasion required. He was held in high esteem by all who knew him and was regarded as a friend by each of the hundreds of men in his employ.

Mr. Parks was until recently a member of the board of directors of the California State Mining Bureau, from which position of honor he resigned because of his manifold duties and ill health. He was also an active member of the California Miners' Association, and a member of the American Institute of Mining Engineers. In recent years he has met with several accidents which doubtless hastened his death, as he had become a great sufferer. He leaves a widow and four children, his daughters being Mrs. John F. Davis of Jackson, Cal., and Mrs. F. W. Bradley of San Francisco, Cal. The sons are J. F. Parks Jr. and Samuel T. Parks, who is now returning home from Korea, where he has been engaged in mining.

The Metallurgy of the Homestake Ore.*

NUMBER III.

Written by C. W. MERRILL, B. S.

PRECIPITATION.—The effluent solution resulting from the leaching with strong solution is run to the weak precipitation tanks, and has a value of, approximately, $2 per ton and a strength of 0.10% KCN. When one of these weak precipitation tanks is full, the stream is turned to the other, and the former is then ready for precipitation. It contains 300 tons of solution, which is brought into agitation by means of compressed air, and about sixty pounds of zinc powder, in the form of an emulsion, is sprayed in during the agitation. The pump, which is of the compound, duplex, outside-packed, plunger type, is then started, and the mixture pumped through two large filter presses 36 inches square, of the flush-plate and distance-frame pattern, containing twenty-four frames, each 4 inches in depth.

While the gold, silver and excess of zinc remain in the frame and on the cloth, the barren solution passes through the cloth and on to the weak solution storage tank below (of the same size as the sand vats), whence it passes again to the sand as weak solution. Its value has been reduced by this operation from $2 to 5 or 10 cents per ton, being a precipitation of 95% to 97.5%. The efficiency of this method lies largely in the fact that cloths of the presses are coated with about ⅛ inch of powdered zinc and precipitate, so that every particle of solution, having to pass through the cloths, gets a molecular contact with the fine zinc, which is true of no other precipitation process. The presses are run without opening for a month, at the end of which the press gauges indicate about ten pounds pressure, notwithstanding the fact that they then contain about a ton of precipitate worth, say, $50,000, when they are cleaned up by two men in about six hours, including the putting together with new cloths. Figures covering the labor of cleaning up $50,000 from the zinc boxes and from electrolytic precipitation would form an interesting comparison.

We will now return to the effluent solution, resulting from the contact of the tailings with weak solution during the latter part of the leaching. This is run to the strong-solution collecting vats. When these are filled, they are strengthened to 0.14% KCN and pumped directly, without precipitation, to the strong-solution storage tank, of the same capacity as the weak storage, whence it goes on to the early treatment of the charge, as before mentioned. Its value is from 30 to 50 cents per ton. It will thus be seen that the strong solution of one day becomes the weak solution of the next day, and that the values are all accumulated in the weak precipitation tanks. The strong solution thus has an approximately constant value, that is to say, only one-half of the total effluent solution is precipitated, the other half being of a constant low value.

REFINING PRECIPITATES.—As the refining of cyanide precipitates is of some importance, owing to the well-recognized losses taking place in the ordinary methods, which are from 2% to 6%, a description of the process we use at the Homestake, in which the loss is less than 0.1%, may be of interest.

The precipitate, after removal from the presses, is treated first with dilute hydrochloric acid in a lead-lined mixing tank, equipped with a mechanical agitator, a hood and a powerful exhaust fan. After agitation and settling, the supernatant liquid is forced through a filter press by air pressure. Sulphuric acid is then added, agitation begun, and the mixture heated. It is then settled, and the supernatant solution put through the press, as in the case of the hydrochloric acid. Wash-water is then added to the mixing tank and the whole mixture put into the press, where it is further washed. The aggregate value of the acid liquors and wash water flowing from the press is less than $20 from $50,000 worth of precipitate. A portion of this value is recovered from a large settling tank, into which the effluent solutions flow, and the remainder constitutes the only loss we have been able to find in this process of refining.

The resultant, acid-treated precipitate is then removed to a large steam drier, where a part of the moisture is expelled, but never all, and the precipitate mixed with litharge, borax, silica and powdered coke. When thoroughly mixed, it is sprinkled with a solution of lead acetate and the whole mass briquetted under a pressure of 4000 to 6000 pounds per square inch. The zinc having been removed, and the briquettes having been dried, a borax slag develops upon the outer surface upon being charged to the cupel, and they fuse quietly, quickly and at a low heat, without dust or volatilization losses. The lead absorbs the values, sinking to the bottom, and the slag is tapped off. All the slag having been removed, the lead is cupelled off as litharge, and the resultant metal, 975 to 985 fine, is ready to run into bars.

(TO BE CONTINUED.)

The Dorleska Gold Mine.*

Written for the MINING AND SCIENTIFIC PRESS by H. Z. OSBORNE.

The Dorleska gold mine has attracted no little attention the past two or three years by reason of its rapid development from a prospect to a regular bullion producer. It is situated in the northern part of Trinity county, Cal., on the boundary line of Siskiyou, on the north and south ridge separating the South Fork of the Salmon river from Union creek, the ridge also being the dividing line between the two counties. The mine is at an elevation of from 6000 to 7000 feet, the collar of the shaft being 6550 feet above sea level. The snowfall at the Dorleska is very great in winter, and a depth of from 10 to 15 feet on the level is not uncommon in the latter part of the winter. This necessitates thorough preparation in summer in the way of providing feed, fuel and supplies, to enable work to be continuous throughout the winter.

The Dorleska was discovered and located in 1897 by the late R. D. Lawrence, an old Colorado prospector. There was no outcrop, and but little quartz, in the way of float, and Mr. Lawrence made the discovery by "tracing" with the pan, finding, as he did, rich prospects in the soil for some distance below the vein. He ran a small and shallow tunnel, at no place more than 30 feet below the surface, on a narrow vein of talc, calcite and rich quartz. At first Mr. Lawrence used an old-fashioned rocker in washing the surface dirt and fine eroded material from the vein. Later he put up a small horse arrastra, which his wife operated while Mr. Lawrence dug at his mine. Only the richest material was handled, and that necessarily in a small way. In two seasons Mr. and Mrs. Lawrence, from their arrastra, and from shipments of a few tons of rich ore, took out about $14,000. Finding the arrastra too slow he purchased a little prospecting mill of five stamps, the stamps weighing about 125 pounds each, and a small engine and boiler combined. He erected the mill under the mouth of his tunnel, but was unfortunate in operating it. An overwhelming difficulty was that it was so high that sufficient water could not be obtained for amalgamating purposes. Thus he was compelled to move the mill farther down the mountain. At about the same time he had run out of rich ore, and this fact, with the worry of the, to him, unfamiliar work of the mill, litigation with the owners of the adjoining mine on the south—the Yellow Rose of Texas—and bad health aggravated by the altitude, determined Mr. Lawrence to sell out. The mine looked very bad at the time, with no ore in the vein at the face of the tunnel, 162 feet in, an inch or so only at the bottom, and all the ore (apparently) stoped out above the tunnel.

To make a long story short, the Dorleska was purchased by the writer, who had been familiar with the mine from its discovery, in the latter part of September, 1900, for $5000 cash. The Union Consolidated Gold Mines Company was incorporated in Los Angeles, Cal., with a capital of $50,000 to operate it, and work was at once commenced and has been continued without interruption to the present time. Rich ore was struck by the new owners, branching out to the southwest from Mr. Lawrence's tunnel, March 15, 1901. A vertical shaft was started about the same time, first as a winze from the tunnel, and afterwards raised to the surface, and at a depth of 81 feet a drift again intersected rich ore 10 feet north of the shaft June 19, 1901. In the meantime the little prospecting mill had been put in order and was started up for the purpose of testing the ore. Although its capacity was but a ton to a ton and a half a day, it did clean work, and in six months turned out over $30,000 in bullion. A 3½-foot Huntington mill was put up in the fall of 1900, and commenced work on December 6 of that year. About 750 tons of ore had been crushed by the two mills when the heavy snow prevented the hauling of ore and stopped milling for the season on February 25, 1902.

In September, 1901, tunnel No. 2 was started. The first 400 feet was a crosscut and about 800 feet was on the vein. The tunnel was completed early in December, 1902, connecting with the shaft at the third level, 172 feet deep. The tunnel is 1315 feet long. Rich ore was struck on this third level June 4, 1902, at a distance of 78 feet north and west from the shaft. Tunnel No. 2 drains the mine to this level, and all ore is now discharged through it, reducing the cost of transporting the ore from the stope to the mill, heretofore done on the surface, from 50 cents to 15 cents per ton. A substantial snowshed, 650 feet long, was built from the mouth of the tunnel to the top of the ore bins at the mill (see illustrations front page), in the fall of 1902, and by this means the mill is supplied with ore the year around, and without regard to the depth of snow in winter.

Following the completion of tunnel No. 2, work was resumed in the shaft December 23, 1902, and 128 feet of shaft was sunk by hand in seventy-one days, the fourth level, at a vertical depth of 300 feet, having been reached March 5, 1903. A station was cut out, a crosscut run west to the vein 89 feet, and a drift north entered the ore shoot in rich ore June 18, 1903, at a distance of 75 feet, making the distance from the shaft 164 feet.

Before snowfall in 1902 a 5-stamp battery, 850 pound stamps, made in sections for mule packing, was got in, and was put in operation March 25, 1903. During this season another 5-stamp battery, a duplicate of the first, has been put in, and will be put up and in operation about November 1. The mill is thus equipped with ten 850-pound stamps, a 3½-foot Huntington, an 8x12-inch Blake rock breaker, two 6-foot Frue and one 4-foot Woodbury concentrators, and two Atlas boilers and engines—the rock breaker being worked separately from the mills.

The shaft, which is timbered, and is of two compartments, is equipped with a Lidgerwood hoist, Worthington pump and Atlas boiler.

The mine also has a sawmill, and about 250,000 feet of lumber is sawed and used per year, in addition to about 25,000 running feet of peeled timbers. The company also has a store—the Union Creek store—and a pack train of about twenty mules. The machinery and supplies are all packed in (the last 15 miles over trails), excepting the boilers and a few of the heaviest pieces, which were sledded in over rough mountains, without roads. There are now four levels opened and about 4000 feet of excavations.

Up to September 14, 1903, about 5100 tons of ore had been mined and milled by the present company, producing $106,041.86, in forty-five bars of bullion, a yield of a little over $20 per ton. This was the result of amalgamation alone, as nothing has been received from concentrates excepting $328.02 from a lot of two tons of specially good grade shipped to Selby. The concentrates, which are accumulating at the mine, average about 1½% of the ore, of a value of about $50 per ton, though in the richest ore they run from $150 to $500 per ton. The concentrate values are in iron and lead sulphides—principally iron. The tailings are banked, and vary from $1 to $5 per ton. The ore is divided into two grades. The first grade is taken down on canvas and sacked, and about 350 tons of this grade has produced an average of over $190 per ton. The second grade ore, 4750 tons, has produced in the battery and on the plates about $8 per ton. The bullion runs from 790 to 816 fine in gold, and from 160 to 175 in silver, varying in value from $16.40 to $17 per ounce, and averaging about $16.60.

A large quartz-porphyry dike, frequently 300 to 400 feet wide, extends north and south near the summit of the divide between Trinity and Siskiyou counties, immediately west of the Dorleska. This great dike is traceable from 8 to 10 miles north and south. West of this dike, on the Siskiyou county side, are belts of schists—mica and hornblende—of 1 or 2 miles in width, extending to the granite mountains west of the South Fork of the Salmon river. East of the big dike, where the Dorleska is located, the country is mainly serpentine, which is cut up by smaller dikes of diorite, diabase and quartz-porphyry. While the general course of these smaller dikes is parallel to the big ones, they vary somewhat, and occasionally intersect each other; and one black dike, known as "Preacher's Peak," runs nearly east and west, at right angles to the others.

The Dorleska vein occurs in a calcareous-diabase dike, which runs north and south, parallel to the great dike of acid rock first mentioned and about 500 feet distant from it. The diabase dike varies from 20 to 60 feet wide, and Mr. Lawrence's first discovery was on the east contact of the dike with the serpentine, where there was a vein of mixed talc, quartz and a little calcite, from 1 foot to 4 or 5 feet wide. The rich ore was narrow, from 1 inch to 1 foot wide, and consisted of white quartz with an abundance of free gold and fine grained galena, associated with which is a small quantity of the tellurides, petzite and nagyagite. Coarse gold is not only found near the galena, but imbedded in the galena itself, forming beautiful and interesting specimens. Soon after they commenced operations the new owners discovered that the ore was not confined to the contact, but that it branched out into the dike in the form of small quartz veins and seams, these often being very rich. The dike rock itself frequently appears to have been replaced by quartz, wholly or partially, in portions where the dike has been cracked and broken by movement, and in such places the mineralization is often sufficient to make good ore for a considerable width. At the third level rich ore was found on both the east and west contacts of the dike, and through it diagonally from northeast to southwest, and for a length of 75 feet there was an average of 10 feet in width of ore. The single drift through this ore, taking out the full width of the ore body, which at some points was 15 feet, produced about 400 tons of ore and over $8000 in bullion.

Between the second and third levels the rich ore was highly concentrated at some points, and one lot of forty-six tons of first-class ore produced over $25,000 in bullion.

At the fourth level the dike was crosscut opposite the shaft and found over 60 feet wide. Seventy-five feet north rich ore was encountered running across the dike, and the ore was of good milling grade for a width of 20 feet. The dike at this point had narrowed to 29 feet in width. The ore was breasted out laterally for a length of 30 feet, the ore averaging 17 feet in width, and as all the ore bins and receptacles were then filled a single drift was extended north, and at 200 feet from the crosscut at the present writing it is still in ore, though not of high grade.

The fourth level is 120 feet deeper than the third, and no ore has been taken out between the two. All the ore milled, except that from the drift in the fourth level, has come from above the third, or 180-foot level.

A second ore shoot was found last summer in a north branch of tunnel No. 2, about 900 feet north of the main ore body, on the east contact of the Dorleska dike. At this point there is a vein of mixed talc, quartz and calcite on each contact of the dike. On the east contact the ore has been drifted on 172 feet, and varies from 6 inches to 5 feet in width of good milling grade. Frequently rich ore with visible gold and galena has been encountered in this drift, but so far less continuous than in the first ore body.

The shaft will be sunk 100 feet deeper the coming winter and a fifth level will be run at a depth of 400 feet. The company have purchased several hundred acres of timber land in the immediate neighborhood, and have compromised the lawsuit with the Yellow Rose on an agreed line between the properties. The principal owners comprise the directors and officers of the company. All are residents of Los Angeles, Cal. They are as follows: H. Z. Osborne, president and general manager; C. E. Keller, vice-president and treasurer; W. M. Van Dyke, secretary; O. Wellborn and S. B. Osborne.

*See illustrations on front page.

Hot Blast Smelting for the Production of Lead.*

Written by S. E. BRETHERTON.

We have made a short run with hot blast at Val Verde, Ariz., upon lead sulphide, containing a little, partially oxidized, iron; but the test was not long enough to decide the question of the value of a hot blast in smelting lead ores, whether as to saving of fuel, regular running of furnace, loss of metal or general technical efficiency or economy. Nevertheless, it has confirmed my impression that warm blast can be employed in the lead blast furnace with considerable resultant saving of fuel, if care be taken to secure the reduction of the lead without too much loss by oxidation; and before we resort to extensive roasting and cold blast smelting (in a place where all fuel is so dear as it is at Val Verde), we shall certainly give the warm blast another fair trial.

For the past three years I have had to contend with my metallurgical colleagues, who hold that, to be of any benefit by reason of its temperature, the blast must be heated to 600° F. or more. Admitting the theoretic advantage of the higher temperature, I still maintain that 500° F. is the limit for technical economy in pyritic smelting; and the amount of fuel that can be saved by using blast at only 200° or 300° F. is surprising. In general practice, I believe 16% coke would be used with cold blast, and (since a part of the sulphur in the charge is utilized even with cold blast), under favorable conditions, the amount of coke needed for that system of smelting may be as low as 12% of the charge. But we have been running regularly here for months on 5% of coke, and sometimes, for several days at a time, with only 3%.

At present (June, 1903), we are running one rectangular copper matte smelting furnace, and doing excellent work on material containing very little copper, our blast for this furnace being heated with the hot-blast stove originally constructed to do this work for the small round furnace. The charge (including 400 pounds of slag) is 2540 pounds, containing twenty-five pounds of copper. The product is matte containing 20.5% to 23% of copper. The furnace works perfectly; the only trouble being that the men employed as feeders have hard work to keep up with it. Our raw concentrates are moulded into briquettes in a press, and these briquettes are used to flux sulphide ores carrying silica in excess.

The general propositions, as to the use of heated blast in the treatment of sulphides in the blast furnace, seem to be:

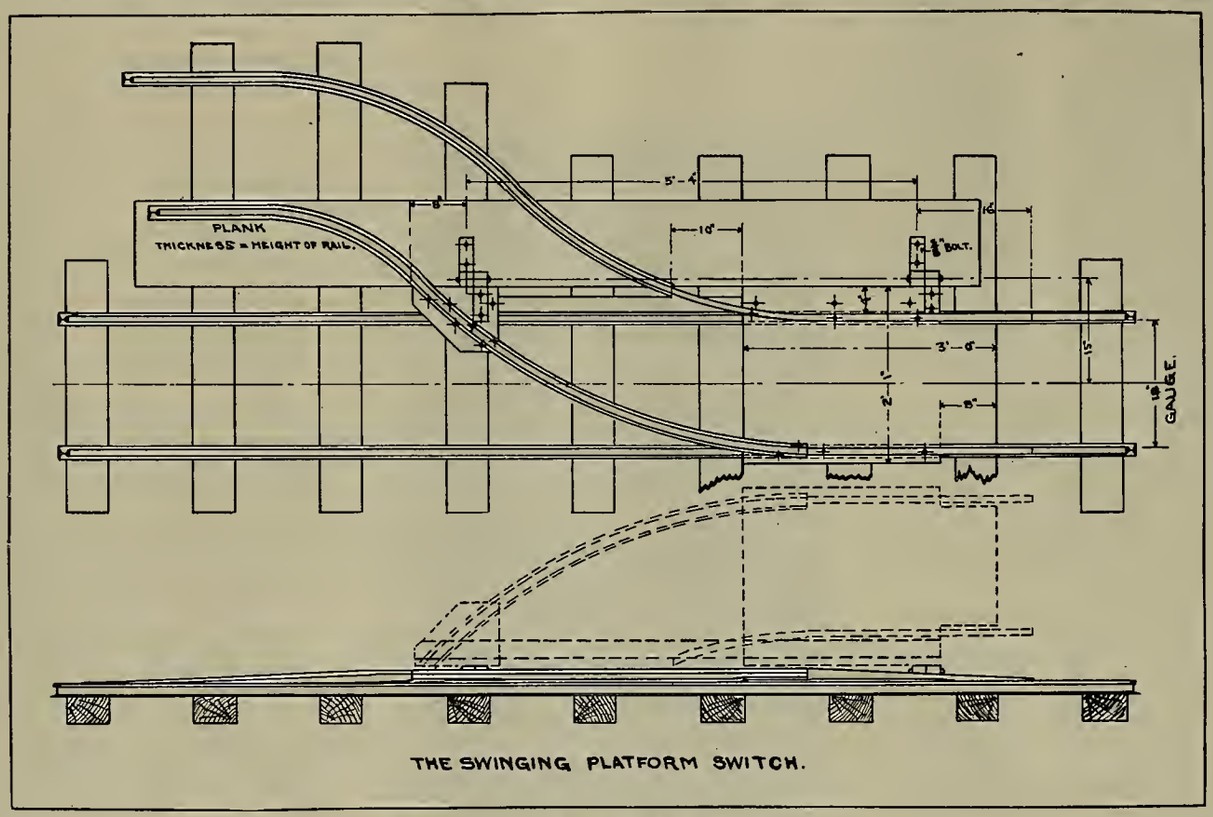
1. That the heat required for effecting what may be called the "net" reduction of the raw material of the charge into metal or matte, and for effecting and maintaining the fusion of the metal, matte, slag, etc., may be furnished by the fuel actually put into the furnace, and burned by the blast, or by the preheating of the blast, or by the oxidation of sulphur, etc., in the charge.

2. That of these sources of effective heat, the first two cost money, while the third does not.

3. That the third can be more effectively utilized if the second also be called into play (that is to say, if the blast be preheated.

4. That the economic limits and advisability of this measure of economy in smelting must be determined in each case after due consideration of all the conditions, including not only the difficulty and cost of securing a suitable ore mixture, but also the local cost of coke and other materials involved in the problem.

5. That, for many localities in the United States, the use of a warm blast in matte smelting or lead smelting is worth considering.



*Abstract Trans. Am. Inst. Min. Engs.

Cyanide Plant and Practice at Ymir Mine, British Columbia.*

Written by EDWIN C. HOLDEN.

In making the original estimates for a report recommending the cyanidation of Ymir stamp-mill tailings, the writer was unable to find in any of the standard works on cyanide practice certain data applicable to the local conditions; nor has he as yet seen the same practice recorded in the rapidly growing literature of cyanidation. To present these figures, together with a few novel features of local practice, the present paper is offered.

The ore treated is obtained from a fissure vein of steep dip, occurring in a slate country. The ore body is lenticular in plan, swelling from 4 feet in width at one end to a maximum of 42 feet, and tapering irregularly to less than 18 inches, where pay values cease. In the wider portions of the fissure the ore is mixed with more or less horse-matter from the walls. The clean ore is white, massive quartz, with from 8% to 12% of sulphurets; the latter being pyrite, sphalerite and galena, the predominance be-

Swinging Platform Switch. (See Opposite Page.)

ing in the order given. The precious metal tenor is variable, the gold more closely following the pyrite, the silver the galena. The present mill supply is practically all from below the oxidized zone.

The unavoidable admixture of horse-matter and stope filling, with the ore as mined, affects more or less the character of the mill feed, which sometimes contains from 10% to 25% of slate. During the last three months of 1902 the mill feed carried 0.3977 ounce gold and 1.903 ounce silver per ton of 2000 pounds, 2.65% lead and 2.92% zinc. The iron, unfortunately, was not determined.

The ore, which will pass a 2-inch grizzly, is fed into sixteen 5-stamp batteries. The mortars are narrow; the stamps average 850 pounds and drop 6.5 inches from 98 to 100 times per minute. The height of issue is from 3.5 to 5 inches, and the screens (diagonal slot) are No. 9 or 11, depending upon the height of issue. The crushing capacity is from 2.5 to 3 tons per stamp per twenty-four hours. There are no inside plates, and but one 56 by 144-inch apron plate to each mortar. The saving on the plates was 61.9% of the gold and 9.4% of the silver.

The plate tails from each ten stamps were, without classification, put over three Frue vanners. A slightly variable concentrate was made, averaging 20.6% lead; 1.17 ounce gold and 12.5 ounces silver per ton; and, approximately, zinc, 12.9%; iron, 23%; and insoluble, 6%. There was an extra smelting charge on zinc in excess of 8%; and it was a delicate matter to determine how high the grade of the vanner tails could be raised with profit, so as to throw over the zinc and reduce the concentrate tonnage. The gold saving in the concentrates was 16%, the silver 35.4%, and the lead 42%. The total saving in the stamp mill was thus 77.9% of the gold and 44.8% of the silver. These totals were higher before the tailings plant was installed, when both battery and vanner work were necessarily closer.

The vanner tailings during the quarter ended January, 1903 (and all the figures here given, unless otherwise stated, are for that period), assayed 0.0882 ounce gold and 1.051 ounce silver per ton; lead, 1.3%, and zinc, 2.2%. Of this material, 65% would pass a 100-mesh screen.

The vanner tailings being of comparatively low grade, the writer felt himself practically confined to the adoption of the system of direct filling and percolation; and, as slimes treatment was not at the same time to be provided for, the object was to treat as large a proportion of the slimes as possible with the sands; or, in other words, to make charges having the lowest practicable rate of percolation. This minimum rate is usually stated as 2 inches per hour.

It is also a current conception that a much larger proportion of slimes can be handled in an intermediately settled charge than in a directly filled one. To determine whether this possible difference in tonnage was important enough to justify the increased cost of installation and operation of a plant with settling vats was an important problem, which our experimental plant decided.

After the usual laboratory tests, the experimental plant, consisting of two 35-ton leachers, 5 feet deep, with solution tanks, zinc boxes, etc., was erected. One leacher was charged direct from a Butters' distributor, which was fed by the bottom discharge of a pointed box carrying the vanner tailings from twenty stamps. The box got rid of excess water and a little of the finest slimes. The second leacher was charged from a two-compartment box in which the vanner tailings were settled, the sands being dropped from the compartments alternately as filled, and shoveled in the leacher as in ordinary intermediate filling plants. We were thus enabled on a commercial scale to compare results of the two systems of filling with the same character of material. A comparison of results from fifty-two charges is here given, screen tests being 100-mesh:

Charged.	Fines. Per Cent.	Gold Recovery. Per Cent.	Silver Recovery. Per Cent.
Direct	44.2	76.5	52.2
Intermediate	39.8	77.2	54.1

The average minimum rate of percolation in the direct filled charge was 1.9 inch per hour. In the intermediately filled charges the rate was quite variable, but the average minimum was over 3.25 inches.

Owing to structural difficulties in the experimental plant, which had to be squeezed into an unoccupied corner of the stamp mill, we could not give the settling boxes area enough to settle regularly charges carrying the same proportion of fines as the direct filled ones; but eight of these charges, made when some of the stamps were hung up, carried 43.7% fines, and the gold and silver recoveries averaged, respectively, 73.6% and 46.5%.

These results led to the rather unexpected conclusion that direct filling, when properly done, not only leaves a charge in as good condition for treatment as the intermediate method, but renders it possible to treat a larger proportion of the slimes. It may be suggested as an explanation that in a charge settled under water the grains of sand are free to arrange themselves most compactly, with a minimum of voids, and the slimes are held near where they originally settled, because the interstitial currents are not marked enough to disturb them; whereas, in charges shoveled into a vat with less than 15% of moisture, the voids are a maximum, and the slimes which originally coated each grain of sand are washed off and settle through the charge, and, thus segregating, prevent uniform percolation. The fact that direct filled charges never pack nor settle more than 1%, while indirect ones frequently contract over 10%, during treatment, tends to confirm this view.

The final plant is located half a mile from the stamp mill and 300 feet vertically below it. The site, from which over 400 cords of timber were removed in clearing, is on a hillside, and required about 5000 yards of excavating and 630 yards of masonry for footing and retaining walls. All the plant is housed, the buildings being heavily framed, as required by the deep snowfalls.

The vanner tailings are carried to the plant by a box launder 6 by 8 inches in section, and the excess of battery and vanner waters allows of a minimum grade of slightly under 5%. At that grade, and with 1-inch riffles set 5 inches apart in the bottom of the box, the durability even of the local soft hemlock and cedar lumber used is quite satisfactory.

To make the required fall of 300 feet to the plant, a series of drop boxes is inserted where the topography is favorable; and a 12-inch sand pocket at the bottom of each drop, to prevent wear, should also be an efficient saver of escaping amalgam or mercury.

The tailings enter the top of the storage solution room; and when, as in the period under consideration, from forty to sixty stamps are running, the classification is done in two boxes, the first being 18 by 24 inches wide by 18 inches deep, with two vertical sides and false ends sloping 60° to a 0.5 by 24-inch slot, under which hydraulic currents can be applied. This box settles only the coarse sands, which are drawn off through a 2-inch nipple into the charging launder. The second box is pointed, 3 feet 6 inches in width and depth, and 7 feet long, with a 3-inch outlet. A plug valve in this outlet, in combination with the hydraulic current in the box, regulates the speed of the distributors, while maintaining the same separating action in the box. The overflow from the box, carrying about 60% of the water and 20% of the total tailings, is run to waste. This overflow should all pass a 100-mesh screen, and is mostly impalpable material.

All of the vats and tanks, except the sumps, are of steel. The leachers, 32 feet in diameter by 6 feet deep, are on timber foundations with masonry footings. Caps and sills are parallel, an arrangement which renders jacking-up easier than the usual right-angled structure. Bents and posts are spaced 4 feet between centers, and the bracing does not extend above the post, the shimming being done between posts and caps. On the caps are 4 by 8-inch joists, spaced 18 inches between centers. There is no flooring on any of the vat or tank joists, and there is headroom under them all, so that leakages occurring in the plant cannot be unknown or inaccessible. The

*Trans. Am. Inst. Min. Eng. (Condensed).

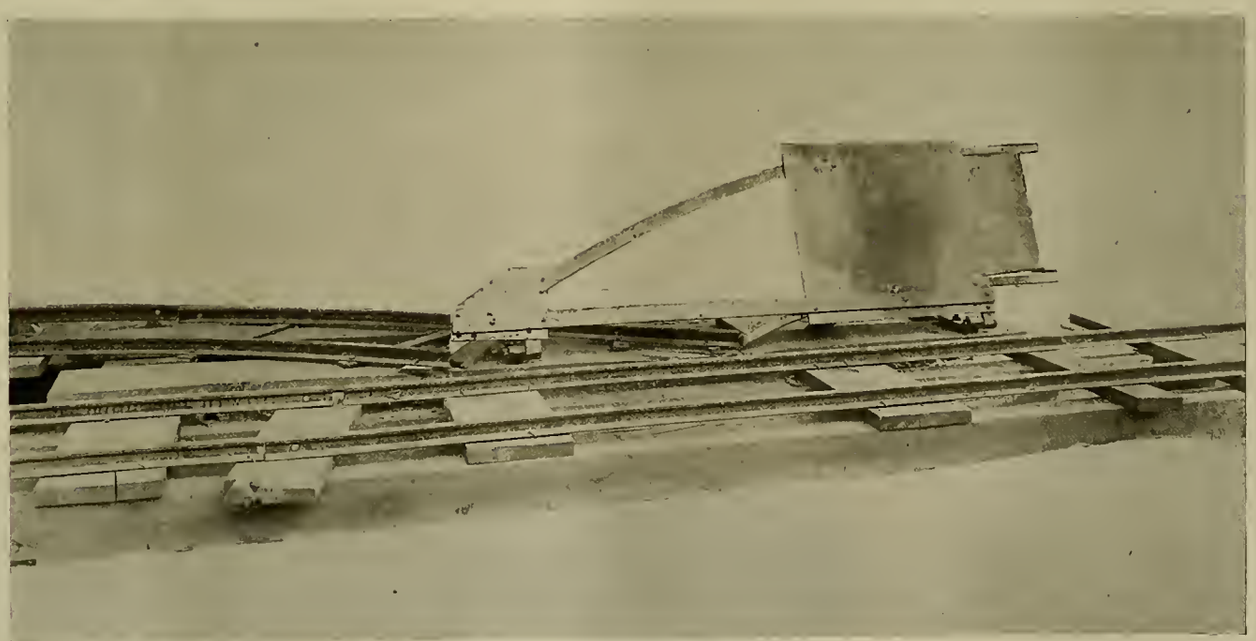
vats are fitted with top annular overflow launders; and, to preserve a level rim, a soft wood strip, projecting above the edge of the vat, is fastened with stove bolts to the side plates, the joint being calked with oakum. Any settling of the vats which is insufficient to require jacking-up from below can thus be easily rectified, as with tongue-shaped wooden vats.

The distributors are of the usual type, and have twenty 1.5-inch arms. This area of discharge openings, with our quantity of tailings, never allowing any head to accumulate in the distributor hopper, renders uniform distribution difficult. The slightest throw of the stream from the chargiug drop box off the center of the hopper results in uneven chargiug, most of the slimes going to the low side of the vat. Many devices were tried to remedy this, and to prevent twisting of the drop stream, which motion also has a classifying effect; aud the last and simplest plan was successful. The drop was made square; and inside the lower end of it au irou strip was fastened to each side. The square drop prevents twisting, and to throw the stream toward the low side of the charge small wedges were driven under the irou strips, as ueeded. These details may seem trifling; but wheu the object is to treat the maximum quantity of slimes by percolatiou they will be fouud of prime importance in obtaining a uniform charge.

(TO BE CONTINUED.)

Swinging Platform Switch.

Herewith is illustrated a swinging platform switch, for use in mines or other places where such switches are necessary or desired. This switch is especially adapted to narrow tunnels which admit of only a single track. It dispenses with any need of frogs, tongues or turnouts. The switch can be located at any point in the main track without the necessity of making any alteration therein.



As will be noted, this swinging platform switch is a simple arrangement, consisting of a hinged plate, carrying 8, 12 or 16 pouud rail. Wheu this switch is lowered in place the rails thereon fit to gauge of track in use. The rail is rigidly bolted to the plate which carries the hiuges, the hinges being connected to each other by a strip of steel and theouter rail, which is riveted to the edge of the plate on the head eud aud the steel plate at the rear end, make a strong, rigid coustruction, at the same time being light and easy to handle. The rail on the switch is counected to the main track by a tapering bar, over which the car rises ou a gentle grade and crosses over to the branch track. The mine rails to the brauch track are conneeted to the rails of the switch in the usual manuer—with splice bars and track bolts. The switch is 7 feet 4 inches long over all, and is made to any gauge desired. The car is raised in passing over this switch the height of the rail in a distance of 2 feet 8 inches, making a slight grade, which is easily traveled over by the cars going in the tunnel, the cars coming out having the advantage of a small down grade at this point.

The hinges of this switch are securely fastened to a heavy plank, which can be spiked or bolted to the cross ties of the main track at any place along the line, and a branch or parallel track can be taken off at that point.

These switches are manufactured and for sale by the Mine & Smelter Supply Co., Denver, Colo.

Manner of Placing Platform Switch.

Electrolytic Refining of Copper.*

NUMBER II.—CONCLUDED.

Written by W. D. BANCROFT.

COMMERCIAL TEST.—In this test an attempt was made to duplicate commercial conditions in the precipitation of electrolytic copper. Through the courtesy of the Baltimore Copper Co. several hundred pounds of their commercial anode plates were obtained.

As the current efficiency could not be computed from the results of this run on account of a short circuit which occurred, an extra determination was made with a commercial auode, using the current-efficiency apparatus previously described. This run was made at 45° Centigrade and a current density of two amp/qdm. From the current efficiency obtained it is clear that the impurities in the anode do not cut down the current efficiency to any extent. The current efficiency of commercial tauks does not reach this high figure, probably due to leakage of the current through the slimes ou the bottom.

CALCULATIONS FOR COST OF REFINING.—Basis—One tank, inside dimensions 2 by 2½ by 9 feet. Outside dimensious taken as 29 by 34 by 16,000 square inches. Ratio of radiating surface of small experimental tauk to commercial tauk is about 1 to 100.

SOLUTION D.—The basis for the following figures on the cost of production is as follows:

Oue tank, cotaining 130 electrodes of two plates each.

Weight of copper per tank = 5700 pounds.
Value of copper per tank = $800.
Cost of power = $20 per H. P. year.
Plant temperature = 20° Centigrade.

The calculation is made on the basis that the heating of the electrolyte is done by meaus of the electric curreut. In such cases, where the cost of heating the solution is greater thau the cost of precipitating the copper, we have taken as the figures of cost the former, and vice versa, since, in precipitating the

*Trans. Am. Electro-Chemical Society, Niagara Falls, N. Y., Sept. 18, 1903.

eopper, the energy is consumed simply in overeoming the resistance of the eleetrolyte, and thereby heating it. The following table gives the results of the ealculations:

COST OF REFINING TANK OF COPPER.

Amp./qdm.	Temperature Degrees.	K. W. Hours to Deposit.	Cost to Deposit.	K. W. Hours to Heat.	Cost to Heat.	Interest on Copper.	Total Cost.
1	20	390	$1.195	000	$0.00	$2.975	$4.17
1	50	196	0.601	793	2.425	2.975	5.40
1	70	153	0.468	1,550	4.755	2.975	7.73
1	90	134	0.411	2.360	7.205	2.975	10.18
2	20	608	1.86	000	0.00	1.487	3.35
2	50	362	1.11	396	1.21	1.487	2.70
2	70	274	0.84	775	2.38	1.487	3.87
2	90	233	0.71	1,180	3.60	1.487	5.09
3	20	795	2.43	000	0.00	0.99	3.42
3	50	519	1.59	264	0.81	0.99	2.58
3	70	400	1.22	517	1.58	0.99	2.57
3	90	341	1.04	787	2.40	0.99	3.39
4	20	1,000	3.06	000	0.00	0.74	3.80
4	50	647	1.98	198	0.61	0.74	2.72
4	70	519	1.59	388	1.19	0.74	2.33
4	90	433	1.33	590	1.80	0.74	2.54

While these figures are based on experiments with the series system. it is probab'e that the conclusions to be drawn would apply equally well to the multiple system.

Exception may be taken to these estimates of the eost on the ground that, in practice, the solntions are heated by steam eoils, and that this eosts less than electrical heating. To meet this objection the results have beeu ealeulated on the basis of eleetrical power at $20 per horse-power-year, and steam heating at one-thirtieth the price of eleetrical heating. The data for the two calculations are given in the table, and show cost per ton of copper instead of per tank.

COST PER TON OF COPPER.

Amp./qdm.	Temperature Degrees.	Cost 20—20.	Cost 20—30.
1	20	$1.46	$1.46
1	50	1.89	1.28
1	70	2.78	1.25
1	90	3.57	1.27
2	20	1.17	1.17
2	50	0.95	0.91
2	70	1.36	0.83
2	90	1.79	0.80
3	20	1.20	1.20
3	50	0.91	0.91
3	70	0.90	0.78
3	90	1.19	0.72
4	20	1.33	1.33
4	50	0.95	0.95
4	70	0.82	0.82
4	90	0.89	0.89

It must be kept in mind that these estimated costs do not include the eost of labor, aud are based on the assumption of 100% current efficiency.

CONCLUSION.—Summing up the results obtained for the different runs, it is now possible to draw conelusions as to what are the most finaneially economical conditions under which to refine eopper electrolytieally.

Two sets of curves were plotted, one showing the relation between the cost to precipitate a ton of copper and the operatiug temperatnre, the seeond set showing the relation between the cost to precipitate a ton of copper and the operating current density. From these curves, it is evident that to operate at a temperature of 90° and a low-current density is entirely out of the qnestion, not only on aceount of the cost of power to heat the solntion and precipitate the copper, but also on account of the deterioration of the solution, whieh takes place very rapidly under these conditions. At this high temperatnre and the higher current densities, the cost rapidly approaches a minimum, bnt here also the deterioration probably more than offsets the advantage of reduced cost of power. To operate at 20° Centigrade is not so costly as would seem at first thought. The cost is maximum at the lowest and the highest eurrent densities, reaching a minimum between two and one-qnarter and two and one-half amp./qdm.

At 50° it would not be economical to operate at one amp./qdm, but the cost drops off very rapidly between one and two amperc. At the higher current deusities the cost fluctuates but very little, reaehing a minimum at about two and one-half amp./qdm.

The result at 70° seems the most satisfaetory, and it is at this temperatnre that we shall get the best results. Althongh the cost runs very high at this temperature for a curreut density of one amp./qdm, it begins to drop off very rapidly as the current deusity increases, until it assumes a practieally constant value at the higher eurrent densities. Between 3.5 aud 3.75 amp./qdm would be the best current density for obtaining economical results, for at this density no extra power would bc reqnired to heat the solution. Operating at this current density, and with the tanks covered, the current alonc would be sufficient to heat the electrolyte to over 80°. In order to secure a good circulation, essential for a good deposit with high-current densities, thc present method of pumping could be retained.

The lower the cost of heating, the greater the advantage of a high temperatnre. Lowering the rate of interest decreases the advantage of a high-current density. With covered tanks it will be possible for men to work in the tank room with the electrolyte at 70°.

If we compare the cost of working under the so-called standard conditions of open tanks, a current density of 14 amp./sq feet and a temperature of 50° with the eost of working with the covered tanks at 70° and a current density of 3.5 amp./qdm (31.5 amp./sq feet), the saving by the latter method will be very close to $1 a ton of refined copper when all power is figured at $20 per horse-power-year.

Therefore, in order to operate a plant most economically, copper should be refined electrolytieally under these eonditions:

1. Covered tanks.
2. Current density 3.5 amp./qdm.
3. Temperature 70°.

Testing Methods in the Physical Examination of Portland Cements.*

NUMBER III.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by A. H. CEDERBERG.

TIME OF SETTING TEST.—This test is in many cement works practically part and parcel of the test for tensile strength, and iu other works, again, it is made entirely separate. For practieal purposes and the saving of time and labor, the first way of testing is amply snfficient. The separate test is, however, very simple. The setting of the cement can properly be divided into two periods:

First—Time elapsed in which the cement has obtained its initial set.

Seeond—Time elapsed in which the cement has obtained its final set.

When this test is made in connection with the making of the briquettes, it consists merely in applying the standard testing needles to the exposed surface of the briqnette and time in minntes recorded, when the ganges fail to show any impression on these exposed surfaces.

For scientific work the so-called Vicat needle is used. The sample of cement to be tested by the Vicat needle is prepared and kneaded into a dough in the same manner as when making briquettes. It is now formed into a ball, also, with the hands and pressed very gently into the rubber ring through the larger opening, smoothed off on both sides with a trowel, and when done it is pnt—small end np—on the glass plate and placed directly nnder the rod bearing the cap at the npper eud and the needle at the lower. The needle is now slowly bronght in contact with the exposed snrfaee of the cement paste and quickly released.

Initial setting has, according to standard rule, taken place when the needle stops at a point 5 m.m. (0.2 inch) above the npper surface of the glass plate on which the "dough" is restiug.

Final setting has, according to standard rnle, taken place when the needle fails to sink in the paste at all.

Every time the needle is used it shonld be well cleaned.

Modern standard Portand cements are supposed to be slow setting—that is, initial setting shonld not take place within 60 minutes or more in neat cement, after being mixed with water. The general standard is about 90 to 180 minntes, resulting in a final set in 4 to 6 hours. Sueh slow setting cements were formerly obtained without the aid of a foreign admixture, but the tendency among modern eement manufaeturers to prodnce a more finely grounu cement has necessitated the addition of a limited amount of calcined plaster or gypsnm in order to overeome the quick setting properties of the fiuer ground eement.

It must be understood that the setting of a cement involves a chemical action, hence the setting is accelerated by heat or fineness of grinding, aud rctarded by cold or coarse grinding. This faet explains that if a cement has normal setting properties at normal temperature (say + 70° F.) these properties will be proportionally modified at a higher or lower temperature.

This fact also explains why the manufacturer who does not hesitate to test his fresh cement has a decided advantage over the one who sticks to the idea of not testing the cement until it is seasoned.

To the expert tester the setting of the cement is very interesting, as it gives him a valnable aid in jndging of the value of the eement as a whole. Samples that show erratic time in setting are generally insufficiently plastered cements.

The marked rise in temperatnre that takes plaee owing to the ehemical action involved in this test begins in a normal cement when the initial set has taken place. From then on the temperature rises rapidly until a maximum is reached, when it gradually recedes and assumes normal temperature again. The intensity of rise of the temperature in this ease has no effeet on the sonndness or unsonndness of the eement, providing the previous boiling test has been satisfactory. If, on the other hand, a rise in temperature occnrs before initial setting has taken place, it is generally a good sign for a more or less overlimed or overplastered eement.

The amount of ealcined plaster that ean be added to a moderu cement is confined within very narrow limits, or from 1½% to 2%. Below 1½% the setting properties are too erratic and above 2% the amount of sulphuric acid gets too close to the danger line.

An insufficiently plastered cement, ground very fine and otherwise perfect, is often slow setting when fresh, but becomes quick setting even after only a few hours' aerating. This ehange in the eement has often resulted in large shipments being rejected, and, while justly so, the fact remains that the cement is perfeetly sound, but it does not meet the speeifications.

A sound cement mixed in right proportions with an insuffieiently calcined plaster also exhibits the same aggravating symptoms after aerating.

A sound cement mixed in good proportions with poorer grades of gypsnm is also very erratic in its setting properties after aerating.

A sound plaster-free cement that has become quick setting on account of fine grinding can be made slow setting by an increased proportion of water, either sea or fresh, although at a slight loss in tensile strength.

A sound and plastered cement, that has become qnick setting after aerating, on the other hand, will get still more qnick setting by an inereased proportion of sea or fresh water.

A plastered cement shows a higher tensile strength than the same cement plaster free.

An overplastered cement (2½% or more) is very dangerous, aud especially in sea water. A briqnette made of snch cement will soon show signs of eraeking and disintegration. In faet, if eement is to be nsed in sea water construction, I personally believe that a plaster-free cement ground abont 88% or 90% fine on 100 mesh is the best all-aronnd, whether qnick setting or not.

An erratic setting cement, while sound as far as boiling test goes, is equally as erratic in its tensile strength.

If, as is the custom in several cement works, the plaster is mixed in with the cement only when ready for shipment, only the most thorough and carefnl mixing will accomplish good results. The most irregular setting has been recorded in cements thus imperfectly treated—and no wonder, because even the naked eye eould easily discover the plaster in streaks all through the sample tested. Only ten days ago such a cement—new brand at that—was shown to the writer, the contractor wondering if there was any "flour" in it.

All np-to-date cement manufacturers mix the calcined plaster in with the clinkers, thus saving themselves all the above recorded troubles.

Iu a few instances I have saved a "disobedient" plastered cement by adding an exceedingly small quantity of finely ground and thoronghly slaked hydrate of lime, mixing same in thoroughly. No matter how irregnlar the setting was before, ranging from 1½ minute to 17 minutes, I brought the cement to time and got an initial setting in from 52 minntes to 90 minutes or more, even after continued aerating. Although I am not in position to jndge from lack of personal observations, I will, however, not hesitate to pronounee as a belief that cements destined for export to tropical climates, especially, would be benefited by this little addition of lime.

SPECIFIC GRAVITY TEST.—If the foregoing testing methods have been strictly adhered to, and satisfactory results have been obtained, the specifie gravity test of Portland cement is of little or no consequence.

The specific gravity is very variable in different brands.

The specific gravity is higher in fresher cements than in older, and a difference is recorded even after 30 days.

The speeifie gravity may vary from 2.90 to 3.20.

Hence the idea of rejecting a eement on accounnt of its specific gravity not being in harmony with the speeifie gravity stipnlated in a specification is just as ridiculous as the man who insists on putting certain specific gravity in the speeifications, without giving due allowance for modification from his normal figure, and it smacks entirely too much of "fixing."

Specific gravity should not enter as an exclusive test by itself in any specifications.

This test becomes of interest in the following instances:

First—If cement refuses to stand the boiling test, a specific gravity of less than minimum normal (2.9) will then indicate nnderburned clinkers.

Second—If cement, otherwise perfect, is far below modern staudard of tensile strength, the specific gravity will then tell yon in some cases, but not in all, that the cement has been adulterated.

As all Portland cements have hydraulic properties—that is, can set nnder water—the ordiuary methods in obtaining the specific gravity cannot be applied here. Numerous devices are in the market. The Le Chatelier apparatus, reeommended by the committee heretofore referred to, is the best. It can be had at any laboratory supply honse. Benzine or kerosene, free from water, should be nsed only in making the determinations. Full description accom-

*Copyrighted.

panies every outfit and is so complete that no additional mention of the same on my part will add to its accuracy.

As all modern and fair concrete specifications call for boiling test of cement to be used, and rejection of cement refusing to stand this test is a matter of right down fact, the specific gravity is only of secondary importance to the engineers.

As all modern and fair concrete specifications call for standard tensile strength, and nine out of every ten brands submitted will show figures considerably above standard requirements, it is evident that only the highest testing cement, all other tests being satisfactory, will be chosen. Hence here the specific gravity test is of only secondary importance.

Color, Etc.—Of other characteristics sometimes stipulated in specifications for concrete there is very little to say. Once in a while one sees color specified. The color in the "non-colored" cement depends entirely on the amount of iron present, but its darker or lighter color has nothing whatsoever to do with the soundness or unsoundness of the cement. There is no need, therefore, to describe the "Portland color." Only, if the Portland cement shows a color more like the light-colored natural cements, there is reason to believe that the cement is underburned, and the boiling test or specific gravity test will soon check that. The cement that is most attractive is naturally the one that is lighter in color. The so-called La Farge cement, a French Portand cement, is almost white, and, being very expensive, is used only in stucco or mosaic work. Cement used in mortar to lay brick or colored building stone may be colored with certain coloring matter and without danger to harmonize with the color of the brick or stone. For construction purposes, however, the question of color should be left out entirely. The word Portland cement is sufficient. To stipulate such a petty detail in this case is generally another case of either ignorance or "fixing."

Adulterated Cements.—I am sorry to say that in the United States adulterated Portland cements have made their entrance into the market and are being palmed off as "Portland cements." They are very few, however, and it is to be hoped that they will not be spread much. They are very difficult to detect, and only to the trained eye they present a somewhat "sluggish" Portland color. Specific gravity will in some cases be of help, but not always. The writer has had two samples submitted to him which have shown specific gravity test and all other tests O. K., with the exception of unusually slow setting properties. This cement was adulterated with a certain foreign matter to the extent of 15%, and after obtaining a sample lot of this foreign matter and grinding it up to the same fineness as a sample cement with which it was to be mixed for further tests, the mixed samples up to 32% with foreign matter showed no physical properties different from the pure Portland cement, except in being extremely slow setting. Above 32% the tensile strength in the mixed samples showed a steady decrease, which became unusually pronounced at a 70% adulteration, but aside from outrageously slow setting and low tensile strength, both neat and sand, all other tests were O. K. The chemical analysis was the only successful "discoverer" in that case. But it is paramount to fraud to sell such a cement as a true Portland cement, and if I am not mistaken I believe the United States government forbids anyone selling a cement as Portland cement that does not contain a chemical composition within the following well-defined limits:

	Per Cent.
Lime	60 to 66
Silica	18 to 24
Alumina	6 to 10
Iron oxide	3 to 5

I have on purpose not said anything about the presence of magnesia in Portland cement. Its injurious qualities on Portland cement, if found in excess (above 5%), is so well known that commenting on same is out of date. Every prospectus that has been sent me indicates that the new manufacturer or promoter entering this remunerative field has a wholesome terror for this particular compound, and it is doubtful if any Portland cement manufactured in the United States shows a quantity of over 4% of magnesia. So there is no need of "fording the river to get a bucket of water."

Conclusions.—The above would go to show that the tests required for practical purposes in order to prove a cement submitted to be a Portland cement should be as follows:

First—Boiling test.
Second—Sand test for tensile strength (1-3).
Third—Neat test.
Fourth—Initial and final setting.
Fifth—Chemical analysis.

If boiling tests show cracks very quickly, or warping, etc., reject the cement, and don't go to the expense of making any further tests with it, because, as stated, there are dozens—aye, scores—of cement brands that will stand up under the test. After having failed on the boiling test, the subsequent tests are of benefit to the manufacturer only, and neither the contractor nor the engineer should carry his burden.

A buyer of Portland cement should insist on a certified shipping test sheet from the manufacturer on every shipment bought, no matter how small or how large, and if a domestic brand is bought the buyer should also be informed by the manufacturer at what period the plaster of paris was mixed in the shipped lot. All foreign cement cargoes are accompanied by such certificates. It does not cost the manufacturer anything more to do it, as he has, if he wants to be in the swing, a permanent testing staff that can do the work in no time. This shipping certificate should embrace the following tests:

Cold water test.
Boiling test.
Neat—
Tensile strength, 1 day.
Tensile strength, 7 days.
Tensile strength, 28 days.
Sand (3 to 1)—
Tensile strength, 7 days.
Tensile strength, 28 days.
Initial setting.
Final setting.
Fineness on 100-mesh sieve.

The ending of this certificate should be worded as follows:

The ..... Company does herewith certify that the cement shipped to ..... by { rail / steamer } this date to ..... tests as per above, and that if cement of this shipment is tested in manner prescribed below it shall show up an equally satisfactory test.

(Signed) N. N..... Co.
Per N. N....., Supt.

If such rules and regulations are observed, such distressing—not to say revolting—exhibitions of concrete work that have lately been made with the use of several new brands of domestic Portland cement "superior to any imported braud" (of course) and "the standard of excelleuce," etc., would never have occurred.

Addenda.—The following "dou'ts" may be of interest to such testers or manufacturers who think they are not too old to learn something new:

Dou't use any but pure, clean water in making pats or briquettes.

Dou't use a water below + 65° F. or above + 75° F. for mixing.

Don't do your testing in a "sweat box." Try to keep, if possible, a normal temperature of about + 70° F. If not, give due allowances.

Don't, when testing quick setting cements, stop to light your pipe, look for a chew of tobacco, or go to sleep. A moment's suspension in your labor, and you may have the "pleasure" of doing it all over again.

Don't try to work a dough after initial setting has once commenced.

Don't use but one and the same method in testing various brands of cements for comparisou.

Don't, when you advertise or favor a special brand, hold up as a club for comparison your own up-to-date test of the favored brand with your dead ancestor's test of the non-favored brand; and last, but not least,

Don't think you alone are wise, or, as the old Romans used to say, "Abusus non tollit usum," which in very free, good, old Euglish may be translated as follows: "Your abusiug me is uot an argument against the truth of what I have said."

Errata.—In chapter No. 2 of this paper, which was published in the issue of October 10th, in the table on page 237, the tensile strength of the Dragon brand at two months should have read 464 pounds instead of 764, as published.

Electricity vs. the Mule.

Mule haulage is to be replaced by electric traction on the De Beers diamond mines, at Kimberly, South Africa. The locomotives are of the Westinghouse Manufacturing Co. and have four wheels, each pair driven by a motor of 10 H. P. capacity at a conservative rating. They can thus develop a full load drawbar pull of about 900 pounds, running at from 6 to 10 miles per hour on the level. The most interesting feature of these tractors is that, the gauge being very narrow, 18 inches, the motors have to be mounted clear of the wheels. The motor pinion meshes in the ordinary way with an additional intermediate gear-wheel. The journals of the shaft carrying this gear-wheel run in boxes working in pedestals over the main journal boxes of the locomotives, and rigidly connected to them. Thus the locomotive frame, which is supported on springs in the usual manner, is free to rise and fall on the axles without disengaging the gears. The motors are hung on the shafts of the intermediate gear as if these were the ordiuary wheel axles, and the usual "nose" suspension is employed.

Some Observed Electrical Phenomena.

From midnight to morning electricity decreases.
From morning to early noon electricity increases.
From noon to early evening decreases.
From evening to early midnight increases.

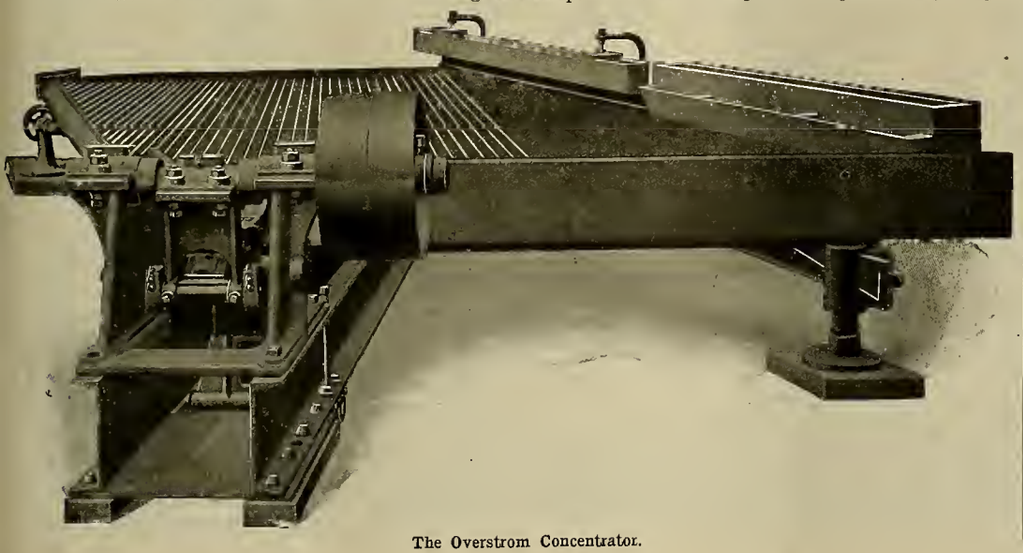
Electricity decreases from winter months to May or June, and then again increases until the winter months are reached again.

In the earth the electricity is generally negative.

In the clouds the electricity is generally positive, but can be negative.

In clear weather the electricity is generally positive.

In foggy weather the electricity is geuerally positive.



In wet weather the electricity is generally positive, but can be negative.

During snow storm the electricity is generally positive.

During thunder storm the electricity is generally negative.

The Overstrom Concentrator.

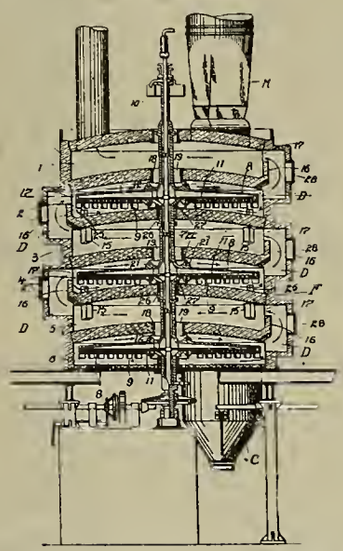
The Overstrom concentrator has been redesigned, and No. 3 is now on the market. In the new machine all of the good features have been retained, and the improvements adopted embody many new and important ones. The table is built of steel and iron throughout, with the exception of the top. It has a new head motion, which, it is claimed, advances the mineral particles more rapidly than before. Rocking arms have been provided to impart a reciprocating motion. The table top rests on four long rollers, which extend the whole width of the table, giving over 24 feet of bearing surface, and it is said by the manufacturers that no lubrication is required, and that the rollers cannot wear flat. The riffles on this No. 3 table have a double taper, a feature which, it is claimed, is a decided advance in table concentration. The machine is made by Allis-Chalmers Co. of Chicago, Ill., and is illustrated in the accompanying engraving. The pulp is fed along one end by a short box, the water feed occupying the remainder of the upper edge of the table. The makers state that the adjustment and mechanical action of the table is such that the waste water and the gangue pass off of the table on the side opposite the feed, the concentrated mineral passing over the end of the machine into a pointed box, from which it drops into a box or other receptacle for sacking or other further treatment. Catalogue No. 12, the Overstrom concentrator, fully describes the machine and its working results.

The Overstrom Concentrator.

The executive committee of the California Miners' Association will meet at the Union League Club, San Francisco, Cal., on the 19th inst., to fix the date of the 1903 convention, and outline future work and policy of the association.

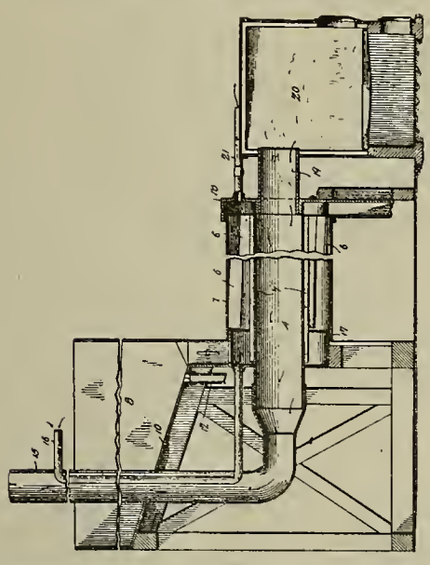
Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 6, 1903.



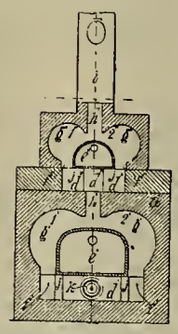
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

CARRIAGE FOR LADLES USED FOR CARRYING AND TIPPING BLAST FURNACE SLAG.—No. 740,405; J. H. Dewhurst, Sheffield, England.



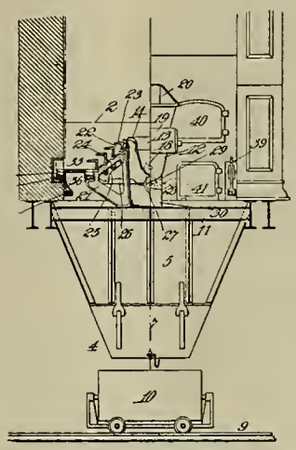
In combination, in carriage for ladles having double or twin trunnions, pedestal bearing for trunnions comprising hollow bearing bracket, one for each side of ladle, three rotary disks arranged in each bracket with spindles resting in bearings in each side of hollow bracket, center roller being made of less diameter than two outer rollers.

ROASTING FURNACE.—No. 740,589; C. H. Repath and F. E. Marcy, Anaconda, Mont.



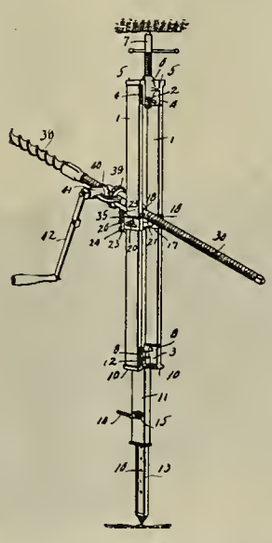
In furnace having plurality of vertically disposed hearths, peripheral chambers establishing communication between several hearths, central vertical stirring shaft in hearths, series stirring arms radiating from shaft and extending into several hearths, spouts or chutes leading from and extending suitable distance beyond margins of alternate series of hearths to series immediately beneath for permitting descent of material, yet excluding gases, and special rakes carried by stirring arms for removing material delivered through spouts.

FURNACE FOR CALCINING QUICKSILVER ORES.—No. 740,539; J. M. Cutler, Ukiah, Cal.



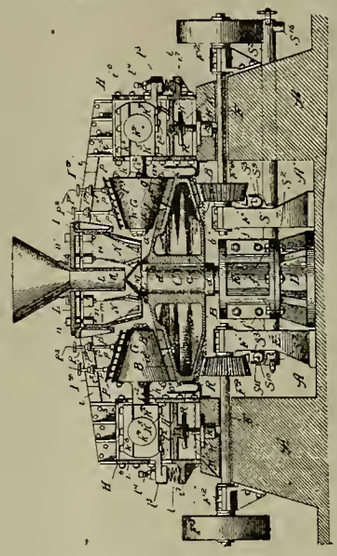
Combination in ore calcining furnace, of rotatable hollow cylinder, inner hollow cylinder concentrically arranged within first mentioned hollow cylinder, ore bin at one end of furnace opening into outer cylinder, fire box at opposite end of furnace communicating with inner cylinder, smokestack connecting with inner hollow cylinder and extending upward through ore bin, hot air pipe within smokestack communicating with interior of outer cylinder, and fume escape pipe at opposite end of furnace communicating with interior of outer cylinder.

FURNACE.—No. 740,528; H. B. Cary, Los Angeles, Cal.



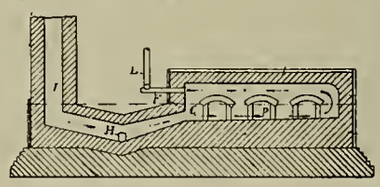
Furnace furnished with primary combustion chamber, contracted outlet leading therefrom, secondary combustion chamber forming abrupt expansion of outlet, contracted outlet from secondary combustion chamber at top of same, tertiary combustion chamber forming abrupt expansion of outlet from secondary combustion chamber, and contracted outlet leading from tertiary combustion chamber walls of tertiary combustion chamber being returned inward toward outlet therefrom.

FURNACE.—No. 740,669; J. MacCormack, Bayonne, N. J.



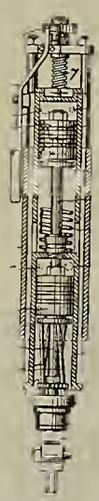
In furnace, combination with automatic stoker having fuel magazine and air chamber partially surrounding magazine, of triangular bracket secured to side of air chamber, inclined bank of rectangular grate bars on each side of fuel magazine, each bank of grate bars resting pivotally and loosely with vertical members in sockets on one side of bracket, an arm on each grate bar, connections between arms and cam for simultaneously rocking grate bars of each set.

COAL OR ROCK DRILL.—No. 740,720; I. Wantling, Peoria, Ill.



Drilling machine, comprising suitable uprights, boxing of two hinged sections together forming feed nut, support for boxing vertically adjustable on uprights having upwardly and downwardly disposed sustaining points, means for supporting boxing between sustaining points of support.

PULVERIZING APPARATUS.—No. 740,764; W. A. Kouemau, Chicago, Ill.



In pulverizing machine, combination with stationary base, rotary crushing bed and crushing roller above crushing bed having outwardly extending shaft, of journal box in which shaft is mounted to rotate, provided on opposite sides with trunnions, journal box support having bearings for trunnions, jackscrew on which support is mounted working through nut on base, spring bearing on support, removable and replaceable spring bearing on under side of journal box projecting beyond outer end thereof, spring confined between spring bearings, and stop on support beneath inner end of journal box.

REVERBERATORY HEATING FURNACE.—No. 740,786; S. Uren, Sacramento, Cal.

Combination in furnace of inclosed heating chamber having vertical sides and ends, discharge passage leading from one end at floor level and inclining downwardly therefrom, floor being also inclined from opposite end toward discharge flue, burner inlet passage located in end wall in line above discharge flue and near top of chamber, burner being directed to discharge hydrocarbon fuel against opposite end of chamber from which it is deflected and returned along floor to discharge flue.

ROCK DRILL.—No. 740,800; W. Brady, San Francisco, Cal.

Combination in apparatus for striking blows of cylinders fixed axially in line and having intermediate space, pistons movable in cylinders, piston rod common to both pistons and extending through end of one of cylinders, tool-carrying head fixed to piston rod, inlet and exhaust valves connected with rear ends of each cylinder, means for advancing apparatus to follow work, and cushion spring 19 surrounding piston rod and located between two cylinders, spring having one end abutting against rear of cylinder and having opposite end lying within open end of other cylinder, and collar or disk on rod in front of piston of last-named cylinder adapted to strike spring, the spring serving to check momentum of parts.

Mining Summary.

Specially Compiled and Reported for the Mining and Scientific Press.

ALABAMA.

Birmingham reports say that 12,000 coal miners in Alabama have had their wages reduced, the cut having become effective Oct. 1st. Those of the Tennessee Coal, Iron & Railroad Co. have been lowered to 52½ and those in the employ of the Sloss-Sheffield Co. to 55 cents. This is brought about by the drop in the average price received for pig iron by the two companies last month, says the News.

ALASKA.

The annual report of the Alaska-Treadwell G. M. Co., operating on Douglas Island, for year ended May 30, has been issued, showing total development work amounting to 6145 feet, including 2158 feet of drifts, 292 feet crosscuts, 1979 feet raises, 896 feet intermediate drifts, 349 feet stations and 113 feet shaft sinking. The principal parts of this development were: Connection of the 220-foot level with No. 5 open pit; the continuation of the 330-foot level, and on the 600-foot level connection was made with the lowest (or 700-foot level) of the Alaska United Mining Co. Average value of ore from this level has increased. Gold bullion from mill during year amounted to $785,515, or $1.04 per ton; from concentrates, $813,448, or $1.075 per ton of ore. Expenditures amounted to $973,493, or $1.285 per ton, divided as follows: Mining, 90 cents; milling, 16 cents; concentrates, 15 cents; other expenses, including office, new construction, etc., 7.5 cents. This compauy owns two mills. In the old mill of 240 stamps, which is run part of time hy water and part by steam power, operations were carried on for 356 days 3 hours during the year, steam being used 215 days 13 hours and water for 141 days. The total ore crushed in this mill was 409,765 tons; an average of 4.80 tons per stamp per day. Steam was used for unusual length of time, owing to very dry season. The new mill of 300 stamps uses water power only, and ran 200 days 13 hours during the year. The total ore crushed was 346,560 tons, average duty being 5.75 tons per stamp per day. Time was restricted for same eause—scarcity of water. The total tonnage of ore taken out was 759,625, and total passed through the mills was 756,325 tons. During the year there was an average of thirty-three machine drills at work in the mine, seven being on development, four on cutting out, 7.5 in pits and 14.5 in underground stoping. Total number of feet of holes drilled in the mine was 783,360, and number of tons of ore broken was 906,625, making an average of 1¼ ton ore broken for every foot of holo drills. The average work on one machine per 10-hour shift was 34.4 feet of holes. During the year 3700 samples were taken from the mine on different levels and assayed, average value being $2.086 per ton. The foundry produced 459,808 pounds of iron castings and 15,738 pounds brass castings. The machine shop, in addition to repair work, made 22 mine cars, 8 mill cars and 4 skips for the mine. A wing-dam 600 feet in length was put in to keep the tailings in place. The locomotives used in delivering ore to stamp mills have been discarded and a rope system adopted. The cars are run down to the mills by gravity, while hoisting engines have been placed at the crushers to pull the empty cars back hy wire cable. This system has worked satisfactorily. Skilled labor was scarce during the year, and wages paid machine drillers in the open pit were increased to $3.50 per day, with board and lodging. Wages paid to machine drillers underground were $2.50, with board and lodging, the difference being due to the extra danger to those working in the open cut.

J. H. Hunter of Portland, Or., for $60,000, has bonded a group of claims at Yankee Cove, above Juneau. The ledge is 8 feet wide. He will put in milling machinery, and will let the contract for driving a tunnel.——W. J. Southerland, owner of the Alaska Perseverance and Greek Boy mines, near Juneau, says he is arranging to build a 200-stamp mill on the Alaska Perseverance, and a 40-stamp mill on the Greek Boy mine. Both mills are to be in operation by next summer. The development includes a 3500-foot tunnel, driven into tho mountain 1400 feet below the surface of the ledge.

Tin deposits in the Lost River and Cape Prince of Wales districts are reported by A. J. Collier, of the United States Geological Survey. The find was made by Randt & Grim.

S. I. Silverman, of Prince of Wales island, west of Ketchikan, says there are several companies engaged in developing copper and gold mines on that island, including: The Silverman-Alaska Co., of New Jersey; the Brown-Alaska Co., the New York-Alaska Co., and the Alaska S. & R. Co., all Washington corporations, with principal places of business in Seattle and head offices in New York City.

Copper properties and gold mines are being developed by the Silverman and the Brown companies. The New York Co. is organized to engage mainly in lumbering and the transportation business and owns large bodies of timber. The smelting company is building a plant, under Superintendent P. Johnson. The smelter is expected to be completed March 1, 1904, and will have a capacity of 500 tons daily, to start with, which will later be doubled. J. L. Freeburn, formerly of Spokane, Wash., associated with C. D. Lane, of Nome, and J. H. Conrad, of Great Falls, Mont., is developing a gold property near the Silverman smelter. They havo 40 feet of $20 ore and are down 50 feet. The property is within 600 feet of tide water. Another Lane property on the islaud is the Crackerjack. They have tapped the vein at depth of 350 feet with a crosscut tunnel 600 feet in length.

The Alaska-Treadwell G. M. Co. reports for month of August that the 240-stamp mill ran 30¼ days; 300-stamp mill ran 29 days, crushing 81,183 tons ore. Estimated realizable value of bullion, $91,179. Saved 1636 tons sulphurets; estimated realizable valuo of same, $92,273. Workiug expenses for month, $84,897.

The United States Geological Survey will have parties next year investigating the mining resources of southeastern Alaska, the formation in the Yukon country and the oil deposits in Alaska. If the appropriation is sufficient, parties will continue the study of the geology of the Nome district and will investigate the coal supply.

ARIZONA.

Cochise County.

East of Tombstone in the Dragoon mountains the reduction plant of the Black Diamond C. Co. is in operation. The smelter is of 200-ton capacity. The company has begun shipments of copper bullion. There are 150 men at work. A pipe line has been completed from the Commonwealth mine at Pearce, from which source 45,000 gallons per day are obtained, this being sufficient to supply the smelter at present capacity.

The Consolidated M. Co. at Tombstone is shipping ten to fifteen carloads a week. An average of one carload a day is being shipped from the main shaft, while the Silver Thread, Tranquility and the Comet contribute the balance, says the Tombstone Prospector. The station on the 700-foot level is being cut, and Superintendent Walker expects to have this station complete, and the two pumps originally intended for the 800-foot and 1000-foot levels set up by December 1. Most of the ore that is being taken from the shaft comes from the third and fourth levels, while a winze on the 600-foot level also contributes. Tho ore bins have been completed. At the Comet the number of men has been increased, and tbe 300-foot level is being cleaned up and a new track put in preparatory to stoping ore. It is the intention of the company to build a narrow-gauge road from the siding at Schusters to the Comet and a branch to Emerald. The Comet ore carries considerable manganese, and is in demand by the smelters for fluxing, says Walker. At the Emerald they have reached the 400-foot level and are repairing the shaft. The company expects to start up the west side this month. The pumps in the main shaft are handling 2,360,000 gallons of water daily.

The Calumot & Arizona mine, near Bisbee, produced 2,535,800 pounds of blister copper during tbe month of September.

Maricopa County.

(Special Correspondence). — The La Gloria M. Co., operating in the White Tank mountains, have completed a wagon road from their property to Beardsley, on the Santa Fe, Prescott & Phœnix Railroad, a distance of 12 miles. One earload of ore has been shipped and two more ore teams will be put on.

C. Rampf, at his gold claims on Lime creek, is doing development work.—— Fleming Bros., in Cave Creek district, north of Phœnix, have opened up a ledge 6 feet wide, showing ore that carries 15% copper and $25 in gold.

The Michigan G. M. Co., who have been dry placering (with power machines operated by gasolino engines) near the Santo Domingo mine, near Morristown, have suspended operations indefinitely. This company bought the machines that were formerly used by the Marieopa G. M. Co.

Phœnix, Oct. 5.

F. X. O'Brien, manager of the Interior M. & T. Co. mines, near Wickenburg, has forty men at work and two shafts are being sunk. Preparations are being made for the operation of the 10-stamp mill. More stamps will be added.

F. X. O'Brien, manager of the Interior M. & T. Co., near Wickeuburg, has forty men at work and two shafts are being sunk for the operation of a 10-stamp mill.

Mohave County.

Operations on the De la Fountaine mine at Stockton Hill, near Cerbat, are suspeuded temporarily, and it is proposed to put in a hoisting plant and other machinery. The main shaft is down 327 feet.

Pinal County.

The Golden Quiver group of mines, in Mineral Hill mining district, 16 miles northeast of Florence, has been sold to C. G. Wernor of Los Augeles, Cal. There has been 1000 feet of work doue. Work will be started next week, and later a reduction plant will be built.

Yavapai County.

(Special Correspondeuce).—The Whipsaw mine will resume operations this week. A gasoline hoist will be put in and the other machinery repaired.

It is reported that the Crown Point stamp mill will be put into operation next week. Men will be put to work on the road to tho Crown Point mine from Wickenhurg.——The Kingston M. Co. is preparing to resume.

Prescott, Oct. 12.

At the Poland mine, at Poland, more men have been put on the tunnel and two shifts are at work on a drift off the tunnel, says Superintendent Martin. In the main tunnel, in 4000 feet, operations are retarded by the heavy flow of water from overhead.

ARKANSAS.

Boone County.

Reports from the Anna mine, 3 miles east of Harrison, say the eight miners at work are taking out jack.

Marion County.

The Arkansas Dev. Co. of Yellville was incorporated last week, with J. M. Clokey, H. Wells, R. J. Williams and R. W. Hess as officers.

CALIFORNIA.

Amador County.

The cyanide plant for treatment of the accumulated sand and tailings at the Sand Pile mine, near Forest Home, is nearing completion, says the Amador Ledger. These tailings are from the Plymouth mills. The plant consists of six tanks, each with a capacity of 240 tons, and it is expected to discharge one tank each day. The contract for the delivery of 240 tons per day of sand to the cars has been awarded at 10 cents per ton. The tailings are said to carry $1 per ton in gold. The plant will keep twenty men at work.

Calaveras County.

At the Bluejay quartz mine, on the Calaveras river, near Jesus Maria, 3 miles east of Mokelumne Hill, the Fanny Marie M. & M. Co. has built a pole line from the Standard Electric Co.'s main line, and put in an air compressor, with motors for power drills, fans, etc. They are running the double track crosscut tunnel 1200 feet to strike the lead, which will he at a point 700 feet from surface. The tunnel is in 700 feet, says Manager F. P. Cortmarsh. Cortmarsh & Gnecco are owners of the north extension of the Bluejay and are developing the lead. Open cuts have shown a 7-foot vein that prospects in free gold.

Work has started again on the Gold Hill Con. gravel mine, near Mokelumne Hill.

The Petticoat Con. group at Railroad Flat, consisting of ten locations, have been bonded by J. L. Green. He says he will sink a three-compartment shaft, 1000 feet on the north end of the Petticoat lode, and a 500-foot shaft at north end of Afterthought ground, and run a crosscut tunnel from Spruce gulch, 1000 feet, that will cut all the veins 350 feet from surface. An air compressor will be put in at Spruce gulch, wbere water can he had from the Calaveras Dev. Co. canal under 550 feet pressure to ohtain power for hoists, mill and drills.

El Dorado County.

(Special Correspondence).—The Gentle Annie mine, owned and operated by the River Hill M. & M. Co., is preparing to sink from the drainage tunnel level (735-foot) to the 1000-foot point. There are forty men at work and twenty stamps are dropping full time on ore which runs 3% sulphides. They are working two parallel veins. The Clay Hill mine at Placerville is being developed. —— Tho Fisk, owned and operated by J. H. Skinner, has a 5-stamp mill running one shift.

In excavating for the abutment of a bridge across the creek in town last week a piece of bedrock was uncovered that had never been worked, and $50 in gold was taken out. Placerville is improving in a business way, both from mining and lumber interests.

Placerville, Oct. 14.

Fresno County.

The Union Oil Co. at Coalinga is down 250 feet on No. 2 and are getting ready to drill No. 3 well. Their lease calls for five wells. —— The Southern Pacific Railroad Co. has teams and men at work on their pipe line, which when completed will tap the entire west side field in Coalinga district.

Inyo County.

The Gold Crown M. Co., operating near Ballarat, is preparing to put up a quartz mill.

Kern County.

(Special Correspondence). — Saturday, the 10th inst., was the first pay day of the Yellow Aster M. Co. at Randsburg since the strike. There are but few of the former employes and strikers left in town. Superintendent Barton has 130 stamps dropping in their two mills, crushing 500 tons of oro per day. There are 200 men on the payroll, and moro are being added.

Atkinson Bros. have their 3-stamp mill in steady operation.

The Pinmore mine and mill at Johannesburg are in operation, under lease to W. F. Ernst & Nelson, on a royalty basis.

Randsburg, October 14.

(Special Correspondence).—At the Exposed Treasuro mine, 5 miles southeast of Mojave, Manager C. de Kalb says thoy propose to add thirty stamps to their 20-stamp mill.——The Karma M. Co. at Mojave has bought a second-hand 10-stamp mill and will add to it teu stamps more. J. R. Gerner is president and superintendent.

The Echo M. Co. at Mojave propose to add a centrifugal or a rotary mill to its 10-stamp mill. Superintendent J. Keith reports opening a rich shoot in the mine carrying horn silver and black sulphide of silver. G. H. Hooper is president and manager.

Mojave, October 12.

Dividend No. 51 ($10,000) of the Yellow Aster M. & M. Co., Randsburg, makes a total to date of $543,789.

The Rayo M. Co., operating in Pioneer distriet, near Randsburg, is putting up a hoisting plant, stamp mill and concentrator at its White Star mine. Superintendent J. H. Parker expects to have the stamps dropping by December 1st.

The oil well which is being drilled near Hiawatha is down 1280 feet. Gas is reported coming from the well and there is oil showiug on the water.

The coal company at Garlock is preparing to prospect its ground witb diamond drills.

Nevada County.

Bourn & Co., who have bought the North Bloomfield Hydraulic Co.'s mining and water properties, will begin drifting operations at the Malakoff gravel mine, near North Bloomfield, next week, says R. A. Thomas of Birchville, superintendent.

In Boston ravine, in southern part of Grass Valley, several men are at work with primitive rockers on the banks of the creek washing out gold. A piece of ground has been struck not touched by early-day miners, and, it is reported, out of two wheelbarrow loads $5 in gold was washed out.

The 3-stamp mill at the Roso Hill mine, near Grass Valley, is in operation. Power is furnished hy a gasoline engine.

The Phelps Hill M. & Dev. Co. has been incorporated, with W. H. Martin, C. R. Quackenbush, W. H. Dunlap, D. E. Morgan, P. F. Simonds, W. P. Ketcham and C. A. Poage as directors, the last named being general manager, with headquarters at Nevada City. The directors met and elected W. P. Ketcham president, C. A. Poage vice-president, C. R. Quackenhush secretary and treasurer. Mr. Quackenbush, who is from Chicago, will remain here and care for Mr. Ketcham's interests.

The Old Home Con. M. Co.'s property, in Blue Tent district, near Nevada City, was sold by the sheriff last week on decree of foreclosure, being bid in by F. Schnittger.

Work is under way at El Oro mine, near Mayhert (formerly the Yuba mine). Lumber and supplies are on the ground and machinery will be taken in, says Superintendent J. L. Bryson.

The Irish-American quartz mine, embracing a number of claims, among them being the claims of the Grass Valley-Carson City Co., the Vulcan, Venus and the Central M. Co.'s properties—a surface area of sixty acres—have been sold to J. D. Hague, president of tbe North Star M. Co. at Grass Valley, for $17,000. The property is between the North Star and Central Shaft mines.

San Bernardino County.

(Special Correspondence).—The Roosevelt M. & M. Co. at Camp Rochester is

preparing to put in a 10-stamp mill, which is expected to be in operation by December 1st. C. R. Emery is superintendent. ——The B. E. Chase G. M. Co., E. H. Stagg, manager, intends to build a 10-stamp mill and a cyanide plant at its mines at Camp Rochester.

Camp Rochester, October 13.

Shasta County.

(Special Correspondence).—The Mountain C. Co. at Keswick has four furnaces in blast and three converters. The output is being increased and more men put to work. There are over 1500 men now on the payroll.

Keswick, Oct. 13.

The Bully Hill C. Co. at De Lamar is building a concentrator between the mine and the smelter, to handle its low grade ore. Work is progressing on the new furnace.

Sierra County.

D. F. Meiklejohn, operating cyanide works at the Young America mine, near Sierra City, has closed down for the winter, but will resume next spring, says the Mountain Messenger.

Siskiyou County.

Jillson & Co. expect to start up work on their gold-bearing quartz ledge, near Henley, next week. They shut down in August on account of a strike at the Gladstone mine in Shasta county, which they also own.

Solano County.

Manager Tregidgo of the St. John Con. Quicksilver M. Co. reports work progressing on their mines 5 miles from Vallejo and a mile north of Vallejo White Sulphur Springs. The property covers 712 acres of mineral rights on which considerable development work was done between 1873 and 1880. The country rock on the west is metaphoric sandstone and serpentine, and on the east sandstone and blue talcose slate, accompanied by a magnesian schist. Cinnabar is found in seams and impregnations. Within a distance of 2800 feet eight shoots of ore have been found and worked, varying in length from 40 to 80 feet. The mine has been developed mainly by tunnels and drifts which give 300 feet of backs. A shaft has been sunk 250 feet below the main adit, which gives a depth from the croppings of 600 feet. There are two furnaces with 12,982 cubic feet of condensing space, and three retorts with 2500 feet of condensing space. Additional machinery has been put in and an improved oil-burning furnace is being built, also an aerial tramway, sawmill and electric lighting plant. C. Bone is president.

Trinity County.

The owners of the Headlight mine will rebuild the cyanide plant burned last summer. It will have 100 tons daily capacity. The mine is on Trinity river, across from Carrville.

T. Hancock of Chicago, Ill., has an option on a one-half interest in the Blakemore placer mine of eighty acres, near Lewiston. The transfer is to be perfected on fitting up of the properties by the grantee with reservoirs, ditches, giants, flumes, etc., work to begin by Nov. 1. The same parties have sold to E. H. Hughes and T. Hancock of Chicago the First Chance, Copper King and Rattler quartz mines in Eastman Gulch mining district. A. J., J. M. & C. Blakemore have appropriated 1000 inches of the waters of Jennings gulch to be used on the Blakemore placer mines.

E. H. Wakeman for Eastern men has a bond to work the Weaver creek properties, near Weaverville, of the Junkan estate by dredging process.

Preparations have been made to work the Senger & Hughes placer mine on West Weaver creek, near Weaverville, by Oakland men. E. F. Burrill of Alameda, who has a bond on the property, has formed a company, and M. A. Senger will superintend the work. The West Weaver water of the La Grange Co. has been leased and hydraulic equipment is being placed.

Tuolumne County.

(Special Correspondence). — W. Sharwood, superintendent of the Soulsby mine at Soulsbyville, is running a crosscut west from the 300 level of the Pennsylvania vein to intersect the west branch of the Soulsby vein. In the early history of the mine this branch was worked extensively. The crosscut has cut a large dike of pegmatite, which in this district is often an accompaniment of an ore shoot.

D. Nagle has bonded the Con. Carlotta and Pennsylvania mines at Cherokee Flat, 1 mile north of Carters. The mine is developed by a vertical shaft and has produced some rich ore. The vein is an east-west fissure in granite, and the ore heavily sulphuretted, carrying galena, blende and iron and copper sulphides, beside pyrrhotite.

Soulsbyville, October 12.

Operations will bo started on the marble quarry owned by Grant Bros., northeast of the Columbia Marble Co.'s works, near Columbia.——Operations have been resumed at the Concord mine under Superintendent C. H. Wilhelm.

At the Mohican mine, near Groveland, there are thirty men on the payroll. Steam has been installed in place of distillate. The underground hoist and machines will be run by compressed air, says Superintendent Chappellet.

E. Lanzone of Stockton has an option on the Electric and the Thunderbolt mines and millsite, on southeast slope of Mt. Elizabeth, 10 miles south of Soulsbyville, for $10,000. A stamp mill and other machinery will be put in. E. C. Hahn of Stockton is superintendent.

The Confidence mine at Confidence, on the East belt, bas been shut down due to a disagreement among the owners as to the advisability of reinvesting some of the profits obtained from the mine in its further development, says the Mother Lode Magnet.

The Longfellow mill at Big Oak Flat is being torn down and removed to the Nonpareil, near Groveland, says Superintendent Dron, of the Nonpareil.

The water is out of the Doyle gravel mine, near Columbia, and operations will be resumed by Estey & Stanford.

W. Sharwood and T. O. West have bought the Independence quartz mine, east of and adjoining the Soulsby mine at Soulsbyville, says the Banner.

The Starr King mine and mill, near Carters, C. A. Holland manager, are running with steam power and twelve men are employed.

Ventura County.

(Special Correspondence).—The Columbus Borax Co. of Chicago, Ill., operating at Griffin, has struck a high-grade body of mineral, and is preparing to make regular shipments as soon as teams enough are obtained. C. Sehliesmayer of Neenach, Cal., is superintendent. Carpenters are at work putting up buildings.

Griffin, October 14.

The Ventura Light & Power Co. has announced that Ventura and Oxnard will be supplied with natural gas for fuel purposes. During the past two months a drilling rig has been developing gas territory in Ventura River Bottom, 2½ miles north of Ventura. From four wells tbey have secured a flow of 25,000 cubic feet per day.

COLORADO.

(Special Correspondence). — Several damage suits have been filed against the Governor and the officers in command of the militia at Cripple Creek by the miners who were arrested and confined in the "bull pen." The past week has witnessed a decided improvement in the strike situation at Cripple Creek, and it will not be many weeks before the militia can be dispensed with. At Telluride the mines are starting operations with non-union men.

Denver, October 12.

The coal miners of Colorado, members of the United Mine Workers, are preparing to call a general strike, tbe operators refusing to recognize them on the following demands: That eight hours shall constitute a day's labor; that all wages shall be paid semi-monthly and in United States coin, and that the scrip system be entirely abolished; an increase of 20% on contract and tonnage prices and 2000 pounds to constitute a ton; that all underground men, top men and trappers receive the same wages for eight hours as they are now receiving for nine and one-half and ten hours and over for a day; for the better preservation of the lives and health of the employes, a more adequate supply of pure air, as prescribed hy the laws of the State, is demanded. Following is an estimate of the number of coal miners who would be affected by the order to strike in District 15, which is to go into effect Oct. 17th.

Colorado (southern fields)	12,300
Colorado (northern fields)	3,300
New Mexico	2,200
Wyoming	3,400
Utah	1,800
Total	23,000

Clear Creek County.

The Silver Plume M. & T. Co. has been incoporrated, with H. L. Roberts, W. H. Stephens, H. H. Noyes, L. L. and W. A. Roberts, as directors, to operate tbe Mary Etta group of claims in the "gold belt" on McClellan mountain, above Silver Plume. Considerable development work has been done, resulting in opening ore from which shipments have been made giving returns in both gold and silver. It is intended to drivo a tunnel to cut the lodes at depth.

El Paso County.

The Golden Cycle M. Co., of Colorado Springs, will unite with a number of other mining companies in building a reduction plant in Colorado City, which will be in operation by March 1st, 1904, says President Milliken of the Golden Cycle Co. The plant will cost $350,000 and will begin with capacity of 300 tons per day, witb arrangements made for another 100 tons if necessary. President Milliken has bought 100 acres of land east of the Telluride mill at Colorado City, for the mill site. The Golden Cycle output of 150 tons per day has heretofore been treated by the Telluride plant by means of the bromide process. The new plant is expected to use the cyanide process and will employ from 100 to 150 men per day.

Fremont County.

The Victor Oil, Coal & Refining Co. has been organized at Victor, and has bought 160 acres of oil land 3 miles south of Florence for $10,750. R. Parker, J. M. Vincent, C. Meeley, J. F. Miller, W. Jones and W. Price are directors. In addition to oil indications the ground is said to be underlaid with a 3-foot seam of coal, whicb will also be developed.

Gilpin County.

The Bluegrass M. & M. Co. are putting in a stamp mill on Beaver creek, in Phœnix district, 1½ miles from Rollinsville. Machinery is on the ground, and they expect to have it in operation by January 1st. Their rock assays $15 in gold.

The New Haven group of ten claims, at the head of Lump gulch, near Rollinsville, has been sold to the Fortunate G. M. & M. Co., in which Prebble & Randel of Rocky Ford and A. M. Stevenson of Denver are interested. New shaft buildings will he put up on the New Haven and Fortunate shafts, and each shaft will be sunk 100 feet deeper. On the New Haven a prospect tunnel run by Manager E. W. Morse showed ore with values in gold and copper.

The Wizard G. M. Co. reports operations will be resumed on its group of claims ou War Eaglo hill, between Lump and Gamble gulches, near Rollinsville. The claims have been partially developed by a tunnel, in 700 feet. At the mouth of the tunnel is a compressor plant. Missouri and Boulder, Colo., men are interested.

Siems & Ehrenbach of Rollinsville report a discovery of tungsten ore 2 miles west of Rollinsville, on South Boulder creek, and have a group of six claims located. The veins show a width of 8 feet.

J. T. McClanahan of Boonville, Mo., president and manager of the Bertba G. M. & M. Co., says development work will be increased. Their mines consist of a group of twenty claims near the Clear Creek county line, near Idaho Springs, on the line of the Newhouse tunnel, near the Sun & Moon and Arizona properties. They also own the Bertha 40-ton mill in Idaho Springs, which is working under lease at present. Work will begin in the Colfax shaft, where there is a showing of ore, but the principal work will be done on the Half and Half vein, where it is opened up in the Newhouse tunnel for a width of 25 feot.

Hinsdale County.

The Isolde mine, near Lake City, is being operated by C. F. Meek and development is going ahoad.

The Moro mine at Capitol City started operations last week with fifty men, says Manager Jamison. The mill is also running. The ore bodies have been exploited along the vein and by deep tunneling.

Jefferson County.

(Special Correspondence).—A. B. Frenzel of Denver has offered through the Colorado Scientific Society a prize of $250 to the student of the Colorado School of Mines who will write the best paper on Tungsten in Colorado. Dr. Alderson, president of the School of Mines, believes this will bring some good papers on the subject.

Golden, October 11.

Lake County.

The Yak Tunnel Co., at Leadville, is making a steady production of 2000 tons a month, and in addition is opening up considerable new ground, says the Carbonate Chronicle. There is a portion of the bore which is in soft ground through the Pilot fault, and it is being repaired and heavily timbered. The company will complete arrangements for working further into Breece hill.

The car situation at Leadville has improved, resulting in the more rapid movement of ore. Tbe A. S. & R. Co. is receiving its regular average, and the zinc smelters are accepting the full amount of ore under their contracts. Tbe September production shows 73,500 tons. There has been increase in smaller shipments from outside districts.

The Oro Leasing Co., J. R. Curley, manager, has resumed operations on Carbonate hill at Leadville. A surface plant has been built.

The La Plata gold, silver and lead mines of Leadville, owned by the Imperial G. M. Co., Ltd., of London, England, have been sold to G. D. Tower et al. of Mendota, Ill., for $30,000. It is intended to begin active operations next week. The average daily output has been twenty tons, yielding $8 per ton.

The owners of mines lying north of Big Evans gulch, near Leadville, where the Progressive, Pride of the West, Price, Hassard and other shafts are located, are organizing a co-operative plan to handle the heavy flow of water that is in this section. The project is similar to that of the Pumping Association which handles the water of Leadville basin. Added to the water in the basin proper, a large flow comes from the El Paso basin on account of the Iron fault, which will have to be handled, says the Times.

The price of zinc at present being up, has given an impetus to the industry in Leadville district, says the Times. The Empire Zinc Co. owns the Colonel Sellers mine, which has a large body of zinc ore, hut so much of this class of ore is coming from other mines that the company will probably not work this property for some time. The Eclipse, on Breece hill, after being idle for several years, has resumed, says Manager Hoskins.

The Keystone mine, in north end of Leadville district, has resumed.

Larimer County.

The Pearl Mining Times says the Coldwater M. Co., operating the Wolverine mine near Pearl, has eighty tons of high-grade ore in its bins. Development work has shown three distinct veins and 9 feet of ore. Twenty-one men are employed.

La Plata County.

There are 400 men working in the La Plata district, says tbe Times, and it is not expected the number will be decreased during the winter. The district will double its gold output of any former year. Among the new mills will be the 500-ton plant of the Bonnie Girl Co. Three other mills will be built along the La Plata river by next spring.

Ouray County.

G. Crawford says he will start work on a tunnel to drain the lower workings of the Yankee Girl, Guston and Genessee Vanderbilt mines on Red mountain, near Ouray. The deepest shaft is down 800 feet. Crawford will also start work on the Old Lot in Poughkeepsie gulch. This mine has produced gold and silver ore.

Near Ironton, tbe Barstow M. Co. proposes to build a mill, in which case the Silverton railroad will be extended from Red mountain. J. Kennedy has opened up the J. I. C. mine in Ironton, and has put in a compressor and other machinery.

Park County.

Ore shipments from Alma mines are increasing. The London mine is shipping ten cars a week and the Hock Hocking four cars. The London has forty miners at work and six ore teams hauling to the railroad. The mine will increase its number of men to sixty as soon as its new ore buildings are completed. The Hock Hocking has twenty-five men at work. The Halo M. & M. Co. has built an assay office at tbe mouth of the tunnel, and other buildings. —— Considerable tunnel work is under way in Alma district, says the Post. The Queen Bee G. M. Co., composed of Boston men, is driving a tunnel in Buckskin gulch, the first contract being for 1000 feet. It is in 200 feet. The Mosher group, in South Mosquito (the Moffat Syndicate group), has started a tunnel to develop its veins. The South London tunnel continues being drivon toward the North London workings. The Montgomery G. M. Co.'s tunnel in North Star mountain is progressing, and the Viking tunnel is also driving. Three contracts are under way on the Dolly Varden mine on Mt. Bross, one of the silver producers in the early days of the camp. Two of these contracts are for sinking and one for cleaning out workings.

San Juan County.

The Venetian M. Co., on the Peacock and other mines on Cement creek, near Silverton, has closed down for repairs, says Manager Cooper.

The men on the Silver Lake mill, near Silverton, struck last week. M. Pickell, superintendent of the mill, had a misunderstanding with W. R. Cox, manager of the Silver Lake, and resigned, and was followed by between forty or fifty men, three only remaining. No question of hours or wages was involved. The Silver Lake mine furnisbes employment for 400 miners, but so far they are not affected.

San Miguel County.

A bond and lease has been given on the Link and Jumbo lodes, in Bridal Veil basin, near Telluride, to Chicago men, who have put men at work under Superintendent W. Hutchinson.

The Butterfly-Terrible mill, near Ophir, is closed, but the management is taking advantage of shutdown to repair the mill and put in steam plant.——Development is going ahead on the Nevada mine through the Deadwood tunnel.——Work on tho Carribeau mine continues and a

portion of the mill is running steadily. Several cars of concentrates, besides some crude ore, is sent regularly to the smelters each month. When the ventilating system has been perfected in the mine more men will be put on and the entire mill put in operation.

At Ophir Loop everything is running and the Silver Bell mill is operated at full capacity, making regular shipments of bullion to the mint and concentrates to the smelters.

Teller County.

Construction work is under way on the cyanide mill for the Snowshoe claim of the Streeter & Cripple Creek M. & M. Co., near Cripple Creek.

The holdings of the Isabella G. M. Co., near Cripple Creek, and controlling interests in the Orphan Bell and Empire M. Co., have been taken over by the Isabella Mines Co., which has been organized under Wyoming laws. The damage suits of the Orphan Bell Co. against the Isabella Co. for claims aggregating $1,500,000 have been dismissed. The Buena Vista claim of the Isabella group is on Bull hill. The president of the Isabella G. M. Co. is E. W. Giddings, Jr., of Colorado Springs.

The Gillett M. & R. Co., which owns a tract of land east of Gillett, will build a cyanide plant capable of treating 100 tons of ore daily. The site of the new plant will be on west spur of Trachyte mountain, says the Cripple Creek Times.

The Jackson G. M. Co., owned by New York men, with J. Huff of Victor manager, will put in a plant of machinery capable of sinking the shaft to a depth of 700 feet. When the 300-foot level is reached lateral work will be started. The Jackson Co. owns twenty acres of ground on the ridge above Dutchtown.

According to the mine owners, Cripple Creek will be outputting its usual tonnage by November 1st. The strike is over, they say, and all that remains to be done is "some house cleaning." The fight against the Western Federation will be continued, even to the extent of refusing to grant leases on properties to any one connected with the Western Federation, employing members of that organization as miners. Secretary Hamlin of the Operators' Association says the strike as a strike is over. The Gold Sovereign mine has been non-unionized. Thirty-two union miners were discharged on the 10th inst. The property is operated by lessees, who continued work during the strike with union men. A. E. Carlton, president, and other officers of the Cold Sovereign Co., which is a member of the Mine Owners' Association, notified the lessees that the Western Federation of Miners must go, and the men were discharged. There were twenty-two men at work on the lease of the Gold Temple M. Co., whose ore is sampled by the Rio Grande sampler and shipped to Pueblo smelters. Ten men were at the Whispor shaft of the same company, operated by Haas & Mayers. Eighty-two miners arrived from Cœur d'Alene, Idaho, on the 14th inst. The mine owners say they have applications for more blacksmiths, trammers, muckers and ore sorters than they can use. The names of applicants, however, are booked and the men will be sent for when enough machine drill men are secured to work two shifts. An attempt was made on the 8th inst. to poison the garrison at Camp El Paso and every man in command, with the exception of three who were absent, was temporarily laid up. Altogether sixty-eight men were down. Poison of some kind was placed in the water tank of the mine from which water is taken for domestic purposes. Many of the miners were also affected.

Engineer Jaquith of the El Paso drainage tunnel reports that readings show the flow of water continues between 1800 and 1850 gallons per minute. No material increase in the flow of water is expected until the east lateral cuts the dike between the Elkton and El Paso mines. This will not be finished for several weeks. A number of properties, however, have already felt the result of the opening of the drainage tunnel in a decrease in the water line. The Elkton and Mary McKinney properties are receding at the rate of 4 feet per month. The American Eagles and the Ajax, on Battle mountain, are also decreasing the water line at about the same rate. The El Paso Gold King, up Poverty gulch, is also showing a decrease. In fact, nearly all of them have experienced the same result, while the Beacon hill mines are entirely dry. Material results, however, will not be experienced on Raven, Gold and Bull hills until the dike referred to is cut.

IDAHO.

Boise County.

The Boston & Idaho C. Dredging Co. propose to build at least two or more drodgers—one at Cold springs, 6 miles below Idaho City, and another below the junction of More and Elk creeks, at Idaho City. Work on the new dredgers will begin next spring, and they will be run by electricity. The power will be brought either from the plant on Boise river or be generated by steam power on the timber claims owned by the company. Dredger No. 2 (the upper one) will be remodeled next season, says Superintendent R. Winters.

Idaho County.

C. D. Hovey of the Gold Reef M. Co. of Kansas City, Mo., reports buying the Confidence group of eight claims and the Mayflower claim, 2½ miles from Warren, on the Thunder Mountain trail. The development on the Mayflower consists of 1200 feet of tunnel and 200 feet of shaft. A contract for an 800-foot tunnel will be let to crosscut the veins on the Confidence group which show on the surface. On the Mayflower a 4-foot ledge of ore has been opened assaying $25 in gold. A water right carrying 1000 miners' inches goes with the group. It has a fall of 200 feet.

D. Mackenzie has bought the Moonlight group of three claims in Thunder mountain, near Roosevelt, for $20,000. Mackenzie has had an option on the property and has development work under way.

Owyhee County.

The McKinnon M. Co. of Salt Lake City, Utah, is developing a group of five claims on War Eagle Mt., near Silver City. They are running a crosscut tunnel. C. B. McKinnon is superintendent.

Shoshone County.

The Snowshoe M. Co. has been incorporated, with principal place of business at Mullan, by A. Hutton, J. Coossa, F. J. Edwards, P. Lucia and J. Howarth.

Men have been put to work on the Dominion mine at Carbon, near Wallace. Work will continue all winter in the lower crosscut tunnel, which will cut three of the five ledges traversing the ground, the objective point being the Bright Hopes ledge. This will require 350 feet more tunnel and will tap it at depth of 500 feet, says the Telegram.

MICHIGAN.

Houghton County.

The Quincy M. Co. at Hancock is dressing its mineral higher than in the past, which cuts down the amount of mineral per month, but increases the amount of refined copper obtained, says the News. ——The September yield of the Franklin mine at Hancock aggregated 341½ tons of copper.

At the Isle Royale mine, near Houghton, two stamps at the mill are treating 900 tons of rock daily. Aside from the extension of the fifteenth and sixteenth level drifts at No. 2 shaft, no new openings are being made.

No. 4 shaft of the Trimountain mine, near Painesdale, is producing. The shaft house, which was removed from the Arcadian, is fully reconstructed, but the first cars were loaded from the rock house bins. No. 4 is hoisting from the fourth level.

Machinery for the Champion's 100-drill compressor is on the ground at Painesdale and setting up will begin next week. Masons are at work on F shaft house. The Champion mill is operating an average of three heads twenty-four hours a day, two being in service by day and four by night. The milling operations are confined to this limit on account of the inability of the mine to furnish a greater supply of rock until added air compressing facilities are available, which will be several months, says the News. The fuel economizer for the boiler battery at the compressor house is on the ground. The compound hoads at the mill, as well as the automatic stokers there, are working satisfactorily.

The Calumet & Hecla shaft in the Kearsarge lode, near Calumet, is in sand 28 feet and very wet. Repairs to the Red Jacket shaft of the Calumet & Hecla have been completed and hoisting resumed.

Machinery for the electric haulage plant of the Quincy mine at Hancock is being set up and is expected to be ready for operation by the 21st inst. The work involves 7 miles of underground trolley, fifteen electric locomotives and ten to twelve individual motors distributed about the shops on the surface, replacing the steam engines now in use. Four copper wires will convey an alternating current of 2500 volts capacity from the power house of the Houghton County Electric Co. on the Houghton side, to the mine. The power will be sent underground through No. 6 shaft to the 56th level, then across to No. 2 and down 100 feet to the 57th level, where a motor generator will transform the current into a direct current for use on the trolley. The mine is wired north of the No. 2 shaft at the 43d, 46th and 49th levels and north and south on the 50th and 56th levels. Each locomotive weighs 5500 pounds, and will haul three tram cars of a combined capacity of 1000 pounds. The cars will be dumped into pockets built in the hanging of the shaft, but on the foot wall of the lode as the Quincy shafts are sunk under the lode. On the surface motors representing 60 H. P. will be distributed through the shops about the mine.

Kewcenaw County.

The Mohawk mine, near Allouez, produced during the month of September 366 tons 1129 pounds of refined copper.

Permanent hoists for Nos. 1 and 2 shafts of the Mohawk mine, near Allouez, will be put in. Conical drums, with compound cylinders, capable of hoisting from depth of 5000 feet, will be used. No. 4 shaft is already equipped with similar hoist.

The Phœnix mill, near Phœnix, is treating 150 tons of rock per day. There are two stock piles to work on besides a large amount of mass copper that is ready for the smelter.

No. 1 shaft of the Ahmeek mine on the Kearsarge lode, near Allouez, has been connected with the drift. No. 2 shaft is 6 feet in the lode. As the overburden was only 10 feet this makes it a case of copper from the grass roots. Good stamp rock is being taken out, but it is not as rich as that from No. 1. The railroad spur 1 mile long will be completed this month.

MINNESOTA.

Saint Louis County.

Five hundred employes of the Minnesota Iron Co. are out of work through the closing down indefinitely of the Soudan mine near Tower.

MISSOURI

Joplin district prices of zinc are reported as remaining at $40 per ton and the assay basis at $34 to $36 per ton of 60% zinc. For the first nine months of the year (to Oct. 1st), while the tonnage is not so large as for the same period of 1902, the higher prices this year bring the value to an increase of $415,476 over the larger output of 1902. Production for the nine months was: Zinc 185,421.93 tons, value $6,383,010; lead 21,455.2 tons, value $1,158,890.

Jasper County.

The Williamsport M. Co., near Joplin, have their mine unwatered and are taking out lead ore.

Anderson & Colger have leased five and one-half acres of the Missouri Zinc Fields Co. at Webb City and are prospecting with a diamond drill.——Superintendent W. R. Crandall of the Missouri Zinc Fields Co. says the company proposes to replace a portion of their present mill and put in machinery for a custom plant to clean the ore of the small operators mining near the mill.

M. C. Conkey is building his mill on the incline shaft north of Webb City.

The Hudson M. Co. has rebuilt the Pleasant Valley mill, near Joplin. The Hudson mine joins it on the south and a lead of ore was followed in the drift on the south line of the Pleasant Valley lease.

The Golden Rod mill, near Joplin, is again in operation, with capacity to handle 200 tons per day.

Zinc ore is being found at the grass roots across Spring river at the north limits of Carthage, where I. C. Wheeler excavates clay for making brick, says the Joplin News-Herald. The land owned by Mr. Wheeler covers seventy acres.

MONTANA.

The receipts of gold at the United States assay office at Helena City during September were $275,655, as against $238,090 for the month last year, an increase of $37,565. The records show increases from Montana, Idaho and British Columbia, and a falling off in receipts from Nevada, Washington, Oregon and Northwest Territory. The receipts from Montana were $234,709; from Idaho, $11,438; from British Columbia, $22,472. In production of Montana gold Fergus county leads. The product of that county is almost all of free or cyanide gold, while from other counties, notably Lewis and Clark, a large proportion of the product goes to smelters, and therefore does not show in the assay office returns. From Fergus county for September, 1902, the receipts were $62,024, while for September, 1903, they were $113,650; Lewis and Clark, $26,354; Madison, $38,368; Missoula, $11,056; Park county, $17,500.

Deer Lodge County.

The Black Diamond Coal Co., which owns 320 acres of coal lands near Anaconda, reports work on its tunnel progressing. The tunnel is in 400 feet and will follow the vein, which is showing 4 feet in width.

Fergus County.

W. G. Moore has men at work on the Norman group of claims, near the Kendall mine at Kendall, prospecting with a diamond drill.

C. T. Durrell, manager of the Chicago-Montana G. M. Co., operating the Big Six group of mines, adjoining the Whisky Gulch section of the Judith range, near Gilt Edge, says he has men at work on the company's properties developing the bodies of cyaniding ores that have been opened. Arrangements have been made whereby the Chicago-Montana Co. will use the Whisky Gulch mill for treatment of its ores. A tram line, 3400 feet in length, is being built from the Big Six properties to the mill. The mill will begin crushing by December 1st.

The Barnes-King M. Co. of Kendall has incorporated under Dolaware laws by E. W. King, J. T. Wunderlin and J. P. Barnes, the last named being resident business agent.

The Kendall M. Co. at Kendall is building a dam in the gulch below the mill site to impound the slums that flow from the mill after cyaniding because of the volume of slums that runs down the gulch. Land owners along the route have complained of the overflow on their property. The dam will be 22 feet high.

M. B. Darrow and J. D. Wilcox have a lease on the Maginnis group at Maiden. They will first work on the tailings from the stamp mill, several thousand tons of which are on the dump.

The Cold Reef mines, near Gilt Edge, are working 135 men, and the Chicago-Montana M. Co. will resume operations on their group in Whiskey gulch and on the Big Six group.

Jefferson County.

It is reported operations will be resumed on the Katie mine, near Basin, owned by the Basin and Bay State M. Co.

Missoula County.

A strike is reported made on the Tarbox lead-silver mine at Saltese. The strike was made in the 400-foot level, west from where the 100-foot crosscut opened the ledge and on the hanging wall side. The tunnel is in 10 feet of ore that will carry 40% lead. The Tarbox Co. is arranging to build a 100-ton mill, says Manager Daxon.

Final payment on the Denver & Rock Island group, near Deborgia, has been made by the Duquesne M. Co. of Pittsburg, Pa. W. T. Hales of Wallace, Idaho, is manager. It is a silver-lead property, and tunnels have been driven which tap the ledge at depth of 200 feet, showing 4½ feet wide, assaying 35% in lead and 20 ounces in silver. Eighteen men are at work. It is about 6 miles from the railroad.

Silver Bow County.

The injunction proceedings involving the claim of F. A. Heinze to certain stopes of ore in the Leonard mine were ended last week, Judge Clancy ruling that Heinze had not made out a case. Heinze and his engineers claimed that a 40-foot strip of ore in the Gambetta mine, being worked through the Leonard shaft, was a portion of the so-called Minnie Healy north vein. Heinze obtained a temporary restraining order in August which threw 250 men in the Leonard workings out of employment. These men will be returned to work.

NEVADA.

Esmeralda County.

Between September 20th and October 3rd the Montana-Tonopah M. Co. at Tonopah shipped 3770 sacks (200 tons) of ore to the smelter, which averaged $100 to the ton, says the Tonopah Bonanza. The Morgan mill at Empire is making a test run on some of the ore. The north crosscut in the mine from the 512-foot station is in 360 feet. The west drift from this crosscut, at 196 feet from the shaft, is in 80 feet. The east drift from the shaft is in 400 feet. The north crosscut from the 612-foot station is in 186 feet.

Men have been started to work at Gold mountain, southwest of Tonopah, on the group of five claims belonging to the Tonopah Gold Mountain M. & M. Co. The property adjoins the Tonopah Union and the Tonopah Gold Mountain, and is owned by Philadelphia men. J. S. Stotler is manager.

At the Mizpah mine at Tonopah the diamond drill is working satisfactorily at a depth of 600 feet below the 700-foot station. The west drift at the 500 level is into the Buckboard ground and ore is being extracted.

Eureka County.

(Special Correspondence).—The Lincoln M. Co., Diamond valley, in development work have 1200 feet on a silver-lead vein and considerable ore blocked out.

The Tybo M. Co. of Ely have a new concentrator and centrifugal pump. They are shipping seventy-five tons silver-lead concentrates monthly.

The Diamond Co. have been hoisting some yellow carbonate, which will return $40 per ton.

All the companies in the Eureka district are working in reserve ground above

the water channel, and some good ore is being shipped.

Laird Bros. are working their Williamsburg property, north of Adams hill, and report prospects good.

R. Sadler is in Eureka organizing a company to work his mining property on Prospect mountain.

The men recently laid off in the Diamond, owing to litigation with owners of the Atlantic & Pacific property adjoining, have taken leases on ground in the Diamond, which they will work during the coming winter.

Eureka, October 14.

An average of 100 tons of iron ores daily are being shipped from the West iron mines, near Palisade, for which the owners are said to receive $3.50 per ton delivered at the smelters at Murray, Utah, says the Trihune. The product of the West mines is of value for fluxes. The property is owned by the West M. Co. of Salt Lake City, Utah.

The West M. Co. is working fifteen men at its mine, near Palisade, and this number will be increased to get an average daily shipment of 200 tons of ore.

Humboldt County.

The Spencer M. Co. of San Francisco, Cal., whose holdings are near the Hidden Treasure mines, near Kennedy, has several men at work grading and preparing the site for a mill.

Lincoln County.

The Searchlight M. & M. Co. at Searchlight, A. B. Day, superintendent, has its works in operation.

Superintendent A. A. Ross of the Empire M. & M. Co. has put men to work on their holdings at Newherry, near Searchlight.

B. Macready, vice-president and manager of the Saturn M. Co., at Searchlight, says he has put men on development work. The Saturn group adjoins the Quar'ette mines on the south.

Fourteen miles west of Searchlight, in the Crescent mountains, the turquoise mines (the Simmons mines) of the Toltec Gem M. Co., says Manager G. Simmons, consists of three parallel dikes, the upper one of which measures 300 feet in width. Through these dikes run shoots in which the stones are found emhedded in matrix. The deepest shaft is down 170 feet.

After a four months' idleness, due to the strike, operations are again under way at Searchlight. The Quartette M. Co. is running its mill sixteen hours and has increased its force. The Southern Nevada Co. has started up with non-union men and the Good Hope is working with union miners. Manager P. D. Carper of the Good Hope says he has resumed under same conditions as were in force at time of shut-down, i. e., an eight-hour day for all employes with exception of engineers, who will be required to work such overtime as necessary in order to enable miners to put in full time. Miners and engineers are to he paid $3.50; muckers, trammers and unskilled top labor, $3; skilled mechanics (blacksmiths and timhermen), $4. Two shifts are drifting on the 200-foot level.

Lyon County.

The tunnel being run by the Silver City Mining & Drainage Co., south of the Daney mine shaft, at Silver City, under Superintendent J. H. Kinkead, is in 1700 feet, and is heing extended along the edge of a vein of ore carrying gold values.

White Pine County.

J. Sharpe, W. McMurray, et al. of Cripple Creek, Colo., have hought the Joanna gold mine at Cherry Creek.

NEW MEXICO.

Taos County.

A strike is reported in the Tampa mine in Bromide district, 12 miles west of Tres Piedras. The vein was struck at 200 feet and is 13 feet wide. Four feet of the ore on the hanging wall carries sulphide of copper and averages $60 per ton, says the New Mexican. The property is owned by the Tusas Peak M. Co. of Manistee. Mich., and is being worked under Superintendent F. Bolton. The company owns a millsite helow the mine on the Tusas and will put in a concentrator. Eight feet of the vein is concentrating ore and the balance will be shipped.

OREGON.

Baker County.

Superintendent J. Reed of the Auburn Deep M. Co., at Auburn, a placer proposition, has discontinued sinking for bedrock, and says he will put in a prospecting drill to determine the direction in which to drift. The shaft is down 242 feet, with indications that it has entered a depression.

Manager Hennessey of the Cracker Cradle mine, in Cracker district, near Sumpter, says he has arranged to begin work next week and continue same during the winter months. He will drive a crosscut tunnel which will open the vein in 250 feet, and from that point the vein will he drifted, giving 300 feet depth.

Clackamas County.

The owners of the Northern Light quartz mine in Shena Creek mining district, 50 miles east of Portland, report opening up ore in the tunnel heing extended into Huckleherry mountain. It is within 6 miles of the Springwater hranch of the Oregon Water Power & Railway Co. The tunnel is heing driven 100 feet farther hy contract. The owners of the Northern Light mine are E. Renfer, T. S. West, V. Schmit, B. Hall and E. Mienig of Portland.

Douglas County.

The Star mine, near Bohemia, owned by G. B. Hengen et al. of New York, will huild a 10-stamp mill this fall. Work to the extent of 900 feet of tunnel has heen done on the ore. The group consists of fourteen full claims. The power line will be extended from the Oregon Securities Co., and electricity will he used to operate the Star mine and mill. The Oregon Securities Co.'s mill at Bohemia will hegin dropping its thirty stamps Nov. 1. says Superintendent Mathews.

F. J. Hard of Bohemia has closed a deal, in which he hecomes owner of the Stocks & Harlow mining property in Bohemia district. The Stocks & Harlow mine is on the west slope of Fairview mountain and joins the Vesuvius, which Hard owns.

Josephine County.

The Mountain View C. Co. mines (the Sowell mines), in Waldo district, are reported sold to the Vulcan C. Co. of San Francisco, Cal., for $24,000.

The Dutch Johnnie hydraulic placer mine, on Rogue river, helow Grant's Pass, which has heen in litigation for several years, has been settled and W. H. Flannagan has control. He will operate it this winter. Men are at work getting the piping and flumes in shape. The hanks are 60 feet in depth, and there is said to be water enough to keep the giants running nine months in the year.

Lane County.

At Blue river there are three gold mills. The Lucky Boy is operating fifteen stamps, with daily output of $400 bullion, says the Telegram. The Uncle Sam M. Co., with 5 stamps, is shut down pending changes in machinery. The Great Northern M. Co. has heen operating two stamps, hut is putting in a 5-stamp mill.

SOUTH DAKOTA.

Lawrence County.

O. N. Brown, manager of the Spearfish G. M. Co., operating in Ragged Top district, west of Lead, says they are preparing to put in additional machinery. The mill is crushing 300 tons of ore per day. ——On the east side of Ragged Top the Victoria mine is preparing to put in a 300-ton cyanide plant.

The Penohscot M. Co., near Maitland, is making daily shipments of ore to the National smelter of the Horseshoe Co. at Rapid City. The ore is hauled from Garden City to Blacktail by wagons. The shipping ore produced hy the mine amounts to seventy-five tons per day. The rest of the ore is treated at the company's plant at Maitland. The 40-stamp wet crushing cyanide plant is running steadily.

UTAH.

Beaver County.

The Wasatch King M. Co. has a ninety-day option on the Crank group, in Beaver Lake district, near Milford. The property shows a vein of iron-copper ore.—— Work on the Beaver Con. shaft was stopped at depth of 509 feet, where a station is heing cut, and crosscuts will he run in two directions. The water coming from this shaft is said to carry copper.

J. D. McAulay of Milford and C. T. Martin of Frisco, having hought an interest in the Gold King group, near the Revenue mine, in Pine Grove district, propose to work it all winter. In the hottom of a 50-foot shaft there is 14 inches of ore that carries sixty ounces in silver and values in gold. Sinking will be resumed.

Juab County.

The management of the Swansea M. Co. mine at Silver City has contracted to ship its argentiferous iron ores to the Majestic C. Co. smelter at Milford, says Manager Geddes. It is desired as a flux, the rock affording 18% iron excess with 15 ounces silver and 60 cents gold per ton.

Eureka reports of the 10th inst. say the situation is practically unchanged at the Bullion-Beck, Eureka Hill, Gemini and Centennial-Eureka mines, all of which properties are affected hy the underground fire which has heen burning since the 5th inst. The openings have been sealed up in hope of smothering the fire. Helmets carrying compressed air will he used in an attempt to locate the fire. Before reaching the openings an attempt was made to hulkhead certain drifts connecting the Centennial-Eureka and the Eureka Hill, hut the men were overcome hy the gas and smoke, resulting in the death of W. Menlove, the Centennial-Eurek shift hoss. Superintendent Allen of the Centennial-Eureka mine is shipping third-class ores from the dump so that the United States smelter will not he forced to close down.

Salt Lake County.

Articles of incorporation of the Utah-Apex M. Co. of Portland, Me., have heen filed, says W. C. Orem of Salt Lake City, resident agent. C. Dunn, Jr., is president and E. W. Guptill vice-president. The company's mines are at Bingham, and include the York and other adjoining properties on which options are pending.

To relieve the valley's customs plant, the sampler at the American S. & R. Co.'s Germania smelter was put in operation last week by Manager C. W. Whitley of Salt Lake City. To enahle them to handle a larger volume of pyritic ore at the Bruckner plant seven more of its furnaces were fired up, increasing the numher in commission to seventeen, each preparing twelve tons for the hlasts. The hlast furnaces at the Germania are also expected to be hlown in.

Summit County.

The shaft having heen unwatered at the Silver King Con. mine, near Park City, development work is heing resumed. What water may he struck between the 500-foot and 600-foot levels will he pumped up to the 500-foot level and handled there by the main pumping system.

Tooele County.

The Greene Reduction Co., having hought the Geyser-Marion mine dump at Mercur, has men to work at the old mill on that property. The plant will he remodeled, says Manager Wiswall of the Greene Co. The capacity of the mill will he increased to treat 300 tons of tailings per day.

WASHINGTON.

Ferry County.

The Pearl, Lone Pine and Surprise mineral claims of the Lone Pine-Surprise M. Co. have heen sold to the Pearl Con. M. Co., the original company retaining only the Last Chance claim. The group is in Eureka mining district, 1 mile north of Republic. The Pearl Con. M. Co. has heen incorporated hy C. D. Bihhins, L. H. Long, T. Ryan, C. P. Robhins and E. K. Schmidt.

The month of September shows a largely increased tonnage of ore shipped from the mines of Republic camp to the smelters over the previous month, says the Spokesman-Review. During August 102 cars of ore were shipped (3430 tons) with an aggregate value of $48,020. The Septemher shipments were 184 cars (6440 tons), aggregate value of $90,160.

WYOMING.

Carbon County.

C. H. Marshall et al. of Denver, Colo., have bought a group of five copper claims, north of Rawlins.

FOREIGN.

AFRICA.

Transvaal.

Glynn's Lydenburg mine, near Johanneshurg, reports output for month of August: Mill crushed 1960 tons, yielding 615 ounces gold; cyanide works treated 1460 tons, yielding 576 ounces; slime works treated 500 tons, yielding 200 ounces. Total, 1391 ounces fine gold: value, £5805. ——Henry Nourse Gold August result was: Seventy stamps running 30 days milled 9358 tons for 3356 ounces; 6234 tons cyanide for 1819 ounces; 2944 tons slimes for 226 ounces. Total, 5401 ounces fine gold.

The May Con. Gold Co. at Johanneshurg for month of August reports: Sixty stamps running 31 days crushed 9735 tons, yielding 3232 ounces; cyanide works, 5560 tons treated, yielding 1169 ounces; slimes works, 2261 tons treated, yielding 190 ounces. Total, 4591 ounces fine gold.

Van Ryn G. M. Estate for August: In mill, seventy stamps working 25 days, milled 8550 tons, recovering 2928 ounces gold. In cyanide works, 5600 tons treated for 963 ounces. Total fine gold all sources, 3891 ounces; recovery value per ton, £1 18s 8d.

The Withank colliery reports August output at 30,773 tons coal.

The Witwatersrand Deep Co. at Johanneshurg during the month of August had sixty stamps working 28½ days, crushing 7470 tons for 1920 ounces: 5614 tons of sands and concentrates treated hy cyanide works; yield 1100 ounces.

West Africa.

The Ashanti Sansu Co. in Ashanti district reports during month of August 1330 tons of ore crushed for 1130 ounces of gold. Several days' time was lost by stoppage of mill due to wet fuel.

AUSTRALIA.

New South Wales.

The Melhourne office of the Broken Hill Proprietary Co. of Broken Hill, on Septemher 25th reports in regard to the wages arhitration case: The Amalgamated Miners' Association claims were disallowed, with the exception of some preference unionists, and the company's counter claim for decrease of 10% also not allowed: The award is made for two years.

The Sulphide Corporation reports during the four weeks ending September 19, 14,427 tons of ore milled at the Central mine, producing 2917 tons of lead hearing concentrates, and 2995 tons of middlings were treated, producing 1482 tons of zinc concentrates. At Cockle Creek during same period 1502 tons of leady concentrates, 420 tons of residues and 3802 tons of purchased ores were smelted, yielding 997 tons of lead, containing 81,754 ounces silver and 14,157 ounces gold.

Queensland.

No. 2 South Great Eastern G. Co. at Gympie reports August output: Tons crushed 3350, yielding 3822 ounces gold.

Western Australia.

The following are output figures for Western Australia to September 1st:

	1903.		1902.	
	Tons Ore.	Ounces Gold.	Tons Ore.	Ounces Gold.
January	158,069	181,173	123,399	143,822
February	160,939	187,771	146,600	858,108
March	179,888	195,544	148,944	166,812
April	174,880	201,885	142,852	158,938
May	169,558	178,287	151,538	171,813
June	196,405	*224,026	157,236	173,185
July	185,458	191,681	167,617	174,494
August	183,775	183,797	167,719	182,591
September	.....	.....	173,377	186,965
October	.....	.....	169,238	188,657
November	.....	.....	165,044	187,037
December	.....	.....	175,763	199,846

*Including 26,924 ounces wbieh belong to previous returns, but, having been omitted, are herein included.

At the Lake View Consols mine at Kalgoorlie, D. E. Bigelow, manager, August returns are reported: 8060 tons of ore treated, yielding 4288 ounces fine gold, value £18,202. Costs: Stoping, 9s 11d per ton; ore reduction ("Diehl" treatment, 14s 6d per ton; general expenses, 2s 7d.

At the Anaconda copper mine at Murrin, near Mount Malcolm, development work is reported progressing. Another furnace for refining of copper matte will he added to the treatment plant.

BRAZIL.

The Ouro Preto Gold Co., at Ouro Preto, in Minas Geraes, on Septemher 21st reported the output for the month of August: Ore crushed 6219 tons, yielding 1943 ounces gold; value, £7760.

BRITISH COLUMBIA.

Boundary District.

The annual report of the Granby Con. M., S. & P. Co., with mines at Phœnix and smelter at Grand Forks, for fiscal year ended June 30, shows:

Expenses at mines and smelters	$1,136,000
Foreign ore bought	72,954
Foreign matte bought	766,000
Total	$1,974,954

The assets, cost of land, real estate, machinery, huildings, dwellings, equipment, etc., are placed at $13,845,000; copper in transit and cash on hand, $179,000; store supplies, $93,000. Production for the year aggregated 12,551,000 pounds copper, 277,574 ounces silver and 35,121 ounces gold. Receipts from real estate amounted to $38,511, making total receipts $2,271,252. The husiness for the year was hampered by the coal and coke situation, necessitating running the smelter only one-half its capacity. The plant has been increased hy two furnaces, making six in all, which they expect to operate full time from now on as against an average of two furnaces last year.

F. L. Sommer of New York, vice-president of the British Columbia C. Co., says they will enlarge their Greenwood plant by the addition of a couverter and four additional furnaces. The present equipment consists of two furnaces. The smelter will have a daily capacity of 2100 tons. The company owns the Mother Lode mines at Deadwood Camp and the smelter at Greenwood.

Ore shipments from Boundary district for the month of Septemher aggregated 61,388 tons, as compared with 69,568 tons in August. Shipments for the year to October 1 amounted to 459.127 tons.

Cassiar District.

J. B. Kinyon has hought the Christopher leases and water rights, covering 1900 acres of hench and creek leases, to-

gether with the water rights on McKee and El Dorado creeks, in Atlin section. Orders have been placed for 50,000 feet of lumber for the construction of a flume and 100 sluice boxes, to go in this fall. The boxes will be equipped throughout with steel riffles.

East Kootenay District.

The Gold River M. & P. Co. has been organized for placer mining and development by water power of electricity, power and light in the mines and towns of southeast Kostenay. The plant will be at Bull river falls, near Cranbrook, where it has 8000 inches of water, with a fall of 200 feet in 1¼ mile. The plans are to put in a dam above the falls and a flume that will carry the entire volume of water in the river, and to mine the bed of the river below the falls for placer gold. In connection with this an electrical generating station and power house will be built at the end of the flume. During the coming winter a sawmill will be set up and material cut for the flume, which will be 16 feet wide and 5 feet high. The company is made up of Iowa, South Dakota and Texas men.

Rossland District.

Ore shipments from Rossland district for month of September amounted to 39,651 tons, as compared with 36,010 tons for month of August. Shipments for the year to October 1 aggregated 292,423 tons.

Vancouver Island.

San Francisco men have taken over the sandstone and granite quarries on Newcastle island, near Nanaimo, and J. D. Dawes is superintendent. He says the company will start oporations this month, and shipments of building stone made.

Fire broke out in No. 4 mine at the Cumberland collieries on the 12th inst. The fire, which originated through spontaneous combustion of coal dust in section 11, is beyond control of tho force engaged in fighting it. All the miners have been taken out of the mine, and lines of hose laid to flood out the section.——All the mule drivers at the Dunsmuir colliery extension struck last week because one of them was discharged. It is expected a tie-up will result.

BRITISH GUIANA.

The custom house at Georgetown reports the following mineral exports from Jan. 1 to Sept. 8:

GOLD.

	Ozs.	Dwts.	Grs.	Value.
1903	58,484	4	15	$1,019,311 34
1902	66,479	11	3	1,159,775 38

DIAMONDS.

	Carats.	Value.
1903	6,274 5-16	$53,007 39
1902	8,684½	89,134 20

	1903.	1902.
Kaolin	....	900

CANADA.

Ontario.

On the "Barker belt," near Wabigoon, a group of claims covering 500 acres has been bought by tho Black Cat M. Co. of Cincinnati, Ohio, in which O. M. Bake, P. S. Briggs, H. H. Hughes et al, are interested. E. W. Gardiner is general manager. Besides the abovo holdings the company has also secured control of the Edna property, in the upper Manitou, which has heen developed to depth of 100 feet. The Black Cat Co. has also a group in the Lake of the Woods district, of which the Crown Point mine, adjoining the Mikado, is the priucipal.

CHILE.

The Copiapo M. Co., September 10th, reports production for the month of August at 1000 tons of copper ore, averaging 17% copper.

Iquique reports show the August production of the Santa Rosa mine: Gross value of metals extracted from company's proporties, $12,000; leasod properties, $3000.

GERMANY.

The exploitation of coal measures in the Rhenish-Westphalian basin has nearly trebled since 1895, the increase in output being from 4,000,000 tons annually to 11,000,000 tons. The more important companies are the Deutscher Kaiser, with 1,576,000 tous; the Gutehoffnungshutte, with 1,575,000 tons; the Krupp, with 1,514,000 tons; Bochum, 1,109,000 tons; Schalko, 898,000 tons; the Rhine Steel Works, 810,000 tons; and Diffordange, 742,000 tons, writes O. J. Hughes, U. S. Consul-General at Cohurg.

MEXICO.

According to official statistics the number of mines in Mexico producing smelting ores at present is reported at 1190, divided among the different States as follows:

Aguas Calientes	23
Lower California	26
Coahuila	32
Chiapas	1
Chihuahua	155
Durango	123
Guanajuato	112
Guerrero	13
Hidalgo	114
Jalisco	55
Mexico	28
Michoacan	37
Nuevo Leon	56
Oaxaca	58
Puebla	6
Queretaro	25
San Luis Potosi	50
Sinaloa	128
Tamaulipas	13
Tepic	12
Zacatecas	122
Total	1,190

The Treasury Department has issued a summary of the imports and exports during the fiscal year 1902-03, compared with values for 1901-02, from which the following figures are taken:

Imports—Invoice gold values:

	1902-03.	1901-02.
Mineral substances	$34,014,997	$21,223,548
Machinery and apparatus	10,337,060	8,308,186
Arms and explosives	1,796,092	1,401,605

Exports—Declared silver values:

Mineral Products.	1902-03.	1901-02.
Total gold and silver (coin and bars and other forms)	$91,763,481 31	$68,947,728 17
Copper	20,122,358 42	16,849,834 87
Lead	5,659,070 21	5,830,845 30
Other mineral products	1,181,786 05	546,771 25
Total mineral prod.	$118,726,676 89	$92,075,179 59

The Secretaria de Fomento, during second half of fiscal year ended June 30th last, issued 1885 mining titles, which covered approximately 75,690 acres. Addiug these figures to those of the first half gives 4132 titles for tho year 1902-03, covering an area of 153,490 acres. The number of titles issued during the fiscal year 1901-02 were 3607, and the area covered 151,600 acres.

Chihuahua.

The San Diego mine at Santa Barbara, owned by the Torreon Smelter Co., is being equipped with a steam hoist, two Corliss whims and other machinory. Seven shafts are being sunk on the main vein, and carbonate oro has been cut. It is expocted shipments will start next week. J. W. Pender of Chihuahua is superintendent.

Durango.

E. H. Stanley et al. of Detroit, Mich., have organized a company to operate a group of mines in Yerha Bueua district.

Guerrero.

Work is progressing at the Huitzuco group of quicksilver mines, 20 miles from Iguala station, on Cuernavaca division of Mexican Central railroad. The company controls an area of 568 pertenencias of 10,000 square meters each. Thirteen of the minos have been opened and three of them are producing. The main shaft is down 800 feet. The reduction works, 6 miles from the mine, consist of six stacks, 50 feet high, with the necessary condensers, etc. A tram line transports the ore.

Jalisco.

Douglas Lacey & Co. have organized the Mexican Exploration and Dev. Co. to exploit a group near Mazatlan, adjoining the Santo Domingo mines. T. H. Selby is superintendent. Threo prospecting shafts are under way.

Lower California.

The copper mines at El Boleo, owned by the Rothschilds of Paris, France, are reported to have produced during the first six months of 1903 5202 tons of copper, against 4861 tons in the same poriod of 1902.

Mexico.

The El Oro Mining & Railway Co. reports for the month ending August 31: The mill ran 31 days, crushed 9194 tons, producing from the new mill $120,354, and from the old cyanide plant $3096; total production, $123,450; working expenses and development costs, $62,630. The profit from the railway for the month was $8723. There has heen expended on permanent improvements, including expenditure on new mill, $21,542.

Michoacan.

The Negociacion Minera do Oro has been incorporated to exploit 200 pertenencias of mineral ground near Morolia. The ore carries hoth free milling and concentrating valuos. The mine is the Juape de Arriha. J. Amhrosius is president and general managor, and C. Kleinschmidt, engineer.

Nuevo Leon.

Smelter No. 2 at Monterey is sending $100,000 in silver bars monthly to the mint in Mexico City for coinage. Each bar averages 90 pounds, says the Mexican Investor.

Oaxaca.

Tho Mexican-American M. Co. of Sierra Juarez is preparing to put in a hydraulic plant on the Socorro river, near Sierra Juarez, says Modern Mexico.

The Conejo Colorado mine at Taviche, adjoining La Blanca, owned by St. Louis, Mo., men, have made an addition to the mill to double their output. The ore being treated has value of $40 per ton.

San Luis Potosi.

The Mexican M. & E. Co. will build a cable line, with a capacity of 1000 tons daily, from their Asuncion mine, in Monterey district, to the line of the National Railway, says Moderu Mexico.

Sonora.

Tho Douglas (Arizona) Dispatch says the Esmeralda mine, 14 miles east of Cos, has been sold to H. M. Patterson, J. Pearheart, and Kronkert & Beard, of El Paso, Tex., for $35,000. Manager Pearheart has started men on development work.

The Cerro Azul M. Co. has been incorporated at Nogales to develop and operate two gold properties, 30 miles from the international line. O. O. Saxhang is president, with F. P. Drew, vice-president, and W. Shuckmann, secretary and treasurer. The holdings of the company comprise twenty-two pertenencias in the foothills of the Cerro Azul mountains, 40 miles south of Nogales and 15 miles east from Imuris, on tho Sonora railroad. E. W. Jones is superintendent.

A. W. Tennent, manager of the Sonora River Placer M. Co., has bought a coppor property near San Antonio pass in Patagonia or San Antonio mountains, 4 miles southwest of Lochiel, says the Cananea Herald. He is sinking a vertical shaft and is putting in a steam hoist, engine, boiler, otc. Tennent reports work is progressing at the placer mines of the Sonora River Co., south of Cananea. Men are laying pipe and have 700 feet down. A pump has been put in at the river and water will he piped to the claims, 700 feet distant. Operations will begin on the claims next week.

A. Solano of Los Angeles, Cal., is reported to have bonded a group of gold and silver properties 40 miles from Magdalena for $75,000.

D. M. Heller, C. A. Overlock, et al., of Douglas, Ariz., have formed a company to exploit the Santa Rosa gold mine, 20 miles south of Nogales. Twenty men are at work sinking a douhle compartment shaft.

The Con. C. Co. at Cananea proposes to build an electric railroad line between Ronquillo and Cananea, a distance of 2½ miles. The power will he furnished by the plant just completed by the company, and having a capacity of 2000 H. P. It will run all the machinery at Cananea.

The Calumet & Yaqui River C. Co. has hought the mines and smelting plant of the Venice C. Co. at Soyopo. The Venice Co. holdings are near the mines of the Calumet and the plant includes two 50-ton furnaces.

Tamaulipas.

Tho Mexican Petroleum Co., operating at El Ehano, near Tampico, has completed twelve wells, says President Doheny, with a combined production of 20,000 harrels per month. The company is operating 10 kilometers (6.2 miles) of standard gauge railroad, using an oil-burning locomotive. They are shipping asphaltum.

Vera Cruz.

H. A. Carner of New York City, N. Y., and W. J. Crittenden of Mexico City report having located deposits of bitumen in the interior of Vera Cruz, which will bo developed by the Pan-American Co. of New York, of which Carner is president and manager.

PERU.

The Caylloma Silver Co., at Caylloma, reports its production for the month of August: Fine silver in export ores 28,000 ounces, and fine silver in hullion 14,000 ounces.

RUSSIA.

In the Caucasus mountains antimony ore is reported found, containing ½ ounce to 1½ ounce gold per ton, which contents cover mining expenses for the antimony. New copper fields are reported being opened up in the Caucasus, and assays show average of 9% copper and ¾ ounce gold.

SPAIN.

Statistics compiled hy the Revista Minera show the mineral exports from Spain during the first six months of 1903 included 68,340 tons of zinc ore, 1038 tons of spelter, 1451 tons of lead ore and 76,835 tons of pig lead.

TASMANIA.

The Mount Lyell M. & R. Co., at Mount Lyell, reports from Aug. 20 to Sept. 16, inclusive, 24,852 tons of ore treated, being 20,820 tons from the Mount Lyell mine and 4032 tons from tho North Lyell mine. In addition to the ahove, there were treated 2115 tons of metal-hearing fluxes. The converters produced during the same period 472 tons of blister copper, containing: Copper, 467 tons; silver, 42,785 ounces; gold, 1571 ounces. Reduction in hlister copper output principally owing to limitation placed on underground extraction at North Mount Lyell mine by present labor disturbance. The mine has been working only two shifts instead of three, and drawing partly from surface workings, which are of lower grade.

Catalogues Received.

Catalogue "D" of the Minneapolis Steel & Machinery Co., Minneapolis, Minn., is an exhaustive treatise on elevator and power transmission machinery.

Catalogue No. 8, from the Colorado Iron Works Co., Denver, Colo., describes and illustrates in vignette, and also sectional drawing, their new patented impact screen for sercening and sizing wet or dry ores from 4 to 80 mesh.

If the Christy Box Car Loader Co.'s machine is as good as their catalogue, it is an efficient device, for their descriptive matter therein is a fine showing of what thoy make. Their headquarters are 811 Equitable Building, Des Moines, Iowa.

"The Whole Story About Wood Pipe" is the title of an 84-page trado treatise from the National Wood Pipe Co., which is copyrighted. It gives good argument for the use of wood pipe, shows how it can be used, gives prices, testimonials, formulæ and technical tables, the whole being finely illustrated by half-tonos and line engravings. It can be had from the National Wood Pipe Co., Sixth & Mateo Streets, Los Angeles, Cal., or 301 Market Street, San Francisco, Cal.

"Steam Powor Plants of tho Pacific Coast" is an unusually fine trade treatise from Chas. C. Moore & Co., engineers, 63 First St., San Francisco, Cal., finely portraying many plants, huildings and engineering constructions on the Pacific coast, including office buildings, industrial works, railway construction, electrical installations, etc., in which the engineering firm of Chas. C. Moore & Co. furnished the power equipment. The little volume, which is a typographic gem, furnishes fine views of many prominent private and puhlic enterprises of recent construction, and apart from the commercial feature, it forms a good exponent of such Pacific coast development. The latter portion is devoted to illustrated description of machinery furnished and installed by Chas. C. Moore & Co.

Books Received.

"The Mineral Industry, Its Statistics, Technology and Trade, for 1903," has been received. This is the eleventh annual volume of this valuable publication, which has become familiar to all mining men. It treats of all mineral products, hoth metallic and non-metallic, and of the methods hy which these are mined and reduced to merchantable forms. It deals with many mining and metallurgical problems in a scientific and practical way, and these chapters give the volumes of the "Mineral Industry" a far greater value than any work compiled for statistical purposes only. The chapters on copper smelting, pyritic smelting and on electro-chomical metallurgy, each hy a specialist in his line, are particularly instructive and valuable. Price, $5. The Engineering and Mining Journal, New York and London.

Obituary.

J. W. HOLBROOK, a pioneer miner of Wadsworth, Nev., and Deputy United States Marshal, died at Wadsworth on the 4th inst., aftor an extended illness. Deceasod was a nativo of Maine, sixty-five years of age.

J. JURY, a pioneor miner of Eureka Co., Nev., died at Ruby Hill, September 30. He was injured by a cave-in in the Eureka Con. mine last January, this being the ultimate cause of his death, as other complications set in. He went to Eureka county from Cornwall, England, in 1876. He is survived by a wife and four sons.

DE F. H. ANDREWS, a pioneer mining man of Colorado and Idaho, died at Boise, Idaho, on the 3rd inst. of congestion of the lungs. Deceased was horn in Iowa, May, 1841; went to Colorado while a young man and engaged in mining and the real estate husiness, and was Mayor of the town of Bald Mountain, Colo., for several terms. He went to Boise, Idaho, in

1889, and at the time of death was interested in Thunder Mountain mines. He was a candidate for Governor at the last State election. He is survived by a wife and several children.

PERSONAL.

SUPERINTENDENT R. B. STANFORD has returned from the East to Columbia, Cal.

C. W. JENKS is in charge of the Queen Esther mines at Mojave, Cal., vice Lund, resigned.

CHAS. WIER has resigned the managership of the Yellow Aster M. & M. Co., at Randshurg, Cal.

J. S. MCBRIDE of North San Juan, Cal., interested in Nevada county mines, is in San Francisco, Cal.

G. K. FISCHER has resigned as manager of the smelter of the United States M. Co. at Bingham, Utah.

J. D. SPARGO succeeds C. A. Stevens as general superintendent Gold Roads M. Co., Acme, Arizona.

JOHN HUFF, of Victor, Colo., is manager of the Jackson G. M. Co., in Cripple Creek district, Colo.

W. SHARWOOD has returned to the Soulsby mine at Soulsbyville, Cal., from San Francisco, Cal.

J. A. JESTER is superintendent of the Southern Nevada M. Co. at Searchlight, Lincoln county, Nev.

G. A. CARTER is in San Francisco, Cal., to get a filter press and cyanide plant for the I X L mine, Sumpter, Or.

F. W. DANIELL is in Lordsburg, Grant county, N. M., from New York, to take charge of the Aberdeen M. Co.

J. R. GIFFORD of San Francisco, Cal., is now general manager of the Chihuahua M. Co., Choix, Sinaloa, Mexico.

A. S. ELMORE, of London, Eng., inventor of the Elmore oil process of ore concentration, is in Rossland, B. C.

W. L. COBB, E. M., of San Francisco, Cal., has gone to Kern county, Cal., to inspect mines 40 miles east of Caliente.

JOHN ROSS JR., superintendent of the Wildman-Mahoney M. Co. at Sutter Creek, Cal., is in San Francisco, Cal.

G. A. WARTS of Cripple Creek, Colo., is manager of the Stratton Cripple Creek M. & D. Co., vice W. G. Rice, deceased.

J. F. HALLORAN is assistant superintendent of the Portland mine, Independence, Colo., vice F. L. Smale, promoted.

J. E. STEVENSON, operating mines at Gavalana, Chihuahua, Mexico, has gone on a six weeks' visit to Utah and California.

R. G. HINKSON is superintendent of the Buena Vista smelter at Buena Vista, Chaffee Co., Colorado, vice B. F. Morley, deceased.

D. J. DUNCAN is assistant manager of the Hays Con. M., M. & L. Co. at Camp Hays, in the Pinto mountains, Sonora, Mexico.

HORACE F. BROWN has returned to San Francisco, Cal., from an examination of coal and iron mines on Cape Breton Island, Canada.

E. R. WHITMARSH of Colorado Springs, Colo., is manager of the Pharmacist Con. M. Co., operating in Cripple Creek district, Colo.

E. W. MORSE is manager of the Fortunate G. M. & M. Co., operating the New Haven group near Rollinsville, Gilpin county, Colo.

A. C. HARMON, manager of the Penn Chemical Works, operating copper mines at Campo Seco, Calaveras county, Cal., is in San Francisco, Cal.

C. A. BAILEY, president of the Central Con. M. Co., has returned to San Francisco, Cal., from a trip to their mines near Grass Valley, Cal.

J. T. MCCLANAHAN of Boonville, Mo., is president and manager of the Bertba G. M. & M. Co.. operationg in Idaho Springs district, Colorado.

J. D. DAWES is superintendent of the sandstoue and granite quarries on Newcastle Island, near Nanaimo, B. C., owned by San Francisco, Cal., men.

SUPERINTENDENT HOLBROOK AND MANAGER MCLAUGHLIN of the Horseshoe M. Co. of Deadwood, S. D., are in the East ou company husiness.

W. J. SUTHERLAND, owner of the Alaska Perseverance and Greek Boy minos, near Juneau, Alaska, has returned there from a trip to London, Eng.

J. E. BEVERIDGE has rosigned as superintendent of the Century M. Co.'s mines and mill in Park valley, Box Elder county, Utah, and is in Salt Lake City, Utah.

J. C. DRISCOLL, recently superintendent of the Silver Shield mine, Bingham, Utah, is superintendent of the La Reine mine, near Eureka, Juah county, Utah.

ROSS E. BROWNE, E. M., of San Francisco, Cal., accompanied hy his wife and son and J. D. and K. F. Hoffmann, left this woek for Johannesburg, South Africa.

STEPHEN THOMAS, who for years was foreman of the Mahoney mine at Sutter Creek, Cal., has gone to Nova Scotia as mine foreman of a gold mine near Halifax.

W. J. ADAMS, E. M., of San Francisco, Cal., is conducting a series of motallurgical experiments in the mining laboratory of the State University at Berkeley, Cal.

E. C. THURSTON, of San Francisco, Cal., has gone to mines near Mojave, San Bernardino county, Cal., to make mine inspections and metallurgical experiments.

J. A. JEFFERY of Nevada City, Cal., is superintendent of the South Yuha M. & Dev. Co., operating near Omega, Nevada county, Cal., vice C. W. Porterfield resigned.

C. T. DURRELL, former manager of the Whiskey Gulch & Spotted Horse mine, in Fergus county, Mont., is manager of the Chicago-Montana G. M. Co. at Lewistown, Mont.

F. M. KURRIE, for several years chief engineer of the Portland mine at Independence, Cripple Creek district, Colo., has been appointed assistant general manager of the company.

C. W. PORTERFIELD of Novada City, Cal., has resigned as superintondent of the South Yuba M. & Dev. Co., operating near Omega, Nevada county, Cal., to go to El Dorado county.

R. B. LAMB, metallurgist, has gone to Kern county, Cal., from San Francisco, Cal., to take charge of erection and operation of a stamp mill at tho Piute mine, 40 miles east of Caliente.

D. T. PARKER, metallurgist, and C. E. Jamison, chief chemist, at the Ohio & Colorado smelter, Salida, Colo., have opened an assay office and laboratory at 1721 Champa street, Denver, Colo.

HERBERT HAAS is now smelter superintendent for the Great Western Gold Co., Redding, Cal. He will start the erection of a 175-ton copper smelter, with sampling works, at the Afterthought property, near there.

W. G. PHIPPS has resigned the superintendency of the Jno. Royal mine, Columbia, Cal., to take charge of the Shady Run mine, Shady Run, Placer county, Cal. A. E. Baier is now mine foroman. The company will enlarge the mill and put in a new cyanide plant.

P. H. TYLER, a pioneer American miner in tho Philippines, left San Francisco, Cal., this week for the gold mining property of himself and associates in the province of Benguet, about 175 miles north of Manila, where he has a free milling gold property in successful operation. His mission in San Francisco was to secure suitable machinery, which he takes with him, this being stated by him to be the first consignment of such American mining machinery to the Philippines. Mr. Tyler says the possible mineral development of the islands is attractive, and that large numbers of Australian miners are taking advantage of such possibilities.

Commercial Paragraphs.

THE Mine & Smelter Supply Co. of Denver, Colo., have an order for fourteen Wilfley concentrating tables to be shipped to the Honerine mine, Stockton, Utah, for their new mill, now in the course of erection.

THE Mine & Smelter Supply Co., Denver, Colo., have an order for forty-three Wilfley concentrating tables from the Calumet & Hecla M. Co. of Michigan. The Calumet & Hecla Co. already had a numher of the Wilfley tables in their mills.

THE C. O. Bartlett & Snow Co., Cleveland, Ohio, report a number of orders received for dryers to dry concentrates; among others they have lately shipped one to the Wood & Swart Co., Denver, Colo.; one to the Payne Con. M. Co., Sandon, B. C., and to the Hanna M. & M. Co., Chicago, Ill.

G. W. MEYERS has returned to San Francisco, Cal., from a business trip through southern California mines and reports placing a number of orders for Chrome steel shoes, dies, etc. The Chrome Steel Works at Brooklyn, N. Y., has its new plant in operation, including a hydraulic press for making shoes and dies.

THE Brooklyn, N. Y., Engineers' Club held the first meeting of the season on the evening of Octoher 8th. Besides the usual formal husiness, a very interesting paper, entitlod, "A History of Pumps, Ancient and Modern," was read hy J. A. Drew of the Worthington Co. Mr. Drew sketched the development of pumping machines from the early Egyptian "Noria," resemhling the familiar well sweep, to the latest triple expansion, condensing, water works pumping engines, requiring little more than a pound of coal per horse power hour. The paper was illustrated by a large numher of lantern slides.

Latest Market Reports.

SAN FRANCISCO, Octoher 16, 1903.

METALS.

SILVER.—Per oz., Troy: London, 28⅛d (standard ounce, 925 fine); New York, bar silver, 60⅞c, refined (1000 fine): San Francisco, 60⅞c; Mexican dollars, 48@50c San Francisco, 46½c New York.

During the past week silver has gone above 60 cents for the first time in several years. The Bureau of Insular Affairs of the War Department has announced that it would make no further purchasos of silver for Philippine coins. It was intended to coin ahout $25,000,000 worth of silver, but word has come from Governor Taft that with the amount on hand and on the way, together with the legalized Spanish silver, there will he enough for the needs of the islands. There are now in the islands or on the way $17,900,000 in new silver coins, and ahout $1,000,000 more in this country ready for shipment. The Bureau of Insular Affairs denied that it purchased $1,000,000 worth of silver on the 15th inst., as reported, and that on the contrary it refused to purchase 400,000 ounces at 60.44. War Department officials predict that with the Philippines out of the market as purchaser of silver the price of that metal will decline.

COPPER.—New York: Standard, $13.25; Lake, 1 to 3 casks, $13.25; Electrolytic, 1 to 3 casks, $13.12½; Casting, 1 to 3 casks, $12.75; San Francisco: $15.00. Mill copper plates, $17.00; hars, 18@24c. London: £54 5s spot per ton.

Tho copper situation remains practically unchanged, though the price is a fraction lower than last week.

The following figures are of German consumption of foreign copper for the months of January-August, 1903, compared with the same period of 1902 and 1901:

	1903. Tons.	1902. Tons.	1901. Tons.
Imports	56,094	54,643	44,539
Exports	6,964	6,118	6,417
Consumption	49,130	48,525	38,122

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco. $4.50, carload lots; 4⅛c 1000 to 4000 lbs.; pipe 6½, sheet 7. bar 5⅜c; pig, $4.75. London: £11 ₱ long ton.

SPELTER.—New York, $6.00; St. Louis, $5.00; London, £20 5s ₱ ton; San Francisco. ton lots, 6¼c; 100-lb. lots, 7c.

TIN.—New York, pig, $25.80 @ 25.90; San Francisco, ton lots, 28c; 500 lbs., 28½c; 200 lbs., 29½c; less, 30c; bar tin, ₱ lb., 30@32c. London, £115 5s.

PLATINUM. — San Francisco, crude, $18.00 ₱ oz.: New York, ingot, $19.00 ₱ Troy oz. Platinum ware, 75 @ 80c ₱ gram.

QUICKSILVER. — New York, $46.00@47.00, large lots; London, £8 7s 6d; San Francisco, local, $43@44 ₱ flask of 76½ lbs.; Denver, $49.50. Export, $42.50@43.00.

BABBITT METAL.—San Francisco, No. 1, 10c; No. 2, 7c; No. 3, 6½c: extra, 17½c; genuine, 35c; Eclipse, 37½c.

SOLDER. — Half-and-half, 100-lb. lots, 18.75c; San Francisco, Plumbers', 100-lb. lots, 15.50c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb., .04c.

NICKEL.—New York, 50@60c ₱ lb.: ton lots, 40@47c.

ALUMINUM.—New York, No. 1, 99% pure ingots, 35c; No. 2, 90%, 30@34c.

ANTIMONY. — New York, Cookson's, 7½c; Hallett's, 6¾c; San Francisco, 1000-lb. lots, 8c; 300@500-lbs., 8½c; 100-lb. lots, 10½c.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.85 @17.35; gray forge, $15.35; San Francisco, bar, 3c ₱ lb., 3½c in small quantities.

STEEL. — Bessemer billets, Pittsburg, $27.00@29.00: open hearth billets, $28.00 @30.00; San Francisco, bar, 7c to 12c ₱ lb.

LUMBER. — (Rotail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50 @5.00; pickets, $21.00; shingles, $2.50 for No. 1 and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00 @35.00.

NAILS.—Per keg (list prices): No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4 and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

LIME.—Santa Cruz, $2.35; Roche Harbor, $2.35 ₱ hhl.

CEMENT.—Imported, $2.50@2.75 ₱ hbl.; California carload lots, $2.25 f. o. b. at works; small lots, $2.50 ₱ hbl. in sacks, 4 sacks to hhl.

GENERAL SUPPLIES.

COAL. — San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracito, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitro-glycerine, per lb., in carload lots, 15½c: less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1** 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c: less than one ton, 12c. No. 2, 35%, carload lots, 9½c; loss than one ton. 11½c. No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black hlasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots. $2.00 por kog.

CAPS.—3x, $5.50 per 1000: 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 fect; double tape, $3.00; single tape, $2.65; Hemp, $2.10: Cement No. 2, $3.00: Cement No. I, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ₱ set; 14 oz., 40s., 10c.

OILS.—Linseed, boiled, bhl., 49c: cs., 54c; raw, bbl., 47c; cs., 52c; Lucol oil boiled, bbl., 44c; cs., 49c: raw, bbl., 42c; cs., 47c. Kerosene—Pearl, per gal., 21c; Astral, 21c; Star, 21c; Extra Star, 25c: Eocene, 24c; Elaine, 27c; Water White, in bulk, 14½c: Mineral Seal, iron bbls., 18½c; wooden bbls., 21c; cs., 24c; Mineral Sperm, cs., 26½c.; Deodorized Stove Gasoline, bulk, 17c; do., cs., 23½c; 86° Gasoline, bulk, 21c; do., cs., 27½c; 63° Naphtha or Benzine, deodorized, in bulk, per gal., 13c; do., in cs., 19½c; Lard Oil, E. W. S., bbl., 85c; cs., 90c; Neats-foot Oil, pure, bbl., 75c; cs., 80c; Sperm, crude, 50@60c; Natural White, 70c; Bleached, do., 75c; Whale Oil, cs., 50@55c.

CHEMICALS. — Cyanide of potassium, 98%-99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c: in tins, 30c; soda ash, $2.00 ₱ 100 lbs.: hyposulphite of soda, 3@3½c por lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, bbls., $1.20@1.40 ₱ 100 lbs.; sks., $1.05; chlorate of potash, 12@13c; nitrate of potash, bhls., 10c; caustic potash, 10c in 40-lb. tins: roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphate, 5½@5¾c; chloride of limo, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

BONE ASH.—Extra No. 1, 5@6c ₱ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ₱ lb. above keg price: in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg pricc. Dry Lead—In hbls., 1 ton and over, 6c: do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb., 6½c: less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ₱ lb.

BORAX.—Concentrated, 6@7c ₱ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANCANESE.—Pure, ₱ lb., 60c.

SODIUM.—Metal, ₱ lb., $1.00.

BISMUTH.—Subuitrate, ₱ lb., $1.75.

CHROMIUM.—90% and over, ₱ lb., $1.00.

PHOSPHORUS.—American, ₱ lb., 75c.

SILVER.—Chloride, ₱ oz., 90c@$1.00: nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ₱ lb.; 100 lbs., 35c: 1000 lbs, 34c: ton lots and over, 33c, Pittshurg. No. 2, 90%. small lots, 34c: ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ₱ lb., $3.50.

(These prices are wholosalo, f. o. b. San Francisco, unless otherwise uoted.)

MINING AND SCIENTIFIC PRESS

Whole No. 2257.—VOLUME LXXXVII. Number 17. SAN FRANCISCO, CAL., SATURDAY, OCTOBER 24, 1903. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Two Noted Black Hills Mines.

Ten miles southeast from Deadwood on Elk creek, at the town of Roubaix, is located the Uncle Sam mine, now owned and operated by the Clover Leaf G. M. Co. This property is reached via the Black Hills & Fort Pierre railway, now owned by the Burlington route.

The mine was discovered in 1878 by two prospectors, who were out on a "grub stake." The ore was rich in free gold, and enough was pounded out in a hand mortar to pay for the construction of a mill of one stamp, operated by horse power. With this in operation the owners were soon able to buy a 15-stamp mill, which was also operated successfully for some time, when the property was sold to Deadwood men, who continued to work it until sold to the Diamond Match Co. of Michigan, who built a 60-stamp mill, spent a large amount of money, and after an unsuccessful career closed the mine down, being unable to handle the heavy flow of water with the pumping plant then at the mine. The present owners have the mine open to a depth of 700 feet, and levels open at 400, 500 and 600 feet, and are drifting on the 700-foot level to the vein. Below the 400-foot level the vein, which has been pitching at an angle of about 45°, has become almost vertical. On the 600-foot level they have drifted 200 feet, all in ore, that has averaged in the mill about $10 per ton. The ore is free milling. The extraction from amalgamation is from 90% to 93%, leaving so little value in the tailings that so far they have not found it profitable to attempt to treat the tailings, although they have made experiments on them. The mill contains sixty stamps, and are running thirty at present, and will gradually increase as development work warrants. They mine $4 ore at a profit. Coal costs $4 per ton delivered at the plant. They pay miners on machine drills $3.50 for ten hours. In exceedingly wet places, or in the shaft, they work three shifts. Top men get from $2.50 to $3; mill men, $3.50 and $4 per day of twelve hours; engineers on the hoist, $4 for eight hours. They are working from fifty to seventy men. S. W. Russell is vice-president and O. B. Amsden, superintendent. One of the accompanying illustrations is that of the Clover Leaf surface plant.

The Clover Leaf illustrates one of the peculiarities of vein formation in the schists of the Black Hills. Ordinarily ore bodies in schistose or slaty rocks conform approximately, at least, to the general trend of the rocks within which they occur; but in the case of the Clover Leaf the quartz ore body assumes a form likened to a saddle, with its apex striking N. 64° W. and pitching to the southeast at an angle of 40°. In horizontal section the ore body assumes the form of the letter U, the branches flaring outward slightly.

Clover Leaf Hoist and Mill, Rubiax, S. D.

The Hidden Fortune mine: This property comprises a group of mines on the divide between Deadwood Gulch and Gold Run and east of Poorman gulch. The nearest town is Central City. Some of the mines were opened in the early history of the country (1876–'78), the most noted being the Bingham and Cheyenne claims. Although there were large bodies of gold ore exposed in the workings, the property did not attract much attention until 1899, when the principal owner, Otto Grautz, in searching for wolframite, found abundance of free gold in the quartzite sheet capping one of the hills. In less than sixty days, it is reported, he shipped nearly $57,000 to Colorado smelters. Much of the gold occurred in ragged sheets, having been deposited in the jointing planes of the rock. The company has extensively developed the property and has built a 60-stamp mill (see accompanying illustration) about 4 miles from the mine, in Whitewood gulch, below Deadwood, where the low-grade ores will be treated by amalgamation and cyanidation. The Hidden Fortune property is one of the few where ore is mined from both the schists and the overlying sedimentary beds. The ore from the former is classed as free milling, the gold occurring native and with pyrite, but in the overlying Cambrian rocks the gold is usually associated with tellurium, and, not satisfactorily amenable to amalgamation, are treated by cyanidation and barrel chlorination.

Possibilities of Modern Engineering.

When Henry Meiggs built the first Peruvian railroad it was looked upon as one of the most daring feats of engineering ever accomplished or attempted. Seemingly insurmountable obstacles were overcome, and modern railroad engineers have since followed some of Meiggs' ideas in construction through mountainous regions, until to-day there are few engineering problems in mountain railway building which are not approached with confidence by the engineer. The proposal of the Pennsylvania Railroad, however, to tunnel from Jersey City under the Hudson river, the city of New York, the East river and a portion of Brooklyn, Long Island, is one of the modern attempts at engineering that is attracting the attention of engineers everywhere. Essentially a mining proposition, it involves much more than is usually contemplated in tunneling. It is a difficult and expensive undertaking to tunnel under a great river, a mile in width, through the most treacherous material known to engineers—silt, saturated with water, and far different from driving an excavation through a mountain, where the material is hard rock. In the latter case the cost can be arrived at with approximate accuracy, but in the driving of a tunnel through soft mud there are involved elements of uncertainty and of difficulty not found in other classes of tunneling. It is roughly estimated that the cost of this work will approach $50,000,000, and it may exceed that sum, but as the traffic of the railroad appears to demand it the construction of this sub-river tunnel has been commenced and is progressing. Similar attempts have been previously made, but after months of difficult work and unsuccessful effort the project has been abandoned. The present work, however, is well under way. A great amount of steel and concrete will be used in the construction, and different portions of it will be built according to the material through which it passes. One portion of the tunnel beneath the Hudson river will be what is known as a tube tunnel and will be practically without foundations. The river section will be constructed by the use of shields and under air pressure, the compressors being required to supply 300,000 cubic feet of free air per hour, at fifty pounds pressure per square inch.

Miners are often called upon to solve difficult problems in cutting through treacherous ground, quicksand, etc., but the magnitude of the Hudson river tunnel eclipses ordinary mining operations, where engineering problems usually have to be considered from the standpoint of economy, such as is not generally contemplated in railroad engineering.

There are many mining problems which remain untried which, though within the range of possibility to accomplish, are not attempted because the calculated result does not justify the expense, and it is only when a corporation with almost unlimited capital at its disposal, or a government, desires to achieve great feats of engineering that engineers have an opportunity to demonstrate what modern scientific methods, properly applied, can accomplish.

Shaft Construction and Inspection.

The necessity for careful daily shaft inspection by competent men is evidenced in the recent accident at the Red Jacket shaft of the Calumet & Hecla mine, near Houghton, Mich., where a few days since an ascending skip caught a projecting sliver on one of the guides, and stripped the guides from the timbers for a thousand feet, beside doing other material damage, which will require some time and considerable expense to repair. All great modern working shafts are heavily timbered, in American mines, and the greater number of them are lined up with great care and precision, in order that the cages or skips may move swiftly up and down without danger, and, as they usually do, without jar or violent vibration. Those who are only familiar with the running of elevators in tall buildings in cities, often comment upon the speed at which these elevators are run, but they seldom exceed 800 to 1000 feet per minute. Cages and skips in deep, vertical mine shafts usually run at not less than 1500 feet per minute and from that to 5000 feet or over. Men are generally moved at a somewhat slower speed, but at a rate far exceeding that of building elevators. In view of this, mine shafts require daily painstaking inspection to lessen the likelihood of disaster, such as happened at the Red Jacket shaft. When a skip is running at the high rate of speed indicated above, one unfamiliar with it can scarcely conceive the rapidity with which these vehicles pass from level to level or from the lower level to the surface without stop. In the case of the Red Jacket shaft, which is nearly 5000 feet deep, if a station were cut at each 100 feet, the station lights would flash by when under full speed at intervals of a little over a second until the surface was reached. It can readily be understood that any slight inequalities in the alignment of the shaft or the guides would render rapid running extremely uncomfortable, not to say dangerous. The fact that most of the great deep shafts in the United States are sunk through solid ground, and are heavily timbered, renders them comparatively safe; but where the ground passed through shifts, due to geological disturbances, or to swelling ground, fast running in safety is out of the question.

On the Rand in South Africa the great shafts are sunk either on the banket at various and often changing degrees of inclination, or are sunk vertically to reach the ore bed, but in most instances, owing to the high cost of timbers (American and Australian), these shafts are timbered with 6″x8″, 6″x9″ and 7″x10″ timbers, dimensions which usually, in America, would be considered too small to afford security, but the vertical shafts are sunk through quartzitic sandstone which exerts no pressure upon the timbers, the latter constituting merely a framework for the convenience of skip ways, ladders, pipes, etc. This practice having proved satisfactory in South Africa, where rapid running is the rule, it suggests that the managers of American mines might profit by the example of the Rand and sink shafts in hard ground, employing timbers of smaller dimensions than are customary here. A shaft timbered with 7″x10″ Oregon pine timbers would require only about one-half the timber (board measure) that would be necessary if 12″x12″ were used. Moreover, in America, it has become the custom to place sets 5 feet from center to center. On the Rand the distance is usually 6 feet, which represents a further possible saving of nearly 16% in amount of timbers used.

The geological conditions prevailing on the Rand greatly facilitate the construction of shafts along the lines adopted there, and it is positive that the same procedure cannot be followed everywhere, but there are many places where the system is applicable in the Western United States. There is one feature of South African shaft sinking, however, which would probably never become popular in America. On the Rand the timbers are seldom carried closer than 50 feet from the bottom of the shaft, and often the distance is much greater than this—100 to 150 feet. This is done in order that the wall plates, which are framed in a single piece and sometimes 30 feet in length, may be swung into place, and avoids the necessity of leaving out dividers from several sets above the bottom. It also reduces the danger of breaking or blowing out timbers when the blasts are fired. Sinking is accomplished by the use of buckets, provided with universal swivels to reduce the tendency of the bucket to spin around rapidly as they would otherwise do on a long lift. When the shaft has progressed a considerable distance below the last set of timbers sinking is discontinued and a number of sets put in as rapidly as workmen can place them.

In America miners are accustomed to having the timbers carried to within a few feet of the bottom of the shaft.

The Alaska Boundary Fixed.

The recent decision of the Alaska-Canadian Boundary Commission in favor of the United States appears to have greatly disturbed some Canadian politicians. The decision was made by a commission fairly representing both sides of the controversy, and was undoubtedly made absolutely upon the merits of the case, notwithstanding which there are those who openly attack the commission and its integrity, but as the decision is final the situation may as well be accepted with as good grace as possible on the part of those who feel that they have lost something which they actually never possessed. By the decision the United States secures all the waterways leading into the interior regions of Alaska excepting that known as the Portland canal, which was awarded to Canada. Portland canal runs in a northerly direction from the vicinity of Port Simpson, beginning at about north latitude 54° 30′. It fixes the boundary along the west side of Portland canal, from the head of which it swings off in a northwesterly direction, and passes far inside the heads of all the large inlets indenting that portion of the Alaskan coast, and conforming in a general way to the outline of the coast. All Americans who claimed property in the disputed territory are safe in their possessions, and as it is presumable that the long-disputed boundary line has been permanently fixed, it only remains for the proper officers of the Government to set the monuments.

THE annual convention of the California Miners' Association will be held in San Francisco, Cal., November 16, 17 and 18, 1903. The reading of a large number of technical papers, contributed by members of the Association, will form an interesting and valuable feature of the session. This is not a new departure in the sessions of the convention, but it is yearly becoming more popular, the Association evidently having entered a broader field of usefulness. Technical societies are springing into existence throughout the country, and their published transactions form a most valuable addition to scientific and technical literature, for generally the authors of these papers write from personal experience, and contribute information which would otherwise be slow in reaching the outside world.

ALREADY the press dispatches from the mining regions begin to tell of death and destruction due to thawing of dynamite by miners. This is rather early in the season for the annual crop of suicides caused by thawing powder to commence, but the ball has been started rolling.

CONCENTRATES.

ANTIMONY OXIDE is not readily attacked by hydrochloric acid.

✣✣✣✣

A HOLLOW CYLINDRICAL COLUMN of iron has greater strength than a solid one of the same weight and length.

✣✣✣✣

FUCHSITE AND MARIPOSITE are essentially the same mineral—a chromium mica. It is a mineral of variable composition, and of no commercial value.

✣✣✣✣

THE only remedy for car and skip wheels that have worn flat at one side is to have them turned "true" in a lathe. If too hard to be turned, buy new wheels.

✣✣✣✣

SILVER is a better conveyor of electricity than copper in the ratio of 1000 to 931. Aluminum, if given double the sectional area of copper, is as efficient a conductor of electricity as the latter.

✣✣✣✣

AIR COMPRESSOR VALVES, which become gummed and fail to work freely, may often be made to operate by oiling with kerosene instead of lubricating oil. It is not advisable to use much oil in the cylinders of the compressor.

✣✣✣✣

ROTARY grinding mills are favored in those districts where the gold is coated with iron oxide or some other substance, preventing its ready amalgamation. The rotary mill brightens the gold and renders it easy to amalgamate.

✣✣✣✣

HYDRAULIC GRAVEL ELEVATORS, when working under favorable conditions, will lift gravel about one-fifth the height of the pressure column. A pressure of 100 feet vertical will lift gravel about 20 feet; a 400-foot pressure will lift it 80 feet.

✣✣✣✣

WHERE rapid running is done in shafts, the shafts should be given daily inspection, and particular attention should be given the guides, to see that there is no likelihood of any projecting sliver, or end of a timber at a joint to catch the passing skip or cage.

✣✣✣✣

LEAKY straight-way valves may sometimes be repaired by unscrewing the cap and reversing the disc, which it will often be found has been cut by escaping water. The valve should be kept closed when not in use, and not permitted to run a small, trickling stream.

✣✣✣✣

THE amount of gold and silver in a cyanide solution may be determined by evaporating one assay ton (29.2 c. c.) of the solution to dryness on a lead tray, which is then rolled up, and cupeled on a hot cupel, weighing the resulting button, the head to be parted in the usual manner.

✣✣✣✣

IT is advisable to use round, cold-rolled steel for car and skip axles, as when worn they may be cut in two at the center by a hack saw and the worn ends welded, making practically a new axle. It costs much more to do this with square steel bars that have been turned round at the ends.

✣✣✣✣

TWENTY POUNDS cyanide of potassium is an unusually large amount to use per ton of ore. Experience has shown that unless a portion of the cyanide in a strong solution is decomposed by bases in the ore, a much weaker solution would be more satisfactory in dissolving gold, as well as more economical.

✣✣✣✣

THE signal to blast in the shaft is 3–2–1. The engineer responds by raising the bucket or skip about 2 feet and lowering again to the bottom, showing he is at his post and ready to hoist. The miners then ring three bells, spit the fuses, get on the bucket and give the final signal, one bell, and are hoisted without delay.

✣✣✣✣

THE more common minerals of strontium are the carbonate and sulphate. Traces of strontium are frequently found in limestones. Metallic strontium is obtained by electrolysis of the fused chloride. It is yellow in color and is harder than lead. Strontium salts are used in the manufacture of fireworks and color the flame a bright red.

✣✣✣✣

WHEN panning material which contains gold in such fine state of division that on exposure to the air it will float on the surface of the water, the gold may be settled by sprinkling water on it with the hand in showers. Gold will not float if kept constantly wet. The same applies to other particles of mineral which float upon the water.

✣✣✣✣

THE hoisting engineer should place side marks on the reel of his engine to determine the exact place to stop the skip or cage, as the indicator is too distant to make its reading exact. On the ordinary columnar or circular indicator one-sixteenth of an inch difference in the position of the pointer may mean a foot in the shaft. This can be corrected by the side marks.

✣✣✣✣

SO FAR as "Concentrates" knows, lagging is never placed beneath the sills of drift sets for the purpose of preventing swelling ground from raising up the floor of the drift. When this difficulty has to be met, it is customary to cut away the encroaching ground and remove it. In some instances if this is not done, the ground will continue to swell until the drift is completely closed.

✣✣✣✣

IT is impossible to give an estimate of cost of stoping an ore body where only the dimensions are known. The character of the ore and of the walls would probably determine the method of mining, and the cost would be influenced by the amount of timber required, by the price of labor, cost of power if machine drills were used and whether or not filling is practiced. These and other factors are important in determining the cost of stoping.

✣✣✣✣

WATER TANKS may be built of a double thickness of 1-inch boards. The weight on each square foot of the bottom of a tank in which the water is 5 feet deep is about 310 pounds. The pressure against the sides varies with the depth of the water from nothing at the surface to 310 pounds at the depth of 5 feet. Particular care must be given the foundations to see that, should the ground beneath the tank become wet, the tank will not settle.

✣✣✣✣

THE weight of bell wires can be taken up by the employment of leaf or spiral springs near the collar of the shaft. They should be adjustable so that, when the line is pulled, the man giving the signal shall have only friction to overcome and not be obliged to lift the weight of the line. If this is not done, there will always be unsatisfactory signal service. Nothing is of greater importance about a mine than a perfectly operating bell service.

✣✣✣✣

THE occurrence of calcite in a gold-bearing vein can not be regarded as an indication of either the richness or poverty of the vein. Some rich mines have calcite in abundance, and some poor ones have calcite. The occurrence of gold in calcite and in marble is not of infrequent occurrence. This is known to be the case in a number of mines in California, notably at the Alvord mine and at the Carbonate mine in San Bernardino county, and the Golden Rule mine in Tuolumne county.

✣✣✣✣

BRITTLE GOLD may be refined by passing chlorine gas through it for several minutes when in the molten state. This converts the base metals present (usually lead, bismuth or antimony) into volatile chlorides, which pass off in fumes. Should silver be present, chloride of silver will be formed, which will float on the surface of the gold. To avoid loss of silver, the crucible should be dipped, before using, in a solution of borax. Borax should also be introduced into the crucible with the gold.

✣✣✣✣

A HALF-INCH plough steel hoisting rope is calculated to have a breaking strain of 11.4 tons, and for this rope the working lode is 2.28 tons. A ¾-inch rope breaks at 34 tons, and should not carry a working load exceeding 6.8 tons. A plough steel rope 1¼-inch diameter will break at 67 tons tension. For it 13.4 tons is considered a safe load. The greatest strain on a hoisting rope comes when the load is suddenly started or stopped. In some instances the strain is estimated to exceed ten times the weight of the load.

✣✣✣✣

ROPE transmission of power can be arranged around corners, across canyons or rivers, either up hill or down. Warm coal tar and linseed oil form a good lubricant for transmission ropes. It can be slowly poured onto the rope while passing over a sheave. To grease hoisting ropes, a hopper shaped, "split" box is made, having a round hole of suitable size in the bottom. The two sections of the box are secured about the rope, and after packing a piece of gunny sack in the bottom of the box, about the rope, the rope-grease, coal oil, or other material to be applied to the rope, is poured into the hopper, and the engineer then permits the skip, bucket or cage to slowly descend, the man at the box working the "dope" into the rope as it passes downward.

✣✣✣✣

TIMBERS may be protected from blasting in shaft sinking by providing suitable fenders, made of either green or dry pine—the former preferred. The fenders should have holes bored through them to correspond to the hanging-bolt holes of the wall plates. When these are to be put in position a short bolt is run upward through the holes of the fender and through the holes not occupied by the hanging bolts in the plate, when a washer and nut are screwed on the upper end of the bolt, the lower end having a square head "upset" upon it, to lessen the likelihood of injury by blasting. This end is also provided with a washer. If dry pine be used for fenders, it is a good precaution to run transverse bolts through the fender to prevent splitting.

✣✣✣✣

AMALGAMATING PLATES in quartz mills are porous, or should be to do good work. Cyanide of potassium solution renders them hard and brittle, and destroys their porosity, making them unsuitable for amalgamation. For this reason, where crushing is done in cyanide solution, but little gold can be amalgamated, although the cyanide brightens the mercury. Copper plates in good condition absorb mercury, and with it more or less gold of microscopic fineness. Most gold ores contain gold invisible to the eye without the aid of magnifying power, and doubtless some of it is almost atomic in size. It is gold of this class that is absorbed by copper plates, and this applies with equal force to silver-plated copper plates. The amount of gold absorbed by plates depends upon the character of the ore. Mill plates, over which a large amount of gold-bearing pulp has passed, are often worth hundreds of dollars in excess of their cost, owing to gold absorbed by the plates.

✣✣✣✣

AT inclined shafts the skip can be made to dump automatically in the head frame by providing a horizontal track for the forward wheels of the skip. The bale should be secured near the bottom or beneath it, and, as the engineer continues to hoist after the forward wheels have run onto the horizontal track, the rear wheels are lifted clear of the track, and the skip dumps when it has reached an angle exceeding 35°. A back stop should be provided for the front wheels to prevent them from running too far forward. Engineers become so expert that they can dump a skip where such arrangements have been provided in about three seconds, the skip barely coming to a state of rest before it is again descending the shaft. Care must be exercised that the rear wheels do not strike the rails with much force.

✣✣✣✣

REPLYING to an inquiry from Mojave, Cal.: "Raising" is directly the opposite of shaft sinking. It means the making of an upward excavation, either in ore or in the barren rock outside of the ore deposit. If the "raise" were continued to the surface it would become a shaft. "Stoping" is the removal of ore from the vein or ore deposit by blasting or by other means, and is used in contradistinction to raising, drifting and shaft sinking. Stoping that is carried on upward from a level is called overhand stoping; that which is done downward beneath the level is called underhand stoping. The latter is seldom employed except in small rich veins, or in forcing the output of a mine where ore is scarce. The dip of a vein is at right angles to its strike (horizontal direction) and can be easily ascertained by placing a clinometer on one of the walls.

✣✣✣✣

A COMPANY or corporation can only take as one claim 160 acres of placer ground, but may take as many claims of 160 acres each as they desire to perform assessment work upon. On a company claim of 160 acres the annual assessment need not be done upon each twenty acres of the tract, but may be concentrated at one place, and $100 worth of work will hold the claim of 160 acres located by the company. In December, 1898, the General Commissioner of the Land Office issued the following decision: "Under the United States placer mining laws one person may make a single location containing twenty acres of placer mining land; two persons may make a single location, containing not more than forty acres in a compact body; three may locate sixty acres, etc., but no single location, whether made by eight persons or more, can exceed 160 acres. It has been decided that a single location of placer mining ground may embrace 20, 40, 60, 80, 100, 120, 140 or 160 acres in a compact body, according to the number of locations. If eight persons should make eight distinct and separate locations of twenty acres each, and seven of the locators should convey their claims to the other, it would require annual assessment work of the value of $800 to maintain the possessory right to all of the claims; but in the case of a single location, embracing 160 acres of placer mining land, the owner thereof, in order to maintain his possessory right thereto, would not be required to expend $100 worth of mining labor on each twenty acres thereof, but his possessory right to the entire 160 acres might be maintained by performing thereon $100 worth of actual mining work, designed in good faith for the improvement of the 160-acre location as a single mining claim."

✣✣✣✣

TO FIGURE the cost of any particular mining operation, or the expense of operating any particular department during a stated time, a system of bookkeeping is necessary, in which the expenses are segregated into individual accounts. In the cutting of a station at the shaft and the driving of a level an accurate account of everything used on that level should be kept, and charged in the books to that account. The number of pounds of powder, number of feet of fuse used, number of caps, number of candles (or other illuminant) required, amount of timber put in, cost of chute door and appliances, ventilating pipe, compressor pipe, rails and ties for track, timber in drifts, etc., timber in ore chutes built on level and other essentials in the construction of the same, cost of all labor, which may or may not be segregated, according as the system of bookkeeping is elaborate or not—all should be charged up. There must also be charged to this level its share of ventilating expense, compressed air (if it is used), blacksmithing and repair of machine drills, hose used, etc., also hoisting pro rata relative to other levels, and also superintendence. When the level is abandoned it should be credited with rails, pipes, timbers, etc., that may be removed and used elsewhere. It is only in this way that a detailed statement of costs can be obtained. In the milling department the same careful segregation of accounts must be carried out. It includes tons of ore delivered at mill (some managers charge tramming to mining expense account, and others to the mill, but if it constitutes a large item of expense it should be made a separate charge), cost of power, lubrication, light, water, repairs, quicksilver, chemicals, fuel, shoes and dies, belting (or transmission ropes), insurance, and miscellaneous supplies, besides labor, which may or may not be segregated. The principal thing is to first properly segregate the various charges to their proper accounts. This having been done, the system becomes simple and of service for comparison.

A Number Scheme for Mines.

Written for the MINING AND SCIENTIFIC PRESS by MATT W. ALDERSON.

In the opening of a new mine, where one sinks on the vein, a level will probably be run at 100 feet and, when stoping commences, chutes will be put in for convenience of handling the ore. These chutes are generally numbered, that time may be saved in referring to their location. Later the shaft is continued to lower depths and the numbers given the chutes are frequently a continuation of those used above. As the levels above are extended and new chutes put in these also are numbered, and the writer has been in a mine where chute No. 18 was on a level several hundred feet below the surface and chute No. 36 on the 100-foot level, with numbers of smaller denomination.

Such a system, or lack of system, becomes in time confusing. One needs a system susceptible of expansion with the development of the mine in whatever direction that work may lead. It is customary in most mines to establish levels at every 100 feet. This is a good plan and, even where a survey may show a level is at 483 feet instead of at 500, it is the part of wisdom to call it the 500-foot level. The idea of numbering the levels in this way is certainly excellent. It is simple, expressive, and allows for expansion to whatever depth the shaft may be driven.

In development work, where one drives on the vein aud pay is continuous, chutes are frequently placed 20 feet apart, that having been found by experience to be a very convenient distance. In making a raise between two such chutes the ore will run easily to one chute or the other if the dip of the vein is sufficient; and, where it is not, 10 feet is about as far as the miner can shovel the ore to advantage to reach the runway.

Commencing, therefore, on the 100-foot level, I would number the first chute 102, the second 104, the third 106, etc. This system has the double advantage of telling the level on which the chute is located and its distance from the shaft. Thus the first figure is always the number of the level and the two figures following are a key to the distance from the station on that level. By adding a cipher to them we have the approximate distance from the starting point. Thus 136 means on the 100 foot level and 360 feet from the station.

In numbering in this way only the even numbers are used for chutes, the odd being applied to the raises or stopes, the raise above the chute receiving the number immediately preceding that given the chute.

In the course of development the vein is apt to be opened both ways from the shaft, crosscuts will be run, and parallel veins developed. How then? The simplest way is to give each vein a letter and to consider each veiu as an individual vein from the station or a base line corresponding thereto. Thus a chute on the first vein may be numbered 122A as we find ourselves going in one directiou from the shaft. Going in the other direction, the letter B may be used after the number. All the letters in the alphabet may be set aside for numbering different veins except the letters I and X. It is preferable not to use I, because it may be confounded at times with the figure 1. The letter X should be used for crosscuts.

In the development of a mine the level may come to where the vein forks. Suppose this is at 346B. The chutes on the hanging wall side should be continued and lettered B. Do not refer to one as the hauging wall vein and the other as the foot wall vein, but give each a letter, and do not commence the numbers on the foot wall vein with 302, but with the distance from the station, regardless of the fact that the vein is not continuous to that point.

Where a crosscut is run some distance from the shaft, from one vein to another, the numbering on the new vein should not commence from the crosscut, but from the base line, as, even if there is no knowu ore in the direction of the shaft, it may be found there some day, in which case the numbers are available. Again, if numbers commenced from the crosscut, they would not correspond with the numbering of other parts of the mine. In the same way it is well on a property developed by a tunnel to commence the numbering from the surface or station on the lowest level, then on the upper levels to use that as a base line, instead of making the numbering of each level start from the surface and be independent of those on the levels below.

This system provides for 980 feet along a vein. Thus 598B means the chute 980 feet from the station on the 500-foot level of the B vein. The next chute should be numbered 500BB, and, as each succeeding 1000 feet are run, another letter is added, after the first three or four letters the additional letters being preferably expressed by a dash and number, thus: 528—5B. Thus a number followed by one letter means that the chute referred to is within the first 1000 feet from the station; followed by additional letters, it is within the 1000 feet area corresponding to the number of letters.

In most veins the ore occurs in irregular shaped bodies, with intervening spaces barren of ore or with ore too low grade to pay to work. Wherever it may be deemed advisable to make a raise the number is ready for that particular place. Then, if development shows that the pay ore extends back over the level where no pay was supposed to exist, and a raise is made up through barren ground to the ore, the numbers for that raise and the chute below are available.

Sometimes veins are so wide for a considerable distance that more thau one row of ore chutes may be deemed advisable to handle the ore easily. Suppose this to be on the D vein. Let the row of chutes on the hanging wall side be lettered D and the rows towards the foot the letters following.

Crosscuts are numbered the same as the chutes. Thus, suppose we have a crosscut on the 400-foot level, 240 feet from the station, between the B and C veins. It would be numbered 424BCX.

In this day of improved business methods everyoue who has the handling of a number of men appreciates the value of system, and of one having as little machinery as possible. In the system above outlined every figure and every letter used means something; there is nothing superfluous and the figures of one level always correspond with those above and below. The system is adapted to the needs of the smallest or the largest mine, providing for twelve parallel veins, both directions from the base line, as many veins as are likely to be developed from one working shaft, and for development horizontally along any or all of said veins for any distance it may be deemed advisable to drive.

Undercurrents for Saving Flour Gold and Platinum Sands.

Written for the MINING AND SCIENTIFIC PRESS by DENNIS H. STOVALL.

Sincc the discovery that the old channel placer diggings of northern California and southern Oregon contained much fine or flour gold, aud the more recent discovery that they also contained platinum concentrates and sands in considerable abuudance, much attention has been paid by the miners to the matter of methods for saving these values. A system of undercurrents attached to the sluice boxes has been found by many to be the best method for saving flour gold and black sand. The best system that the writer has found in his rounds of the southern Oregon placers is that in use at the Royal Group hydraulic mines of Galice district. Manager J. R. Harvey of these placers has given much of his time to this work alone, with the result of having a system of undercurrents that practically saves all of the flour gold and platinum concentrates.

The accompanying photograph shows a part of an undercurrent as attached to the sluice box. The sluice box itself is supplied with a full complement of riffles, there being first a long bedrock race cut across the diggings which catches all of the nuggets and coarse gold; then the sluice boxes are reached with, first, a system of standard steel riffles, followed by block riffles, all of which can be easily lifted and rinsed, leaving a smooth floor to clean from at clean-up. The undercurrents set near the end of the sluice boxes. About one-half of the flow of water is drawn down through a ½-inch grizzly in the bottom of the sluice. The dropping of this water through the grizzly creates a suction and carries down with it all of the black sand and flour gold that would have otherwise went on over the dump with the waste water and boulders. The water drawn off is first spread out over a broad riffle table, as shown on the left in the photo. This table is about 10 feet wide and 13 feet in length. Here the coarser particles and much of the flour gold settles. This flour gold and the platinum sand acts very much like coffee grounds when stirred—they will not settle so long as they are disturbed. For this reason they are easily drawn off, and the problem then resolves itself into the question of how to settle them.

Undercurrent in Oregon Placer Mine.

After the sands pass over this first undercurrent they are carried further and dropped into a hopper and run through a steel screen with ¾-inch openings. Everything larger than ¾ inch in diameter passes over this screen and is lost, but these are usually only small pebbles, as the gold particles of that size are caught long before, and the platinum particles are all smaller in size. Everything that runs through this screen is spread out over a riffle of cocoa matting. This riffle table is arranged in divisions so that each strip of matting can be lifted up and cleaned when covered with sands, the water being turned on the other divisions.

The sands that are caught on the cocoa matting riffles are worth from $140 to $170 a ton, the values being about equally divided betweeu platinum and gold. The sands that are found on the "old channel belt" of southern Oregon and northern California, recently described by the writer in the MINING AND SCIENTIFIC PRESS, are not what are commonly known as "black sands." They are a black sand in one sense, but they are more than that—they not only carry platinum and gold in the free state, but in combination also. They are largely refractory and contain all of the metals of the platinum group.

W. F. Smith, a representative of the Welsbach company of Philadelphia, has been experimenting and working in the placer diggings of the old channel placer belt of northern California and southern Oregon for over two years past. He has found that platinum conceutrates and flour gold occur in quantity all the way from Happy Camp, Cal., to Rogue river, southern Oregon. His company put in undercurrents in the Waldo placer mines of southern Josephine county last year and saved several tons of platinum sands. The company, or a department of it, knowu as the Waratah Minerals Co., is uow installing a plant at the Royal Group mines on Galice. This plant will be equipped with a mill and concentrating tables for treating the sands after they are taken from the uudercurrents.

The manager of the Royal Group mines estimates that his undercurrents pay the running expense of his mine, leaving the gold a clear "pick up." They do not interfere with the regular process of gold mining. The same results could be obtained at a number of placer mines in northern California and southern Oregon, where undercurrents are not now in use.

Platinum concentrates have much the appearance of coarse gun powder. They are not black, but are a dark steel gray. Their metallic luster is easily discerned with a close examination.

A Colorado Placer Mine.*

One of the up-to-date placer mining plants in Colorado is that of the Oro Grande Placer M. Co. at the junction of Blue, Snake and Ten-Mile rivers, near Dillon, in Summit county.

The water rights consist of 5000 inches from Snake river and the same amount from Straight creek. The Snake river ditch is 9½ miles long and carries 2500 inches. The Straight creek ditch is 1½ mile long and carries 1000 inches. The water is brought from the pressure box through 8000 feet of 54-inch riveted steel pipe and 1000 feet of 24-inch pipe to two elevators, and through 1000 feet of 16-inch pipe to one elevator. The fall is 520 feet to bedrock. The working pressure is 220 pounds. Two of the elevators, which are on bedrock, lift 99 and 100 feet respectively. When the sump is finally made in bedrock the lift will be 105 feet for both elevators, which is said to be uext to the highest lift in the world. The elevator discharge pipes are 16 inches in diameter to the elevators, and the supply pipe to the elevators is 15 inches in diameter, using 12-inch throat and 5-inch jet in both. The depth to bedrock is 79 feet from the surface of the ground.

The pit (see illustration) is 350 fect in length and 250 feet wide. The flumes are 100 feet loug, fitted with 3½-inch angle-iron riffles over cocoanut matting. The larger percentage of the gold is caught in the first 40 fect, includiug that which will pass 120-mesh. The floor of the flume is 19 feet above the surface of the ground. The tailings go into Blue river, and the high water in the spring, thus far, has carried off a large amount of same. The

*See illustration on front page.

large rocks in the pit are removed by means of a gravity tram, automatic dumping, operated from 110 feet steel-girder derrick. It is the intention of the company to install a specially designed steam shovel for removing rocks. T. D. Harris is manager of the company and F. R. Blount of New York is president.

The Machine Drill in Mining.

The employment of machine rock drills in mining operations is becoming more general everywhere. Formerly machine drills were only introduced at a mine after the value of the mine had been actually proven by hand work, but it is recognized that the cost of prospecting and development may be lessened materially by the use of rock drills to as great an extent as in the operation of the mine after a large amount of exploratory work has been done. Not only is the cost per foot lessened by the use of machine drills, but time is saved in performing any work, whether drifting, stoping, sinking or raising.

Fig. 6.—For Final Blast.

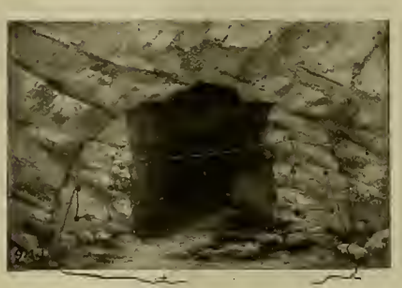

Fig. 7.—In Position to Blast Curtain Walls and Sides.

Time saved is capital saved, and the greater the amount of money invested the more important is the element of time.

It is a good plan to provide a small compressor and drill plant for prospecting and development work, the plant to be increased later if the mine justifies such additional expense.

It were useless to make any comparisons between mining operations in widely separated regions, and such comparison is almost as unreliable in the same district, but it is generally safe to say that in a hard rock country any considerable amount of mining work done by hand could have been more quickly and cheaply done had a machine drilling plant been provided, and the work done by experienced men. It is not essential that the rock work should be under ground to make machine drills advisable. Quarries can use them to great advantage, and it is a question if there is not as high a percentage of saving in the use of machines in outside work as under ground.

In the employment of machine drills, in order to derive the greatest benefit and thereby make the greatest saving of time—which means money—it is essential that the miner running the drill be carefully instructed in its use if he has not already had that experience. He must also be a good judge of "ground," and understand placing the drill holes to advantage. However, this last qualification is not so essential as a knowledge of the machine, and how to handle it, for this latter is always important, while in most instances the drill holes are put in systematically without reference to the slips and seams, grain or rift of rock, which are so important in hand mining. Generally it may be assumed that a miner who is experienced in hand drill mining will place his machine holes to better advantage than a first-class machinist who, thoroughly understanding the machine drill, knows little of rock blasting. The illustrations in this article are furnished by the courtesy of the Ingersoll-Sergeant Drill Co. of New York.

Fig. 1 shows a column bar with two machines mounted thereon. It also shows the manner of pointing the holes as viewed from the side. Fig. 2 shows the position of the holes as viewed in plan. The center is known as "the cut" or "key block," and the side holes are driven in what are sometimes called the curtains. Holes driven straight into a face of hard rock never prove satisfactory, and can be broken by the strongest nitro powder only after being repeatedly fired. Pointing the holes as shown in Fig. 2, the center holes should be shot first and the side holes either immediately after or after cleaning up the rock broken by the first holes—usually the former.

This is accomplished by one of two means. Either the several fuses are cut of such length that the holes will be exploded in the desired order, the hole

Fig. 8.—Connecting up and Firing a Series of Holes in Open Quarry Work.

with the shortest fuse going first, followed by th others in the order of their respective length of fuse, or by means of the electric blasting outfit. All miners are familiar with the first method, which is identical, whether for hand or machines drill holes. The electric battery exploder is coming into more extended use. The cartridges used are those of any nitro powder company, in every respect similar to those used in hand or machine drill work, the difference being in the cap or exploder. This is prepared for the express purpose of firing blasts by electricity, and is illustrated in Fig 3. The exploder consists of a shell of copper, A, partially filled with fulminate of mercury, B, which is sealed in the tube by sulphur cement, F. Through this plug, and projecting into the fulminate, are the ends of the two exploding wires, C, across the ends of which is soldered a short, thin platinum wire, E. This is placed in a hole punched in the nitro powder cartridge and the farther ends of the wires connected with the "push" blasting machine. This machine is contained in a strong wooden box. It consists of a powerful electro-magnetic generator operated by a rack.

When the holes have been drilled and loaded with the powder, including the cartridge containing the electric exploder, the holes are tamped, the wires connected with each other throughout the series and the leading wires are taken back and connected with the battery. When all is in readiness the man who is to fire the holes, being at a safe distance, grasps the handles of the battery and pulls them slowly to their full height. He then pushes down, at first slowly, but with accelerating speed until the rack strikes the bottom of the box, when, if all things have been properly arranged, the holes will be fired.

Fig. 4 illustrates a tunnel heading ready to blast, with the electric wires connected to those holes (the cut) which it is desired should go first. Fig 5 shows the curtain holes ready to blast, and Fig 6 shows the heading after Fig. 5 has been fired, and is wired for blasting the side holes. Fig 7 illustrates both curtain and side holes wired ready for firing, and Fig. 8 illustrates the manner of wiring up a series of holes in a rock quarry where it is desired to displace a large mass of rock and to break it along a given line.

In shaft sinking generally, and in drifting when it is necessary to carry the timbering close to the face, it is not advisable to fire all of the holes simultaneously, as it may damage the timbers by the heavy discharge of flying rock, and also by the effect of the concussion.

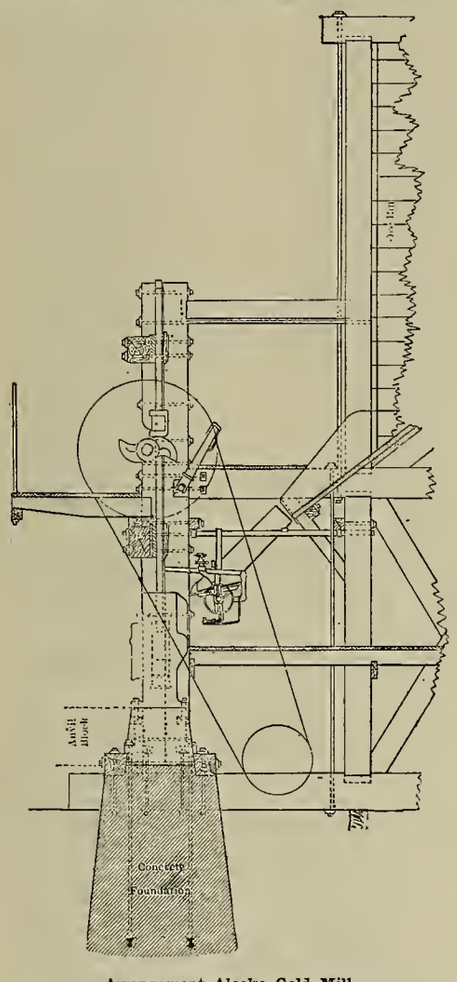
Machine drills are made to meet every requirement of modern mining, and range from 2-inch pistons up to 5½ inches. In stopes, cut in moderately hard ground, the smaller machines are found to answer admirably.

Milling on Douglas Island, Alaska.*

Written by R. A. Kinzie.

The ores on Douglas Island are peculiarly adapted to the methods of extraction in use. The gold is contained in altered syenite in the form of free gold and in the sulphides, the principal gold-bearing minerals being pyrite, arsenopyrite, molybdenite and calcite. The ore on the surface has been subject to little oxidizing action, and that on the lowest level is more free-milling than that in the surface pits. It has been found that 48.04% of the gold is caught on the plates by amalgamation and the balance is contained in the sulphurets and tailings.

The crushers are placed in the head frames of the various mines and are of the gyratory type. When the ore is hoisted out of the mine it is spilled by self-dumping skips on a grizzly formed by 1-inch by 10-foot pieces of iron, bolted together by 1-inch iron bars and placed 2 inches apart by disc-shaped pieces of cast iron. The over-size from the grizzlies goes to the crushers and the under-size passes through into the ore bins beneath the crushers.



Too much stress can not be laid upon the effect of efficient crushing as related to the duty and output of a stamp mill. This is particularly true on the island, where the crushing capacity is in excess of the demand and where there is abundant water power, which costs practically nothing. During the past year the duty of the mills has been increased over one ton per stamp in twenty-four hours, and, without doubt, 50% of this increase has been caused by setting the crushers to break the rock 20% smaller. An efficient crushing plant for mines similar to the Treadwell would consist of four Gates crushers, arranged in pairs, one above the other, the upper to be of such a size that they would receive rocks 18x36 inches, and the lower to turn out a product not larger than 1½ inch in diameter. The rock, when hoisted, would be dumped on grizzlies with 5-inch spacing between bars, the over-size going to the upper crushers, the under-size falling on a second grizzly with bars set 1½ inch apart—over-size going to the lower pair of crushers and under-size passing into the storage bins. The product from the upper pair of coarse crushers to be spilled on a grizzly with bars 1½ inch apart, the over-size going to the lower crusher and the under-size and crushed product from the lower crushers falling into the bin. If the above method were used it would do away with a great deal of the "bulldozing" in the mines, making appreciable reduction in cost of mining.

There are three different methods in use for conveying ore from the crusher bins to the mill ore bins. At the Treadwell small locomotives are used, draw-

*Abstract Trans. Amer. Inst. Min. Engrs.

ing trains of six cars, each car holding 2½ tons. At the Mexican, where the crusher and mill are practically under one roof, the 2½-ton cars are pushed by hand; while at the Ready Bullion the ore is handled by a gravity tram operating a train of four 2½-ton cars, the cars being returned by means of a small winding engine at the crusher bin. The tracks from the crusher ore bin are continued along the top of the mill ore bins, so that the ore can be dumped directly from the cars into the bins.

In the 300 and 240 Treadwell stamp mills the stamps are arranged back to back, and the bottoms of the bins are made in the shape of an inverted V, so that the ore will be equally divided and fed uniformly to the stamps on either side. In the other mills, where the stamps are arranged in a single row, the bottom of the ore bins, from a point 8 feet below the

Arrangement Alaska Gold Mill.

track, is given a slope of 45° to the open ore chutes at the level of the cam floor. The bins are double-boarded, and on the side next the stamps are lined with ¼-inch steel plate to protect them from the scouring action of the rock. From the bins the ore is taken out by openings at the level of the cam floor and conveyed by chutes to the hoppers of the Challenge feeders. The 300-Treadwell, Ready Bullion and 700-Foot mills are provided with suspended Challenge feeders. Both types are central feeders, the bumper rod being placed next to the central stamp, guided in the usual way.

There are three kinds of mortars in use on the island. The 300-Treadwell, Ready Bullion and 700-Foot mills use Fraser & Chalmers' No. 67–A type; the Mexican uses the Fraser & Chalmers' No. 67, while the 240-Treadwell mill uses a special mortar. End and side liners are used in all the mills, aud false bottoms are used, except in the 240 Treadwell mill, where the die rests on the bottom of the mortar. The false bottoms and liners are cast at the company's foundry. The false bottoms consist of a piece of cast iron 3 inches thick and of the width and shape of the flange portiou of the die. Their object is to protect the bottom of the mortar from excessive wear.

The stamps in the 300–Treadwell, Ready Bullion, Mexican and 700–Foot mills weigh 1020 pounds, while those in the 240–Treadwell weigh, when new, 850 pounds. The stems, tappets, boss-heads and shoes are joined in the usual manner. A shoe lasts three months and crushes 489 tons of ore, which means that 0.27 pound of iron is consumed per ton of rock crushed. The dies are cast at the company's foundry and last ou an average 4.49 months, crushing 732 tons and consuming 0.16 pound of iron per ton crushed.

There is no part of a mill so essential to its efficiency as a good mortar foundation. There are two kinds used on Douglas Island. The Ready Bullion, 700–Foot and the 300-stamp mill at the Treadwell have concrete foundations, capped by cast iron anvil blocks, while the Mexican and the Treadwell 240-stamp mills have the ordinary wood foundation.

On account of the peculiar climatic conditions at Douglas Island, the life of a wooden foundation of the best Oregon or Douglas fir has been about six years. It then commences to rot, causing the mortar bolts to loosen, which results in an uneven wearing of the top surface of the block. The life of the mortar block can be prolonged from six months to a year by planing down the top and leveling it by placing strips of rubber belting between the mortar block and the mortar, in case the decay has been confined to the surface, while the interior of the block remains sound. The blocks are built in the usual way, with four pieces of Oregon pine, 1 foot 28 inches by 26 inches, bolted together by iron bolts. The holes for the auchor bolts are drilled into the mortar block from above, at distances apart corresponding to those on the flange of the mortar. At a distauce of 4 feet below the top, holes are cut to receive the nuts and washers that secure the lower end of the bolts. It is evident that when the decay of the wood penetrates to, say, a depth of 4 inches, there is no longer a secure fastening for the mortar and the mortar block becomes useless. If a 2-inch iron rod be passed through the ends of opposite mortar bolts and through the block, the life of the foundation will be prolonged from two to four years. The best wooden block is oue built up of 2-inch plank, bolted and nailed together, and the mortar bolts fastened as above.

Fig. 1 shows the character of foundation used in the newer mills. Soon after the mills were started it was noticed that the edges of the concrete next to the mortar showed signs of crumbling. The mortars were then raised and a sheet of ¼-inch rubber belt inserted between the mortar and the anvil block. This lesseued the crumbling, but did not stop it, and during the third year full one-quarter of the mortar blocks in the mill had their anchor bolts broken off at the point of contact of the concrete and the anvil block. In nearly every instance, on removing the anvil block, it was found that when the foundation was installed, instead of surfacing up the concrete to the correct level, it was allowed to set; then cement was poured in between the anvil block and the already hardened concrete to raise the foundation to its proper height and level. This caused a plane of weakness and consequeut crumbling, resultiug in the breaking. The above condition might be remedied in the first instance by properly finishing the concrete and making it 8 inches wider on either side thau the bottom of the anvil block, as shown in Fig. 1. With the above exceptions, the concrete foundation with the anvil block has answered the purpose for which it was designed, and, with a few minor changes, it is preferable to the wooden foundation, under the conditions existing on Douglas Island.

(TO BE CONTINUED.)

The Metallurgy of the Homestake Ore.*

NUMBER III.—CONCLUDED.

Written by C. W. MERRILL, B. S.

The cupel slag and the cupel bottom are put through the blast furnace, the lead content of the slag reduces to lead, which absorbs the values, and is drawn from the lead well in the usual manner. This lead is returned to the cupel at the next clean-up, the litharge from the cupellation goes to the next precipitate, aud the blast furnace slag is worth less than $5 per ton.

The total cost of this refining amounts to less than ¾ of 1%; so that the Homestake Co. realizes $20.52 per ounce for its cyanide gold, less the usual U. S. Assay Office charges on dore bullion, and the expressage to New York. These charges amount to between 10 and 11 cents; and the net realization per ounce of fine gold precipitated is thus $20.42 in New York exchange. A parting plant is now contemplated, which will make a further saving in this connection and enable the company to turn out fine gold and fine silver.

TONNAGE, PERCENTAGE AND COSTS.—Tonnage: The maximum monthly tonnage of this plant—which is ascertained by placing cubic-foot boxes in many parts of various vats, determining the dry weights per cubic foot of sand and averaging a large number of such determinations—was attained in October, 1902, when 40,236 tons, or 1298 tons per day, were treated. This gives to the Homestake Co. the largest sand treatment cyanide plant in the world; the next largest being, to the best of my knowledge, that of Simmer & Jack in South Africa.

Percentage: As a comparison of the various assay determinations and valuations with the bullion produced is always of interest, the following figures for the last half of the year 1902 are given:

Extraction.—The extraction, as shown by the difference between charge and residue assay multiplied by the tonnage, was $292,579.

Precipitation.—The precipitation, as shown by the difference between assays of unprecipitated and precipitated solutions multiplied by the solution tonnage, was $301,233.

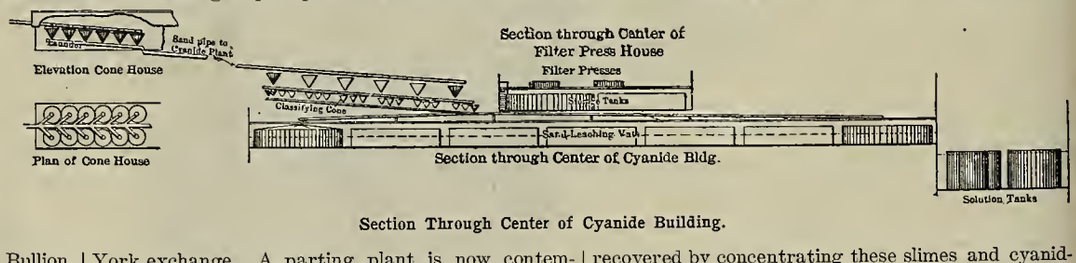
Gold in Precipitates.—The amount of gold in precipitates, that is, the assay value of the precipitate sampled upon removal from the presses, was $302,-895; the gold value of bullion shipped, $307,635, and the silver value, $2874.

The average percentage recovered in bullion by the treatment for these six months is 74.7%.

This is not as high a percentage of bullion as should be recovered from a porous or oxidized ore, or one in which the values are along cleavage planes; but, in view of the facts that such a high percentage is recovered by amalgamatiou, that the values are very finely disseminated in the Homestake ore, and that the tailiugs are very low-grade, we feel, and all our tests so far have verified our conclusions, that it is the ecouomic percentage, yielding the maximum net profit.

Mauy tests and experimental runs of the plant, looking toward a greater net yield, have been made, covering longer treatment, stronger and weaker solutions, extra oxidation with sodium and barium dioxide, and other similar reagents, varying alkalinities and alkaline reagents, etc. The question of separate treatment of concentrates and coarse sands has also been investigated, all with negative results. The conclusion of the writer iu regard to this latter point is that, even if a higher net yield could be realized by separate treatment, which is contrary to the results of all our tests, a much greater proportion of the fines (passing 200-mesh screen) would have to be thrown off aud wasted, entailing a serious net loss.

Costs: As to operating costs at the Lead cyanide plant, the followiug are the averages per ton for the year 1902, during which the average value of the material treated was $1.65 per ton:



Classification—Labor and Supplies		$ .017
Treatment—		
Cyanide	$ .152	
Labor	.030	
Lime	.022	
Supplies	.005	
	$ .209	.209
Precipitation—Labor and supplies		.026
Power—Labor and supplies		.051
Water		.026
Assaying—Labor and supplies		.013
Refining—Labor and supplies		.006
Miscellaneous		.005
Total		$ .353

As compared with the above, the lowest costs I have seen authoritatively stated for other plants are as follows:

City & Suburban, South Africa	$ .55
Geldenbuis Estate, South Africa	.605
Geldenhuis Deep, South Africa	.62
Robinson, South Africa	.62
Worcester, South Africa	.72

The African costs refer, of course, to operations before the late war between England and the South African Republic; but they are the only figures available to me, and I do not think they have been reduced materially siuce.

As regards the Homestake slimes, which are not at present being treated, their assay value ranges from $0.80 to $1.10 per ton, which is very much lower than that of any slimes now being cyanided elsewhere, and which does not offer much inducement to undertake their hydrometallurgical treatment as a whole. It is the writer's judgment, however, that a material profit, greater than that attainable by any method of treating the whole bulk of slimes, may be recovered by concentrating these slimes and cyaniding the concentrates so obtained; and experiments on a workiug scale will shortly be undertaken along these lines.

Section Through Center of Cyanide Building.

*Read at Am. Min. Congress, Lead City, S. D., and to be read at Oct. meeting Am. Inst. Min. Eng., New York City.

To "square a circle" is to construct geometrically a square equal in area to a circle of given diameter, or to state in terms of its radius the exact area of a circle, a problem shown by modern research not to admit of a vigorous solution, says the Standard Dictionary.

Electricity in Gold Extraction.

The gold with which we are most concerned is that which occurs in metallic form in quartz and quartziferous rocks, accompanied only by the usual impurities, such as pyrites, mispickel, etc., says the Electrical Review, and alloyed with small quantities of silver, platinum, rhodium, etc. Copper and lead ores in which it is present are best left for discussion when dealing with these metals.

The Classification of Gold Ores.—The gold ores can be conveniently divided into two classes: (a) "free milling" and "alluvial" ores, and (b) "refractory" ores. These two classes sometimes overlap, as, for instance, when it becomes necessary to treat an ore by an amalgamation process and the tailings from this process by a subsequent chlorination or cyaniding process. The washing and amalgamation of free milling and alluvial ores are both simple and inexpensive matters, and in all probability the only difficulty that electricity can ever be made to overcome has already been successfully met by the Molloy process, in which the mercury is used as a cathode in dilute sodium sulphate. By this means a "film of hydrogen" is formed on the mercury, or, perhaps, it is more correct to say that a small quantity of sodium is deposited into the mercury and any oxidation of its surface consequently prevented, so that the prevention of "sickening" is successfully accomplished, the surface remaining bright and more easily catching up and retaining the fine gold. If the price of sodium metal falls sufficiently, it is possible that the more direct means of keeping the mercury bright by simply adding sodium to it will again be resorted to.

Processing Refractory Ores.—The case is somewhat different with regard to refractory ores or tailings which have refused to give up a large proportion of their gold to the amalgamation plates. In the ordinary way two courses are open for the treatment of such materials—they must be chlorinated or cyanided. If they are chlorinated, a somewhat complicated plant is required and the chlorine has itself to be made, which is a fairly expensive matter in districts where it is usually carried on. The ore is then leached and the resulting dilute solution of gold reduced by charcoal, sulphurous acid or ferrous sulphate, methods in themselves efficient and satisfactory, but somewhat cumbersome.

The Work of the Electrician.—A fair amount of attention has been given by the electrician to this part of the problem, but as a rule it has seemed as though the position of affairs had not been fully understood. As already pointed out, a really free milling ore is better left to the devices of the gold miner, and the electrician need only turn his attention to the refractory ores. In many electrolytic processes the ore is stirred up in a vat with a solution of common salt. Carbon anodes are continually agitated in this mud and serve to liberate chlorine, which immediately acts upon the gold and dissolves it. The cathode is of mercury and is intended to catch all gold reduced into it from the chloride of gold solution in the vat. There is reason to believe that all gold which is naturally sufficiently finely divided, together with any float gold, is largely chlorinated and voltaically reduced. The bulk of mud being treated by such a method is, however, very large. There may be, for instance, several tons of mud being continuously stirred and electrolyzed for a long period of time in a complicated and expensive apparatus, involving large wear and tear and unavoidable loss of mercury. For this reason this method has not attained to much commercial importance.

The Cyanide Process.—The other way of dealing with a refractory ore is by the cyanide method. Here is an almost perfect process in which electricity, although not essential, may be employed to make it more perfect. The main disadvantages in the cyanide process are the excessive time required for the cyanide to dissolve the gold, the poisonous nature and the high cost of the cyanide. The excessive length of time required for the dissolving is to some extent accounted for by the fact that air is required in the reaction, oxygen or some other oxidizing agent, in fact, seems to be necessary, and on a small scale it is possible to hasten the reaction by the use of some such oxidizing agent as bromine, but in practice it does not appear practicable. A very weak solution, indeed, is theoretically needed to dissolve the gold from an average ore, say 0.005% or less, but in practice it is found necessary to use 0.05% cyanide to dissolve the gold. Even this is too weak to enable the zinc afterward to precipitate the gold from the solution, so that it is found necessary to use five or even ten times as much cyanide for this reason. On the Rand, in South Africa, a solution of about 0.3% cyanide is generally used.

Electrical Reduction.—Attention has been directed to the electrical reduction of gold and regeneration of the solution with some degree of success, the solution being made to pass slowly between the electrodes, the gold being plated onto the cathode in the ordinary way. Out of the several processes devised for this purpose one of the most successful has been that of Siemens & Halske. In this process iron anodes and lead cathodes are used. When the cathodes are sufficiently coated with gold they are expelled for the precious metal. One of the advantages of electrical processes over the ordinary methods is that they enable a much weaker solution of potassium cyanide to be used than is necessary for the spontaneous precipitation of the gold by metallic zinc, and the strength of the solution may then be influenced only by that necessary for dissolving the gold from the ore, thus saving a considerable loss in cyanide. The electrical method of precipitation is gaining headway in South Africa and in New Zealand. According to A. von Gernet, the cost of electrical precipitation for a plant on the Rand, treating 500 tons of gold ore per day, is as follows:

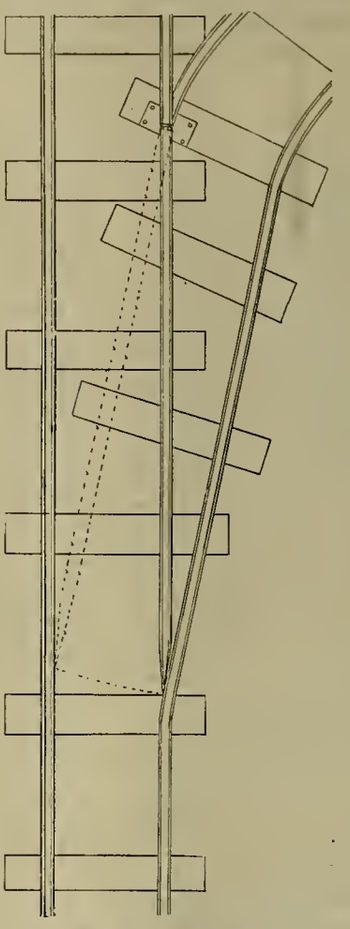
	Pence per Ton of Ore Treated.
Cyanide	3.4
Filling	10.0
Fuel, power and lime	4.5
Labor, native and white	6.9
Lead and iron	1.8
Charge due to extra cost of plant	0.5
Stores and general	3.2
Total	30.3

According to another authority, as much as 99% of the total gold in the solution can be separated on the cathodes, and a strength of 0.5% cyanide (provided that there is no cyanicide in the ore) is sufficient to dissolve the gold at a reasonable rate. The current density generally stated to be most desirable is from 0.03 to 0.06 ampere per square foot of cathode surface and the voltage from four to six volts. The time required to deposit the whole of the gold held in solution seems to vary considerably, according to the efficiency of the circulation of the liquid, but Cowper-Coles, by his process, claims to have deposited from a 0.01% solution of potassium cyanide, containing 2.5 pennyweights of gold per ton, 95% of the total in ten hours, the rate of flow of liquid being fifteen gallons per 100 hours for every cubic foot of cell or 3 square feet of cathode surface.

Electricity in the Cyanide Process.—Many suggestions have been made for aiding the dissolution of the gold in the cyanide by electrical means, but the fundamental principle upon which they are based is weak. It is an obvious impossibility to bring any reasonable proportion of the fine gold into contact with an anode, however it may be constructed, and the mere passing of the current through the mud, and thus using the small gold particles as "intermediate" or "secondary" electrodes, can not be expected to help matters at all, since, the particles being so small, the current would prefer to go round them to passing through them, and thus would be of no service. Even if a small proportion did go through these particles of gold, the efficiency of the process would be almost nil.

Home-Made Oil Filter.

In small plants where the owners do not think they can afford the luxury of an oil filter, a very satisfactory filter can be made from the following directions: The accompanying drawing represents an oil filter which the writer made for use in a plant which needed one. The tank was of galvanized iron, 14



Home-Made Oil Filter.

inches in diameter by 30 inches long. A is a shallow tank made to fit inside of tank B, with a slanting bottom into which the tube C is soldered, the latter being 1¼x19½ inches. D is a perforated tin plate, and E is a layer of felt of the same size as the plate Cock F is placed 14½ inches above the bottom of the tank and is to draw the oil, and cock G is to drain the tank when necessary.

In action the oil is poured into the receiving tank A, where it drains through the felt and screen, and flows down the inside of the tube C. Passing out from the bottom of the tube the oil ascends drop by drop to the surface of the water surrounding tube C. The water level is kept constant by means of the overflow pipe H, which is 13 inches long inside the tank and is tapped into the latter at a point 14 inches from the bottom. The valve of this pipe is open at all times to allow the escape of excess water. A gauge glass is in addition, but can be dispensed with.

A Convenient Mine Switch.

One of the greatest sources of annoyance and loss of time in mines is poorly constructed tracks and switches. The latter, particularly if not made with care, frequently cause the derailment of cars, which are usually loaded, with the constant stopping of traffic and loss of time in replacing the car on the track. Switches may be built with "frogs" in the same manner as railroads, but these are expensive and not essential for the light traffic of most mines. Switches should be so built that they will not become clogged with rocks or other mine debris. The accom-

Convenient Mine Switch.

panying sketch shows a good form of mine switch—the single, movable rail. The rail must be shifted by the trammer or some other person, but this can be readily done with the foot. There are no frogs to become clogged, and a switch of this description is easily kept clean. The movable pointed rail is held in place by a pin driven through a hole provided by the blacksmith at the upper end of the rail, at which place it rests on an iron plate, as shown. The pin passes through the iron plate and to a depth of not less than 3 inches into the tie. It should be so made that, if desired, the switch tongue may be lifted out and any obstruction removed from beneath it. A tie should also be so placed that the point of the switch shall rest upon it at either side of the track. This is not properly illustrated in the sketch.

Electrical Furnace Experiments.

An interesting experiment is described by M. Ch. Fery in a recent issue of Le Genie Civil. The experiment, which was made to test the accuracy of an optical pyrometer of his devising, consisted in the fractional distillation of brass in an electric furnace. This furnace took 600 amperes at 80 volts, and with it 11 pounds of copper could be boiled off in six minutes. On charging it with brass containing 37% of zinc, the temperature rose in half a minute to the boiling point of zinc, which was found to be about 1100° C. This temperature remained nearly constant for one minute, which sufficed to get rid of all the zinc, and in two minutes more the boiling point of copper was reached, which was found to be 2100° C. The copper left in the furnace at the end of the experiment contained barely a trace of zinc and was very nearly pure, though a little carbon was mixed with it in the form of graphite.

The pyrometer used in these experiments is of a very interesting type. It has the advantage that no portion of it is exposed to a really high temperature, its indications being dependent on the fact that the total radiation emitted by a "theoretically black" body varies as the fourth power of the absolute temperature. The interior of any furnace into which there is but a small opening acts as a theoretically

black body. M. Fery's method of measnring the temperature, however, is to receive the radiation, from a small opening into such a furnace, on a thermopile so shielded that the amount of radiation received is independent, within limits of the distance of the couple from the opening. This thermopile is connected to a D'Arsonval galvanometer, and the temperature is estimated from the observed deflection in the nsual way. In cases in which it is impossible to have an opening direct into the furnace, M. Fery builds a small muffle into the wall of the furnace and obtains his temperature readings by pointing his instrument at the interior of this muffle.

Cyanide Plant and Practice at Ymir Mine, British Columbia.*

NO. II.—CONCLUDED.

Written by EDWIN C. HOLDEN.

Where there is enough head room to give distributor arms 3-inch grade per foot, arms of 1 inch diameter, or even smaller, could be nsed without danger of clogging. This would be an improvement upon the nsual form, which has 1.5 inch arms at 1.5 inch grade; for it would approach the ideal conditions requiring a maximum number of arms fed from a full hopper.

Continuous, uniform charging is essential to make a good charge; hence, so far as possible, stamp mill hang-ups were made between charges. When, however, an emergency hang-up was made with a charge incomplete, a gentle hydraulic current was started under the filter in the vat; the water feed to the distributor was increased; and, when charging was recommenced, the settlers were run with a strong hydraulic current for a few minutes, allowing only the coarse sands to settle. Despite every precaution, however, a slime layer will mark in the charge every mill hang-up of over ten minutes' duration.

The overflows from the vats and the separators were combined before they reached the overflow sampler, so that I cannot give separate figures on the vat and box separations. The longest distributor arms occasionally make a wave strong enough to throw over a little of the finer sands into the overflow launder, so that of the combined overflow 1.1% was caught on a 100-mesh screen. Much of this coarse residue, however, was wood fiber from the mine and flumes.

The classification of values in charges and overflows was marked, the average assays and screen tests for the year being:

	Au. Oz. Per Ton.	Ag. Oz. Per Ton.	Through 100-Mesh. Per Cent.
Vanner tails	0.0838	1.008	64.86
Charges	0.0931	0.637	50.70
Overflows	0.0621	1.878	98.90

The high silver in the overflow is due to its association with galena in the slimes.

The system of classification, it must be admitted, was crude; and if the plant were pushed to its full capacity, close hydraulic classification, yielding a clean, quick percolating charge, would be necessary; but, as run at this time, the system was very satisfactory, for it settled and treated a total of 70.1% of vanner tailings. When we were treating oxidized ore, charges could not be successfully treated that carried over 45% of fines.

With all the stamps dropping, a vat was filled in from twenty-eight to thirty-two hours; but during the last quarter of 1902 it required from forty-eight to sixty hours. The experimental work called for five days' treatment; but, with the reduced crushing, we increased the proportion of slimes settled, and treated charges as long as our capacity allowed—the average time of treatment being 10.5 days. A normal charge was 185 tons, dry weight.

The acid tests seem, in the case of the Ymir tailings, to be worthless as an indicator for the use of lime. The ordinary tests for latent acidity called for over one pound of lime per ton. Phenolphthalein indicated more. We used 200 pounds to the charge for a while, until the zinc boxes grew so foul that dried precipitates assayed under 1200 ounces of total fine bullion per ton. The methyl-orange indicator was more satisfactory. It called for less than 0.5 pound of lime per ton. But the final practice, which gave the best results, was to use less than 0.1 pound per ton, and apply it in 5-pound lots, the last lot going on with the final dose of strong solution. The cyanide consumption was thus reduced over 10%; and the zinc-box crude precipitates rose in grade to over 5300 ounces per ton. In treatment, the final filtrates became very cloudy when they titrated between 0.1% and 0.05% KCN; and the small addition of lime, just before starting weak treatment, tended to keep the slimes coagulated and the filtrates clearer.

Vacuum percolation was soon discarded, as it gave a very dirty filtrate and packed the charges, so that the final rate of percolation was slower, even with the vacuum, than it would have been if unassisted throughout.

The routine of treatment was as follows:

After leveling and adding dry lime, two 5-ton doses of weak solution (between 0.1% and 0.05% KCN) are successively given. When these have disappeared they are followed by four or five 10-ton doses of strong solution (0.2%) at 5-hour intervals. There is no trace of cyanide in the filtrate for six hours after the first application of weak solution, and there are no values until after fifteen hours. After forty or fifty tons of strong treatment, the charge is drained six hours, when the filtrate has almost ceased, and titrates 0.04% to 0.07% KCN. Twenty tons of strong solution are now run in under the filter. It requires from six to eight hours to run this in without channeling the charge, and when it is all in, if drainage has been sufficient, there will not be more than 5 inches of solution on top of the charge. After soaking from three to six hours the charge is drained and a 10-ton top treatment follows. Top and bottom treatments thus alternate until 160 tons of strong solution have been applied. Then follows weak treatment, applied on top in 5-ton doses as rapidly as it disappears, to a total of forty or fifty tons. This is followed by wash solution (0.05% to trace KCN), forty tons; and this, by water as required, to preserve the balance of solutions or secure low end filtrates. No solution is run to waste other than which is lost as moisture in the residues.

The adoption of bottom treatment had a marked effect. During the first six months' operating, when only top treatment was used, the gold extraction gradually fell off from 70% to less than 50%; and assays from the bottom of the charges were discouraging. When the connections for bottom treatment were made in October the gold extraction rose at once from 48% in September to 75% for October; and the average actual gold recovery for the last quarter of the year was 80.23%, while the actual silver recovery also rose from 25% to 41%.

The total time of treatment was from 9.5 to 11.5 days. The average rate of percolation was 1 inch per hour, although 64% and 71% gold extraction were obtained from charges having only 0.5 inch and 0.6 inch rates. The highest rate during this period was 1.5 inch per hour. This slow percolation means high cyanide consumption and long treatment; but it also means larger slimes tonnage treated. It does not require a large increase in daily tonnage to pay for extra vats and a little more cyanide.

Residues are discharged through two 10-inch plug flanges placed 4 feet from the sides of the vats. A 2.5-inch hose with 2-inch nozzle is used under 115 pounds pressure, the hose being held in a swivel clamp at the edge of the vat. The bottom 6 inches is cleaned out at reduced pressure. One man will sluice out a charge and clean the filter in from 3.5 to 4 hours.

The filter is three thicknesses of 16-ounce burlap, having the usual false bottom and rope grounting, and anchored to the vat bottom to counteract its buoyancy.

Precipitation is effected by zinc shavings in eight 10-compartment steel boxes, and it is perfect with the weakest solution when run at the rate of one ton of solution per twenty-four hours per cubic foot of shavings. The shavings in the wash solution box are lead dipped. Whenever there were values in the effluent, running at the normal rate, they were found to be due to precipitate mechanically carried over after dressing boxes, and it was found best not to disturb a box after it had been running more than a week, but to add shavings on top as required.

The clean-up method, while it just about competed with refiners' rates, was not satisfactory. The precipitate was dried, fluxed and smelted direct, without either acid or roasting treatment, and without refining, which produced a bullion of 720 total fineness. The treatment loss was 1% of the gold and 0.5% of the silver. The clean-up cost, including freight and treatment of the resulting high-grade zinc slag, was 17 cents per pound of dried slimes. This does not include charges for bullion treatment.

Operating costs per ton in detail for the last quarter, when 7150 tons were treated, were as follows:

COST OF TREATMENT PER TON.

Cyanide, at $0.22 per pound	$0.200
Zinc, at $0.09 per pound	0.020
Lime, at $0.009 per pound	0.001
Fuel, at $2.50 per cord	0.019
Clean-up supplies	0.029
Repairs	0.014
Miscellaneous	0.003
Labor (wages at $3.50 and $4.50 per day)	0.234
Total	$0.520

Assay office costs were not alloeated; but the cyanide plant proportion should approximate $0.025 per ton. These results were obtained when treating but seventy-eight tons per day. This cost can be reduced to 38.6 cents when the plant is treating its full-rated capacity of 200 tons per day; and the introduction of reverberatory and enpel furnaces for clean-up would still further reduce it.

The plant is equipped with steam heating and electric lighting plants, and has an auxiliary water power system capable of developing to 300 H. P. The pumps and lighting dynamo are run by Pelton water motors under 320 feet head; and the only cost of power is the trifling item of maintenance of flumes.

The total cost of the works, including the power plant, was $57,951.63. Omitting the costs of the main mill building, boarding houses, power plant and heating system, and thus reducing the estimate to the basis of an open air plant, the cost was $33,782, including the clearing, excavating and masonry, previously referred to, which amounted to $6321.34.

Gold Reduction Plant on the Rand.*

The broken ore is raised from the mines through vertical and incline shafts, or a combination of both, nsually in skips, which are now built to carry three tons per load. Cages to transport the mine trucks from below to the crusher station are still used in some few instances, but this practice is now disappearing. On incline headgears the skips run up from below on rails and two pairs of flanged wheels, and on reaching the top of the headgear the lower pair, which have a very broad flange, engage with an onter pair of rails, which cause the tail end of the skip to be raised above the level of its mouth, and the contents are shot into an ore bin; in vertical headgears the self-dumping action is on the same principle; the skip is inverted by engaging with runners, which divert its mouth over the ore bin while the tail continues its way up the vertical guides.

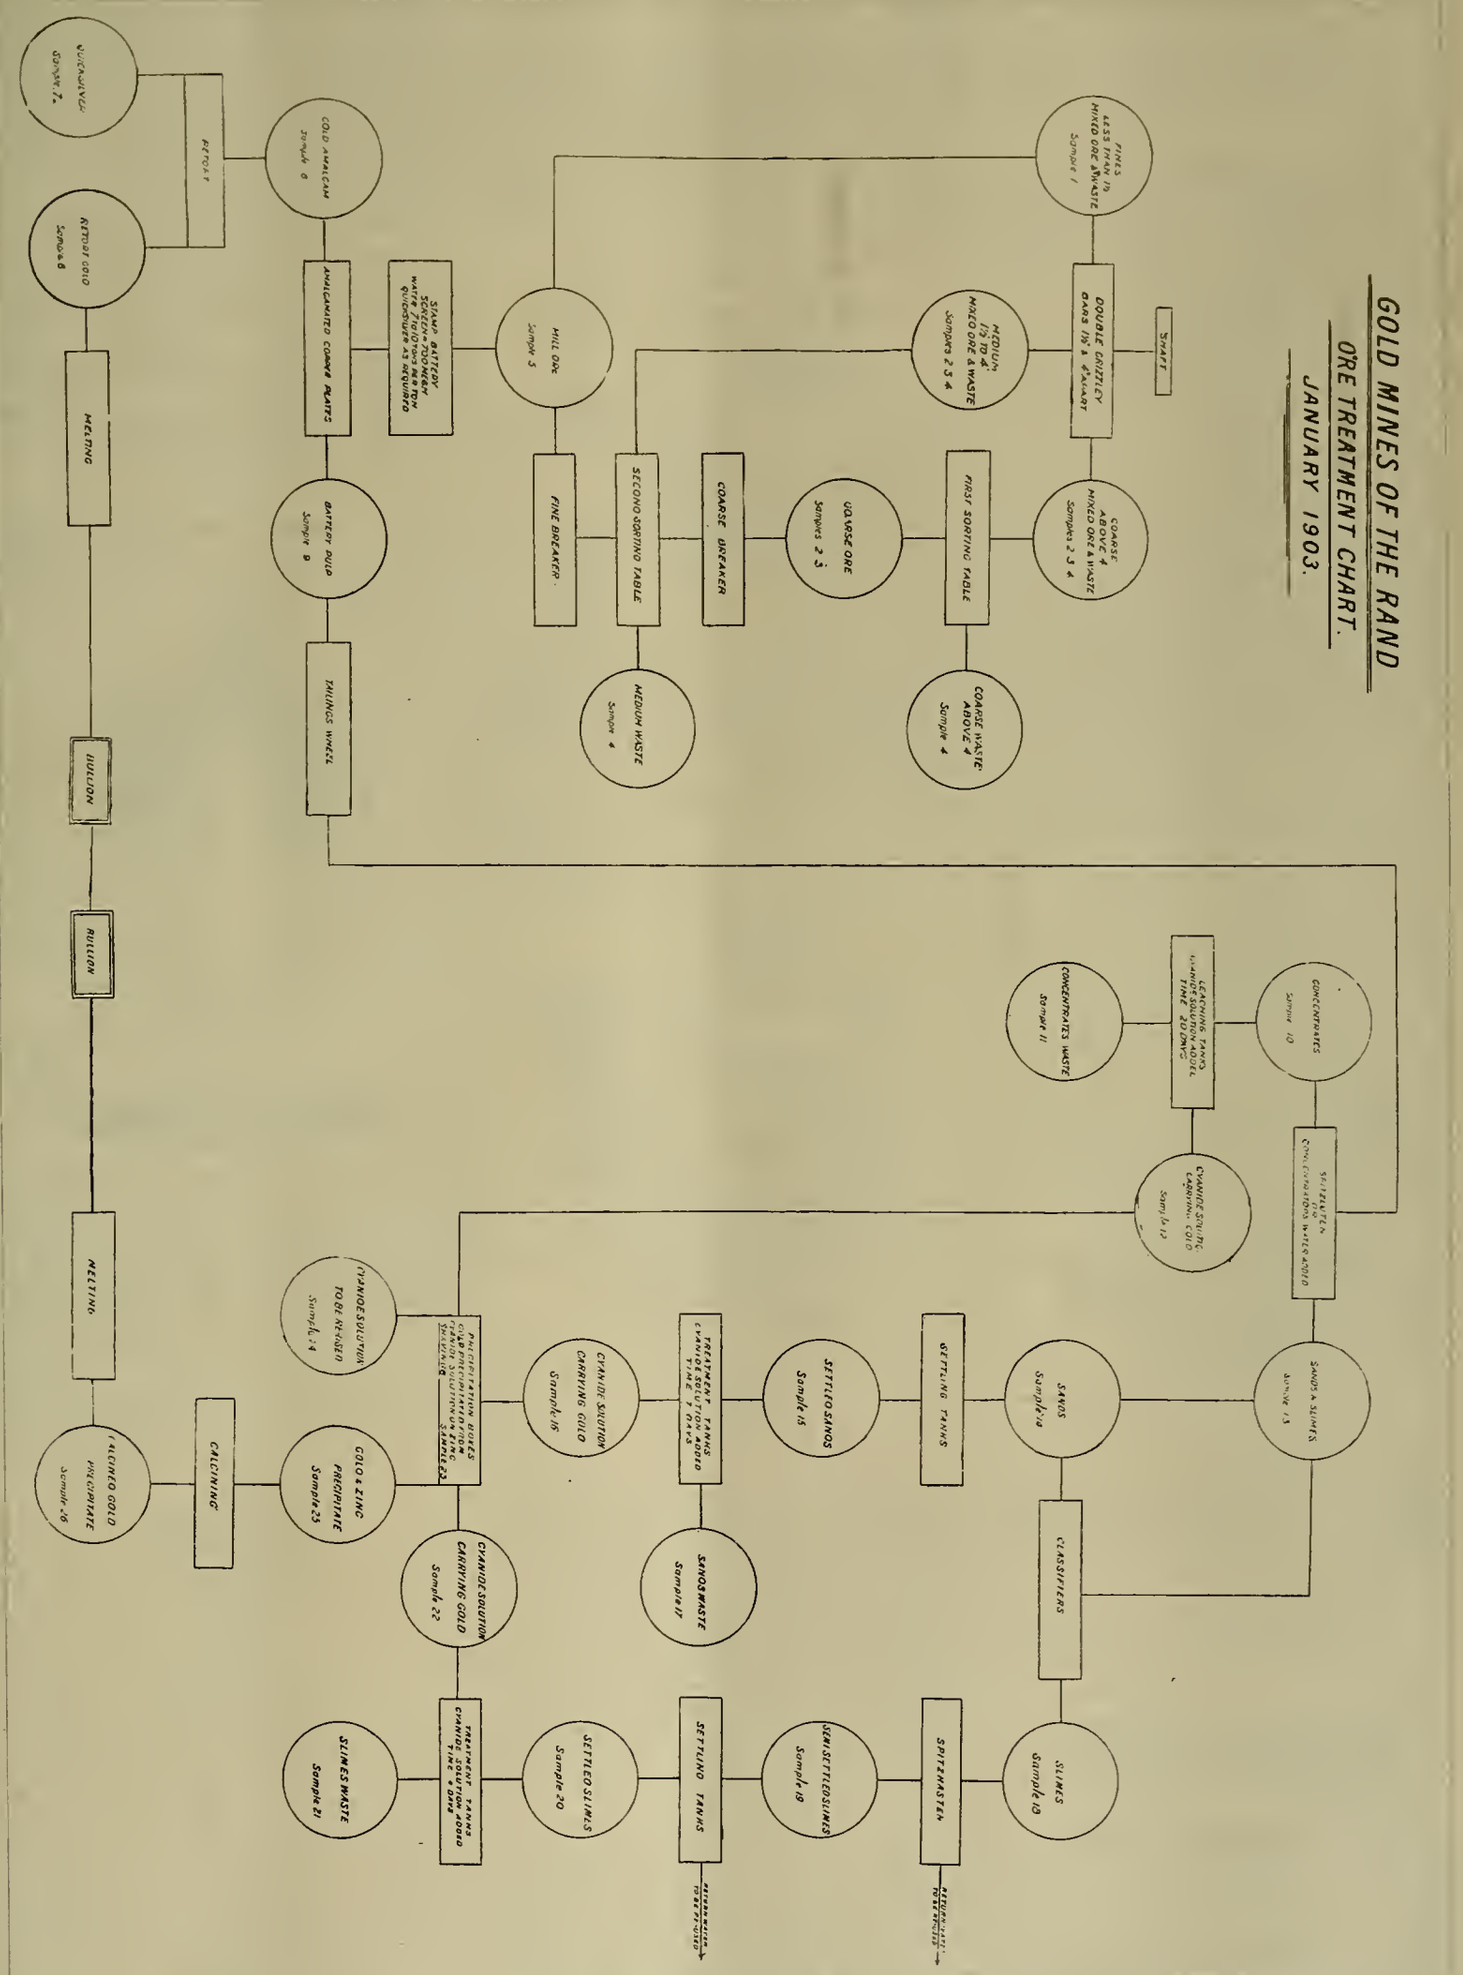
The rock as sent up from the mines often consists of a considerable percentage of waste sandstone, and to eliminate this as early as possible it is "sorted" as it leaves the bin into which it was dumped from the skip.

Sorting is done by three methods. The rock passes down over grizzlies, which eliminate the unsortable "fines" on to the sorting floor, where it is treated as follows:

1. On floors, on which the rock is spread out, sprayed with water, the waste is picked out and thrown into bins, whence it is conveyed to the dumps, and the pay rock is thrown into the crushers, which are on a level with the floor.

2. The rock having passed over the grizzlies is led on to the slow moving belt, and at the same time is sprayed with water. The sorters (natives in charge of a white man) are ranged alongside of the belt, and each piece of rock has thus to pass the scrutiny of many eyes before it reaches the end of the belt and is shot off into the bin beneath. The waste is thrown off as before and trammed to the waste dump.

3. The system mostly in vogue on the fields is the sorting table. This machine has undergone many changes of construction since its first adoption at the City and Suburban mine, and the present design has reached a high state of efficiency. The rock passes through a revolving screen and is at the same time sprayed with water. It thence runs on to the table, which is here revolving in a reverse direction to the hands of a watch. The sorters are ranged round both within and without the circle of rock; they pick out the waste and throw it into conveniently placed shoots. The pay rock is automatically scraped off at the far side of the table and runs down into the jaws of the crushers on the floor below.



The crushers are usually of the gyratory type and the rock is delivered from them into the bin, which already contains the fines, broken to a size sufficiently small for treatment in the stamp mill. According to the requirements of the particular works, the crushing and sorting station is either built into the headgear or forms a separate house.

From the crusher station the ore is hauled to the mill bins, usually by mechanical means, though in some cases mules are still employed to draw the trucks. Where the mill is situated some distance away, either steam or electric traction or endless rope haulage is employed. For short distances reciprocating haulage is used. A heavy skip is drawn up into the mill from the bottom of the crusher station and empties itself automatically into the required mill bin. At the bottom of the mill ore bin are shoots, from which the rock is fed piece by piece into the mortar boxes, the flow being regulated by automatic feeders.

The rock is broken by the stamps in the mortar boxes to a consistency of fine sand and slimes, and is water-borne through the screens over the copper amalgamating plates. The size of mesh of the screens is varied according to the requirements of the rock and with regard to the economical running of the cyanide and slimes works.

The majority of the free gold is caught by the amalgam on the plates, and the particles held in the sands; the pyritic portion and the fine gold in the slimes are carried over the plates and fall from the launder into the sump at the base of the tailings wheel. Tailings wheels are usually made of wood with steel shafts, and are constructed with either single or double bucket lifts. The water-borne tailings are raised by this means above the level of the cyanide works, which are so designed that no further elevation of the material is required throughout the rest of the treatment. In the launder leading from the top of the tailings wheel is fixed an automatic sampler, which takes at regular intervals a sample of the material being delivered to the cyanide works. From the launder the tailings pass through a series of three or more hydraulic classifiers called spitzlutten. These are boxes so constructed that the heavier sands and concentrates are drawn off at the bottom and are led off into vats for special treatment, while the lighter sands and the slimes flow over and continue their course towards the general treatment vats. The concentrates obtained are either treated with cyanide solution in special vats, or are handed

over to chlorination works for extraction of their gold contents. At the foot of the spitzlutten is fixed another automatic sampler, and the sands and the slimes thence pass through the spitzkasten. This is an hydraulic classifier so constructed that by a definite pressure of water being introduced at the bottom of the box the slimes are borne upward and over the edge of the box, while the sands are drawn off through the bottom and are led away to the percolating vats. In some cases no extraneous water is required for this action.

Percolating vats or tanks are now built of steel, are round in shape, and are arranged in pairs one above the other, to admit of easier manipulation in the double treatment. The sands from the spitzkasten are run into the top vat through a flexible hose, and the superfluous water carrying some of the remaining slimes is taken off through a side discharge, the height of which is regulated by slats of wood as the level of the sand rises in the vat.

When the vat is filled with material the first cyanide solution is pumped on and is allowed to percolate through the mass. It is drawn off through the filter bed at the bottom of the vat and flows away to the extractor house. The discharge doors in the bottom of the tank are then opened and the sands are shovelled through into the lower vat, where more cyanide solution is pumped on and drawn off below. The mass of the sands is then washed with water to extract the remaining solution, and the valueless residues are discharged through doors in the bottom of the vat into trucks and hauled away to the tailings dump.

The designs of these percolating vats have undergone and are still subjected to many changes. The earliest forms were square wooden tanks, which were afterwards changed to round vats, built of wooden staves and mounted on masonry foundations. The sands from the mill were settled in a tailings dam, loaded into trucks, drawn up and dumped into the vat. They were then subjected to single treatment, and were shovelled back into the trucks and taken away to the dump. With direct treatment came the necessity for larger vats, and several plants were erected consisting of rectangular concrete tanks; these have now been superseded by steel vats.

The water-borne slimes, after leaving the spitzkasten, are charged with a certain amount of lime by means of an ingenious automatic arrangement. They are then led into a further series of spitzkasten, and the action of the added lime is such that the slimes settle in the spitzkasten and are drawn off at the bottom, while the superfluous clear water flows off at the top and is returned to the reservoir. The slimes, which have now a gelatinous consistency, are run into the slimes vats, where they are allowed to settle and concentrate, the bulk of the water being eliminated by decantation. They are then agitated with cyanide solution. This is done either by stirrers in the vats, or by passing the liquid mass through centrifugal pumps and returning it to the vat. The latter treatment is more in vogue at the present time. The mass is allowed to settle, the solution is decanted off, and the residue washed with water to remove the remaining solution. The residue is then discharged through the bottom of the vat into the slimes dam by aid of centrifugal pumps.

The gold-bearing cyanide solutions from various tailings treatments are pumped into solution vats and thence are led into the extractor house. To avoid unnecessary treatment and undue loss of cyanide, the washes of one treatment are converted into the weak solutions of another, and so on. They are thus built up in strength and gold-bearing contents for the more economical extraction of their gold contents. The extractor house contains the extractor boxes, the pumps for transferring the solutions and agitating the slimes, and in some cases for returning the clarified water to the mill. In it also are the acid vats for dissolving the zinc and the smelting furnaces for the final stage of the process. The gold-bearing cyanide solution flows in through the pipes at the head of the boxes, and flows out denuded of its gold contents at the foot, whence it is pumped to the solution vats to be used over again.

There are various methods of treatment within the boxes, of which the following are the main points. The various compartments are in every case partitioned off so that the solution to be treated is introduced into the bottom of the first compartment, flows over the top, and is introduced into the bottom of the next, and so on:

1. The boxes contain perforated trays which are filled with fine shavings of zinc, pressed well down and forming a spongy mass. The gold is deposited on the zinc and falls through the bottom of the tray in the black slime.

2. The compartments are filled with strips of lead, which hang closely suspended in rows. An electric current is passed through the solution, the lead foil being used as the cathode and iron plates for the anode. The gold is deposited in a black slime on the lead foil.

3. The zinc shavings as described in (1) are first dipped in a solution of acetate of lead, thereby giving them a fine coating of lead. A zinc-lead couple is thus formed and more energetic action is induced. The gold is deposited on the shavings as in (1).

4. The solution passed through the boxes prepared as in (3) is rendered more susceptible of parting with its gold contents by the continual addition at the head of a box of a sufficient quantity of free cyanide solution to bring the strength up to the desired standard. The gold is deposited on the shavings as in (1).

The latest method in vogue on many of the principal mines on the Rand is the use of very weak solutions in the extraction of the gold from the tailings, and the adoption of the extractor box treatment (No. 4) for the precipitation of the gold.

The greatest measure of success is obtained by studying the output of each mine separately and by finding out the particular treatment and method of extraction that is most suitable to these particular conditions.

The accompanying drawing shows the arrangement of a modern mill on the Witwatersrand.

Identity and Continuity of Veins.

NUMBER III.—CONCLUDED.

The court found, however, that "the continuation of the east dipping fissures has not been satisfactorily established at any point where the two veins come together;" also, that the above theory is not in conflict with the claim of continuity of the Pennsylvania vein through the complications.

By a circuitous route the vein was followed continuously downward on a westerly dip from the apex to the lowest level without the intervention of any complication. Both to the north and to the south of the Horseshoe winze the vein was so traced from the 700-foot level to the bottom level—i. e., from a level above the Horseshoe complication to a level below it. The court considers that the bearings of these facts were not overcome by evidence of complications elsewhere, and says: "To my mind, the most conclusive fact establishing the continuity of the Pennsylvania vein is this fact, that the vein can be followed as a dominant, persistent vein from the surface through continuous stopes down to the lower workings of the mine."

In the northwesterly portion of the mine there is a marked divergence of the strike of the vein in depth from the course of the apex. The Grass Valley Co. urged this as an objection to the claim of identity and continuity. But the court says: "This fact would be of some importance if the vein was an ideal one, maintaining a uniform strike and dip throughout its entire course. But it is not an ideal vein, and there are very few such to be found. . . . This twisting or turning of the vein is accounted for . . . by the folding of the rock under pressure and contraction. . . . This objection to the Pennsylvania vein is, in my judgment, without any force. . . ."

Finally: "It follows from these considerations that I am of the opinion that the Pennsylvania Co. has established its right to all the ore bodies and sections of the mine in dispute."

The distinction between the character of complications existing in the Pennsylvania case and the occurrence of faulting and normal displacements previously illustrated is manifest. The difficulties of determining identity increase as complexities are multiplied, and necessarily each case must be determined upon a consideration of the peculiar facts therein developed.

Speaking of the difficulties surrounding this class of cases, Judge Hawley has pertinently said:

"In all controversies concerning the identity of ore bodies found on different levels at various depths beneath the surface there is always room for a wide divergence of opinion among men of equal credit and experience as miners. The absolute truth is often difficult to ascertain, except in cases where connections are made between the different bodies of ore found on different levels. . . . A wide latitude is always permissible for the purpose of ascertaining the reasoning upon which the conclusions of witnesses are based, as well as their general knowledge of the ground, their experience and observations, and their qualifications as practical miners or experts derived from years of experience in the particular district where the ore bodies in question are found."

The several cases heretofore cited, together with the opinions of noted jurists, are but a few of the numerous contentions coming before the courts for adjudication. No phase of the mining law is so prolific of litigation as that permitting the extralateral right. The fact that in most mining districts the vein system is complicated—the veins striking in various directions, often crossing each other—together with varying dip, tends to make a complex question of it, which is not simplified by the vagaries and the irregularities of the veins themselves.

In the earlier years of mining in the West force was often employed in an effort to hold disputed territory underground, nor has this tendency wholly disappeared yet in some districts. In some recent instances noxious gases and irritating dust have been employed to drive opponents from mine workings, but usually the decision is left to the courts, where all such contentions must eventually go, if not compromised by the parties to the conflict. The United States is the only country where the extralateral right is permitted, it having having been abolished in all English colonies where it had been introduced. British Columbia is an instance of this kind, where, under the "extralateral right" law, within a short time enough litigation resulted to last for many years.

The mining law was framed years ago, when mining geology was not as well understood as at the present day, and it evidently assumed a condition that does not often obtain. It conceived a possible series of parallel veins, with uniform dip. Under such conditions no conflict could occur. The numerous changes in the law from time to time indicate an increasing knowledge of geological facts, but no amount of law can meet the great variety of geological vein phenomena.

Geology of El Oro District, Mexico.

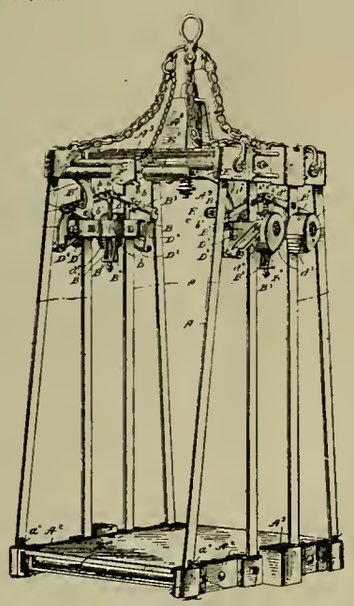
Written for the MINING AND SCIENTIFIC PRESS.

The movement of capital from the United States to Mexico has grown of late years. It is to be expected that in the number of investors eager to secure shares in the mineral resources of Mexico there will be found the erring element which follows extraordinary mining activity in all countries. At the same time the unscrupulous element whose motive is always to lead the erring to disaster is to be looked for at the very front of the movement.

In the past five years more capital has been invested in the mines of Mexico than in the previous twenty years. Most of this capital will be rewarded with profits, particularly capital invested in properties outside the leading mining centers. In the new camps which have come into existence in the past five years many investors may fare badly.

El Oro, one of the noted camps of Mexico, about 75 miles west of the city of Mexico, first came into prominence when the Somera mine was purchased by the El Oro Mining & Railway Co. of London. This was about five years ago. Shortly after the Somera became the property of the English company August Sahlberg, who had been superintendent of the Somera, but had severed his connection with it in order to devote his energies to the development of the Esperanza, an adjoining mine, which he had bought, discovered the San Rafael vein in the latter. The opening of the Descubridora vein on the El Oro mine, and of the Dos Estrellas vein on the mine of that name, increased activity in the camp greatly. Mills and cyanide plants were erected without loss of time, and the production of bullion was doubled in the course of three years. The Somera, El Oro, Dos Estrellas and Esperanza mines were proven to be among the most valuable gold and silver mines of the world.

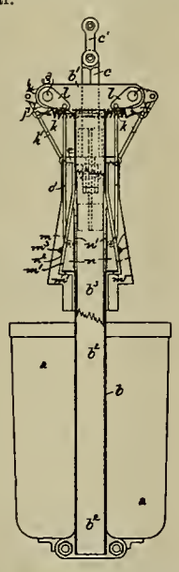
The most prominent feature of the topography at El Oro is the hill called Somera. In this upheaval, which attains an altitude of 13,200 feet above the level of the sea, centers the greatest geological and mineralogical interest of the belt. Within this hill, and the group of mountains to which it belongs, is situated the system of veins comprised in the El Oro, Esperanza, Somera and Estrella mines. The mountains themselves, in the form of separate ranges, descend to the north until they finally terminate abruptly in the low-lying lands of Tepetongo and Bravo. It has been determined that the country comprised by Somera hill, and the apparently dependent mountain mass to the northeast, is formed of argillaceous slates, overlaid by a capping of volcanic rocks, the capping being thickest to the northeast of the hill and thinnest to the southeast, disappearing almost entirely on the eastern slope of the hill, in the vicinity of the Dos Estrellas and Jesus del Monte mines. In the camp of Tlalpujahua the slate is exposed. The plane of contact between the slates and volcanic rocks is inclined from southwest to northeast. The points at which the principal explorations have been made to ascertain these facts are the claims Ojo de Agua, Progresso and Estrella No. 1. The first work on the shaft on the San Patricio claim has been in gray slates, stratified with seams of quartz. There are three classes of volcanic rock recognized in the formation at El Oro. The first of these is hornblende-andesite; the second rhyolite, and the third a dark-grey andesitic porphyry, which occurs in dikes. In some of the mines the second class of volcanic rocks have the form of a porous amygdaloid, the amygdules being sometimes filled with chalcedony. The slates are always of the same class, the only difference being noted is that produced by the action of heat and atmospheric agencies. Development work shows that there exists a system of parallel veins extending eastward from Somera hill, and that these veins occupy fissures, the thickness of which varies in a most remarkable way between a few inches and 20, 30 and even 40 feet. The general trend of the veins, with the exception of the Tlalpujahua section, where it is north and south, is 32° southeast to northeast, with a dip to the east. The veins are composed of quartz containing gold and silver. They occur entirely in the slate, those in the eastern end of the belt having a capping of volcanic rocks whose thickness varies from 250 to 500 feet. Never do the apices of veins rise above the slate. Many faultings have occurred in them, but none are extensive. Yet, when some mining engineers assert that it is a rule that "the veins of greatest width have the greatest length," the question of a mistake being made by them becomes evi-



dent, since it is well known that in the widest veins there have been many breaks, with slate intervening between the sections of the vein in such a way as to discourage the operators in attempts to relocate the veins. Notwithstanding this, however, the prospects of the leading mines appear to be bright until the 600-foot level is reached—that is to say, a depth of from 200 to 300 feet below the apices of the veins. At that level the values of the ore, which begin to diminish rapidly at the 500-foot level, are too low to pay the present expenses of extraction. There is, therefore, only from 200 to 300 feet of stoping in the mines. As the veins are from 18 to 50 feet wide, and carry gold and silver to the extent of from $25 to $50 per ton throughout their entire extent, which is great, it is easy to be seen that they have a long life before them, even with vastly increased milling facilities taken into consideration.

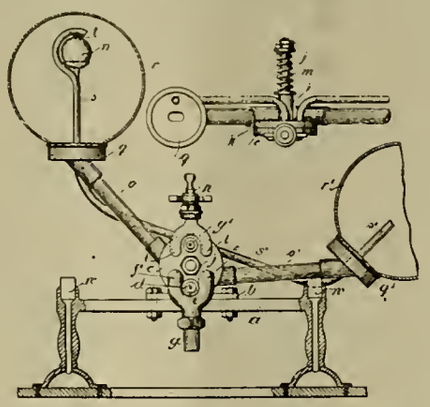
Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 13, 1903.



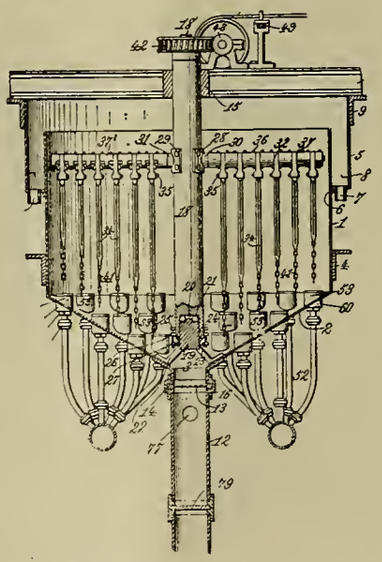
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINER'S SAFETY CAGE.—No. 740,872; F. C. Kerst, Springfield, Ill.



In safety cage, combination of main frame, vertically slidable lifting rod, transverse plates secured to main frame, collared bolts passing through plates, levers turning on collars of bolts provided with hubs, dogs surrounding hubs of levers and turning on bolts, springs acting against dogs, connecting device connected with lifting rod, intermediate levers connecting first named levers with connecting device, and springs operating intermediate levers.

SAFETY GEAR FOR MINE SKIPS, CAGES, ETC.—No. 740,942; W. B. Stevenson, Witwatersrand Gold Fields, Transvaal.

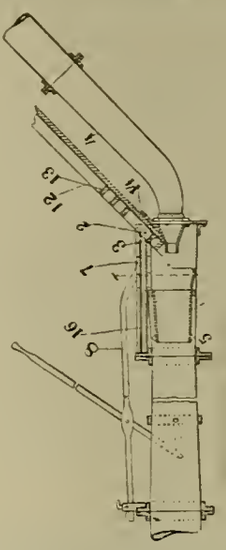


In safety gear of nature indicated combination with skip or cage and supporting frame of containing and guiding straps having longitudinal slots formed therein fitted to frame and forming angular recesses at each side of guides or runners, dog wedges or catches arranged in angular recesses and each provided with vertical serrated or toothed gripping surface parallel with guides or runners, studs or projections on backs or inclined surfaces of dog wedges or catches projecting into slots in straps to retain catches in position and to compel gripping surfaces thereof to move parallel with guides or runners, and means for raising wedges or catches in containing and guiding straps should skip or cage become unsuspended.

VALVE FOR HYDRAULIC AIR COMPRESSOR.—No. 741,172; J. C. Schneider, Hamburg, Germany.

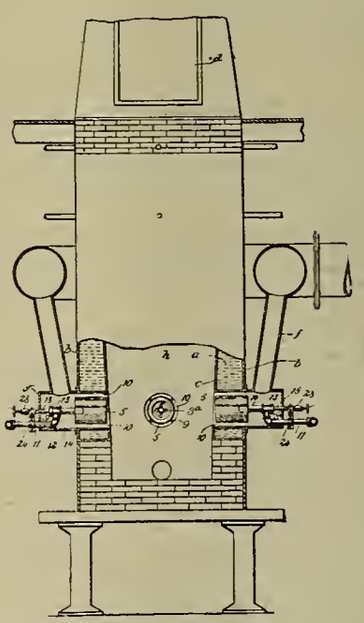
Combination of valve, consisting of two disks, facing each other, one of which is mounted to turn on axis and other fixed, air and water inlets in fixed disk, two hollow arms extending in opposite directions from movable disk and communicating with ports therein, reservoirs carried at ends of arms, air pipes leading from upper ends of reservoirs to ports in movable disks, and floats in reservoirs for closing air pipes.

APPARATUS FOR EXTRACTING PRECIOUS METALS.—No. 741,189; H. H. Thompson, Churchville, N. Y.



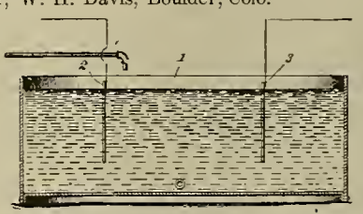
Apparatus for extracting precious metals, comprising receptacle provided with conical bottom, having outlet and upper portion surrounded by overflow compartment, having outlet; series of bodily movable and loosely mounted diamond-shaped agitating arms, gradually decreasing in length and adapted to be retained in operative position when rotated in one direction and to assume inoperative position when moved in opposite direction, rotatable means for suspending arms within receptacle, series of nozzles disposed throughout and connected to conical bottom and communicating with interior of receptacle, means for supplying cyanide solution, compressed air and water to each of nozzles, either separately or in any preferred combination, operating means for rotatable suspension means, and means for changing direction of movement of operating means.

TREATMENT OF SULPHIDE ORES.—No. 740,701; A. M. G. Sebillot, Paris, France.



Process for treating ores containing sulphur consisting of sulphating ore in closed vessel by action of sulphuric acid upon metallic sulphides at temperature above its boiling point and simultaneously recovering sulphuric acid used, calcining sulphated ore at temperature of 700° Centigrade to dissociate sulphate of iron to prevent dissolving of too great quantity of sulphate of iron in lixiviating liquors, and lixiviating calcined ore.

HYDRAULIC ELEVATOR.—No. 741,291; J. H. Adams, Alameda, Cal.



Hydraulic elevator, consisting in combination of upraise pipe, receiver, bottom plate for latter having lift water inlet, and projecting top flange, nozzle secured to inside of plate coincidentally with inlet, water conducting pipe, receiver having opening at side, exterior, longitudinally slidable gate for opening and means in conjunction with gate for regulating size of opening from point above, sluice section having bottom section projecting through opening into juxtaposition with nozzle, and supported upon top flange of bottom plate, and air relief mechanism for freeing lift water when gate is closed.

MEANS FOR UTILIZING OIL OR GAS IN ORE REDUCING FURNACES.—No. 741,504; W. Kemp, Tucson, Ariz.

Ore reducing furnace having tuyere opening and combustion chamber situated in tuyere opening and communicating with working chamber of furnace and with wind box, burner extending into combustion chamber, and means for supplying fuel to burner.

PROCESS OF TREATING CYANIDE SOLUTIONS.—No. 741,231; W. H. Davis, Boulder, Colo.

Process for treating cyanide solutions during, or subsequently to, their contact with ore, consisting in introducing into solution alkaline hydrate, and then subjecting mixture to action of alternating electric current, thereby raising osmotic pressure, to dissociate double salts in solution, causing precipitation of hydrates of base metals, and to combine freed cyanogen with alkaline hydrates, to cause simultaneous regeneration of cyanide in solution and clarifying of latter.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

At Silver Bow basin, noar Juneau, the Alaska-Perseverance M. Co. has surveyed a site for a 200-stamp mill, says the Juneau Dispatch.

Nome reports say that the work of extracting gold from the Nome beaches still continues. During the season of four years ago this was very profitable, and many miners refused to make known the large amounts of gold which they secured from the beach with rockers. Twenty-five plants were operated this season between Nome cemetery and Penny river and fifteen more on the eastern outskirts of Nome. The plant usually consists of a gasoline engine, a hose and sluice boxes. It is estimated that each took out an average of $2500, giving an output for this season of $100,000. Four years ago the beach was estimated to have yielded $900,000.

ARIZONA.

Cochise County.

B. F. Graham of Bisbee has bought the R. L. Benton interests in the Bisbee Queen mine, near Bisbee, and also in the Lucky Tiger mine in Sonora, Mexico, south of Bisbee.

The Lake Superior & Pittsburg mine south of Bisbee, in Warren district, reports producing ore in both No. 2 and No. 3 shafts. From No. 2 ore has been shipped that netted $3000 por car.

Graham County.

The annual report of the Arizona C. Co. at Clifton shows in the smelting department 50,283 tons of oro and 1,647,787 pounds of copper from the leaching plant were smelted, resulting in gross yield of 15,412,544 pounds of copper. This does not include 2505 pounds of copper produced in form of sulphate. In the concentration plant 210,717 tons of ore were treated, yielding 28,226 tons of concentrates—a product of 1 ton of mineral to 7.46 tons ore. The concentrating ore was partly sulphide ores from the Humboldt and the Yavapai and partly oxidized ores from Metcalf. The leaching plant treated 41,358 tons of tailings, producing 1,661,939 pounds of copper and 5.01 tons of copper sulphate. The acid plant turned out 1920 tons of sulphuric acid. The profits earned during the year from the mines at Clifton amounted to $717,500, while the company's railway net receipts were $120,000. Many improvements have been made at the mines and at the reduction works during the year. Development work has been increased in the Fairplay mine and also at the Coronado.

C. E. Stevens, superintendent of the Stevens mines at Metcalf, reports the company's steam plant in operation and sinking in the winze is progressing. The gasoline plant proved unsatisfactory and steam was substituted.

Mohave County.

J. Carroll reports developing his claim, 1 mile west of the Juno mine, near Chloride, and has a small vein of high grade silvor ore in the contact. The tunnel is in 200 feet.

Near Chlorido the Altata mine and three adjoining claims have been sold to J. F. McBride of Chicago, Ill., for $15,000. McBride will put in a gasoline hoist of 1000 feet capacity, and developments will be started next month and continue in the 250-foot shaft. The Rainbow mine has been bonded by A. M. MacDuffee.

A 50-ton cyanide plant is boing put in at the Great West mine, near Kingman.

Yavapai County.

There are 500 men reported at work in Bigbug district.

Yuma County.

S. B. Moore reports work boing increased in the mines around Quartzsite. O. A. Pease will build a 200-ton mill on his property at Chollos.

ARKANSAS.

Marion County.

A concentrating mill is being built at the Ponca City mines.——A concentrating mill is going up on the Susquehanna mine, near Dodd City.——At Zinc and at the Beulah mine core drills are being used to prospect the ground instead of the churn drill.

The Arkansas Dev. Co. of Yellville has been organized to do prospecting with core drills and development work on property of non-residents. They propose to put in six core drills. J. M. and I. W. Clokey and R. J. Williams of Decatur, Ill.; H. Wells of Yellville, Ark.; and R. W. Hess of St. Louis, Mo., are directors.

Newton County.

The Speers M. Co., composed of Little Rock capitalists, has bought 200 acres in Newton county for $25,000. The company already has a large quantity of ore on the dump and a concentrating mill is being built.

CALIFORNIA.

Amador County.

G. S. Andrews, ownor of the Grand Prize mine, near Pioneer, says he will install a larger hoist and make other improvements to more rapidly develop the mine.

At the Fremont mino, between Amador City and Drytown, quartz crushing began last week in the 20-stamp mill, says Manager A. Goodall.

Calaveras County.

The Continental mine, near West Point, is dropping its two stamps.

The work of developing the South Bank mine, near Sheep Ranch, is progressing, says Manager W. H. Clary, and a hoist is being put up on the main shaft.

The mill of the Mountain King M. Co., on the Rose Rock mine, near Murphys, started up last week, but as the water supply is limited regular crushing is not expected until the rainy season begins, says the Calaveras Chronicle.

El Dorado County.

(Special Correspondence).—The Crystal mine, north of the Vandalia mine, near Shingle Springs, is in full operation, drifting on the vein. Some high-grade ore is in sight. They have ten stamps, with amalgamation, concentration, and the tailings are cyanided.

The Peyton Chemical Co. has bought the E. E., this claim being the north extension of the Noon Day copper mine, operated by this company, says Superintendent Morrison. Improvements, including head frame, ore bins, etc., are being put in. The work so far in sinking the shaft shows copper sulphides, with little wasto. Three 8-mule teams are hauling ore to the railroad, about fifteen tons per day being shipped. This property is about 5 miles south of El Dorado.

The Union mine, 3½ miles south of El Dorado, is running with a few men, under Manager Harpending, the owner.

The Larkin mine, southeast of Diamond, is closed temporarily.——Larkin Bros. are running a crosscut on the Oro Flamme to cut the vein at depth. They have retimbered the shaft.

It is reported the Church mine, 3 miles south of El Dorado, will resume operations. Several mines are waiting for the American Electric Power Co. to furnish them with power. The work on this plant is progressing.——Snow Bros. have over one-half of their 2 miles of pipe line laid. They are preparing to take water from the Coon Hollow reservoir, near Placerville, to work gravel near Diamond.

Placerville, Oct. 20.

(Special Correspondence).—A shoot of ore has been opened up by a tunnel on the Charles ledge, owned by E. R. Moroy. The find was made at south end of the claim and directly opposite tho shoot of ore on the Mount Pleasant. The tunnel has followed a well-defined ledge for 139 feet with average width of 10 inches, and is 60 feet helow surface. They are sinking a winze in the tunnel, the ledge being there 12 inches wide and showing free gold and sulphurets. There is another vein of ore 10 feet west from this ledge which is expected to unite with it at depth.

Grizzly Flat, Oct. 21.

The mill at the Del Monte mine, on the American river, 4 miles below Coloma, was put in operation last week. The mill is a 2-stamp triple-discharge, weight of stamps 1000 pounds, and has a table concentrator. Power is furnished hy 12 H. P. gasoline engine. B. McBeath is superintendent.

The Ohio Quartz mine, adjoining the Mt. Pleasant mine, near Grizzly Flat, has boen sold to W. Brown of Oleta.

At El Dorado the Harpending mine is in full operation on a non-union and eight hour schedule, says the Mountain Democrat.

The mill has been completed at the Del Monte mine, near Lotus. It is a 2-stamp triple discharge battery, and will be operated by a 12 H. P. gasoline engine.

The Minnehaha G. M. Co. has been incorporated at San Francisco to operate a group of mines near El Dorado. S. W. Payne, J. Osborne, R. Payne, R. E. and C. S. Payne aro directors.

Superintendent F. Mott has men at work at the Rosencrans mine, below Georgetown, and has started siuking a double-compartment shaft. He is building a cyanide plant.

Fresno County.

In west section at Coalinga, J. H. Elmore of Greeu Bay, Wis., has leased a forty acre tract and will put up a rig and begin drilling. J. L. Roberts of Monterey is superintendent.

Kern County.

The Kern River Oil Co. has two additional rigs up and drilling will begin next week.

B. Ostick has purchased the Porter one-third interest in the Rainbow and Tipton claims, near Randsburg, giving him a two-thirds interest in the group.

The Associated Oil Co., which for several months has been drilling on the California Standard lease at McKittrick, and where six wells are down, is moving its outfits on to the Monte Cristo lease, south of McKittrick. The Associated Oil Co. will sink ten wells on the Monte Cristo. The new wells will be confined to the land adjacent to the hills, as so far all the best wells that have been drilled in that territory are those nearest the range of hills, says the Californian. The Pacific Crude Oil Co., on adjacent territory to the Monte Cristo lease, has brought in its third well.

Mono County.

Superintendent Turner of the Standard Con. M. Co., at Bodie, says he is making tests with view of working the sands and slimes of their mill tailings separate.

Nevada County.

C. A. Bailey of San Francisco, president of the Central Con. M, Co., oporating on Little Greenhorn creek, near Grass Valley, says they will build a 10-stamp mill on their group this fall. By the time it is finished it is expected to havo ore enough uncovered to keep the mill running. In addition to the Duval vein, which they are developing, they expect to cut the Greenhorn vein, which is located in the footwall.

The company owniug the Yuba mine, near Mayhert, is working on a 2500-foot gravity tramway, which will carry oro from the Mayflower to Yuba's mill, says Superintendent J. L. Bryson.

The North Bloomfield M. Co., at North Bloomfield, has men at work refacing Bowman's dam, which is expected to be finished by November 15. The company also has men running a tunnel a distance of several hundred feet. When completed it will be used as a passageway for the water which will be run from the dam to the mine, doing away with danger of flumes being swopt away by the winter freshets.

The German quartz mine, on the South Yuba river between Washington and Mayhert, after being idle for several years, will resume next month, with M. D. Cooley as superintendent.

The Quartz Quarry G. M. Co., operating the Junction mine near North San Juan, is negotiating for the 40-stamp mill on the Gold Bank mine at Forbestown, which will be moved to the Junction mine tunnel portal. They will run the machinery by electricity from the Bay Counties Colgate power houso. The Junction voin is 60 feet thick, on contact betwcen granite and slate, and milling tests have shown the general run of the ore averages $3 a tou, says Superintendent H. Huckins.

The compressors bought by the Empire M. Co. of Grass Valley with the Allison Ranch plant will not be moved, but will be operated in thoir present position to supply power to the machinery at the Omaha mine. It is the intention of the company to run a pipe line from tho Allison Ranch mine to the Omaha mine.

El Oro M. Co. has been incorporated at San Francisco, to operate near Nevada City. Directors are C. W. Hopkins, W. Henderson and R. E. Starr of Oakland, A. F. Stevens of Alameda and J. T. Houx of San Francisco.

The Sixteen-to-One mine at Washington will have a mill, says Manager Eagan.

The Empire M. Co. of Grass Valley has bought the machinery of the Allison Ranch mine, near Grass Valley. G. W. Starr, manager of the Empire, says the machinery will be removed to the Omaha mine, which is boing operated by the Empire Co. The mill is of 20 stamps.

Manager Hay has men at work developing the Hay mino at Randolph Flat.

Placer County.

A strike is reported in the Crosby mine, between the Three Stars mine and Lincoln, 7 miles northwest of Auburn. After cleaning out the old works the shaft was sunk from tho 300-foot level 140 feet. Drifts were started east and wost and struck the ledge on tho west side. It showed 14 inches in width. The ore averages $25 per ton, says Superintendent F. Crosby. The mine is incorporated as the Crosby G. M. & M. Co., and is owned hy Lincoln men.

Increased operations are under way at the Bartou mine at Westvillo, and fifteen more men will be put on next week.——The Gaylord mine, near Auburn, has been started up for the winter season and fifty men will be put at work next week.——It is reported the Red Point mine will be shut down. The tunnel has reached the 4-mile point, says the Placer Republican.

Sacramento County.

The Sutter M. Co. has been organized by Sacramento men, and is now sinking a shaft on the Murray place, on which the original Blue Ravine mine was located, near Folsom, says the Bee. The ground has been prospected by drill.

P. C. Cohn of Folsom will reopen the Prosperity mine, near Folsom. A pump and other machinery has been set up and the workings are being unwatered.——The new plant of the Gray Wing M. Co., which is located several hundred feet west of the old works, is about completed.——On the lower end of the Broder ranch, a mile from its present plant, the Blue Ravine M. Co. will put up works and open up the ground. It will be necessary to have two plants to work the ground the company has.

The Hupp & Roberts Co. will sink a new shaft on the Perazzo ranch, near Folsom, 800 feet east of its previous workings.——The Folsom Dev. Co. has its drills at work prospecting the ground it has bonded. It is said the company will build four dredges in addition to the two in course of construction.

San Diego County.

Superintendent R. K. Humphrey of the California King G. M. Co., at Picacho, reports the mines and plants in steady operation. A double drum gasoline hoist is being put up on the Apache claim, 1000 feet from the old mine. A double compartment shaft has been sunk on it. Aside from the ore body opened up in the Apache, ore has been blocked out in the Dulcinoa. Diamond drills, run by gasoline, are exploiting the body lower down.

Machinery for the Encinitas C. Co.'s concentrating plant at Encinitas is on the ground and being set up. The crusher will handle seventy-five tons of ore per day.

Shasta County.

The Texas Con. mine, near Keswick, was sold on the 17th inst., under forcclosure of mortgage, to Paul & Garlick of San Francisco for $20,000.

In the Old Diggings district, near Redding, the Keystone group of mines has heen sold to W. W. Old of Redding for San Francisco men. The new owners will bogin running a tunnel between 500 and 1000 feet in length to tap the body of ore showing at surface, and as soon as the mine is opened up a 100-ton smelting plant will be built.

The Quartz Hill mine, near Redding, is shipping quartzose gold ore to the Keswick smelter. The mine has been reopened under Superintendent W. O'Donnell, who has eleven miners at work. The shipments are being made for test purposes, and, if satisfactory, development work will be increased. The ore will be transported to Keswick, a distance of 5 miles, on cable tramway, to have capacity of 100 tons a day, says the Free Press. The Quartz Hill mine is about 4 miles north of Redding, on the east side of the Sacramento river.

Sierra County.

J. W. Morrell, manager of the Alleghany Drift M. Co., at Alleghany, says they are preparing for winter operations, and he expects to have water in the ditches next week.

Siskiyou County.

Work is resuming at the Spengler mine at mouth of Humbug creek, near Hawkinsville, in getting ready for winter. This mine is worked with steam derricks, ground sluicing and hydraulicking.——The Stallcup Bros. and Standford are reported taking out pay in their river claim below Hornbrook, on the Klamath rivor, in bedrock gravel.

Tuolumno County.

(Special Correspondence).—The Kodak mine, on the north fork of the Tuolumne river, near Carters, is under bond to L. F. Walker of San Francisco; he has men at work grading the millsite for a 10-stamp mill. He expects to have it in operation this winter.

Carters, October 20.

The Hampton mine, near the Rawhide extension, near Tuttletown, is being worked by E. J. Rule and the Hampton Bros. They are drifting on vein No. 1, which shows free gold and galena.

The bond on the Vine Spring mine, near Columbia, has been extended by the owners to the Yankee Hill M. Co. Five stamps will be added to the 2-stamp mill and a cyanide plant put in.

Sheriff Adams last week deeded to the Big Casino G. M. Co., of Seattle, Wash., under a judgment against the Mack Con. G. Co., all interest of the latter in the Wooten quartz mine, 10-stamp mill and improvements; also the Contention quartz mine at Big Oak Flat. The Big Casino G. M. Co. has bought the Priest interest in the Wooten mine, at Big Oak Flat, adjoining the Mack mine; also water rights.

The tramway has been finished between the Grizzly and Garfield mines, near Car-

ters, and rock from the latter is being crushed in the Grizzly mill.

L. A. Bowen and F. J. Pedro have a bond for a deed to the Reed one-half interest in the Mary Ann quartz mine, on the Stanislaus river, above Pine Log, near Columbia, and near the Hyapoo mine.

Trinity County.

The Layman mine at Hayfork is being developed under Superintendent J. B. Layman. When the recent bond expired the face of the lowest tunnel was a distance of 30 feet from the ledge. Layman is running a crosscut.

R. A. Skinner, owner of the Yellowstone group of mines on East Fork, near Weaverville, has resumed development work. ——E. F. May, secretary of the Trinity Dredging & Hydraulic G. M. Co., near Weaverville, says the company purposes installing a dredger.

COLORADO.

Clear Creek County.

Six belt concentrators, besides tables, have been added by Manager Crow to the equipments in the Con. Alpine mill, near Idaho Springs. The mill will be in operation this week, adding about seventy-five tons daily to the milling capacity of Idaho Springs district. Machinery is being put in at the Coronation tunnel on Trail creek, including a six drill compressor and boiler.

An addition has been completed at the Jackson concentrator, near Idaho Springs, and two more buddles placed therein. They will be used to work over the pulp from the tables that now goes into the creek. The Jackson mill is owned by J. G. Roberts. He has water power plants, with power to double his present milling capacity.

T. May & Co. are getting out ore from the Frostburg lode, near Silver Plume. Besides having a body of milling grade ore there is a small streak of gray copper through it that runs high in silver.

W. H. Crawford of Nashville, Tenn., vice-president of the Southern M., M. & Dev. Co., says operations will be resumed on the group consisting of the Evening Star and Poor Man's Relief group of claims on McClellan mountain, near Silver Plume. It is intended to drive a tunnel to cut these lodes at depth.

Custer County.

O. W. Murphy of Colorado Springs, who has a two-year lease on the Silver Bar mine, has arranged for the use of the Rocky Mountain Reduction plant, also in Custer county. He is building a shafthouse and putting in a steam hoist, and will increase development work.

Fremont County.

Two oil wells were opened last week near Florence. The United Oil Co. brought in well No. 322, 5 miles south of Florence, at a depth of 1500 feet, which will produce fifty barrels of oil per day, but the company may decide to drill the well to a depth of 2500 feet. The other oil well was opened by the Frazer Oil Co.

Gilpin County.

The Golden Rod M. & M. Co., in which Chicago men are interested, is operating in Silver Creek section, west of Central City. A shaft building has been built at its Pet, or main shaft workings, and has put in a hoisting plant. The shaft on the Pet is down 50 feet and will be sunk to a depth of 200 feet. Ore has been taken out of this shaft giving returns of $37 per ton. The company is putting in a two-drill air compressor. A new road has been built from Silver creek to the Pet shaft. J. Lillig is president and manager.

The Avon M. Co. is shipping an average of three cars per day from the San Juan mine on Quartz hill, near Central City, via the Gilpin Tramway Co. to the company stamp mill in Nevada gulch. The ores are coming from the third, fourth and sixth levels. W. C. Denison is manager.

The Missouri-Colorado M. & M. Co. has a lease and bond on the Snowden group, near the head of Silver creek, near Central City, and has put men to work. The company is stoping in the upper tunnel and is shipping test lots of ore. They will work it in conjunction with their Old Ann property, to the north. The Old Ann shaft is down 425 feet. W. C. Hollister is manager.

Sinking operations have begun at the Kemp Calhoun mine, near the head of Leavenworth gulch, near Central City, and are being carried on with three eight-hour shifts. The shaft is 350 feet deep. The property is being operated by Manhire Bros. under lease and bond, and they are shipping smelting ores.——McFarlane & Co. of Black Hawk are putting in new mortars at the Polar Star and Meade mills, on North Clear creek, and are building a flume 480 feet in length, 3 feet wide and 2 feet deep, to the Polar Star mill.

Gunnison County.

The Gothic M., M. & Coal Co. at Canton, Ill., operating in the Gothic section, has remodeled its mill and put in a combination treatment plant. The original plant was for treatment of silver and lead ores by leaching and smelting, but now consists of a milling and concentrating section and smelters for the further treatment of the mill products. The ore, middlings and slimes are each handled separately. The company has on a lower level than the mill and concentrating plant a fifty-ton copper matting furnace and a fifty-ton lead smelter. Ores which contain lead and copper together, or all three metals, will be first milled and the several compounds of those metals separated. They will then be in the form of fine concentrates which will be briquetted and then smelted. F. L. Clements of Canton, Ill., is manager and superintendent, and D. H. Lawrence is smelter superintendent.

Lake County.

Manager Linderman, of the Louise M. Co., operating in English gulch, near Leadville, says development is going ahead and showing considerable low-grade ore. The company will build a mill at its mine.

At Leadville the work of rebuilding the Elgin smelter will be started next month by the Ohio & Colorado Smelting Co., which owns the Salida smelter, says Manager Goodwin. They will build two more lead furnaces at the Salida smelter.

It is reported the Garhutt mine on the gold belt, near Leadville, will again be developed. It is owned by W. S. Checsman of Denver.

In addition to outputting 8000 tons a month the Ibex M. Co. at Leadville is doing considerable development and prospecting in new territory. A station has been cut in No. 4 shaft at the level where the shaft connects with the Yak tunnel. A drift has been started 100 feet above the tunnel and a body of ore opened. It is not the intention to transport the ore through the tunnel, but it enables the development at greater depth.

The Iron-Silver M. Co. is starting work on the Tuscan mine, which belongs to the company, and which has been idle for some time. The Tuscan shaft was sunk to the sulphide contact, and bodies of low-grade sulphide ore opened.

Manager G. F. Campion says he has put fifty men on the Caribou mine at Leadville, and will resume shipping a heavy tonnage of silver-lead ore to the Salida smelter. The Carihou was sending 100 tons a day to the Salida plant when they shut down a few weeks ago.

W. F. Deaner, manager of the La Plata mine, near Leadville, which has been sold to Illinois men, is repairing the surface plant and will lease the ground in blocks to miners.

Mineral County.

The Rovenue Tunnel Co., W. Skinner superintendent, has resumed operations on the Rovenue tunnel on Mammoth mountain, near Creede, and will continue driving for another thousand feet. The breast of the tunnel is in 1310 feet from the mouth.——C. W. Roe started up his concentrating mill last week to treat the zinc ore in the Happy Thought dump that he is working under lease.——K. Barriclaw and J. L. Peters have a lease on the Krutzer Sonata mine, near Croede, and will begin development work next week.

President G. Davis of the Humphreys mill, near Creede, says they have given orders to shut down the mill for the winter. The cold weather has so decreased the water supply that they have insufficient power, and the steam power plant will not be ready for use until Nov. 1. Superintendent Lees meanwhile will mine only ore that can be shipped to the smelter.

The ore output of Creede district for the year is as follows:

Month.	Tons.
January	5,383
February	5,788
March	7,072
April	5,715
May	5,645
June	5,711
July	5,636
August	6,396
September	6,891
October (to Oct. 10)	2,018

A five-year lease on the Mike Le Fever claims on McKenzie mountain, near Creede, consisting of the Paris and Diamond King lodes, between the Corsair and Krutzer Sonata mines, has been given to R. Lucette, C. McGillivray, J. Graden, A. Bunch, G. Martin, W. Cosgrove, F. Hughes and C. Welle. They intend driving a crosscut tunnel near the foot of the mountain to cut the vein at depth of 500 feet from the apex where it has been developed by shallow shafts. In these shafts samples from the vein run 100 ounces in silver per ton. The tunnel will have to be driven 300 feet to cut the vein, says the Creede Candle.

Ouray County.

I. M. Jordan of Cincinnati, Ohio, part owner of the Shulesburg group of claims, at the mouth of Poughkeepsie gulch, near Ouray, says they will reopen the group and increase development. Low-grade ore is on the dump awaiting starting of the Home pyritic smelter.

J. H. Tumbach of St. Louis, Mo., reports consolidation of properties near Ouray, comprising 300 acres. The ground known as the Blow Out gulch properties is owned by the Ouray Con. M. Co., the new organization, and includes fifteen claims and a millsite held by location, five claims and a millsite patented, and contracts for six additional claims. They contracted to buy the 10-stamp mill in operation on the ground. The company will put in machinery and drive the tunnel through its entire acreage, a distance of 5200 feet. The greatest depth that will be attained by the bore will be 3000 feet. About 1000 feet of tunneling has been done on the principal group of claims. The directors of the company are: H. Ziegenheim, P. J. Doerr, J. H. Tumbach, J. Hayward, T. W. Emerson, J. W. Jones, T. Osborne, F. S. Mallory and F. J. Hulaniski. J. Hayward is manager.

Park County.

(Special Correspondence). — About 12 miles from Fairplay, at 12,300 feet above sea level, and near the summit of Mt. Sheridan in Horseshoe mining district, is the Last Chance mine, owned and operated by the Cerussite M. & M. Co., B. S. Schlessinger, manager. The mill has a capacity of fifty tons per day and is 2½ miles below the mine, on a branch of the C. & S. Railway. The ore is hauled from the mine to the mill by wagons. The ground in the mine is frozen to a depth of 450 feet. In one of the stopes they have what is known as the "ice palace." The frozen condition of the rock enables them to mine without timbering. The stope is from 40 to 60 feet wide, and in places 200 feet in width without any timbering. At present they are mining forty tons of ore per day, and employing twenty-five men. The ore carries lead and silver and some gold.

Fairplay, October 17.

Saguache County.

The Steel Canon M., M. & I. Co., which is operating at Villa Grove, near the Orient mines of the Colorado Fuel & Iron Co., report having opened up a large body of low-grade silver-copper ore. A 60 H. P. boiler, compressor and air drills will be put in. Arrangements are completed for building a 100-ton smelter.

San Juan County.

A tailing plant will be put in at the Gold King mill, near Silverton, says the Standard. Grading the ground adjoining the mill has been done, and plans have been made for a building 75x160 feet to cover thirty-six slimes tables.

San Miguel County.

At the Black Bear mine in Ingram basin, near Telluride, development work is progressing. A reduction plant will be built.

The Silver Bell mine, near Opbir, is turning out 200 tons of ore per day. Regular shipments of bullion are made to the mint and from two to three cars of concentrates are shipped daily to the smelter. The company has 150 men on the payroll. ——The Carriheau-Montezuma mill, near Ophir, is also running steadily and thirty stamps are dropping. This company granted its millmen an eight-hour day at the same time that the new scale of hours and wages was adopted by the Silver Bell, and never suspended work a day. All the product of the mill is sent to smelters for treatment, the ore being refractory, and some ore is also shipped. The principal development work at the mine is opening an air shaft from the second level to the surface, which will add to the ventilation of the underground workings. The company is employing fifty men, but this number will be increased.

Summit County.

Near Breckenridge work on the Monte Cristo group is reported progressing. A mill will be built. The aerial tramway is being put in place.

The Masontown M. & M. Co., operating the Victoria mine at Frisco, having bought the Smith stamp mill north of Breckenridge, is tearing it down and moving it to its property on the Ten-Mile range, says Superintendent Wortman of Climax.

A former producer in the Consolidated Ten-Mile district has been bought by the Felicia Grace M. Co., which has been incorporated to develop it. The property consists of several fractions (ten acres in all) at Robinson. The Rio Grande Railway has built side tracks to the main shaft building and shipments have begun. The directors are: C. C. Worrall, D. Keneven, E. T. Buller, E. C. Straub of Denver, and M. Brockstedt of Leadville.

Teller County.

Superintendent King of the Sioux Falls & Cripple Creek M. & Dev. Co., which holds a lease on the Fort Wilcox and Fluorine claims on Copper mountain, near Cripple Creek, says they will start operating the cyanide plant next week. The mill will have capacity of treating 100 tons of ore per day. There is on the surface ore that can be successfully handled by cyanide process which will yield values of $5 per ton in gold.

Manager H. E. Woods reports a strike on the Gold Coin mine at Victor. In the tenth level a 16-foot vein of ore, carrying values of two ounces gold per ton, has been cut and has been traced for a distance of 125 feet. The tenth level is 1039 feet below the surface and development work has reached depth of 1250 feet. Woods says there has been a marked decrease in the water levels since the drainage tunnel was driven.

Lessee H. M. Gilbert of the Milwaukee Leasing Co., operating on the Le Clair claim, near Cripple Creek, is putting in additional machinery. It is the intention of Gilbert to take up the bond which he holds. The pay streak is 1 inch in width, of a deep fluorite, carrying sylvanite. The vein is broken down for 4 feet and the entire stuff is shipped, giving returns of two ounces gold per ton, says Gilbert. He has a 6-drill compressor, a hoist 8x10 feet and an 80 H. P. boiler. The shaft is down 335 feet and two drifts have been extended both north and south.

President and manager N. Franklin of the Eagle Sampler at Cripple Creek says he has seventeen men at work and is running through 150 tons of rock per day. The T. & P. and the Rio Grande samplers, as well as the Black sampler, are working a regular force and are treating nearly up to the standard. The gross amount of tons being treated and shipped out directly, exclusive of the Portland mine, is 500 tons per day, says the Cripple Creek Times.

IDAHO.

Bingham County.

The Carihoo G. & C. M. Co., Ltd., has been incorporated, with the principal place of business at Idaho Falls, with F. A. Putnam, C. Miller, W. A. & E. M. Holden and A. W. Holden as directors.

Blaine County.

Superintendent J. Peterson of the Navarino & Comet group of mines, on Deer creek, near Hailey, says he has eighteen men at work and several buildings have been put up. Two six-horse teams are getting in wood, timbers and lagging for the winter. This done, the teams will be put to hauling ore from the mines to the site on Deer creek where a mill will be built in the spring.

Boise County.

The Banner mines, 20-stamp mill, two hoists, sawmill, pumps, lathe and other machinery have been bought by V. Thorne for the London company owning a group of mines in Gamhrinus district. The Crown Point hoist will be moved this fall to the company's Gamhrinus group. It has capacity for sinking 1200 feet. The Crown Point mine was worked to a depth of 600 feet and the Banner to a depth of 590 feet.

K. Keller, who has a bond on the Elkhorn mine, near Idaho City, will put in a boiler and pump and unwater the shaft sunk in the lower tunnel.

J. E. Richardson says he has men developing a group on Charcoal gulch, 2½ miles west of Neal and ½ mile from where Charcoal empties into the Boise river. The vein is 5 feet wide, with a granite hanging wall, and assays $40 in gold, with a little silver. He will start a tunnel to get a depth of 500 feet on the vein. He proposes to build a reduction plant.

Canyon County.

W. C. Austin of Boise and W. V. Garrett of Spokane, Wash., report buying the opal mines on the Snake river for Eastern parties. They will employ twenty to thirty men at the mine, including lapidaries. The opals are found in andesite, being in calcareous seams and in geodes, says the Idaho Capital News. They will break out the rock by using lime instead of powder. A hole is drilled in the rock and filled with lime, water is then poured in and a wooden plug tightly driven in the mouth of the hole. The swelling of the lime breaks the rock gradually, so that the opals are not injured. The locations consist of six full claims near the river, 20 miles southwest of Nampa.

Elmore County.

Near Atlanta, G. Butler, H. Crab, H. Tesky et al. are developing a group of locations on the head of Black Warrior creek, 4 miles from the Walker and Birdwell discoveries. The ledges show free gold.

Idaho County.

C. L. Hathaway of Warren reports that he has 5000 acres of placer ground 12 miles west of Warren, and has put in machinery, buildings, etc. A ditch 6 feet wide on the bottom, which will carry 6000 miners' inches of water, is being cut. The ground averages 25 cents per cubic yard and is 25 feet deep.

C. Hildebrandt, in Rapid River district, northwest of Warren, reports, in driving tunnel, he cut a shoot carrying values in tellurides.

Owyhee County.

The Florida Mountain mill at Dewey, near Silver City, was started up last week by electric power, says the Avalanche. The property is owned by the Trade Dollar Con. M. & M. Co., which has reconstructed the Florida mill and is concentrating its operations at Dewey by closing the Blaine and the Black Jack mills and delivering all the ore at Dewey through the Florida tunnel. One important change in the mill was made by placing the concentrators ahead of the pans and amalgamators, and putting in a machine shop on the floor where the vanners formerly stood. Current is obtained from the electric power plant at Swan Falls on Snake river, 27 miles distant. There are 120 lights in the mill, besides those in the tramway leading from the ore bins at the end of the tuunel tramway.

Shoshone County.

Operations have been resumed at the Springfield mine, in Stevens Peak section, near Mullan, after being closed down for several months. Sinking has begun on the ledge in the lower tunnel. If the ore holds its value at the latter depth a lower tunnel will be started, which will give a depth of 1500 feet on the ledge by driving 2000 feet. The group includes seven claims, 7 miles south of Mullan. The ore carries copper values in chalcopyrite. O. B. Livingston is president.

MICHIGAN.

Houghton County.

Mine Inspector Hall's report for the year shows 13,629 men employed in the Houghton county mines. For the year ended September 30th there were thirty-three deaths from accident, of which thirty-one were underground and two on the surface. In addition there were eight non-fatal accidents. Fatalities were distributed as follows: Arcadian 1, Atlantic 1, Baltic 1, Calumet & Hecla 10, Centennial 1, Champion 1, Franklin 3, Isle Royale 2, Kearsarge 4, Osceola none, Quincy 5, Trimountain 3, Wolverine 1, Wyandotte 1 and Winona 1.

The Wolverine mine, near Calumet, is arranging to put in a third boiler at No. 4 shaft, with the third automatic stoker and economizer through which the gases from all three boilers will be discharged. This additional equipment is made owing to increased depth of workings.

Work on the Centennial mine shaft house on the Kearsarge amygdaloid, near Calumet, is progressing.

The Red Jacket shaft of the Calumet & Hecla, near Calumet, is out of commission again. Operations were resumed last week after the trouble caused by a previous accident, and on the night shift an up-bound cage caught a sliver on one of the gauges and tore out the timbers for a distance of 1000 feet, says the News, while another cage struck the "keeps." The remains of the five-deck working cage struck in the former accident are still in the hottom of the compartment. The shaft will not be in full working order till about Nov. 15.

The Mayflower mine, near Calumet, is drifting on the amygdaloid lode from depth of 580 feet in the shaft. This lode is east of that on which the Old Colony is working and the latter is itself east of the Kearsarge. Occasional bunches of copper are found, but thus far the lode bas shown no commercial value. The Old Colony crosscut is approaching the point where the drill showed copper and is being driven at right angles to the formation from depth of 550 feet.

No. 1 shaft of the Elm River mine, near Winona, is 400 feet deep. The shaft is in the foot wall and no crosscuts will be driven to examine the lode until depth of 1000 feet has been reached.

Keweenaw County.

Sinking will be resumed at the northerly pit on the Miskwabik mine, near Allouez. Compressor, hoist and air drills are being set up. At a depth of 100 feet a drift will be run to show up the lode and will he south of the permanent shaft a distance of 300 feet, from which a raise will he carried to connect with openings from above. The permanent shaft has passed through the overhurden and is now in the ledge with copper showing.

Ontonagan County.

Six rock crushers for the Michigan mine at Rockland are heing set up in A and B shaft houses. Rock shipments from the Michigan will begin by Nov. 10.

MISSOURI

Jasper County.

The Imp M. Co., composed of Veatch, Chrisman, Smith & Bennett, of Webh City, have struck a lead prospect 4 miles north of Joplin, on the Smith & Stickney ground, says the News-Herald. They have three drifts opened up and have put iu hand jigs and commenced washing. The first fifty tuhs washed cleaned up 1500 pounds of lead. The lead was struck 10 feet from the shaft in a drift which they were running to catch a run of jack which had raised from the 75-foot level.

The Octo mine on the Wolcott-Baird lease has heen sold to J. Laidlow of Toronto, Canada. The property consists of three lots and a steam hoisting plant. The mine was developed six months ago and since that time has cleared $41,000, says the Jopliu News-Herald.

Drill hole No. 13 on the Shoman lease on tbe Harvey farm, across Spring river from Joplin, is reported to have struck ore at 75 feet and the drill has sunk into 14 feet of mineral.

A strike is reported on tbe Johnson land, 6 miles west of Webb City. Jack was found at 22 feet and the mineral has continued to 75 feet, with the drill still in mineral. The memhers of the company owning the lease are R. Stickney, J. Logan, G. W. Ash, P. Hannum, C. Bishop and R. Glenn of Carthage.

A prospecting drill is at work on the Neighbor's field, west of Carl Junction. ——The Mammoth Lead Co. has its machinery in working order and is developing.——L. Anderson, W. Downs et al. have a hoist and tramway built at their shaft in Lehigh and have hegun work.

At the Seven Devils mine, near the Lincoln mine, near Joplin, on hand jigs they are producing from twenty to thirty tons of ore per week. They are driving drifts and developing the ground.

Newton County.

The Scotland mines, between Granby and Joplin, are being reopened by Webb City and Eastern men. These mines were abandoned several years ago on account of water, says the Granby Miner.

MONTANA.

Jefferson County.

Laughliu & Ham, owners of the Midnight and Morning claims, in Cataract district, near Basin, report having struck a hody of high-grade sulphide ore, carrying gold, silver and copper. They have run a crosscut tunnel 500 feet and struck the lead at depth of 250 feet. Several shipments of surface ore have heen made, averaging $40 per ton. These claims are 6000 feet north of the Crystal and Bullion mines.

The Ajax M. Co., near Basin, is putting up a 10-stamp mill at the bead of Big Swamp creek, in Big Hole Basin.

The Minnesota mine, near Wickes, has resumed operations, under bond to O. M. Holmes. He will sink a new shaft and a tunnel will he driven at the foot of the mountain.

Madison County.

F. B. Feetham of Grand Forks, N. D., manager of the Hungry Hollow mines, near Virginia City, says development will be increased. A road has been built. It is proposed to sink a vertical sbaft to depth of 200 feet and then crosscut to the lead. Should the vein at tbat depth prove as good values as near the surface, a mill will be built.

The Bonanza mine, near Rochester, has been leased and bonded to the San Domingo M. Co. of New York for $50,000, says the Basin Progress.

T. H. Teal reports the Shafter mine and mill, near Dillon, will be closed down next week for the winter.——At the Kearsarge mine buildings are going up, and excavation for the 60-stamp mill is finished. The foundations for the batteries and engines are heing huilt. In addition to plates and concentrators, will bave a cyanide plant with 500-ton steel tanks, says tbe Madisonian. The company has 150 men on its payroll, and additions are constantly heing made. Development work in the mines is progressing.

R. C. Knox, manager of the Revenue M. Co.'s gold-bearing interests at Norris, says they will build a cyanide plant of 100 tons daily capacity, the plant to be located at the mines and water piped to it from the well 2½ miles distant. Meanwhile the high-grade ores which are shipped to the smelter are providing means with which to develop the mines. The last lot marketed assayed 8.9 ounces gold and 6.1 ounces silver, says Knox.

Ravalli County.

A gold strike is reported on Owl creek near Hamilton, and Manager Cross of a New York company has located thirty-eight claims. They say the ledge is several hundred feet wide.

Silver Bow County.

F. A. Heinze says he is working every man available in the Minnie Healey and Rarus mines at Butte, and will increase his reduction facilities. His concentrator at Basin will be enlarged, and he is building a flume to furnish water for the concentrator, which will be 4½ miles long; 100 men are on this work. On the ground at the Belmont mine he has material for hoisting plant and ore bin, and is cutting a station at the 600-foot level of the mine. As soon as this is done the shaft will be suuk to the 800-foot level. He has a lease and bond on the Gem mine, north of the Speculator and Bell mines.

NEVADA.

Eureka County.

(Special Correspondence).—The Ruby Hill Tunnel Co. will drift from maiu tunnel 100 feet south.——Tremont & Laird, working the Cloud mine, near the Silver Connor mine, have taken out a shipment of silver-lead ore.——A. Laird, working the Alexandria, has shipments ready.

In the Keystone development work is progressing and the company has 600 tons of copper-lead ore ready for shipment. With tbe proceeds from this lot of ore Superintendent Porter proposes to build a small furnace for treating the ore on the ground.

The mines at Hamilton are paying $7 per ton for hauling their ores to Eureka—an increase of 50 cents per ton.

E. E. Phillips of the Lincoln M. Co. has men at work and will start shipping next month.——The Diamond mine has taken out 150 tons of ore for shipment the past ten days. The ore is a "yellow" carbonate that runs $8 gold, 10% to 15% lead and several ounces in silver. The maiu tunnel on the Diamond has beeu run 2300 feet in the limestone without the quartzite hanging wall. Men are crosscutting on a drift northwest, which will opon new ground.

The Atlantic & Pacific Co., adjoining the Diamond, is running a tunnel south in ground carrying gold values.——The Banner mine, west of the Diamond, has a 3-foot ledge of low-grade gold-silver ore on the shale and limestone contact. Assays run $6 gold.——The California and "76" are reported to have silver-lead ore carrying manganese which may be concentrated. —— The Bullwhacker mine, a former producer of Eureka district, is being opened up and developed by leasers.

Eureka, Oct. 21.

The Rocco-Homestake-Nevada M. Co., at Hamilton, has bought the hoisting plant, including boiler, engine, reels, etc., at the Seligman mine, on the west side of White Pine mountain, and has men dismantling it for hauling to the mine, where it will be put up on a vertical working shaft the company has started 400 feet north of the present incline. This new shaft will be sunk to depth of 1000 feet.

Lincoln County.

The mill of the Southern Nevada M. Co. at Searchlight was put in operation last week and is running two shifts. Superintendent Day, of the Searchlight M. & M. Co. says he will resume the sinking in the main shaft.——The Quartette M. Co. has its mill running steadily sixteen hours a day and work is being done on the three lower levels of the mine, says The Searchlight.

Storey County.

The small steam hoist is in place at the Forman shaft, near Gold Hill, and work on tbe gallows frame is in progress. Men bave been put on the 500-foot level to remove the obstruction at that point that prevents a free circulation of air in the Sutro tunnel south lateral hranch. Repairing the shaft timbering down to the tunnel level will follow.

Washoe County.

The Springfield-Nevada M.Co., at Olinghouse, reports opening up a foot of $50 ore in the face of the drift heing extended north. A sufficient amount of tbis is heing taken out to keep one of the Huntingtons on an eight hour per day run. The stopes are being square set and carried along with the drift. Over 100 feet of stoping ground has heen onened up in the old tunnel, showing an average of about 3 feet of ore, with values $9 per ton. They are preparing to bring in a supply of water to their 50-ton mill.

NEW MEXICO.

Bernalillo County.

The smelter of the New Mexico S. & R. Co. is expected to be iu operation by Jan. 1st. Additional machinery will he put in. The smelter will have capacity of 150 tons daily. The property of the company is 25 miles north of Albuquerque, N. M. A. G. Frank, of Denver, Colo., is president.

Grant County.

Work on the Granite Gap mines, near Lordshurg, is progressing under S. C. Pratt.——F. Wyman will reopen the Wyman mine, which is said to be on the same ledge as the Volcauo and Bachelor, near Lordsburg.

The St. Louis Gold Gulch M. Co. has been incorporated hy Silver City men, with T. W. Carter, H. E. Dillon, M. W. Porterfield, H. M. Powell and C. Gatzweiller as directors. They have hought two gold mining claims at Gold Gulch—the Lucky Bill and Dutch Uncle—which have a mill on them. These two claims are on either side of the Owl claim and on the same lead. Work will be started this week.

The Con. M. Co. has heen organized to work a group of gold mines at Gold Hill, with W. H. & A. M. O'Beirne, P. Lawrence and J. Sterling as officers, the last-named heing manager. The main office of the company is at Huron, S. D. The company will work the Sterling mines at Gold Hill, which consist of the North Star, Reliance, Divide, Olive, Gem and Apache. They expect to put up a 5-stamp mill and will work the ore by the cyanide process.

Superintendent G. A. Easton, of the St. Louis Gold Gulch M. Co., at Gold Gulch, says they will have a concentrating plant to handle their low grade ores.

At Gold Gulch, the Owl M. Co. is putting down three shafts on the Owl claim and has put in a steam pump in one of them.——Work has been suspended temporarily on the Carbonate claim, which joins the Owl, on account of water in the shaft, hut the company will put in a pump, after which it will resume sinking.

San Miguel County.

The concentrator of the Faywood Lead Co. at San Jose is in steady operation and shipments are being made to the smelter at El Paso. Improvements have been made to the mill this month. A fan was put in last week to clear the mill of the lead dust.

Socorro County.

G. A. Freeman, manager of the Kat and Kittens mine, near Mogollon, says he is arranging to huild a mill on the property.

OREGON.

Baker County.

Men have heen put on development work on the Golden Eagle mine, near Greenhorn.

Two more claims have been added to the holdings of the Cracker Summit Co. on Cracker creek, near Sumpter. They lie north of the group and hring the company's total up to seventeen claims. They are well timhered, as well as showing mineral bearing veins. The raise from the lower tunnel is heing driven to open the intervening ore, while arrangemeuts are being made for development work on south end of group.

E. S. Topping, A. D. Whittier et al. of Sumpter have bought 160 acres of Placer ground in Dead Mule Gulch section, which they will develop. Near these placers they found an iron-bearing vein between porphyry and syenite, and also a 2½-foot seam of coal between sandstone.

Manager Bellman of the California mine, near Sumpter, says he is building a reverberatory furnace. The California mill and mine were closed down temporarily last week pending leveling up and adjustment of the aerial tramway.

Superintendent A. Hillier of the Golden Rule mine, near Sumpter, says the mine has been shut down until spring, when development work will -be resumed on a larger scale.

O. C. Wright, president and manager of the Blue Bird mine, near Sumpter, says he has started construction of the mill. It will he a 100-ton concentration plant, with rolls.

Grant County.

Manager McGuigan of the Alamo mine, at Alamo, says he expects to have his mill machinery in position at the plant next week. With this plant in operation will make the second 10-stamp mill in Alamo district, the Quebec heing first.

W. Wade, superintendent of the Scandia tunnel, near Granite, says the crosscut is in 2450 feet, with 800 feet farther to drive before cutting the main lead. Several small veins have been cut, which will be drifted on later. The main ledge shows a width of from 8 to 14 feet on the surface. The crosscut will give a depth of 1200 feet.

Manager Carson of the Milwaukee placers, near Granite, reports he will complete hy Nov. 15 his working test of the placers that has heen in progress throughout the summer. Piping into the elevator has heen going steadily for several weeks, and they have a cut 150 feet in length, 24 feet deep and 50 feet wide at the top. A few feet of gravel was left on the bedrock, which remains to he run through the hoxes before the bedrock can be cleaned. Last week they hroke into a bed of gravel under a hank of clay, which appears to be the deposit from an old channel of Granite

creek, being 20 feet below the present level of the creek. The holdings of the Milwaukee Placer Co. take in 3 miles of Granite creek and comprise mainly patented ground; also a sufficient amount of water for working.

SOUTH DAKOTA.

Custer County.

The Black Hills Porcelain Clay & Marble Co. has resumed operations on its lithographic stone deposits west of Custer, says Superintendent Nasen.

Lawrence County.

There are the following mills in operation in the Black Hills mining sections, treating ores by cyanide process:

Plant.	Daily Tonnage.
Homestake No. 1 (tailings) at Lead	1,300
Homestake No. 2 (tailings) at Lead	800
Horseshoe, near Terry	500
Golden Reward, at Deadwood	250
Penobscot, Garden City	150
Spearfish, near Lead	300
Deadwood-Standard, near Lead	125
Wasp No. 2, Lead	120
Lexington Hill, Deadwood	100
Columbus, Central City	80
Jupiter, Deadwood	80
Imperial, Deadwood	200
Total	4,005

The following cyanide plants are either in course of construction or will be under way by January 1st, says the Mining Record:

Plant.	Tonnage.
Reliance	300
Lundberg, Dorr & Wilson, Lead	75
Golden Crest, Deadwood	60
Columbus, Central City	1,000
Hidden Fortune, Deadwood	300
Victoria, Lead	300
Phœnix	250
Branch Mint	250
Addition to Deadwood-Standard	125
Dakota, Deadwood	120
Malm, Morris & Leach	100
Total	2,880

The output of the district for the month of September was the largest for the year, due to the following: The Horseshoe 500-ton mill was put in operation; the Penobscot increased its output of smelting ore; first cleanup was made from the Lexington Hill; the National smeltor at Rapid City, Pennington county, was blown in; capacity of the Spearfish was increased to 300 tons a day; the Horseshoe began shipping ore from the Ben Hur mine to the smolter; the Imperial mill was started after a shutdown of sixty days; the Cloverleaf mill treated higher grade ore and increased tounago.

T. J. Steele of Deadwood has taken over control of the Dakota M. & M. Co., owning a group of claims in Bald Mountain district, and will increase development work. Their mill, which is in Deadwood, will he removed to the mine and enlarged. Its present capacity is 125 tons daily. The main shaft will bo sunk to the quartzite to develop a supply of water, as well as for ore.

Pennington County.

J. Cochran, owner of the Cochran mine (the Alta-Lodi), near Rochford, reports development work progressing, and he is drifting east and west from the bottom of the shaft, showing ore on both sides. The Huntington mill at the mine will be started in the spring.

TEXAS.

Beaumont reports say estimates of the amount of oil in storage in the Beaumont (Jefferson county), Sour Lake (Hardin county) and Saratoga (Hardin county) fields show 13,500,000 barrels in these and intervening sections.

UTAH.

Beaver County.

The report of the manager of the Horn Silver mine, at Frisco, shows for the current year to Sept. 1 the management has marketed 2993 tons of ore and 1500 tons of concentrates, while in September there was delivered at the smelters 1000 tons of ore, with two lots of concentrates. The Horn Silver M. Co. is down to depth of 1650 feet, and while connection at that depth has not been made with the main ore-bearing bodies, it has been found during the year that there is ore and profitable work in the stopes from the surface down to the 700-foot level. While the silver and lead ores continue to predominate, copper-bearing rock has also been taken out, says Manager P. T. Farnsworth.

Juab County.

G. M. Galsford has a lease on the property of the Boston & Tintic M. Co., near Eureka.

Salt Lake County.

The Dewey mill in Bingham canyon, near Bingham, has been added to the holdings of the Columbia M. Co. and remodeled and enlarged. It will handle the second-class ores, says Manager Tibbets. The plant was originally designed to reduce the low-grade argentiferous-lead ores of the camp. At present the Columbia is using the Rogers' concentrator, reducing twenty tons daily.

Summit County.

The annual report of President and Manager C. L. Rood, of the Naildriver M. Co., operating at Park City, shows buildings put up and machinery placed, including a direct hoisting engine, 18x60, with boilers 54x16. The shaft is down 525 feet, and a crosscut run from the shaft 60 feet towards connection with the Green tunnel, having 60 feet farther to go. Work is being done with machine drills. It is proposed to continue sinking the shaft and then crosscut and drift on the vein. In grading for the shaft ore was found near the surface.

WASHINGTON.

Ferry County.

A ledge of silver-lead ore is reported opened in the Byrne mine, near Republic, and they are driving a crosscut tunnel.—— At the Iconoclast a steam hoist has been put in and they are drifting on the vein from the bottom of a winze below the 300-foot level, showing copper-silver ore.—— The Summit M. Co., having more water than they can conveniently handle with the whim, proposes to put in a gasoline hoist. The Summit shaft is down 150 feet on the vein, following ore 18 inches wide, which runs $30 per ton in silver, copper and gold.—— The Malachite mine has resumed.

The motor and air compresser are in operation at the Mountain Lion mine, near Republic, furnishing power for the machine drills which are at work above the 300-foot level. Some timbering is being done in the stopes, preparatory to breaking into ore reserves. There are thirty men employed.

Okanogan County.

The Nighthawk M. & T. Co. has ten men on its mine north of Conconully, driving a tunnel, which is 1150 feet in, and they have cut a ledge of mineralized quartz, making the third ledge crossed in the tunnel. They are drifting on the first ledge. Manager Church says a ventilating plant is being put in.——The Six Eagles M. Co. has men at work on its tunnel, in 1500 feet. They have 100 feet more to run to strike the main ledge. The same company also has men at work on its electric light plant at the Similkameen river falls.——The Ruby M. Co. is getting out high grade ore for shipment. They will start another tunnel 300 feet farther down the mountain, and will have to drive 700 feet to cut the ledge. Arrangements are being made to start the Golden Zone mill on Ruby ore.

The sawmill at the Mineral Hill mine, near Conconully, is cutting lumber to replace the building destroyed by fire. Superintendent Wheeler says he is arrangiug to put in an air compressor plant, machine drills and other mining machinery.—— The Prize M. Co., near Nighthawk, is building a mill.——The Favorite M. Co. has men at work running a tunnel on one of the ledges.——The Pinnacle gold mine will put on more men at the mine, at the mill and hauling ore, says Manager Metcalfe. They intend to run a large dump on Bunker Hill mine through the Black Bear mill.

Whatcom County.

The Mount Baker & Shuksan M. Co. will put in reduction machinery on its property near Shuksan, near Mt. Baker. A millsite has been cleared. The ores are said to carry values in gold, silver and copper. G. T. Bacon, part owner in the Mount Baker & Shuksan M. Co., says 300 feet of tunneling has been driven and 150 feet of shaft sunk. The mine is 3½ miles from Shuksan by pony trail route. There are two lodges and assays show $15 per ton.

FOREIGN.

AFRICA.

Natal.

U. S. Consul-General W. R. Bigham at Cape Town says the reports of the collectors of customs at Durban shows, during the year 1902, imports from the United States into Natal included the following: Electrical machinery valued at $119,268.18; mining machinery, $48,168.62; engine packing, $4,642.64; electrical fittings, $47,273.18.

Transvaal.

A meeting under the auspices of the Labor Importation Association was held recently at Maraisburg and was attended by miners from the Consolidated Main Reef mines, the Aurora West United Gold M. Co. and the New Unified Main Reef. The meeting adopted a resolution in favor of the importation of Chinese labor. Another public meeting held at Standerton passed a like resolution favering the importation of unskilled Asiatic labor.

BELGIUM.

The production of coal in Belgium is one of its principal resources, reports U. S. Consul McNally at Liege. Coal is imported into Belgium for various purposes, including that of coke making. Belgium exports some coal to Germany, but the principal country of export is France. The importation of briquettes—a composition of coal dust, fire clay and tar—amounted to 44,000 tons in 1902, of which 39,000 tons came from Germany. The provinces of Liege and Hainaut cover the richest coal region of Belgium. Up to the present Belgium's developed coal fields have been in a tract of land contignous to the valley of the Sambre and Meuse rivers, and having strike of west-southwest to east-northeast, the fields being widest in the west. Recent investigations have shown another promising coal field in the north (the Campines), which is being prospected. The production of coke in Belgium in 1902 amounted to 1,848,000 tons. The gas produced is used for heating the coke ovens. One and three-tenths tons of coal are required to produce a ton of coke. The Copee ovens are principally used. The by-products are sold, as sulphates of ammenia, for agricultural purposes. The tar is sold to rotining works. The cost of mining a ton of coal is between $1.93 and $2.51, according to location of the mines. Charges f. o. b. boat are 58 cents. The mines are drift and sbaft. The shafts are from 1312 to 3937 feet in depth, while the drifts extend up to 1.8 mile. The Government receives 3½% of the gross profits.

The mines are owned and operated by companies or individuals under special legislation. According to the law of 1810—still in force—grants are made by the Government in perpetuity. By the grant the owner obtains a title to the mine distinct from the surface and which can be mortgaged separately from the surface. The operation of the mines is under Government supervision, whose powers are delegated to a beard, the members of which are selected by the State. The liability for damage to the surface or the appurtenances thereon attach to the owner of the mine. Mine owners are compelled not only to pay certain fixed revenues to the Government, but also to the owners of the surface, which latter sum is fixed by the State in its deed of concession and cannot be less than 5 cents per 2.471 acres, together with 3% of the net output. The mines are not subject to a tax, as are commercial enterprises, and pay no license, but must pay annually the sum of $1.93 per 0.386 square mile, together with an amount, fixed annually by the Government, not to exceed 5% of the production. The budget laws, however, invariably fix the amount at 2.5%.

There are in Belgium 134,000 miners, of whom 98,800 work underground and 35,200 on surface. The average wages of miners are $273 per year. Compared with other industries, wages of coal miners are relatively high. Under recent legislation women are forbidden to work in the mines, but are still employed on the surface, leveling coal, etc. Their employment in and about coal mines, however, is being gradually done away with.

BRITISH COLUMBIA.

Boundary District.

It is reported negotiations are under way for consolidation of the British Columbia C. Co., owning the Mother Lode mine and Greenwood smelter, and the Snowshoe C. Co., near Greenwood. The British Columbia company is arranging for enlargements. A 2-stand converter plant will be put in, and excavations of the site are under way. The blowing engine for the converter plant is arranged so that it can be operated either by steam or electricity. The steam cylinders are 16x42 inches and air 40x42 inches, and will be connected with the motor by rope drive. In the converter power house will also be located the hydraulic accumulator, with electrically driven hydraulic pump, to furnish water to operate the converters. In the convertor building there will also be a 72-inch silica mill, for preparing converter linings, and on the north side of the building will bo put up bins for silica and clay, together with crushing machinery. The buildings are of steel, on masonry foundations. A contract has been made between the British Columbia C. Co. and the Cascade Water, Power & Light Co. for electrical power from the latter's plant at Cascade. The Cascade Co. is building a transformer station on the smeltor site to reduce the voltage from 20,000 to 2000. The motors for operating the smelter plant will be as follows: Three 100 H. P. motors for furnace blowers and sample mill; one 300 H. P. for convertor blowing engine; one 15 H. P. for elevators; one 25 H. P. for hydraulic pump, and one 40 H. P. for driving relining machinery; also, one 5 H. P. for sample grinder, and in addition to these will be a 75 K. W. motor generator set to convert the alternating current into direct current to operate the crane. The converter plant will have capacity for treating the matte from 2000 tons of ore per day. The locomotive for carrying away the molten slag is running. Until the slag dump is leveled up to meet the requirements of the track, the slag from one furnace will be granulated as at present, but eventually all the slag will be handled by the railway.

East Kootenay District.

On Bull river, near Fort Steele, work is under way on the ditch being built by the Gold River M. & P. Co.——J. Larsen has men at work on the Tiger-Poorman group.

The Kintla Lake Oil Co. of Fort Steele will resume drilling operations on its well.

The Sullivan M. Co. of Spokane, Wash., owning a group near Marysville, is being reorganized, and they will complete the smelter which was started last year, says B. Layton, of Spokane, vice-president. The company has four men working on the dump and shipping the ore.

Nelson District.

The Poorman-Granite mine, 5 miles west of Nelson, is again closed down, this being the fourth suspension of operations in the past year, says the Nelson News.

Vancouver Island.

J. G. Davis, foreman at Emery's Newcastle island sandstone and granite quarries, has begun clearing away preparatory to resuming shipments. He says blocks of stone weighing up to fifteen and twenty tons will be taken out and shipped south.

CANADA.

The principal portion of the world's supply of asbestos is furnished by Canada, where the production has increased to 40,420 tons for the year 1902. During same year the United States produced 1010 tons and Italy and Russia 2000 tons. The brittle hornblende asbestos is chiefly used where resistance to heat and acids is demanded, but for spinning only the highly flexible fibers of serpentine or chrysotile asbestos are suitable, says F. Cirkel in the American Manufacturer. The principal Canadian deposits are at Thetford and Black Lake, between Sherbrook and Quebec, where serpentine is associated with Cambrian schist, conglomerate and quartzitic sandstone. It contains nodules and masses of steatite and chrome ironstone, and also, though not invariably, veins of asbestos from 5 to 80 milimeters thick and up to 20 meters long. Mining is carried on in open workings. The better grades of asbestos are sorted by hand, and are divided into: Crude 1, with fibers over 30 mm. long; and crude 2, with fibers 6 to 30 mm. long. In mechanical process of preparation the fibers are frequently disintegrated. The product is separated into two classes—fiber and paper stocks. The cost of production amounts to $131 per ton for crude and $17 for mechanically prepared. The selling price is $20 to $28 for paper stock, $30 to $60 for fiber, $100 to $128 for crude 2, and $180 to $200 per ton for crude 1. There are twelve companies engaged in production of asbestos, employing 3000 men.

Alberta.

The International Coal Co., west of Blairmore, reports developing two seams, respectively 6½ and 5 feet wide, of coking coal, producing coke similar to that of Fernie. The International Co. is getting out fifty tons a day, and the Canadian Pacific Railway has placed a standing order for 1000 tons daily. The coke ovens are being built close to the mines and are connected with the Canadian Pacific by a short spur. At Blairmore Proctor & Fishburn are putting a spur from their coal mines to the railway and the Byron Creek property is being opened up.

MEXICO.

The following shows the number and the location of metallurgical establishments in Mexico in operation, says the Mexican Investor:

Coahuila	1
Chihuahua	5
Durango	2
Guanajuato	3
Guerrero	2
Hidalgo	2
Jalisco	2
Mexico	3
Michoacan	1
Oaxaca	1
Puebla	1
San Luis Potosi	2
Sinaloa	2
Sonora	5
Tepic	1
Zacatecas	3
Total Sixteen States	36

The systems of reduction employed in these establishments are the following: Fundiciou (smelters), 12; toneles (barrel chlorination), 1; patio, 7; panes (amalgamating pans), 3; placas, 3; lixiviation, 6; cyanide, 3; destilacion, 1. The twelve smelters are in the following States: Coahuila, 1; Durango, 2; Guerrero, 2; Hidalgo, 1; Mexico, 3; Puebla, 1; San Luis Potosi, 1; Sonora, 1. The toneles system is employed in Hidalgo. The old Mexican

patio system exists still in Guanajuato, 3; Jalisco, 2; Oaxaca, 1; Sonora, 1. The three pan establishments are in Guanajuato. The placas system is used in Chihuahua, 1; Oaxaca, 1; Sinaloa, 1; lixiviation, in Sinaloa, 1; Sonora, 2; Tepic, 1; Zacatecas, 2; cyanide establishments, in Chihuahua, 1; San Luis Potosi, 1; Sonora, 1; destilacion process in San Luis Potosi.

Chihuahua.

Manager G. W. Boyce has started work on the Senorita mine at Victorino. Cyanide tests will be made. The vein is 100 feet wide and carries 0.32 ounce gold per ton, with a little silver.

F. McDonald, J. D. McKenzie and D. Minnahan are working a copper property near Aldama.——F. McDonald is working the San Rafael and Colon properties at Terrazas; also the Santa Elicia at Victorino, 6 miles distant.

T. Williams, B. F. Maurer, D. Bauchert, J. B. Johnstone and C. West, near Minillas, have resumed work on their La Cruz mine.

The Las Vigas mine near Coyame is shipping copper ore.

Urique reports say at the Lluvia de Oro mine preparations are being made to put up a 20-stamp mill.

Durango.

A company has been formed at Monterey, Nuevo Leon, to exploit the Guanacevi district of Durango. M. de la Garza Campos, owner of the San Ramon mine, is president. The San Ramon mine is near Guanacevi, and carries gold and silver.

W. Pettit, of Parral, owner of the Adela mine, near Santa Barbara, has bought the W. S. Benton group of fourteen mining properties, near Inde, for $120,000 Mexican. The ores of Inde carry silver and lead with some gold. Lack of transportation facilities has hindered development of the district, as they have to haul ore 60 miles to Rosario. The National is making preliminary survey from Discubridora to Inde, a distance of 80 miles. From La Cruz mine Avila & Benton ship 200 tons per month, that runs 100 ounces silver, 10% lead and 0.3 ounce gold. The Potrillo mine of V. Mortos, adjoining the Pettit properties, is shipping 200 tons of $125 ore, monthly. R. Towne, of the San Luis Potosi smelter, has perfected title to 135 pertenencias.

Guanajuato.

El Cubo M. Co. has put in an electric plant for a 20-stamp mill, concentrators and twenty drills, and will obtain power from the Guanajuato Power Co.

Mexico.

The annual report of the El Oro Mining & Railway Co., operating at El Oro, shows work was carried on in all levels from the San Juan to the 786-foot level—most of the ore coming from the hanging wall ore body above the 286-foot and 386-foot levels. The vein runs 22 to 33 feet wide. On the 786-foot level drifts have been run north and south from the main crosscut. On the 486-foot level a crosscut is being run east from north shaft to cut the Descuhridora vein. On the Somera, a 13-foot vein has been opened up.——There was mined during the year a total of 114,436 tons of ore. The reserves of ore in mine and dump assay average of $11.75 in gold and 3 ounces silver. The 100-stamp mill crushed 110,958 tons of ore, 16% of the values being recovered hy plate amalgamation. The mill tailings were cyanided, giving a total hullion recovery of $1,522,951, or 82.7% of assay value of the ore. The total tons millod was 110,958. Working costs for year were as follows:

	Total.	Per Ton
Mining	$161,570	$1.46
Development	88,780	0.80
Milling	83,861	0.76
Cyaniding	119,868	1.08
General expenses	96,970	0.87
Total working costs	$551,049	$4.97
Construction expenses	55,867	

The figures are in Mexican dollars. The total costs show an increase over the previous year, due to increased construction and heavier cyaniding, milling and development costs.——Construction has begun on an additiou of 100 stamps to the present milling capacity. During the year, in conjunction with the Exploration Co., secured an interest iu a working option on the extension of the San Rafael vein.

Superintendent J. Devereaux reports developments progressing on the Descubridora mine, near El Oro. The 3-compartment shaft is being sunk.

Sonora.

B. F. Graham of Bisbee, Ariz., principal owner of the Lucky Tiger mine, near Douglas, says development work and ore shipments will he increased. Ahout 3500 feet of tunnels have been driven under the present management. The wagon road has been completed from the railway station to the mine, doing away with the hurro train.

PERSONAL.

J. F. SMITH is superintendent of the Phœnix mine, Liscum, Ariz.

GEO. W. SHELTON has returned to Alma, Colo., from Denver, Colo.

F. W. WILLIAMS, of Seattle, Wash., is in San Francisco, Cal., on mining business.

W. E. SHARON, a mine superintendent of Virginia City, Nev., is in San Francisco, Cal.

C. I. RADER has resigned as manager of the Annie Laurie mine, near Kimberly, Utah.

H. M. PEASE, of Stent, Tuolumne Co., Cal., is in San Francisco, Cal., on mining business.

H. E. CAREY of Salt Lake City, Utah, is in New York in interest of his Mexican gold mines.

W. L. WATTS, E. M., is in San Francisco, Cal., on mining business from Los Angeles, Cal.

S. F. SULLENBERGER, of Glohe, Ariz., interested in Arizona mines, is in San Francisco, Cal.

J. P. HENNESSY, interested in Tonopah, Nev., mines, is in San Francisco, Cal., from Tonopah.

J. R. SERRANO has beon appointed mining agent at Guerrero, Mexico, for the Department of Fomento.

C. W. RAYMOND has returned to San Francisco, Cal., from an examination of mine property in Oregon.

H. B. VERCOE, managing director of the Fresno C. Co., Ltd., has returned to Clovis, Cal., from Los Angeles, Cal.

G. COOPER is superintendent of the Crackerjack M. Co., at Buffalo Hump, Idaho, vice C. Flint, resigned.

R. A. FOSTER, metallurgist, of San Francisco, Cal., has returned from Eureka, Nev., on mining business.

C. C. JONES of the Mountain C. Co., Ltd., at Keswick, Shasta county, Cal., is visiting Utah mines and plants.

G. A. FREEMAN, manager of the Kat and Kittens mine, Mogollon, Socorro county, N. M., is in the East on business.

A. E. HYDE JR. is manager of the Annie Laurie mine, near Kimberly, Piute county, Utah, vice C. I. Rader, resigned.

G. W. CAMPBELL, manager of the Black Oak mines, Tuolumne Co., Cal., is in San Francisco, Cal., from Soulsbyville, Cal.

J. R. COOPER has resigned as smelter superintendent of the Quincy M. Co., at Hancock, Mich., to take effect November 1.

L. GREENE, manager of the Clayton M. & S. Co., whose mines and furnaces are at Clayton, Idaho, is in camp from Salt Lake City, Utah.

E. E. PAYSON is superintending construction of a 100-stamp mill for the Yale-Brown M. Co. at Red Mountain, Ouray county, Colo.

W. TECHOW bas resigned as superintendent of the North Pole mill, near Sumpter, Or., and entered business in Portland, Or.

O. WISER, formerly master mechanic, is mill superintendent of the Annie Laurie mine, near Kimherly, Utah, vice H. Calvin, resigned.

H. G. VERCOE, superintondent of the Fresno copper mine, Clovis, Cal., has returned from the Green Mountain mine, Mariposa county, Cal.

R. L. BENTON, of Bisbee, Ariz., has resigned as manager of Lucky Tiger mine in Sonora, Mex., and the Bishee Queen mine near Bisbee, Ariz.

C. A. MELSON, Salt Lake City, Utah, representative of the London Exploration Co., returned there last week from its mines in South America.

T. S. LEWIS, of Los Angeles, Cal., treasurer of thc Cieneguita C. Co. of Phœnix, Ariz., has gone to Denver, Colo., and New York on company husiness.

ERNEST A. HAGGOTT, manager Arizona Blue Bell C. Co., Mayer, Ariz., has returned from a professional trip to Silverton, Colo., mining district.

D. R. OLIVER, president and general manager of the Zubiate M. Co., has returned to San Francisco, Cal., from a trip to their mines in Sonora, Mexico.

S. E. BOWERMAN, vice-president of the Brant M. & M. Co., has returned to Kansas City, Mo., from a trip to the company's properties at Thunder Mt., Idaho.

T. H. TRACY, general superintendent of the North American C. Co., Encampment, Wyo., has returned from attending a meeting of the stockholders of the company in Denver, Colo.

W. P. SMITH, assistant superintendent of the Calumet & Hecla smelter, at Buffalo, N. Y., will be smelter superintendent of the Quincy M. Co., at Hancock, Mich., vice J. R. Cooper, resigned, to take effect November 1.

Obituary.

THOMAS DAVEY, till recently a mining superintendent at De Lamar, Idaho, died at Boise City, Idaho, on the 8th inst. Deceased went to De Lamar from Granite, Mont., in 1894. He is survived hy a widow and two daughters.

JOHN HILLARY, a pioneer miner of Calaveras county, Cal., died in Alameda, Cal., October 2. Deceased went to Calaveras county in 1852, and was an owner in and locator of the Lone Star and Reed & Hillary mines, near West Point, from 1863 till 1887.

JAMES BECK, who discovered the Alexandria coal fields on Vancouver Island, B. C., died at his home near South Wellington, on the 12th inst. Beck was a partner of the late Robert Dunsmuir in prospecting days, and sold the Alexandria to Dunsmuir for $20,000. Deceased went to British Columbia in the days of the rush to Cariboo, going from Ontario, Canada, to San Francisco, Cal., via Panama, and thence going north.

Catalogues Received.

Catalogue No. 9, from Harron, Rickard & McCone, 21-23 Fremont street, San Francisco, Cal., is devoted entirely to wood working machinery. The 130 pages of finely printed matter give illustrated description of many machines in general use, and a variety of wood working devices that the firm carry in stock for immediate delivery. The contents are admirably arranged and the work is an addition to trade literature.

Commercial Paragraphs.

THE Austin Manufacturing Co. of Chicago has sold to King & Craig of Cripple Creek, Colo., a gyratory crushing plant.

H. K. OLSEN has within the last few days entered into copartnership with A. J. Van Drake, 308 Mission street, San Francisco. Cal. The name of the firm is now Van Drake-Olsen Machine Works. Mr. Van Drake has gone East on business for the firm.

Latest Market Reports.

SAN FRANCISCO, October 23, 1903.

METALS.

SILVER.—Per oz., Troy: London, 28 5/16d (standard ounce, 925 fine); New York, bar silver, 61¼c, refined (1000 fine); San Francisco, 61¼c; Mexican dollars, 49@51c San Francisco, 46¾c New York.

Silver has taken another upward movement since last week, reaching 61⅞ during the week, hut receding to 61¼, the present quotation. The announcement that the Government would discontinue coinage for the Philippines has not affected the market as yet.

COPPER.—New York: Standard, $13.12½; Lake, 1 to 3 casks, $13.12½; Electrolytic, 1 to 3 casks, $13.00; Casting, 1 to 3 casks, $12.75; San Francisco: $15.00. Mill copper plates, $17.00; hars, 18@24c. London: £54 10s spot per ton.

Copper remains weak and the market is somewhat lower, the price of Standard, Lake and Electrolytic having receded to 13 cents. Still authorities on the copper market predict a rally and say that there are no large accumulated stocks on hand and the consumers are running short of supplies. Buyers are holding off for lower prices and producers and dealers are not offering any inducement to huyers, in view of which the market is weak, with a lowering tendency.

LEAD.—New York, $4.50; Salt Lake City, $3.50; St. Louis, $4.00; San Francisco, $4.50, carload lots; 4¾c 1000 to 4000 ℔s.; pipe 6½, sheet 7, har 5¾c; pig, $4.75. London: £11 1s 3d ₱ long ton.

SPELTER.—New York, $6.12½; St. Louis, $5.10; London, £20 10s ₱ ton; San Francisco, ton lots, 6¾c; 100-℔. lots, 7c.

No. 2** 30%, carload lots, 9c; less than one ton, 11c. Black hlasting powder

in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

CAPS.—3x, $5.50 per 1000; 4x, $6.50; 5x, $8; Lion, $9, in lots not less than 1000.

FUSE.—Triple tape, $3.60 per 1000 feet; double tape, $3.00; single tape, $2.65; Hemp, $2.10; Cement No. 2, $3.00; Cement No. 1, $2.65, in lots of 3000 feet and up.

CANDLES.—Granite 6s, 16 oz., 40s., 11c ℔ sot; 14 oz., 40s., 10c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00: Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lots, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $10.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

CHEMICALS.—Cyanido of potassium, 98@99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphito of soda, 3@3½c per lb.; caustic soda, in drums, 3@3¼c ℔ lb.; Cal. s. soda, bbls., $1.20@1.40 ℔ 100 lbs.; sks., $1.05; chlorate of potash, bbls., 10c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2@3c; flour sulphur, French, 3½@3¾c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

BONE ASH.—Extra No. 1, 5@6c ℔ lb. No. 1, 4@5c.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 6c; less than 500 lbs., per lb., 7c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb tin cans, 100 lbs. per case, ½c. per lb. above keg price. Dry Lead—In bbls., 1 ton and over, 6c; do. in kegs, 6½c.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb., 6½c; less than 500 lbs., 7c.

LITHARGE.—Pure, in 25-lb. bags, 8@9c ℔ lb.

BORAX.—Concentrated, 6@7c ℔ lb; powdered, 8@10c; fused, 20@25c; crystal, 7c; calcined, 25c.

MANGANESE.—Pure, ℔ lb., 60c.

SODIUM.—Metal, ℔ lb., $1.00.

BISMUTH.—Subnitrate, ℔ lb., $1.75.

MERCURY.—Bichloride, ℔ lb., 90c.

MOLYBDENUM.—$2.00 ℔ lb.

CHROMIUM.—90% and over, ℔ lb., $1.00.

PHOSPHORUS.—American, ℔ lb., 75c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 55c.

ALUMINUM.—No. 1., 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs, 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

URANIUM.—Oxide, ℔ lb., $3.50.

(These prices are wholesale, f. o. b. San Francisco, unless otherwise noted.)

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

VEHICLE WHEEL RIM.—No. 741,401. Oct. 13, 1903. H. Harris, San Francisco, Cal. One-half assigned to Wm. J. Gorham, of same place. This invention relates to improvements in vehicle wheels employing inflatable tires, and pertains particularly to a form of sectional rim having means for quickly attaching and detaching the tire. Its object is to provide a rim and a double-tube tire therefor of simple construction and suitable for bicycles, automobiles and other vehicles, whereby in case of puncture or other needed repair the tire may be quickly and easily detached, the inner tube removed and mended and the tire again replaced and locked in position securely on the rim.

HYDRAULIC ELEVATORS.—No. 741,291. Oct. 13, 1903. J. H. Adams, Alameda, Cal. This invention relates to improvements in apparatus for lifting gravel, tailings and the like to elevated points by the aid of a jet of water under high pressure delivered into a pipe into which the material to be lifted is brought in such a manner as to be acted on and carried upward by the jet. The object of the invention is to provide a lift which can be operated no matter to what depth the nozzle may be submerged.

COMBINATION CANES.—No. 741,373. Oct. 13, 1903. Le Roy Robertson, Oakland, Cal. Two-thirds assigned to John Yule and L. W. Forsting, Oakland, Cal. This invention relates to a combination cane and device for concealing and exploding a flag or other ornamental attachment, together with a means for producing a sound. The device is especially intended for political and other marching bodies of men, where it is desirable to provide means for producing a blast or sound at intervals, and by means of the horns all sounded in unison this can be effected. The device can be taken apart and the sections used separately, or the parts can be assembled and the device becomes an ornamental cane suitable for ordinary use.

FRUIT PULP MACHINE.—No. 741,428. Oct. 13, 1903. C. R. Wilson, San Francisco, Cal. Immense quantities of fruit go to waste annually simply for the reason that the growers have often no means at hand of disposing of the fruit which becomes too ripe for shipment. The object of this invention is to provide a crusher of simple construction by which this ripe fruit may be reduced to a pulp and the pits extracted, and to accord means in connection with the crusher whereby the pulp may be spread into a thin sheet and cut into squares preparatory to drying.

AIR DRAFT HEATER.—No. 741,608. Oct. 13, 1903. J. McDermott, West Berkeley, Cal. This invention relates to an apparatus which is designed for heating air to be employed for draft in furnaces in connection with oil burners or for like purposes. It consists of one or more casings having transversely disposed foraminous diaphragms and means for admitting air into one end of the casing and withdrawing it from the other. The object of the invention is to heat air which is to be used for various purposes requiring an elevated temperature.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market St., S. F., has official reports of the following U. S. patents issued to Pacific Coast inventors:

FOR WEEK ENDING OCTOBER 13, 1903.

741,291.—HYDRAULIC ELEVATOR—J. H. Adams, Alameda, Cal.
741,097.—RAILROAD SWITCH—W. J. Bell, Los Angeles, Cal.
741,471.—CONVEYORS—H. W. Blaisdell, Yuma, Ariz.
741,008.—ROLLER BEARING—F. E. Brooks, S. F.
741,307.—CLOSURE—E. E. Chapman, Los Angeles, Cal.
741,014.—SNAP HOOK—R. F. Covert, Salida, Cal.
741,319.—CLEVIS—J. G. Evans, Baker City, Or.
741,122.—BURGLAR ALARM—W. H. Fletcher, Capitola, Cal.
741,479.—WOOD WORKING MACHINE—H. O. Fry, Cosmopolis, Wash.
741,325.—MOTOR—S. A. Gibbs, Tacoma, Wash.
741,385—STEAM BOILER—B. H. Green, Los Angeles, Cal.
741,401.—VEHICLE WHEEL RIM—H. Harris, S. F.
741,248.—INDICATOR—F. W. Jones, Santa Paula, Cal.
741,504.—OIL BURNER—W. Kemp, Tucson, Ariz.
741,515.—WINDMILL—T. W. Lowe, Stockton, Cal.
741,355.—COLUMBARIUM CELL—W. J. Mathews, Oakland, Cal.
741,608.—AIR DRAFT HEATER—J. McDermott, Berkeley, Cal.
741,278.—GUN—G. D. Potter, Spokane, Wash.
741,609.—SHADE FIXTURE—M. E. Rice, Los Angeles, Cal.
741,373.—CANE—L. R. Robertson, Oakland, Cal.
741,107.—WINDOW SASH—E. Wadey, Los Angeles, Cal.
741,203.—FLUSHING TANK—W. A. Williams, S. F.
741,428.—FRUIT PULP MACHINE—C. R. Wilson, S. F.

SITUATIONS WANTED.

ASSAYER, EXPERIENCED IN CYANIDING, desires position. References. Address "Assayer," care of Mining and Scientific Press.

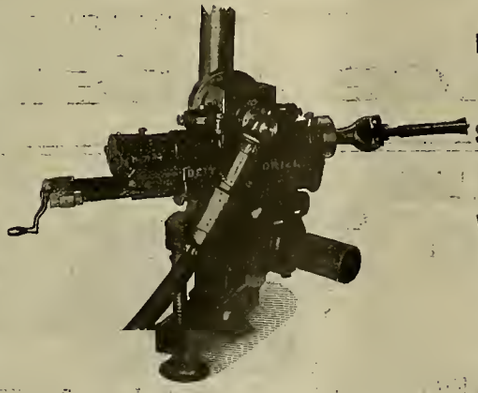
CYANIDE CHEMIST WHO HAS SUCCESSfully managed cyanide plants will be open for engagement in November. Ten years' experience in different countries. Reasonable salary. Address "Reliable," care of this office.

MINING ENGINEER DESIRES POSITION AS Manager or Superintendent. Good executive ability. Extensive experience in mining and treating large bodies of low grade refractory gold ore. South Africa or West Australia preferred. Address "Telluride," this office.

EXPERIENCED MILLMAN WISHES POSItion. Address Box 117, Oroville, Cal.

MINING ENGINEER AND METALLURGIST, with sixteen years' of practical experience as manager, superintendent and consulting engineer of mines and mills, desires position on or after November 1st. Speaks Spanish fluently. Address P. O. Box 77, Durango, Mexico.

MINING ENGINEER OF GOOD STANDING, with twelve years' experience in mines and mills, wants position as expert. School of Mines graduate. Address V. X., this office.



SITUATION AS MILLMAN OR CHARGE OF small mine, after November 15th, by middle-aged man. Over twenty years' experience in mine and mill. All round worker. Nine years with present company. Wish to make change. Good references. Address "Millman," care of Mining and Scientific Press.

SUPERINTENDENT WANTS POSITION WITH substantial company. Practical miner, millman, assayer and cyanide expert. Address Supt., this office.

WANTED, BY A FIRST-CLASS CYANIDE Chemist and Assayer having had ten years' experience in the construction and management of plants in some of the main gold and silver camps of the West, a position with a reliable company. Satisfactory work guaranteed. Highest references given. Moderate salary. Address "Cyanide Chemist," care of Miniag and Scientific Press.

WANTED BY AN EXPERIENCED MINING Engineer and Manager, a position as mine manager in gold, silver or copper proposition, with a first-class corporation. Have had 35 years' experience in U. S. and Mexico; prefer Mexico. Speak Spanish, German, French and English. Am well acquainted with Mexico, and am employed now. Desire a change between November and January 1st, 1904. Salary expected not less than $5000 per annum. Can furnish the best of reference. Address "Mine Manager," care of Mining and Scientific Press, San Francisco, Cal.

THE DIETZ
Electric Rock Drill
Has Solved the Problem of Drilling Rock with Electric Power.

Is built for rough work and will stand up to it.

Saves time—and time is money.

Will run with less repair expense than any drill upon the market, either electric or air.

One user writes, "In an eight months steady run have been cutting rock for $5.00 per foot that cost me $14.00 by hand."

Another writes that rock that cost him $12.00 per foot he is now cutting for $3.50.

ASSESSMENT NOTICES.

LARKIN MINING COMPANY.—LOCATION OF principal place of business, San Francisco, California; location of works, El Dorado County, near Placerville, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 21st day of September, 1903, an assessment (No. 15) of two and one-half (2½) cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 112 Main street, Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 26th day of October, 1903, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on MONDAY, the 16th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
N. F. REMINGTON, Secretary.
Office—112 Main street, San Francisco, California.

WILLIETTA MINING AND MILLING COMpany.—Location of principal place of business, San Francisco, California; location of works, near Jacksonville, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 19th day of September, 1903, an assessment (No. 7) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 233, Crocker Building, corner Post and Market streets, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 27th day of October, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on TUESDAY, the 17th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
E. MCALLISTER, Secretary.
Office—Room 233, Crocker Building, corner Post and Market streets, San Francisco, California.
☞ **Prompt payment is requested.**

GOLDEN WEST MINING AND MILLING Company.—Location of general place of business, San Francisco, California; location of works, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 11th day of September, 1903, an assessment (No. 1) of one (1) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, 123 California street, Room 423, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 24th day of October, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on WEDNESDAY, the 18th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
CHAS. BOVONE, Secretary.
Office—123 California street, Room 423, San Francisco, California.

EUREKA CONSOLIDATED DRIFT MINING Company.—Location of principal place of business, San Fraacisco, California; location of works, Placer County, California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the 15th day of September, 1903, an assessment (No. 38) of one-half (½) cent per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the secretary, at the office of the company, Room 31, 214 Pine street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 17th day of October, 1903, will be delinquent, and advertised for sale at public auction; and, unless payment is made before, will be sold on SATURDAY, the 7th day of November, 1903, to pay the delinquent assessment, together with the costs of advertising and expenses of sale.

By order of the Board of Directors.
GEO. W. DIXON, Secretary.
Office—214 Pine street, Room 31, San Francisco, California.

POSTPONEMENT.

The date of the delinquency of the foregoing assessment has been postponed to Saturday, October 31st, 1903, and the day of sale from the 7th day of November, 1903, to Saturday, November 21st, 1903.

By order of the Board of Directors.

A paid-up Hydraulic Engineering Scholarship in the International Correspondence Schools of Scranton, Pa., for sale at a sacrifice.
Address 1268 Harrison St., Oakland, Cal

FOR SALE.
Cinnabar Property, Over 180 Acres, in El Dorado County, California.
PARTIALLY DEVELOPED.
BERNARD CINNABAR MINING CO., Room E, Academy of Sciences Building, San Francisco, Cal.

THE CALIFORNIA DEBRIS COMMISSION having received applications to mine by hydraulic process from E. C. Kavanaugh and Wm. H. Duffey, in Phillips Mine, near Forest Hill, Placer County, Cal., draining into Missouri Creek which reaches American River, and from North America Consolidated Gold Mining Co., in its mine near Gibsonville, Sierra County, Cal., draining into West Branch of Slate Creek which reaches Yuba River, gives notice that a meeting will be held at Room 96 Flood Building, San Francisco, Cal., Nov. 2, 1903, at 1:30 P. M.

ALLEGHENY, PA.

Our Catalogue No. 1 describes **WATER WELL MACHINES** of many sizes, both traction and non-traction, for wells 50 to 1000 feet deep, and gives full illustrated instructions for operating.

Catalogue No. 2 describes **MINERAL PROSPECTING MACHINES** for exploring for Iron, Lead, Zinc, Coal and all minerals. Several sizes, both traction and non-traction. Also **PLACER GOLD TESTING MACHINES** for assaying Alluvial Deposits, Lake and River Beds to bedrock. Can be used on boat.

Also Sectionalized Machines and Boilers for easy transportation to difficult places. They make 6 and 8-inch holes through anything and bring to the surface everything found. Full instructions for operating.

Catalogue No. 3 describes **OIL WELL MACHINERY** for wells 1000 feet to 2500 feet deep. Several sizes, with full equipment and instructions for operating.

Our Machines are the sum of all excellence, in use all over the world. Top quality, bottom prices. Catalogues FREE.

Mine Drainage.

The problem of mine drainage is often a serious one, from financial and mechanical points of view, and for this reason mines which may be operated through adits are preferred by many to those which can only be worked through shafts. In former years pumping machinery of more than nominal capacity was more expensive than now, and this, together with the uncertainty of the amount of water which might be met, often deterred capital from investment in wet mines. Modern engineering and mechanical methods have simplified the problem, and pumps now raise quantities of water to a height which a few years ago was impossible with the appliances then in use. Pumps are of many kinds, ranging from the simple China "pump," consisting of two wheels around which passes a belt having cleats secured to the surface of the belt at stated intervals, and run by a water wheel, to the great modern steam and electrical constructions which raise enormous amounts of water by direct lift over 1500 feet.

The best safeguard against the flooding of a mine is in providing ample facilities to handle not only the coming water, but a much larger amount than has been developed in the workings. There are few mines which have facilities for handling water greater than they actually require. At mines where water power is available the question of power is simplified, for Cornish pumps may be operated by water power and steam pumps may also be run by compressed air, the compressor being driven by water power.

Formerly Cornish pumps of various patterns were the most extensively used in deep mining, but the cost of installation of the direct-acting Cornish pump was so great that engineers were urged to devise larger, more efficient and less expensive steam pumps to cope with the increasing volumes of water encountered in some mines. The mechanical engineers met the demand and it is only rarely now that an elaborate Cornish pumping system, with its long, heavy pump rods and expensive balance "bobs," are installed in American mines, the steam and electrically driven pump having superseded, and in many eases, displaeed them. The Cornish pump is an efficient pump, but with high first cost, and this, accompanied by the uncertainty as to what water may be found in the further development of the mine, makes it less popular with mine managers than formerly. A Cornish pump designed to raise 1000 gallons of water per minute to the height of 1000 feet may perform all that is claimed for it by its makers, which is all that can be expected of any pump, but should the quantity of water increase materially the Cornish pump is soon under water, though that proves no disadvantage with it, as it can be operated under any depth of water so long as it remains in working order, but to increase the capacity of a Cornish pumping plant once installed is an expensive and unsatisfactory operation.

If steam or electric pumps be placed in a mine to handle a given amount of water, and the water unexpectedly increases, additional pumps can be placed in the mine at various stations, or at other convenient places, and by this means any probable increase in water is promptly cared for. The first cost is far less than that of a Cornish pumping plant of equal capacity, and the steam and electric plants are capable of being quickly expanded to meet any probable change in conditions.

When designing a shaft for a mine a large compartment should be provided for pumps, pipes and manway, for often the size of shaft compartment determines the size of pump that can be economically placed in the mine. Some of the larger station pumps of to-day are made in sections which cannot be taken down through a small compartment. In such an instance two or more pumps of smaller size would have to be substituted for a large one, which is doubtful economy, both in first cost and future operation.

The employment of skips in hoisting water has been demonstrated to be an economical and satisfactory method of handling mine water, either to unwater flooded workings or to keep the water at a stated level. They are comparatively inexpensive, quickly placed in position or removed from the shaft, as required, and they will handle a large amount of water at low cost, particularly if the skips are of good size, working in a properly constructed shaft in good condition, running in balance. Where a flooded mine is to be unwatered the skips may be run tandem. In a properly equipped shaft an average of 1000 gallons may be easily raised from a depth of 1500 feet every minute without great expense, employing two skips each of 1500 gallons capacity and running in balance. The economic utility of skips is coming to be realized by many who have had little experience with them. They are being more extensively used as carriers of water as well as of ore and rock, throughout the mining world.

Tin in the United States.

For many years past efforts have been made in the various districts in the United States where tin ores are found to develop a profitable tin mining industry. Up to the present time, however, these efforts have not been rewarded with success, but this fact does not deter others from making a similar attempt, nor is there any reason why it should. The tin districts of the United States are notably those of the Black Hills, South Dakota, where tin occurs in coarse granite dikes, in the Harney Peak region of Custer and Pennington counties, and on the Dakota-Wyoming line in Lawrence county; and that of southern California, near the town of Corona, in Riverside county. Tin also occurs in numerous other localities, though, as far as developed, only in small amount.

In the Black Hills region a large amount of development work has been done in both of the districts mentioned, and expensive concentrating mills have been built—the first at the Etta mine near Keystone in 1886. Although the mine had considerable development and was well situated for attack by mining operations, the vein subsequently proved more valuable for spodumene than for tin, although cassiterite occurred in the rocks. The Etta mill ran but a short time, there being too little tin ore to keep it supplied. Later mills were built at and near Hill City, and further attempts were made to concentrate and reduce the ores. While such operations were generally successful from a mechanical standpoint, they apparently never realized a financial success, which is the usual object in equipping and operating mines.

In California an elaborate plant was built for the treatment of the tin ores occurring on the San Jacinto estate in Riverside county in 1890-91, and considerable tin was produced, but without profit.

Whatever may be said of the management of these several enterprises in the past, all of these operations were conducted at periods ranging from ten to seventeen years ago, since which time many improvements have been made in metallurgical appliances and processes, and the knowledge of concentration has been materially increased. As it is no uncommon thing to see gold, silver and copper mines which in past years failed to pay, or, having once paid, closed because they could no longer be made to yield a profit under existing conditions, are now again successfully operated under the new conditions, it is reasonable to expect that the tin mines under the new state of things may be enabled to make a success.

Litigation in Butte, Montana.

The handing down by Judge Clancy of the District Court of Montana a decision in the Minnie Healey and Parrott cases adverse to the Amalgamated Copper Co. has had an unexpected effect. The Amalgamated Co. has closed down all its mines and works, not only in Butte City, but throughout Montana, throwing 15,000 men out of employment. What the outcome of this arbitrary action will be is difficult to foresee. Different interests view the situation differently. One class looks upon the action of the Amalgamated people as a bid for public sentiment in their favor, in view of pending and possible future new litigation. Others consider it as a "bull" movement in the copper market.

Whatever the motive, it has created consternation among the miners of Montana, and its outcome is looked forward to with doubt, not to say apprehension.

The Minnie Healey and Parrott cases are but two of a number of cases which have been before the Montana court for months past, and it looks as though the litigation between the Amalgamated interests and those of A. F. Heinze and associates will be interminable, unless some sort of compromise is arranged. With this object in view, a mediation committee has been appointed, consisting of W. A. Clark, Paris Gibson, J. J. Hill and Governor T. K. Toole. This committee has been asked to arbitrate the differences, if possible, but little is hoped for from its efforts.

The Minnie Healey case, as well as most of the other cases pending in the Montana courts, is directly the outcome of the pernicious extralateral right law, which permits the following of a vein or ore deposit beyond the side lines of a mining location. In a region where the vein structure is simple the law would operate perfectly, as the framers of it conceived no complications such as are usually found. This aptly illustrates the wide difference between legislative and scientific geology. In a region where the vein system is complex, the extralateral right law invariably results in litigation if all the properties are not owned by one person or company.

In the Butte district the geology is very complex, and the conflicting interests have been many. Long-continued and expensive litigation has resulted in settling or compromising a great number of these contests, but a great many still remain to be adjusted.

In addition to the extralateral right controversy, a new feature has entered into the Butte litigation. Judge Clancy has rendered a decision that under the common law the Amalgamated Copper Company (a New Jersey corporation) has no right to own and hold stock in the Boston & Montana, and the Parrott Silver and Copper companies, which are Montana corporations. It is contended by the amalgamated interests that, if this decision be just, then the United Copper Company—also a New Jersey corporation, controlled by the Heinze interests—has no right to hold the stocks of Montana corporations. If this decision is sustained it would affect other corporations not of Montana, holding stocks in corporations organized under Montana laws.

Judge Clancy has made permanent the injunction restraining the Amalgamated Copper Company from doing business in Montana, and rather than have receivers appointed by the court the Amalgamated Company has closed down every interest controlled by them in Montana.

There were three receiverships sued for: two by J. MacGinniss, vice-president of the Montana Ore Purchasing Co. vs. the Boston & Montana Co., in which Mr. MacGinniss owns 100 shares out of 150,000 shares stock. By this action, it is claimed, $2,000,000 were tied up which would have been disbursed in dividends.

Another case was that of J. MacGinniss and J. Lamm, who own 80 shares out of 240,000 shares of the Parrott Silver and Copper Mining Company.

The court granted everything asked for by plaintiffs in these cases except the actual appointment of receivers, which is held in abeyance pending the action of the Amalgamated Company in complying with certain conditions.

That a complete shutdown was necessitated by the decision of the court is not evident, but rather than submit to the property being placed in the hands of receivers the Amalgamated Company has closed all its mines and works, and as both sides appear to be unwilling to make any concessions, it is impossible to anticipate the end of this, the most serious trouble that has ever confronted Butte. Even the "smoke nuisance" is forgotten in its absence.

If the mines remain closed for any considerable time, it will doubtless affect the copper market. The Boston & Montana is said to be capable of producing 100,000,000 pounds of copper annually, and the Parrott Co. about 12,000,000 pounds. With this large output withdrawn from the market, the price is likely to go up somewhat. The present price is higher than that of last week, but whether as the result of the Butte difficulty or not is as yet indeterminate.

The Labor Situation.

From nearly every district, where a few weeks ago miners walked out at the call of the officers of the Western Federation of Miners, comes the news of renewed activity. In Cripple Creek, Colo., district about 1800 non-union men are now at work, besides 500 union men in the Portland mine. Many of these were formerly affiliated with the Western Federation, but were reinstated upon withdrawing from that organization.

In the San Juan district of Colorado the mines are gradually starting up with non-union crews, and there is more activity generally in those localities in Colorado where strikes have prevailed throughout the greater part of summer.

At Searchlight, Nev., the mine owners who stood together with a single exception, have been enabled to resume operations with non-union men, only one mine being worked with Federation men. At Randsburg, Cal., the Yellow Aster is working to its full capacity with non-union men. In other districts the mines are operating steadily, threatened trouble having been averted generally by mutual concessions. In a few localities the Western Federation is still supreme, but they are far less aggressive than formerly.

In Arizona the southern mines are all at work, and only in Yavapai is the mining industry not under full headway, but an early adjustment of the long continued difficulties in that district is anticipated.

Danger in Mine Fires.

The occurrence of a mine fire attended with death is reported from Eureka, Utah, where a fire starting in the workings of the Bullion-Beck or the Eureka Hill mine flooded the Centennial and Gemini mines adjoining, as well as the workings of the burning mine, with deadly gas, causing the loss of a mine foreman and a large amount of damage to the workings. This occurrence emphasizes the necessity for providing during the development of the mine against spread of fires, and means for preventing the passing of deadly gas and smoke from the burning chambers and other portions of the mine in event of a possible fire. In this case, as usual, there were no means to confine the fire, and men went into the workings with their heads encased in helmets something similar to those used by divers, and although they were enabled by this means to make an inspection, found that they could perform no work with the cumbersome headgear. As in Eureka district a scarcity of water made flooding of the burning stopes impracticable, attempts were made to smother it, but as previously stated, the men were unable to accomplish much with their life-saving apparatus.

If suitable doors of iron with brick casings were provided at points on each level, in order to shut off the fresh air supply, fires would be of short duration in mines, as they cannot make headway without a continuous supply of oxygen. In view of the great damage often done by mine fires, which are not infrequently attended with loss of life, it is strange that the provision of doors, which upon occasion of a fire may be made air tight, are not provided in all dry mines or those where fires may possibly occur.

CONCENTRATES.

THERE are stated to be 98,000 native miners in Mexico and still mine labor is scarce in some districts.

COARSE and fine (relatively) slimes, as well as sands, require separate treatment. Both cannot be treated on the same vanner or table successfully.

THE rock specimen from Midas, Nye county, Nev., is quartz with hematite (iron oxide) and the variety of iron ore known as specular iron, or micaceous iron. The ore may contain gold, as it often does elsewhere.

PLACER GOLD was mined in southern Minnesota on a stream called the Zumbro over forty years ago. The amount of gold obtained was small, and as far as known the source of the gold has not been discovered.

THE greater portion of gold produced in the world is from the native metal direct, by amalgamation. That obtained by smelting, chlorination, cyaniding, etc., is generally a by-product of some previous operation.

THE occurrence of rocks of Devonian age in the Black Hills, S. D., uplift is a matter of dispute. Some authorities claim the Devonian is represented in a stratum of limestone, others refer this stratum to the Silurian.

THE rock sample from Bell Ranch, N. M., is silica and carbonate of lime. The light yellow, silt-like mineral is iron ochre, no uranium, and the heavy metallic mineral iron sulphide. Unless these contain gold or silver they are commercially valueless.

MERCURY will often amalgamate with brass and in time cause it to disintegrate. The mercury probably unites with the zinc in the alloy. A solution of nitrate of mercury will, if applied to thin sheet brass, cause it to disintegrate in a few days.

MUCH of the iron ore of the Lake Superior region occurs in connection with large masses of jasper. The ore bodies, though large, are generally of irregular shape. Ore bodies of this kind are sometimes discovered by use of the magnetic dipping needle.

THE owner of a mine cannot prevent the natural drainage of water from a neighboring mine into his own properties. Each mine owner has the right to mine his property as he pleases, and so long as he does not cause his drainage to enter the property of his neighbor by artificial means he may continue to work as he sees fit.

FULLERS EARTH is a clay-like mineral, but contains only a small percentage of alumina. It has the property of decolorizing and clarifying oils. It contains a large percentage of water, but is not plastic like most clays. It is found in numerous localities. The most extensive deposits developed in the United States are in Florida and South Dakota.

IN melting refined gold, any lead that may be present rises to the surface of the gold, and may be removed by sprinkling bone-ash onto the melt. The bone-ash absorbs the lead and other impurities and is then skimmed off. In melting bullion not refined, the slag formed from the fluxes can be more readily skimmed off if thickened by adding bone-ash.

STEEL is not heavier than the iron from which it was made, unless the iron contained impurities which were expelled during the process of conversion to steel. Steel weighs about 490 pounds per square foot, and a steel stamp shoe 9 inches in diameter, with height of about 9 inches, weighs when new about 185 pounds, more or less, according to height and also to shape and size of the shank. An inch of a shoe 9 inches in diameter weighs about eighteen pounds.

SALTS of antimony, called "antimonites," are of an unstable character. The presence of other substances in mercury is often deleterious to amalgamation. Among these are lead, copper, sulphur, mercurous oxide, etc., and "Concentrates" has never learned that antimony is an advantage in amalgamation. Sodium and cadmium, however, appear to possess beneficial properties when mixed with mercury. That, in any event, antimony and mercury amalgam will collect rusty or coated gold is doubtful.

IN some milling plants the mill men avoid making slimes as far as possible, in view of future difficulties when the pulp reaches the cyanide tanks. At the Homestake, Lead City, S. D., all of the ore is crushed with a view of creating slimes, as it has been found that by so doing a much higher extraction is possible. This instance can not be taken as a rule which should be followed by all gold mill men, though there is an increasing tendency in the direction of finer crushing.

THE locator of a placer claim who may know of the existence of a vein or lode within the placer location may also locate the lode. No person other than the owner of a placer claim may enter the same for the purpose of prospecting for a vein. The fact that a lode or vein exists in a placer claim not being known to the locator of the placer claim, when such fact was known to others who had properly made a location of said lode, does not secure the owner of the placer against the claimant of the vein.

BLEACHING POWDER (chloride of lime) is manufactured by exposing slacked lime to chlorine gas. The gas is absorbed, the product being a dry white powder which has a strong odor of chlorine. It is used in the barrel chlorination process. The "bleach" is charged with the ore, water and sulphuric acid. The reaction being as follows: $CaCl_2 + Ca(OCl)_2 + 2H_2SO_4 = 2Cl_2 + 2CaSO_4 + 2H_2O$. The sulphur of the sulphuric acid unites with the calcium of the bleaching powder forming calcium sulphate (gypsum), chlorine being freed, which unites with the precious metals in the ore.

STEAM SHOVELS are extensively used in mining iron ore in the Minnesota and Michigan iron "ranges" by the open cut system. The ore is first "stripped" of surface soil and other debris by the shovels and the underlying iron ore is then scooped up by the shovels and deposited in cars standing on a track at the side of the shovel. The mines are usually worked in a series of benches or terraces. In underground operations several different systems of ore extraction are employed, dependent on the size, shape and general character of the ore body. Most of the mining is carried on at a low cost, a minimum of timber being employed.

ANALYTICAL ASSAYS or analyses of country rock for gold with a view to the determination of their relation to the genesis of the ore deposit probably give no definite knowledge on the subject, for the reason that the mineral solutions, which, coming from great depth, deposited their values in the vein or ore deposit, may also have deposited a small portion of their values in the wall rocks as well. Many wall rocks contain gold, silver and other metals, similar to those found in the neighboring vein, but this fact is not conclusive evidence that the values in the vein were derived from the wall rocks, by what is known as "lateral secretion."

SINKING or tunneling through rock strata of unequal hardness is often attended with difficulty, particularly when the hardness of the several strata vary greatly. Should the drill be driven through a hard layer and suddenly penetrate a soft one, it is generally advisable to abandon the hole and drill another in the hard stratum about three-fourths of the way through it. Blasting will throw out the hard stratum, when the soft one may be removed by picking. Better headway can usually be made by drilling short holes than long ones when this condition obtains. Rock strata of this character are not of infrequent occurrence in sedimentary formations.

THE "ore in sight" in a mine can only be determined approximately at best. Long experience has proven that appearances in mine development are often deceptive and unreliable. No mining engineer is safe in assuming a larger tonnage "in sight" than he can estimate in ore bodies cut on four sides, within relatively short distances, although some are willing to base their judgment on cuttings exposing three sides of the block of ore. Those suggestions contemplate the measurement of a body of ore in a vein of moderate width—20 feet or less. When the vein exceeds this width even greater caution is necessary. It is a curious fact that ore bodies upon being extracted rarely produce a tonnage in excess of estimates previously made.

THE only stamp mill in which the batteries were placed in a double line facing each other of which Concentrates has any knowledge, was that built at the Father de Smet mine at Central City, S. D., in 1878, and contained eighty stamps—afterward increased to 100. The mill had larger ore bin capacity than is usually found in mills of similar size. All of the plates can be watched at one time, and all machinery is easily accessible. Beyond this a mill of this type of construction has no advantages, and it is not a popular method of construction. The central portion of the mill was always dark. It contained eight rock breakers when one large one outside the mill would have broken all the ore for the eighty stamps, thus dispensing with three breaker men.

GOLD has been reported discovered at various times in the past on the Jaina and Isabella rivers in Santo Domingo, and it is said that immediately after their discovery in the early part of the fifteenth century that the placers produced a large amount of gold, but the field has long since been worked out. The quartz of the veins or zones is interbedded with slate and follows its foldings closely. These veins cannot be considered fissures. They occur most abundantly near intrusive dikes. Those portions near the dikes are gold bearing, and as distance from the dikes increases the gold diminishes until the rock is barren. Only those streams which cut metamorphic rocks are gold bearing, the streams running through syenite carrying no gold. Although many veins of quartz contain gold on the island, it has never been discovered in paying quantity.

THE richest ore deposits discovered in the Leadville, Colo., district were on Fryer Hill. The ore bodies were covered with from 100 to 150 feet of glacial lake drift—sand, gravel and cobbles, and no ore outcropped anywhere on the hill, the nearest point of approach of ore to the surface being in the Little Pittsburg mine. Nearly all the blue limestone on this hill was found replaced by ore, much of it of phenomenal richness. All of the carbonate (oxidized) ores of the district were of greater average richness than the sulphide ores. This is known as secondary enrichment of ore bodies, and has been the subject of much research and speculation by students of mining geology. While the fact that secondary enrichment has often taken place in oxidized ore bodies is recognized, the source of enrichment is many times obscure, and theories regarding it are unsatisfactory.

A ROCKER OR CRADLE for washing gold-bearing gravel may be made of any size from 12x24 inches to one 30x48 inches. A fair size is one 20x36 inches. It should have a riddle or sieve of sheet iron or steel, having ¼-inch round holes punched in it. This is secured to the square frame or hopper on top of the rocker, and must be easily detachable, for the purpose of throwing out coarse rocks, etc. Underneath the riddle is placed an inclined frame covered rather loosely with canvas, so that the cloth will sag down when wet. On this will usually be found the greater part of the coarse gold, as well as some of the fine. In the bottom of the rocker cross riffles should be placed to catch fine gold. In setting the rocker the grade at which the machine is placed should be such that the rocks and earth passing through the riddle shall pass out quickly in a steady stream. The rocking should be done vigorously, but carefully, and the stream of water poured into the hopper should be regulated as uniformly as possible. The rocker is at best a rude device, but it will do good work in experienced hands. The capacity of the machine is determined by the class of gravel or other material being treated, size of cradle and skill of the operator.

TELLURIDE ORES may be concentrated satisfactorily if the appliances are properly adjusted and the operater understands his business. The coarser particles usually give no trouble in concentrating on shaking tables, but the fine slimes can not be concentrated equally well in this way. Canvas tables adjusted as to grade, quantity of water employed and amount of material fed will concentrate a high percentage of these slimes. A sloping table, similar to the canvas table in design, but covered with cement, also affords an excellent surface upon which to concentrate telluride slimes. Some constructors build these tables on a masonry base, with fixed grade, but by using care in building the foundations, tables may be made adjustable. The board surface is first studded with shingle nails, which project about ½ inch, and over this the mixture of sand and cement is spread to a depth of at least ¾ inch, completely covering the nails to the depth of ¼ inch. The surface may be finished with neat cement or sand and cement, as experience has shown is necessary with the particular ore under treatment. Usually when tellurides have been concentrated and roasted properly they give no further trouble in the recovery of the gold they contain.

THE broken condition of the limestones and quartzites, etc., along the northern base of the San Bernardino range of California is due, probably, to crushing of the rock masses at the time of the uplift of the San Bernardino range, which must have been more abrupt than mountain elevation generally is. It has resulted in fracturing all of the sedimentary rocks over an area of several hundred square miles. The rocks have been recemented in part by the infiltration of calcium carbonate and iron, forming a massive, but incoherent rock mass. The region is faulted by step and thrust faults, but no intrusive dikes have been observed. In some portions of this greatly disturbed region the crushed rocks are ore bearing, as at Silver Reef, where they carry chloride and bromide of silver in limestone; at Gold mountain, where gold occurs in shattered quartzite, and at the Black Hawk mines, where gold occurs in the limestone, associated with hematite, the latter both massive and in dust-like particles scattered through the lime. Throughout this region the rocks, though shattered, have not been displaced in most places sufficiently to destroy the planes of bedding. In the ore-bearing zones, however, the crushing has been extensive and stratification is practically destroyed.

THE Ballarat district of Victoria, Australia, comprises two distinct belts—the east, about 8 miles long, and the west, about 5 miles long. In the east belt the formation has been much folded, and fissure veins have formed. These are accompanied by what are locally termed indicator veins or beds. These are certain beds of dark-colored shale which follow the fissures, but are confined to the country rock. They carry pyrite and mispickel, and these minerals sometimes replace the original rock completely. The indicators run parallel with some of the veins and are intersected by many of them. At points of intersection the vein is generally rich. In the west belt the veins are fissures cutting folded sandstones and shales. "Feeders" to the main veins are numerous, and these with the main vein sometimes form "stockwerks" many feet in width. The east belt at Ballarat has produced a number of masses of gold in place (pockets) ranging from 30 to 135 ounces. In some respects these pocket mines resemble some of those of California, notably the Bonanza mine at Sonora, Tuolumne county, where the pockets followed a thin fissure in the slates, which was filled with a soft material, largely iron and black oxide of manganese. The vein in which these pockets are found cuts the slates obliquely.

Notes on Gold Milling.

Written for the MINING AND SCIENTIFIC PRESS.

It is desirable in milling gold ores, whether the tailiugs are to be cyanided or not, to have the ore crushed to uniform fineness. This can only be accomplished by using a constant quantity of water in the battery, and keeping the drop of stamps and height of screen above the die absolutely uniform. Under this set of conditious the product will be fairly uniform. As the shoe and die wear, the stamp becomes lighter, and would have reduced crushing capacity except for the fact that the additioual height of fall results in a greater uumber of foot pounds, so that the crushing capacity of a stamp will really be increased rather thau diminished, if the screen be lowered to the same height above the die. This is accomplished by the use of chuck blocks having a 2-inch differential. Thus, the uniformity of the product of stamping is only approximate, and not actual. The tappet, which regulates the height of drop, may be shifted to keep the drop nearly uniform, but the difference in height of chuck block still exists. This may be lessened by employing ⅜-inch strips beneath the chuck blocks, which may be removed as the die wears down. By the use of two chuck blocks, having a difference of 2 inches in height, and providing three ½-inch strips of iron to place beneath the blocks, the discharge may be kept nearly uniform.

Generally when dies are renewed the particles of saud are coarser thau when the die is worn down. This is because too little attention is given to keeping the discharge as uuiform as possible. The amount of water fed to the battery must also be kept constant.

Fine crushing in the rock breakers greatly increases the capacity of the mill. It also reduces the wear of shoes and dies in the battery, as well as increases the life of screens.

This is not a new discovery, but a well-knowu fact, though one which is seldom put iuto practice in the operation of quartz mills.

Wet clay and earth in ores require constaut attention at the feeders to prevent clogging. Sometimes the feeder will clog at the top while the plate below is bare. This may be avoided by careful watching.

The loss of quicksilver in a mill where inside amalgamation is practiced is always greater than where amalgamation is done outside the mortar in the same mill. When the stamp strikes a globule of mercury fairly it divides it into microscopic spheres which are splashed about among the fragments of ore which are being coustantly churned by the rapidly dropping stamps, and they have small chance of uuiting with other particles while remaining in the mortar. There are a vast number of these minute globules of quicksilver in the mortar and these are dashed out through the screen together with the pulp, and the greater number of them attach to the outside plates, but many others float upon the surface of the stream flowing over the plates, and reach the vauners where they wash over and are lost, or are carried by the belts, together with the sulphides, to the washing box beneath the machine, where they are washed off together with the conceutrates. Here again extremely fine globules of mercury have a teudency to float, aud these particles, together with that portion of the sulphides known as "slimes," may often be observed floating on the surface of the water in the washing boxes. This overflows into the settling boxes beneath the vanners. If this overflow passes over a small weir in the washiug box, or is drawn off through a pipe, the stream falling iuto the settling box, a large percentage of the floating slimes and quicksilver will asceud to the surface of the water of the settling tank and float again, being eventually lost. If, however, the pipe from the washing box be made to discharge beneath the surface of the water the slimes will settle to the bottom of the box, where they may be recovered.

Dies having an outwardly flaring base are a uuisance to handle in the battery. All shoes and dies of whatever material should be of uniform size, having shanks of equal dimensious, but they are not found to be cast in this way. For some reason difficult to explain mill founders appear to think that having furnished a mill they will ever after be called upon to supply the shoes and dies, and to still further enhance their chance of getting this business, cast the boss-heads and shoes a little different from any other. The result ofteu is that in a single district where there may be a dozen or more mills no two have exactly the same shaped shanks on their mill shoes, and consequently the shoes are not interchangeable rom one mill to another. There should be established a standard size for the shanks of mill shoes, that all should be of uniform size regardless of the weight of stamp, boss, stem and tappet.

Sizing of battery pulp before sending it to conceutrating machiues produces better results than can be had by sending the pulp to two machines without sizing, which is generally the practice. It is not reasonable to expect to separate slimes and coarse sulphurets from gaugue mineral in a single operation, with a given grade, fixed amount of water and certain number of vibrations of the machine.

Alluvial Deposits of Horsefly, B. C.

Written for the MINING AND SCIENTIFIC PRESS by W. M. BREWER.

The Horsefly river, in the southeastern portion of the Cariboo mining district, B. C., flows for some distauce from its source in a westerly direction, thence uortherly, and empties into the great Quesuelle lake. The section of couutry drained by it is a vast plateau, its elevation ranging from 2000 feet to 3000 feet above sea level.

To the east, about 50 miles distant, is situated the Selkirk range of mountains, and to the west, about the same distance, is the Fraser river. To the south lie the agricultural lands of the Lac la Hache valley, aud the stock rauges coutiguous to it, and to the uorth the Cariboo mouutains and the placer miuing section.

The history of the Horsefly country is particularly interesting, from the fact that the same party of prospectors who discovered Hill's Bar, the first important discovery of gold ou the Fraser river, in 1858, also discovered placer gold on the Horsefly river during the same year and blazed the trail into the Cariboo mining country proper.

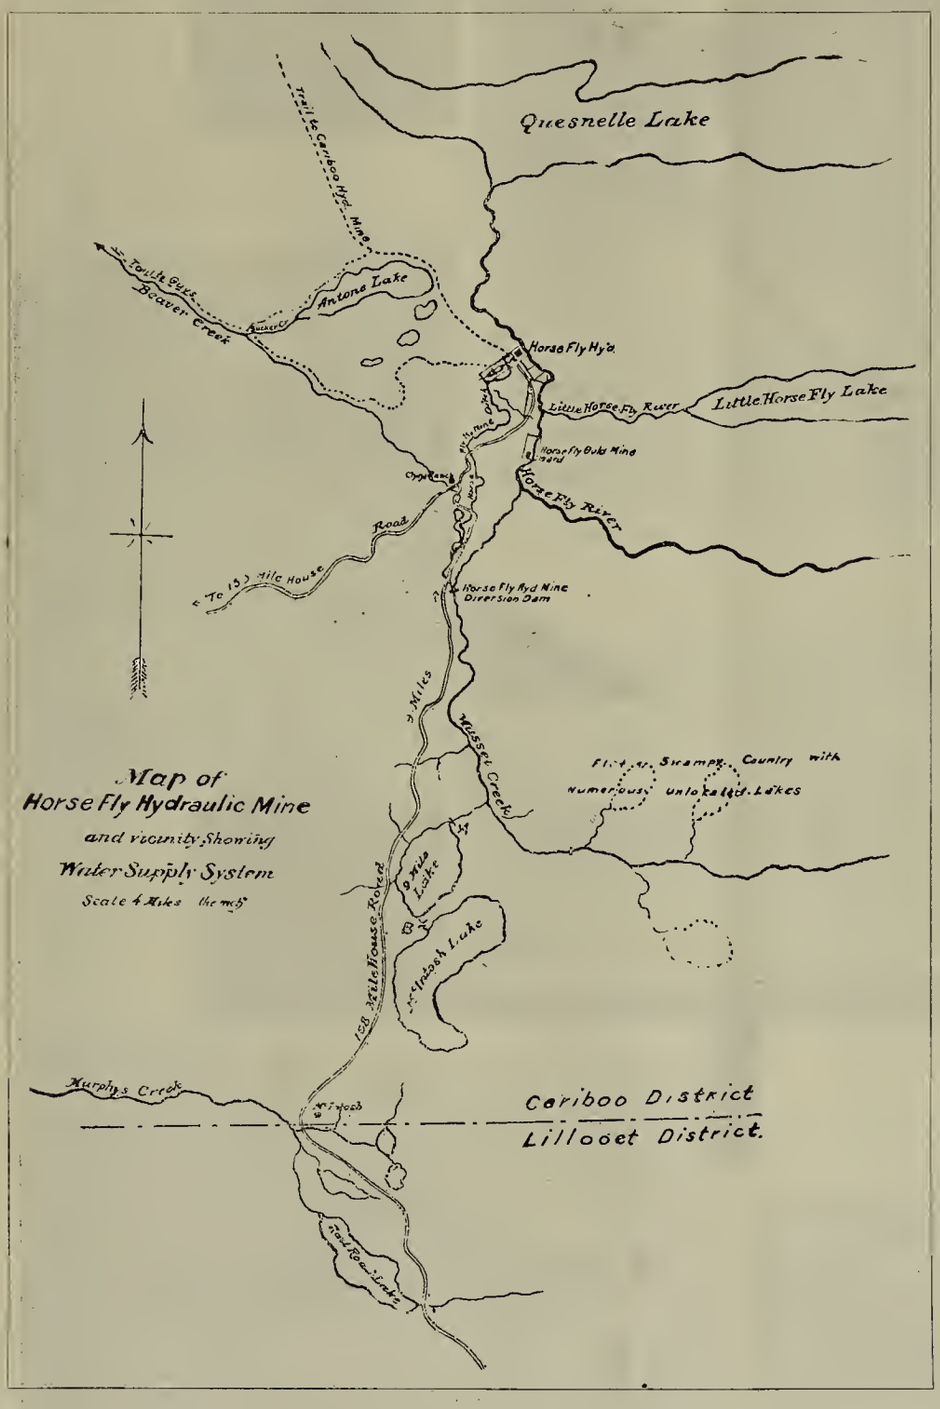
During the late fall of 1901 important discoveries of placer gold were reported to have been made in the mouutains to the eastward and near the head of the Horsefly river. These reports caused a small stampede, but as no phenomenally rich diggings were found, aud the couutry proved a difficult one to get into, the excitement died out, and that section still remains unexplored.

The geology of the Horsefly territory is particularly interesting. To the south lies an extensive area of basaltic rocks. The rock formations in the area containing the auriferous gravel deposits belong to

the Tertiary period, and within that area occur the channels of ancient Miocene rivers of stupendous proportions. Underlying the basalt, in places, occur beds of white quartz, water-worn gravel. At one point on an ancient river channel a shaft has been sunk to a depth of 480 feet without reaching bedrock. The rimrock was cut into at the bottom of this shaft, and the shaft continued down 50 feet into the shale which formed the rimrock. From that point a tunnel was run under the channel and an upraise made into the gravel. There apparently occurred the bedrock, and it was reported that the gravel prospected and showed good pay; but the influx of water drove out the miners and afterwards operations were abandoned. This shaft was sunk through white quartz (water-worn gravel) nearly its entire depth, but as it is reported that the gravel carried very little values above the bedrock, it would have been necessary to have found phenomenally rich pay on bedrock to have warranted the continuation of mining operations by the drifting system. One peculiar feature about this very deep channel, at the particular point where it was attacked, was the fact that, while the gravel carried such low values, yet the work was done because it was supposed that that portion of the channel was an extension of a channel immediately to the north, where is located the Ward claim, which has yielded very rich pay, over a surface area covering about forty acres. Although the character of the material forming the bedrock at both places is almost identical, yet it is doubtful if the rimrock can be traced from one to the other, and there is considerable difference in the character of the auriferons material; therefore, it appears to be quite possible that the deep workings to the south are located on a separate and distinct channel from that on which the Ward claim is located. Another reason for this conclusion is that in following up the course of the present river for a distance of 5 miles above the Ward claim, there occurs apparently the same ancient channel paralleling the present course of the river as is being worked at the Ward claim; the bedrock at both places is of the same character of shale and is encountered at about 150 feet—the same depth below the present surface—and the auriferous material, which carries values from the surface down, appears similar and is reported to carry about the same values at bedrock.

SCENES IN THE OPERATION OF THE CARIBOO HYDRAULIC MINING COMPANY'S PROPERTY, BULLION, CARIBOO DISTRICT, B. C.

The course of this ancient channel appears to conform closely to the course of the present river, which in many places has apparently intersected the ancient channel. This condition is shown at the Ward claim, where the owner, in working on the ancient channel, has more than once completely changed the present course of the stream in order to work the channel on the opposite side.



The Horsefly portion of the Cariboo district presents a marked difference with regard to the available water supply for carrying on extensive hydraulic workings to the Quesnelle Forks portion. Mussel

creek, a tributary of the Horsefly, which has its confluence with that river, a short distance south from the Ward claim, will furnish from 4000 to 6000 miuer's inches of water during the entire season of seven months, and that taken out from the creek within 5 miles of its mouth. There are two systems of canals constructed from this creek, one having a length of about 6 miles, the other about 12 miles. The first one carries the water supply for hydraulic operatious at Ward's claim, while the second carries the water for hydraulic operatious at the Horsefly hydraulic mines, 5 miles northerly from Ward's.

The last-mentioned caual is interrupted iu two places by 8000 feet of 30-inch pipe laid in the form of iuverted syphons, to carry the water across two depressions 180 feet in depth.

So far as oue can judge from the results of operations iu both placer and hydraulic mining, it would appear that the area contaiuing auriferous gravel in paying quautities is comparatively limited in extent in this particular portiou of the Cariboo district. But there are extensive areas of the ancient river channels which have not beeu exploited. One of the principal reasons for this is the great depth to the bedrock and auother is the lack of dumpage facilities. In consequence of this latter reason the alluvial deposits would have to be attacked, either by drift mining, as has been done at the Horsefly hydraulic mine, or by a method of elevating the tailings, as is practiced at Ward's claim, or by dredge mining, which latter has not yet been introduced into this portion of the Province.

The Horsefly hydraulic mine affords an excellent opportunity for studying systematic drift mining, as will be seen from the accompauying map of the undergrouud workings. (See Fig. 1.)

Uutil the early 90s this property was worked by the hydraulic method aud about $150,000 produced.

In working by the hydraulic process, as the bedrock was followed towards the south, it was found that the gravel immediately overlaying the bedrock had become cemented so hard that it was impossible to successfully attack it with water under pressure; consequently, a 10-stamp mill was erected and a system of drift mining iutroduced. A main tunnel was run from the hydraulic cut towards the south, the mouth of this tunnel being connected with the mill, which was built near the bank of the river, by a covered track. From the main tunnel drifts were run towards the east and west and the body of cement blocked off into squares.

It was found that, in driving the maiu working tunuel to the south, the bedrock continued at variable augles, and sometimes at almost 45°, iudicating that the workiugs have not reached the bed of the channel, but are probably on the northern rim of what may be an extensive alluvial deposit belonging to an ancient channel. During the progress of opening up the mine for operations by drifting aud milling process, 9901 tons of cemented gravel, bedrock, etc., mined from the various drifts, were run through the company's stamp mill and produced $14,564.21—an average of about $1.46 per ton. The extent of the development is 1200 feet main tunnel and 3165 feet of working crosscuts and drifts, which have been driven at right angles to the main tunnel.

During the drifting operations on this property it seems, from the mauager's report, that about 25% of the material miued was free gravel, which it was not uecessary to run through the mill in order to save its values.

(TO BE CONTINUED.)

Notes on Quartz Milling on the Rand.*

Written by FRASER ALEXANDER.

Millmeu are not taxed with a theoretical and an actual output. The millman is at peace with all the world so long as he is doing big duty and has no stoppages. If he had a chain round his neck with a heavy weight at the end of it labelled "daily residue," "theo. aud actual output," to drag about every hour of the day as cyanide men have to do, I should not be in the unpleasant position of throwing this accusatiou at them. Iu discussing theoretical and actual, it will probably be said that it is impossible, owing to the difficulty of sampling. Mr. Roskelly has shown us that this difficulty cau be overcome, and I am convinced that once this method is adopted, and the mill is called upou to account for the gold according to asssy results, the millmeu will soon fiud means of taking accurate samples, and see that their tounage is correct, and I should expect that daily free milling assays will be made, uot occasionally for curiosity. In fact, what is desired is that the mill should look upon the cyanide plant as a residue dump, in the way that the cyanide works look upon their dump, and not allow any gold to go there if possible. Let them remember that a grain of gold that is recoverable in the mill, if allowed to pass on to the cyauide plant, is theu only 85% of a grain, for that is all that we can expect to recover.

I am of opinion that, if we are to obtain that much-to-be-desired 5% extra recovery on the value of the ore milled, it is the mill that will be the means of accomplishing it. Whether the gold is finally won ou the cyanide plaut or uot it will still be the mill that brings the result about, for it will be due to a better product reaching the cyanide plaut, thus allowing better recovery. In modern cyanide plants, where there is ample capacity, it can be claimed that uearly all, if not all, the accessible gold is dissolved, and in plants to be erected in the near future provision will be made to ensure this. Accepting this as a fact brings us to a poiut where there is little hope of any great improvement under present conditions, but under changed milling conditions there is a very promisiug future. To illustrate what I mean I give you the history of a concentrate residue.

Duriug the war the Boer Governmeut worked the Bonanza cyanide plaut, aud ou the occupatiou of the British the tanks were left full and treatment was completed on behalf of the company on my return to the mine in July, 1900. A wooden vat, coutaining coarse sands and concentrates, was sampled and the residue was found to be 3.5 dwts. KCy solutiou was circulated contiuuously through the vat in order to prevent the woodeu vat from drying aud opening out. In the following November the vat was again sampled aud the result was found to be practically the same.

It was again sampled when discharged in August, 1901, it still haviug been under solutiou, and the value was still the same. I used this residue as a filter for slime solutions, aud for another four months solutiou carrying 0.02% KCy was constantly filtering through; and yet, on again sampling, approximately the same value was found. Iu all, this residue had been treated from May, 1900, to December, 1901, without improved extraction, a proof that none of that 3.5 dwts. could be recovered by a solvent unless the imprisoned gold was released. Further, I can state, from a great number of residues investigated, that without exception, after panniug off the sulphides, the coarser the particles the higher the gold conteuts; but this law does not hold good with originals, in which it is not unusual that the fiuest portions will give the highest assay value.

Under present couditions millmen are urged on aud pitted oue against another to smash as big a tonnage through as possible without consideration as to the effect on gold extractiou. We want to learn whether it is not more profitable to mill less, crush fiuer, aud whether the extra recovery resulting from this change would not more thau pay for extra stamps to make up for decreased tonnage. There are so mauy points from which this phase of the subject can be discussed; for instauce, would it be better to take the pulp leaving the mortar boxes and pass it direct to a grinding machine, or to separate, by meaus of classifiers, the particles requiring grinding, before amalgamation or afterwards? It would appear to be better to do so before, for, if doue afterwards, the reground portion would have to pass over the plates for the secoud time. Is it uot likely that it is the coarser particles that help to scour the plates?

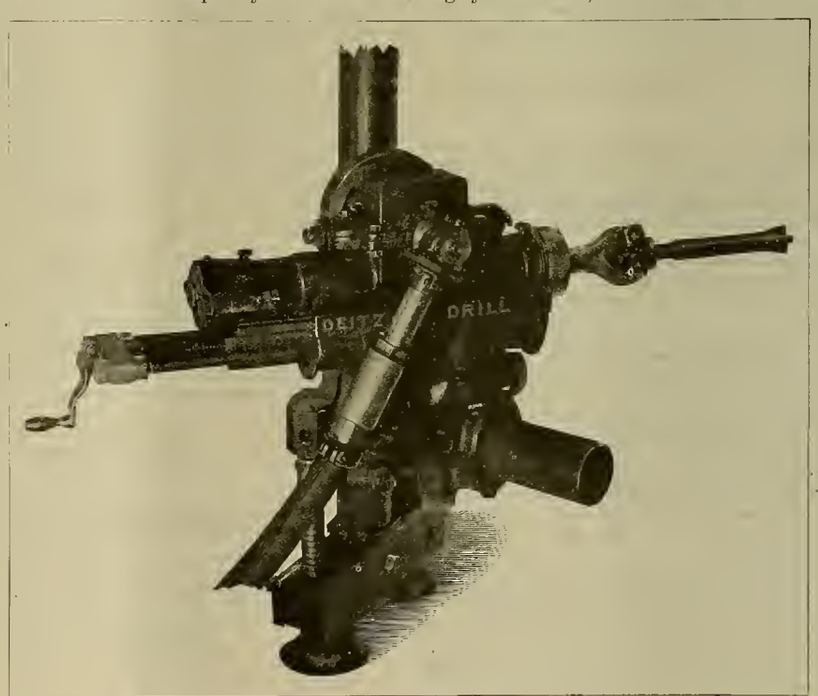
Regarding mercury losses and flouring of amalgam, a very interesting fact has come under my uotice. It happeued iu a mine where inside amalgamatiou is used. The pulp leaving the mill is lifted by a pump 40 feet in a vertical column aud then passed ou to the usual spitzlutten, from there over sand spitzkasten, across a large return sand spitzkasten, and so to the slime separator spitzkasten. Small cast-iron hollow plug valves are used for the discharge of this slime spitzkasten, and they are continually getting choked up with hard, bright, clean amalgam. Some of this

*Abstract Journal Chem., Met. and Min. Society, S. A.

chipped off the valves was found to contain 22% of gold. Also in the same tank Peat valves are used, and twice since the war they have been renewed owing to mercury amalgamating with the copper that faces the valves, thus rendering the copper so brittle that it breaks away and the valve cannot be kept from leaking. It seems an extraordinary fact that amalgam should be able to travel so far and pass or float across spitzkasten that will settle the smallest and lightest particles of sands. In connection with this, in the first spizlutte, where one would expect all the mercury to be caught, although mercury is caught in an appreciable quantity, this carries little gold, no more than 2%. The explanation of this, I suggest, might be that the mercury caught in the spitzlutte is mercury that is washed or spilt off the plates during dressing, and the amalgam found on the slimes plant is floured amalgam. With my limited knowledge of milling I should not like to express an opinion as to the cause of the amalgam escaping in the finely divided state, but I would value millmen's opinions on this interesting fact. I often wonder that no means have been tried or experiments carried out to attempt to prevent this loss. Perhaps they have, but I am not aware of it. The very primitive mercury trap in general use cannot be considered the only possible means of dealing with this. A. M. Day of the Nigel tells of an interesting fact in connection with this matter. By using a discarded vanner for the purpose, he shows a recovery in thirteen months of 14,082¾ ounces amalgam, an average of 1083 ounces per month, equal to 300 ounces gold per month. It almost looks from this that even the expensive vanner plant might give a good return on the money for equipment on a mine of twenty years' life. I think, however, that millmen may be relied upon to find means to prevent this loss as soon as they realize the necessity. I call these "losses," for gold in the form of amalgam in the cyanide plant is only to a very limited extent attacked by KCy solutions.

It is to the advantage of the cyanide plant that millmen should use every endeavor to keep the mill at a constant weight, not at one time heavy and at another time light. Cannot renewal of shoes be arranged so that the mill shall at all times be of a regular average weight? In connection with this, I have found that the product reaching the cyanide plant from a heavy mill is different from the product when the mill is light, although using the same screening. With the mill heavy there is a higher percentage of coarse particles. This, I know, accounts for some of the otherwise inexplicable difference in residue values on the cyanide plant. When there is found suddenly an increase in value of residues, there being no change in the ore milled, on investigating the residue to determine where the gold is, in my experience this will generally be the cause—the product will have changed.

I should like to know from millmen whether they have any experience of counter-weights being fixed to the stems to make up for wear and tear of shoes. Has this been tried? It seems feasible. Could not a quick way of fixing varying counter-weights on the stem be devised? If not, why? I believe a shoe in its first week of life will crush, say, half a ton per day more than in its last week of life. If this difference is due merely to loss of weight then a great gain could be attained by adding counter-weights to make up the difference.



Another question of importance to the cyanide works is the varying quantity of water used. I know of a case where the cyanide men knew who was on shift in the mill by the quantity of water used. One man in particular used water so much in excess of his fellow shiftsmen that when he was on duty the launders were always flooded and overflowing. It seems to me that there must be a correct quantity, and too much might mean a serious loss to the mill, and too little, loss of efficiency. Mr. Harland of the Robinson mine has a very simple system, in fact, so obvious that I cannot understand why it is not universal in mills. He has two valves to the mortar box and a steady head of water to the mill. One valve is set by him to the correct amount of water and afterwards never touched. A shiftman shutting off water for dressing plates or other cause merely closes the second valve, which shuts the water off; and on restarting the battery all he has to do is to open this valve. The valve in front being always set, there is no waste of time by men standing adjusting the quantity of water, and it is unnecessary to leave the adjustment to the shiftmen, each of whom may have a different opinion as to the correct amount and so cause varying quantities. The objection to this variation on the cyanide plant is that the spitzlutten are set and depend to a great extent for classification on the volume of water passing through the machine. Varying quantities of water will, therefore, give varying percentages of sands classified. On the slime plant it is a great inconvenience, for, if using an automatic lime feeder, the machine has to be constantly adjusted. It is found that it is useless to add lime in excess of what will bring the pulp to .005% alkalinity. If the machine is adjusted to accomplish this at a time when a large quantity of water is being used, and later the water is diminished and yet carries the same quantity of slime, lime is being used without advantage, and so adds to the costs. Excess of alkalinity has also other serious disadvantages, which it is unnecessary to go into here.

Another point I have noticed which I think will interest millmen: At times coarse pebbles in some quantity will reach us, from the size of a pea, due to broken screens; and also, where inside amalgamation is used, these partly crushed pieces escape out of the mortar box when screens are off to allow of getting at inside coppers. These pebbles are then washed off the plate and reach the cyanide plant. On sieving them from the sands I have found them of considerable higher value than the ore milled. The only explanation of this that occurs to me is that it is due to the heavy particles having secured amalgam and picked it up in their journey across the amalgamated plates. It would be a very simple matter to catch this product before reaching the cyanide plant and to return it to the mortar box. If these particles rob the plates it must also be remembered that not only is there this loss of amalgam, but the cyanide plant will get but little recovery from these pebbles, the gold being imprisoned in such coarse particles that solution will not reach it.

Men on the cyanide plant are naturally more familiar than millmen with the product leaving the mill, for it is on this that the attention of the cyanide men is centered. Therefore we should endeavor to bring before millmen as much light as possible on this subject. The man in the mill has little or no opportunity of studying the pulp; he is confined to the mill, and his time and attention are fully occupied in keeping his mill and plates in order. On the cyanide plant we see the product in all its separate conditions, and it should be our business to keep millmen informed of our observations. As I before stated, I believe the millman has a more promising future before him than the cyanide man. Improved, changed conditions of milling are, I believe, the only means that will realize our ambition—another 5% recovery bringing the total recovery to from 95% to 96% as against our present 90% to 91%.

Deitz Electric Rock Drill.

A new electric rock drill known as the Deitz electric rock drill is being placed upon the market and is illustrated herewith. The manufacturers of this drill claim that the construction is such that the piston carrying the drill steel is completely released from the driving mechanism before striking the rock; that this prevents the concussion from being transmitted to the mechanism, and thus thoroughly overcomes and prevents breakdowns. The manufacturers also claim that they have had these drills in steady use now for a year past in different mines under different conditions, and the results have in every case exceeded their most sanguine expectations. The mining world is interested in the development of rock drilling by electric power, and if this drill will do what the manufacturers claim it will certainly merit endorsement. The drill is being manufactured and for sale by the Deitz Electric Drill & Machinery Co., 1606 Blake street, Denver Colo.

Deitz Electric Rock Drill.

Iron ore is not a good precipitant for copper from its solutions. Scrap iron, particularly sheet scrap, including tin scrap, is the best known material for this purpose. The "cement" copper obtained is not absolutely pure, but is of good grade. Copper may be precipitated from solutions emanating from roasted ore heaps or from solutions which are the result of treating naturally oxidized ores by sulphuric acid process.

Consumption of Zinc in Cyanide Plants.*

Written by Walter H. Vigor.

In considering the consumption of zinc on any cyanide plant, where zinc in a filiform condition is used as a precipitating agent, it will be observed that the consumption of zinc is always in very large excess over that amount theoretically required for the precipitation of the metals obtained in the product. It will also be observed that this loss or consumption of zinc is due to two causes, the one mechanical, the other chemical. There is a loss of zinc mechanically in cleaning up metallic zinc with the deposited metals in the product, and there is a chemical loss owing to zinc being dissolved in the cyanide solution in excess over what is actually required for the precipitation of metals.

It is customary to record the consumption of zinc in pounds or ounces per ton of ore treated, or in kilos per metric ton, if the metric system be used. Such a record is sufficient when calculating working costs, but on the plant the chemist should record the consumption of zinc not only per ton of ore treated, but also per unit of solution flowing through the boxes, and should record the loss under the two heads of loss by mechanical means and loss by chemical means. Such additional records, though they may not be absolutely accurate, yet will be approximately so, and will afford a great deal of information that is valuable and interesting.

By mechanical loss is meant that loss or consumption of zinc involved in the removal of zinc from the extractor boxes in the product, whether as metallics or slimes, during the process of cleaning up. By chemical loss is meant that amount of zinc dissolved by the solution flowing through the boxes which is represented more or less accurately by the difference between the zinc removed in the product and the amount of zinc found necessary to refill the boxes after the cleanup.

The causes which govern the consumption of zinc on any plant should be most carefully considered, because a heavy consumption of zinc not only increases the cost of treatment of the ore, but, if the loss be largely mechanical, it increases the cost of reduction of the product, which, owing to its baseness, requires refining before or during smelting, and, if chemical, the plant solution is apt to contain more zinc than is advisable, perhaps.

Gold product is always much baser than silver product, and the expenses of reducing such product are, therefore, always much higher per ounce of fine metal obtained than the expenses of reducing silver product per ounce of fine metal. The reason for this is obvious enough: Fifty tons of solution, containing 25 ounces of gold, may flow through 200 pounds of zinc in twenty-four hours, and deposit 25 ounces of gold, whereas a silver-bearing solution of equal amount and value would deposit some 1000 ounces, and although both the chemical and mechanical consumption of zinc might probably be higher in the case of the deposition of the silver, yet it would be in no way proportionate to the amount of fine metal deposited, and, therefore, the resulting product would be of much finer grade.

As a matter of fact, silver-bearing solutions require far less zinc box capacity than gold-bearing solutions,

*Jour. Chem. Met. and Min. Soc., S. A. (Condensed.)

and the consumption of zinc per ounce of fine metal deposited is very much less. Commonly, with gold-bearing solutions, the consumption of zinc is in the proportion of 16 to 1 of gold deposited, whereas in the case of silver-bearing solntions the consumptiou may be in the proportion of 1.3 of zinc to 1 of silver deposited, or even as low as 1 to 1, which proportions I have observed from figures afforded by the practical results of the operation of various plants in Mexico and elsewhere.

It is customary on most cyanide plants when making the periodical cleannps to class the product under two heads, viz., metallics and fines, the fines prodnct being such material that admits of being smelted direct in nearly all cases, and the metallics that portion which consists of broken particles of zinc, which arc in too fine a state of division to be returned to the extractor boxes, and which cannot be generally smeltcd to advantage without some preliminary treatment.

Metallics represent that part of the product which will pass throngh the screens with which the boxes are provided, and which is retained afterwards on that screen by which the fines are separated. The sizes of these two screens are determined by what experience dictates as most suitable aud economical. For instance, on plants where the product is very base it may be advisable to defiue as fines that portion of the product that will pass a 60-mesh screen, experience showing, perhaps, that this grade of mesh yields the best product, economically speaking, for direct smelting; and it may be advisable to determine as metallics that portion of the product which, passing from the boxes through an 8-mesh screen, is retained on the 60-mesh.

Metallics which are likely to pack and hinder the proper flowing of the solntion must not be returned to the boxes, neither should fines be produced of too base a character by the nse of too coarse a screen for direct smelting. On some plants in Mexico the nature of the prodnct cleaned up is such that all the product which passes a 12-mesh screen can be smelted direct with ease, and no metallics are produced which cannot be returned to the boxes.

Excessive mechanical losses of zinc are generally due to such simple causes as:

(a) Unnecessary handling of the zinc during clean-ups, due generally to a desire to obtain as much prodnct as possible by scrubbing and rubbing the zinc, a practice that cannot be too strongly condemned.

(b) Care not being taken to place thc zinc under water directly it is removed from the boxes, whereby it oxidizes very rapidly aud becomes heated and brittle.

(c) Uneven flow of solntions through a sponge of zinc, whereby the zinc mass or spongc becomes broken np through holes and channels being bored through it, the uneven flow being generally produced through the blocking of screens, or to the too tight packing of the zinc in the boxes.

(d) The zinc threads being poorly cut, with threads of uneven thickness, the gradual weariug down of these threads producing a large number of short pieces of zinc.

(e) An excessive amonnt of metallics or shorts is likely to be prodnced where large bulks of very weak solntions flow through large quantities of zinc, depositing over a large area a small amount of the precions metals, especially when the zinc is hand-cut instead of being cut by self-feeding lathes.

Excessive chemical losses are generally dne to:

(a) Excessive alkalinity of the solntion.

(b) Precipitation of base metals, such as copper, mercury, manganese, etc., on the zinc.

(c) Contact of the zinc in the boxes with unprotected iron surfaces.

It is also observed that strong solutions of cyanide flowing through zinc will produce much heavier chemical losses than are prodnced by weak solntions.

When too much lime is used on a plant the result is very noticeable in the extractor boxes, a too vigorons evolution of hydrogen being in evidence, showing that a wasteful solution of zinc is taking placc.

The precipitation of base metals naturally causes the chemical consumption of an eqnivaleut amount of zinc and entails a waste of that metal by inducing more vigorons electrolytic action. The contact of iron with the zinc in the form of unprotected screeus, iron screen frame handles, etc., acts in the same way.

No metal is more destructive than mercnry when deposited on the zinc, as it rapidly reduces it to a pulpy mass, from which the metallic mercury may be largely separated by sqneezing it in a cloth. I have had cousiderable experience with this metal in the treatment of old pan amalgamation tailings in various parts of Mexico.

Again, the consumption of zinc per ton of ore treated will depend largely upon the amount of solutiou that flows through the boxes in comparison with the amount of ore treated. For instance, the treatment of a slow-leaching ore may be attended with a very low zinc consumption, whereas the elimination of slimes from such an ore may facilitate its leaching capabilities, and, more solution being nscd, the consumptiou of zinc per ton of ore will be increased, although the actual consumption of zinc per ton of solutiou flowing through the boxes may remain practically the same. For this reason I always consider it advisable, when cousidering the consnmption of zinc on a plant, to look at it first from the standpoint of consumption per unit of solution flowing throngh the boxes.

There is no doubt in my mind that the consumption of zinc on any given plant wonld be largely decreased if the solutions were allowed to accumulate a certain degree of valne before being passed through the zinc boxes, in which case it would be advantageous to displace the cyanide solntion in the boxes by water, after the passage of the solution through them, to prevent loss of zinc through its being needlessly in contact with the cyanide solntion; bnt such a procednre should only be attempted by oue who was perfectly familiar in every detail with the chemical features in connection with the plant handled.

Where zinc fume is used as a precipitant it is sometimes the case to allow the solution to accumulate values before being agitated with the zinc. This method is very effective and insures a minimum time of contact between a minimnm quantity of zinc and the cyanide solution. Therefore chemical losses should be low, although the exceedingly fiue state of division of the particles of zinc might be considered to render it in a fit condition for dissolving very rapidly in a strongly alkaline solution. The chief difficulties attending its use appear to be in the collecting of the precipitate and in the acid treating of the collected and filter-pressed material. It has been urged as a drawback that the process is not a continuous one, but if two gold precipitation tauks be employed the method is, to all intents and purposes, continuous.

Zinc dust is used in several plants in the United States—at the Consolidated Mercnr Co.'s mill, which is the largest cyanide plant in the United States, at the De Lamar mill in Idaho, at De Lamar's Nevada Gold Mining Co.'s property at De Lamar, Nev., and elsewhere. It is reported that the process is snccessfully used at these places. Filter presses are nsed at the De Lamar piant in Idaho, where the consumption of zinc dnst is stated to be 3 pounds to 4 pounds per ton of ore treated. At the mill of the Nevada Gold Mining Co. the process has been used for several years, aud it is found that five miuntes of agitation of the solution after the addition of the precipitant is sufficient for complete precipitation. At this plant the precipitate is collected in ordinary zinc boxes, the compartments of which are filled with oakum. Thc advantages of this method of precipitation have not been made apparent to me from such data as I have been able to procure from practical working results, and sevcral mills in the Black Hills of South Dakota have discarded this method in favor of the ordinary method of thread precipitation.

TABLE A.—SANDS PLANT: 64.4% OF PULP.

MONTH.	Tonnage.	Product Removed from Boxes.		Total.	Zinc Added to Boxes, Kilos.
		Metallics, Kilos.	Fines.		
October	611.1	20.0	47.9		358.3
November	684.3	38.7	53.5		354.5
December	704.9	48.25	48.1		355.6
January	646.1	44.95	41.8		328.9
Totals	2646.4	151.9	191 3	343.2	1397.3
SLIMES PLANT: 35.6% OF PULP.					
October	362 5	101.0	59.3		192.7
November	347.3	120.7	71.0		189.4
December	396.0	125.5	73.2		198.0
January	375.2	121.3	56.9		204.6
Totals	1481.0	468.5	260.4	718.9	784.7

Sands: Tonnage, 2646.4; consumption of zinc per ton = .52 kilo.
Slimes: Tonnage, 1481.0; consumption of zinc per ton = .53 kilo.

TABLE B.—SANDS PLANT, SHOWING THE RELATIVE CHEMICAL AND MECHANICAL CONSUMPTION OF ZINC ON SANDS AND SLIMES PLANTS FOR THE MONTHS OF OCTOBER, NOVEMBER, DECEMBER, 1901, AND JANUARY, 1902.

MONTH.	Zinc Added to Boxes, Kilos.	Zinc Removed From Boxes in Form of Product.		Total.....	Chemical Loss Shown by Difference....	Mech. Loss, %...	Chem. Loss, %...
		Metallics.	Fines.

SLIMES PLANT.							
Oct., 1901, to Jan., 1902	784.7	454.9	41.1	496.0	288.7	63.2	36.8

Sands Plant: Total tonnage treated, 2646.4; zinc consumption per ton, .52 kilo.
Slimes Plant: Total tonnage treated, 1481.0; zinc consumption per ton, .53 kilo.

If the zinc dust method is the better method, then the sooner it displaces zinc thread the better, for the time will come when its merits will be recognized and its use will become general. But the process is growing old, and the patentees cannot, or do not, convince the cyanide world of its advantages by the publication of practical statistics which alone appeal to it.

A plant in the State of Mexico treats 660 tons per month of sands and 390 tons of slimes, the product of a 15-stamp wet crushing battery. The consumption of zinc on both is practically the same, viz., .5 kilo, or 1.1 pound per ton of ore. Table A shows tonnage treated and the amouut of product removed from the boxes aud the amount of zinc added to the boxes over a period of four months. It will be observed that the amount of zinc added to the sands plant boxes during the four months was 1397.3 kilos and the amount of product removed was 343.2 kilos, of which 151.9 kilos represented metallics and 191.3 kilos represeuted fines. Again, it will be observed that the amount of zinc added to the slimes plant boxes was 784.7 kilos and 718.9 kilos of product were removed from the boxes, 458.5 kilos being metallics and 260.4 being fines.

Inasmuch as the zinc consumptiou per ton of sands is practically the same as the zinc consumption per ton of slimes, viz., 0.52 kilo, as compared with 0.53 kilo, it is evident that there is a heavy mechanical loss of zinc in the slimes boxes and a light chemical loss as compared with the mechanical and chemical losses on the sands plant. To arrive at some idea of these two losses on the two plants, the following must be considered:

The value of thc metallics produced on the sands plant is abont 3.6 times the value of those produced on the slimes plaut in bullion contents. For instance, 50.3 kilos of sands plant metallics were found to contain 16.8 ounces gold and 30.7 ounces silver, and 184.4 kilos of slimes plant metallics were found to contain 18.5 ounces gold and 38.3 onnces silver.

Thc exact values of the metallics produced separately on the two plants during the period mentioned is not known, as the metallics of the two plants are treated together during the process of reduction and smelting, but it is safe to assume the data yielded by thc above figures as correctly indicative of their respective values.

(TO BE CONTINUED.)

Annealing and Case Hardening Tool Steel.

In annealing tool steel in small lots in an ordinary blacksmith's fire my method is to cut the steel to the desired length and heat it evenly and thoroughly to a good red heat, but not hot euough to scale it, says E. A. Spaulding, in Sparks From the Anvil. The work is best done in a hollow or mound fire, which is made by packing wet coal on the fire until a good mound is formed, when an opening is made in front, of a size large enough to admit the steel that is to be annealed. Such a fire is practically an oven.

When the coal is well charred the steel is put in and heated up slowly and thoroughly, care being taken that it shall not get above a good red. The steel is then put in a bed of ground wood charcoal in a box to cool. My annealing box is made of cast iron, 4 feet long, 15 inches wide and 12 inches deep. This is filled about two-thirds full of the charcoal dust. If quite small pieces are to be annealed, I heat them in an iron pipe 2½ inches diameter, plugged at one end, the pieces being packed in with charcoal and all heated together. When thoroughly heated, the pipe, with its contents, is placed in the charcoal dust in the box to cool.

Small pieces if placed in cold charcoal, without the protection of the pipe, will come out imperfectly annealed and with more or less hard spots. I have used lime to some extent for cooling, bnt do not like it as well as coal dust, as it does not retain the heat as long. Some persons complain that cooling in lime pnts hard "pins" and "streaks" in steel, but I do not think any trouble will arise on this score if the piece be large enough to heat np the lime; if, however, the piece is rather small, it is better to heat it packed in a pipe and cool it as above mentioned. I have had very good results from this mode of treatment.

For case-hardening we use prussiate of potash, pulverized and mixed with fine salt, abont eqnal parts. We heat the pieces to be hardened, apply the potash and immerse while it is flowing. I wish to emphasize this. Many smiths hold the piece until the potash is burned off. This is a mistake. It should be dipped while the potash is in a liquid state, as otherwise the piece will not come ont as hard as it should. If we want a piece very hard we sometimes use cyanide of potassium, and heat in an ordinary forge fire, but this method is resorted to only when there are but a few pieces to be hardened.

We very often have pieces to harden, snch as steps, centers, cups and tracers, which require to be soft on one end so that they can be riveted after hardening. For this pnrpose we nse "carburizer." the pieces are packed in a box made for the pnrpose, about 5x3x1½ inches deep.

A layer of carburizer is pnt in first; theu the pieces are placed in the box, with the ends down that are to be hardened; the mixture is then filled in over and around the parts that are to be hardened, the qnantity to be proportioned, as nearly as possible, to the depth of hardening required, and the parts that are not to be hardened are covered with slaked lime.

The box is theu placed in an idle forge and kept at a good heat for an honr or more according to the size of the work. At the end of the heat, before quenching, the fire is forced so that the pieces may be hardened on a rising heat; they are then dipped. If the operatior has been properly done the pieces will be glass-hard where covered by the carburizer and soft where covered by the lime.

Milling on Douglas Island, Alaska.*

NUMBER II.

Written by R. A. Kinzie.

Starting with the 5-stamp mill of the Treadwell, erected in 1881, the number has been increased from time to time, until at present there are 880 stamps dropping on the island, and these are distributed in the various mills, as shown in Table I.

sonable rates. The coal is transported to the mines by means of barges, which on their return trips carry concentrates in bulk to the Tacoma smelter.

The free gold is caught both inside and outside of the mortars by means of quicksilver. There is a diversity of opinion among the various amalgamators as to where, when and in what quantities the quicksilver should be fed. Table II gives quantities used. The result of a series of tests in the various mills shows that the quantity of quicksilver fed in the mortars and on the plates varies directly with the gauge of the screen, and, consequently, with the except the Ready Bullion, where it lasts only fifteen days. Salt water is used in this mill, and the corroding action seems to be intensified by the scouring of the sands in the mortar, which keeps the inside surface of the screen bright, thus always furnishing a fresh surface for the action of the water. These screens do not wear out as in the other mills, but become brittle and break.

Experiments are now in process with a make of iron-wire screen, but they have not advanced far enough for any conclusion to be reached.

The motion of the battery water, caused by the

During the summer months there is sufficient water to run 760 of the 880 stamps, and during the winter there is always enough to supply the batteries and vanners and run a portion of the mills.

This water supply is obtained from a series of ditch lines running along the mountain sides and aggregating 18 miles in length. The main Treadwell ditch starts from a lake in the mouutains 14 miles distaut from the mines. It follows the coutour of the mountain range, gathering water from numerous small springs and streams, and delivers it to the penstoeks at an elevatiou of 480 feet above the mills, and at a

coarseness of the ore. The coarser the crushing, the more quicksilver it is necessary to add to the mortars to make any saving at all.

On the other hand, the seouring action of the coarse sands on the plates uecessitates frequent dressing to keep them well coated with silver. It was the praetiee up to 1901 to keep the plates very wet (soft), and even though the crushing was much finer an exeessive amount of quicksilver was used. It will be seen from Table III that, although the tounage crushed per stamp has shown a marked increase, the quantity of quicksilver used per tou is

falling of the stamps, throws the pulp against the sereeu, and all particles fine enough pass through it and fall on the lip of the mortar. At the edge of the lip are placed two dashboards arranged in steps to stop the rush of water aud sand, and cause it to drop in a steady flow on the aprou plates, which are placed immediately in frout of the lip of the mortar, with the upper edge under the lip. This diuminishes the scouring action, allowing the amalgam to collect near the upper end of the plate. The amalgam here is kept harder than at the lower end. This allows the lower end of the plate to be kept quite wet,

distance of 1500 feet from them. Ou aecount of the heavy snowfall and low temperature in winter, the ditches are covered throughout their entire leugth by split lagging and boughs of trees. The snow on the mountains usually lasts until the end of April, and from then to the end of November rains are depended upon to supply the requisite amount of water.

At the Ready Bullion mine no provision has been made for a supply of fresh water for mill use other than that for the boilers. Here salt water is pumped from the channel and used for all purposes in the mill. Experience has shown that while it is very

only about one-half the quautity formerly used.

The ouly amalgamated eopper plates used inside the mortars are the chuck blocks. Two sizes are used at present (the 4-inch and 6-inch in height), but very little amalgam is collected from them. Formerly they furnished 13.7% of the amalgam collected, but since the fine screens were replaced they colleet practically no amalgam, except duriug short periods in the winter wheu salt water is used. At these times the chuek blocks become eoated, but as soon as fresh water is again used the amalgam is scoured off, leaving the copper bare.

destructive on all exposed iron in the batteries and on the vanners, it is better than fresh water for amalgamating purposes, but this advantage by no means compensates for the loss caused by its corrosive action on all exposed iron and on the vanner belts. The coal—about 22,000 tons per year—is obtained from the mines on Vancouver Island, at rea-

The diagonal slot screens which are used in all the mills are made of No. 23 gauge heavy Russian iron. Both the No. 4 aud No. 5 are in use, these being equivalent to the 20 aud 18-mesh wire screens, and are mouuted in frames in the usual mauner. Two widths are used, viz.: 9-inch and 12-inch, the former giving the better satisfactiou.

A screen lasts about seven weeks in all the mills

which gives a better chance to catch the finer particles of gold that otherwise might float off.

These plates are made of the best Lake copper, $\frac{3}{16}$ iueh thick, 4 feet wide, 10 feet long, and are given a fall of 1½ inch to the foot. The plates are prepared in the usual mauuer by cleaning with a weak solution of potassium cyanide aud rubbing in quicksilver until the upper surface is thoroughly amalgamated. While in use they are dressed with quicksilver twice a day, and the time taken for dressing should not exceed four miuutes per day.

At the lower end of each plate is placed a wooden trough lined with copper, called the tail box, where very little amalgam is caught. From the tail boxes the pulp is conveyed through 3-inch pipes to the mercury traps. These traps are made of cast-iron in the shape of a four-sided truucated pyramid, having the smaller end down. The trap is 14 inches square at the top, 15½ inches deep, with the lower end 6 inches square. In the bottom is a 2-iuch tap closed by a plug for drawing off the contents when cleaning up. Iuside the trap is a block 14 by 8 inches on top, 11 inches deep aud 8 by 8 inches ou the bottom. It then flows up through the space betweeu the trap aud the wooden block, and thence into the discharge launders.

These boxes are usually suspended under the battery floor aud from them the pulp flows through launders, where it is divided and conveyed by 3-inch iron pipes to the distributing boxes of two vauners.

On the floor of the distributing box of each vanner is placed an amalgamated copper plate, varying with the size of the vanner used, those ou the 4-foot vanner being 18 inches by 3 feet 4¾ inches, and on the 6-foot vanners 18 inches by 5 feet 9 inches. From this plate the pulp flows over the vanner, the heavy particles, including sulphurets and some free gold, being saved, while the lighter passes over the tail of the vanner into the tailings launders, which discharge into Gastiueaux channel.

By reference to Table III it will be seeu that 47% of the value contained in the ore is recovered by coucentration. For purposes of concentration two sizes of Frue vanners are used: the 4-foot and 6-foot. These vanners are so arranged that the pulp from five stamps is divided between two vanners. This style of concentrator is adapted to the ore, and from a study of the tables given above it would be hard to realize a much better saving. The wear and tear on

*Abstract Trans. Amer. Inst. Min. Engrs.

the machinery is very light in all the mills, with the exception of the Ready Bullion, where the vanners get more than their share of the destructive effects of salt water in use.

When a stamp is crushing 5.6 tons of ore in twenty-four hours, each stamp requires 4.25 gallons, and each vanner 1.5 gallons of water per minute. In the mills where the 4-foot vanners are used they are overloaded. This accounts for both sizes of vanners using the same amount of water.

There is a little less than 2% of concentrates in the ore. The concentrated product has a value of about $51 per ton in all the mills, with the exception of the Ready Bullion, where the concentrates assay about $35 per ton.

In connection with each mill is a storage bin for concentrates, holding about 400 tons. These bins are situated near the mill, and when the concentrates have been collected at the vanners and shoveled into cars, they are trammed to a small hydraulic elevator which raises the loaded car to the level of the top of the bin, where it is dumped. From these storage bins the concentrates are drawn off through chutes into cars holding two and one-half tons, and hauled by locomotives to the wharf, where they are dumped through chutes into the hatches of the barges which transport the concentrates to the Tacoma smelter, where they are treated.

Table II shows in detail the cost of the different departments of milling as well as the equipment and running time of the various mills for the last ten months.

(TO BE CONTINUED.)

Iron Cement for Machinery.

Many breakdowns, incidental to machinery subjected to steam and hydraulic pressure, can be successfully repaired by use of material known to engineers as Smooth-on Iron Cement. The uses of this material in repairs are numerous, and one of these shown in the engraving is of the repairs to a

Pump Repaired With Iron Cement.

large centrifugal pump in a dry dock pumping station, New York navy yard.

The following is an extract from a report made by an engineer in the department of construction and repairs:

"For over four years I have used your Smooth-on Iron Cement No. 1 and have found it to be as good as a new casting, when used in repairing breaks in castings. I have found it to make steam joints tight when everything else failed. I have used it on porous castings that had to stand 180 pounds steam pressure. I have used it on steam pipes that leaked and will say that I have never had any trouble with anything I repaired with the same.

"About four years ago one of our 45-inch centrifugal pumps split almost in two, due to a sudden strain. The crack was over 20 feet long and in some places opened up ¾ inch. To replace this pump would take months, and we needed it badly. This fracture was repaired with Smooth-on Cement No. 1, and the pump running on the third day after the break, and ran successfully for thirteen months, when it was replaced by a new pump. The repaired pump was, however, still giving as good service as when first repaired. This pump (above cut) broke about one and one-half years ago and was repaired with Smooth-on, as was the first pump, and it never has given us any trouble since. The cut shows the pump as now in use. The fracture extends from A through B to C, and from C to D; patches 1, 2 and 3 are brass; straps 4, 5, 6 and 7 are of wrought iron; Smooth-on was used in fracture and under patches and straps.

"When the new pump (see cut) was placed, the flanges connecting the gate valve with the pump did not come in line by 2½ inches; to make this joint the pump flange was cut off, a plate of wrought iron was flanged and shaped to fit the interior of the main and bolted to it, so the flange fitted the flange of the gate valve; both the flange joint and the joint between the main pipe and the inserted flange sleeve were made with Smooth-on.

"The suction pipe to this pump broke in two, underground, due to settling of the ground, over three years ago. This was also repaired with Smooth-on and has never given any trouble since. I have had at least a dozen more of these breaks, and after repairing them with smooth-on, have never had any trouble with them."

Smooth-on Iron Cement No. 1 is a metal cement which, when properly mixed with water, metallizes and slightly expands during the process. This action makes it valuable for many mechanical uses. This iron cement is made by the Smooth-on Manufacturing Co., Jersey City, N. J., U. S. A., who will send their illustrated book free. Sold in 5, 10 and 25-lb. tin cans. The Western Repair & Supply Co., 61 Steuart St., San Francisco, Cal., are Pacific coast agents.

Drift Timbering.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

When the floor of the drift in soft ground is wet it is often necessary to place the foot of the posts on sills or blocks to prevent their being forced down into the soft rock. Face boards may be held in place by the forward ends of the side lagging, a head block being interposed between them, and the face boards removed, one at a time, to permit the cutting out of the soft ground, the board replaced and the lagging driven forward before another board is removed, the work progressing from the bottom upward. It is a slow and laborious process, but in wet, running ground is often the only way in which headway can be made. The head blocks are cut from 6 inches to 12 inches wide and 4 inches long. In very wet ground—such as wet, caved, foliated slate—the face boards cannot be removed with safety for fear of a run. In such case the ground is cut out from beneath and behind the face board, which is kept advancing by driving up the side lagging, this carrying the face board forward. The details of this method of drifting are shown in Fig. 7.

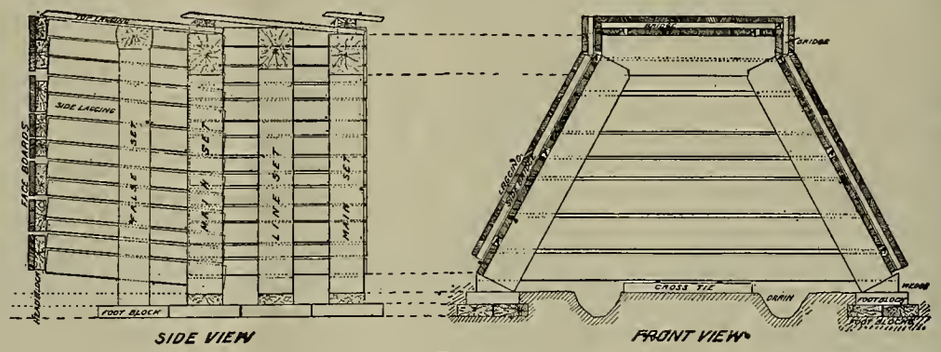

FIG. 7.

Soapstone, serpentine and some other rocks, which when wet cave unexpectedly, should always be substantially timbered when first cut through to prevent caving later on. When passing through sheared zones, faults or cross heads, as well as veins, extra

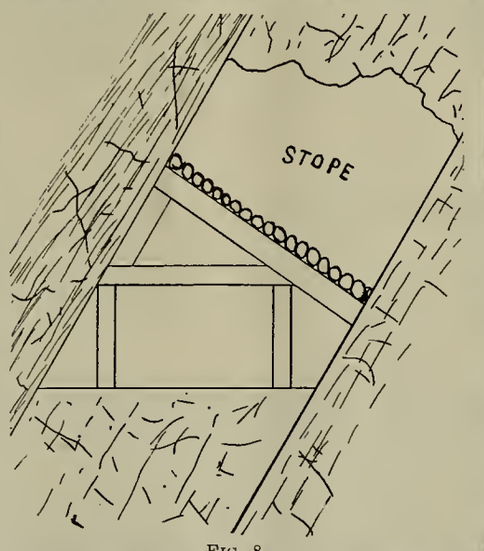

FIG. 8.

precautions should be taken to prevent subsequent caving, though the ground may stand well at the time of excavation.

In Fig. 8 is shown an unusual method of timbering a wide drift beneath a stope. This method gives additional support to the stull where the hanging wall is not secure, and is a very strong set and capable of sustaining great weight. It is a question, however, if the modification of the square set system, known as the "cap sill method," would not prove as economical and satisfactory.

In some mines the ore deposits lie nearly flat, and, having moderate height, are timbered in the same manner as the workings of many drift mines, by a system of "posts and breasting caps." These consist of single posts, over the head of which are placed a head block (breasting cap), and in some cases two other caps are placed transversely across the top of the first cap, the whole set being secured by wedges, tightly driven from all sides. Stoping may be carried on on both sides of the main gangway by this method, or from one side, any waste accumulating being thrown behind the workmen. The best practice is to drive crosscuts from the main gangway and from one side of the crosscut stope backward from the crosscut, setting up the posts and breasting caps as the work progresses, and throwing the waste behind. Often many of the timbers may be recovered; if not, and the roof falls, no particular harm is done and the miners at the face are always safe from falls of rock excepting such as may occur at and near the face, which they should anticipate and endeavor to prevent by prompt timbering.

The ways of timbering tunnels and drifts are so various that only the general principles can be given. Knowing these, the miner must adapt some method or variation of a known system to each particular case. The great variety of conditions and the frequent changes in these conditions, even in the same mine, require that the timberman of a mine be a man of fertile resource, and often he must show a fearlessness of danger that in other occupations would make him a hero.

Mining Telluride Ores in the Black Hills.

The ore deposits of the Cambrian formation in the Black Hills were discovered early in 1877, and for several years considerable development work was done in the Bald Mountain and Terry's Peak section. At Galena, also, east of Deadwood, lead-silver ores were discovered, and the mines of this camp were extensively and profitably mined and treated. Large shipments were made from the Galena district to smelters at Omaha, Denver and elsewhere. It was found that the siliceous ore of the Bald Mountain and Terry's Peak region were not readily amenable to amalgamation, the saving by that process often being less than 50% of the values, while both mining and milling were expensive, due to the extreme hardness of most of the rock, and the fine crushing and grinding in the mills, necessary to secure even 50% of the values. In 1881 the ores of the carbonate camp district west of Deadwood were discovered and a large output of lead-silver ore resulted. This success led to the discovery of extensive gold-bearing deposits in the Cambrian quartzites and Carboniferous limestones in that region. Among these discoveries were those of Squaw Creek canyon and the Ragged Top district on the limestone plateau northwest of Terry's peak.

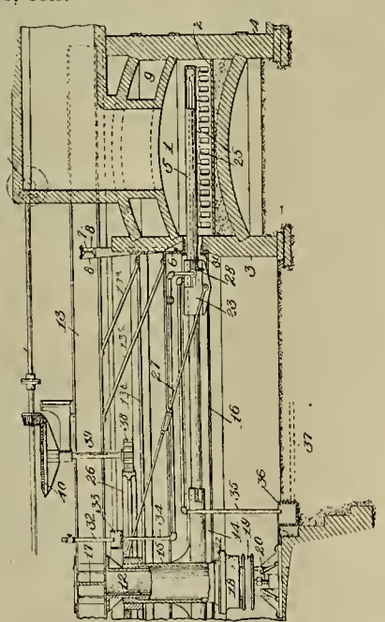
Until the introduction of the barrel chlorination process and the cyanide process in the Black Hills in the treatment of these ores, it cannot be said that success had been achieved in the treatment of these ores. The mining of these deposits was an easy matter. Most of the deposits lie flat, or nearly so, and large amounts of the ore are mined by open cut system, as shown in the illustration on front page. In some of these mines drifts are extended into the ore body beneath the overburden, which may consist of porphyry or the original sedimentary strata. In the Ragged Top section, near Preston, the Deadwood Standard M. & M. Co., owning 400 acres of ground, are operating by the open cut system, mining 125 tons of ore daily. They are also developing underground to secure a supply of ore during the winter season, when the heavy snows will make open cut work difficult, if not impossible. Their mill contains crushers, rolls and cyanide plant. W. O. Morrison is president and manager.

The Spearfish G. M. & R. Co. own 400 acres of ground near Crown Hill, in Ragged Top district.

They have a mill of 300 tons daily capacity. The ore occurs in limestone, and $7 ore pays a good profit. The mill (see illustration, front page) is composed of crusher and rolls. The ore passing a grizzly goes to a 10x20 Blake crusher and from there passes to a set of 16x36 Davis rolls, set to ¼ inch. This product is elevated to ¼-inch screen, and the rejected product passes through a set of 14x27 rolls and elevated to ¼-inch screen, which is as fine as they crush. The ore is then trammed to the leaching tanks, which consists of ten tanks, 26 feet in diameter by 7 feet deep, each tank holding 133 tons dry weight. The tailings are sluiced out through two bottom-discharge gates, 10 inches in diameter. The ore is treated about eighty hours with strong cyanide solution—six pounds to the ton—which is followed with a weak solution, containing two pounds cyanide to the ton, and treated for twelve hours, and then followed by wash water, making the total treatment ninety-six hours. The gold solution passes from the leaching vats to the gold tanks—one for strong and one for weak—and from there through three steel zinc-precipitation boxes to the sump tanks, where it is standardized and returned to the storage tanks at the top of the mill.

The precipitates from the zinc boxes are washed through steel launders to a refining tank, where the precipitates are treated with sulphuric acid, washed, filtered, dried and roasted at a slow heat in cast-iron muffles and then melted into bars averaging over 900 fine in gold. The mill has a capacity of 300 tons of ore per day and it is the intention of this company to increase the capacity. The plant is located at Cyanide P. O., 3½ miles from the railroad. According to figures furnished by O. N. Brown, general manager of the company, costs are divided as follows:

Mining	$ .98 per ton.
Transportation, mine to mill	.12 " "
Milling	.98 " "
Total	$2 08



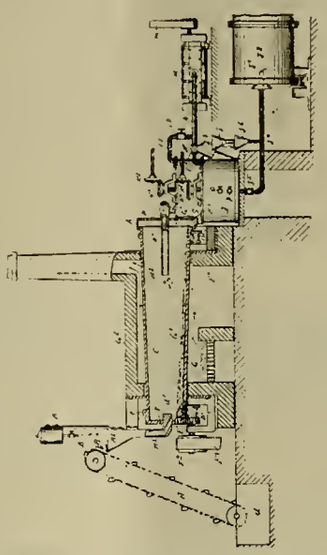
The ore is mostly mined by the open cut system (see illustration, front page), though they also have extensive underground workings. The ore is hauled on a 24-inch gauge track by small mine locomotive in trains of forty 1-ton cars. The railroad is ¾ mile in length, with about the same length of switches to the various openings on the property.

Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 20, 1903.

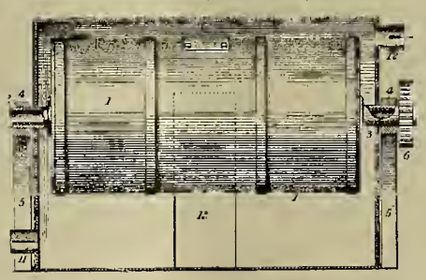
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE ROASTING FURNACE.—No. 741,549; J. Roger, Denver, Colo.



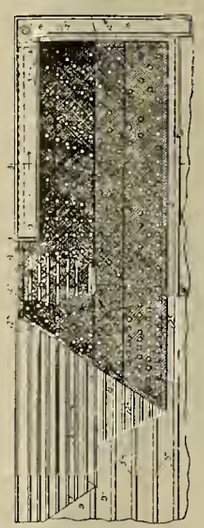
Combiuation with circular furnace, of column or pillar arrauged concentrically thereof, sleeve rotatably mounted upou column, beariug arranged at lower portiou of column, adjustable ring supportiug bearing, rabble mechanism carried by sleeve, and stay bolts or guy rods connecting upper portion of sleeve and outer portions of rabble mechanism.

PROCESS OF TREATING REFRACTORY ORES.—No. 741,712; E. C. Pohle and S. Croasdale, Denver, Colo.



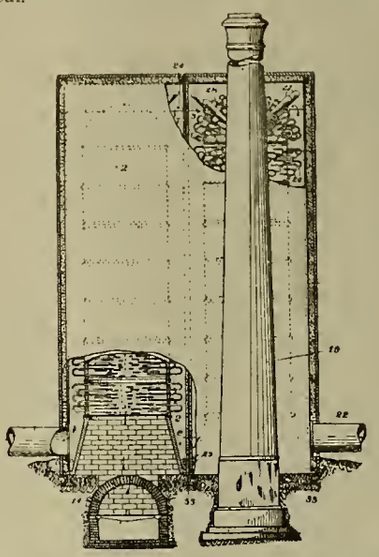
Process of effecting mixture containing ore, sulphur and haloid of alkaline or alkaline earth metal, relative proportions of materials being those quantitatively requisite to produce, when heated in the presence of oxygen, haloid of metal or metals to be extracted from ore and sulphate of alkaline or alkaline earth metal; roasting mixture with free access of air and agitation at temperature sufficient to effect reaction mentioned; and volatilizing and recovering metal values as haloids or oxyhaloids.

ORE DEARSENICATING AND AMALGAMATING APPARATUS.—No. 741,338; T. H. Hicks, Fort Wayne, Ind.



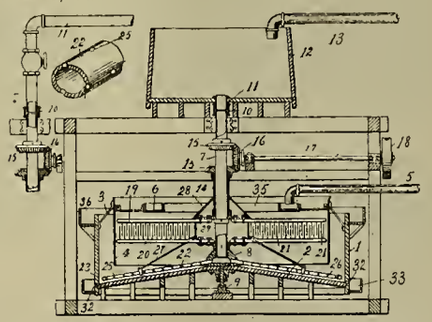
In combination retort adapted to be rotated and having open outlet end; statiouary eud casing having loosely fitting union with open outlet end of retort; ore collecting tank adapted to contain water and receive discharged ore contents from retort; cover arranged to seal top of tank to prevent escape of fumes therefrom; downwardly projecting partitions depending from cover of tank and arranged to dip into water contained in tank; and suction device attached to tank and arranged to draw air and fumes from retort under partitious and from tank.

PROCESS OF TREATING ORES.—No. 741,439; C. E. Baker and A. W. Burwell, Clevelaud, O.



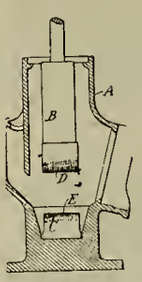
Process of treating ore containing base metal or metals and metalloid by combining metals and metalloid with chlorine, and supplying sufficient heat to vaporize aud separate metalloid chloride from metal chlorides.

CLASSIFYING OR SIZING APPARATUS.—No. 741,565; A. Ten Winkel, Denver, Colo.



Classifier or sizer comprising transversely inclined riffled bed, provided with screen sections varying in mesh, finest mesh section being placed uppermost on bed and other sections below in order of fineness, coarsest section being lowermost, the sections being all located in same inclined plane and provided with projections applied to upper surface of finest section, and section coarser than finest section, but finer than other sections lying in same plane with finest section, coarser section being placed upon projections of finest section, and riffle placed on finest section below its projection to direct material to riffles beyond screen.

HOT BLAST STOVE.—No. 741,680; H. Lang, Oakland, Cal.



In hot blast stove or air heating apparatus, series of more than two adjacently placed air cells in communication alternately at top and bottom, air inlet to first cell, air outlet from last cell, series of superimposed retort sections forming contiuuous tier in each cell, all in communication at bottom, heating furnace, and means for sendiug products of combustion of furnace into and out of retorts in successiou, in reverse direction to that of air current through cells.

CONCENTRATOR.—No. 741,725; E Schutz, San Francisco, Cal.

In combiuation, tank having conical bottom sloping outward and having in its side at juncture with bottom small hole for escape of conceutrates, rotating pipes also sloping downwardly outward in close proximity to bottom of tank, and having perforatious for discharging water therefrom at bottom of tank, means for feeding water to pipes and shell within tank having its lower edge raised above bottom of tank whereby lighter material iu escapiug from tank is compelled to pass below lower edge of shell aud in close proximity to bottom.

STAMP MILL.—No. 741,852; G. Thomsou, Elizabeth, N. J.

Stamp, die or like, haviug face composed of alloy of copper, nickel and steel.

MINER'S BLASTING SQUIB.—No. 741,968; T. R. Jones, Wilkesbarre, Pa.

Miner's squib comprising body portion and two matches connected thereto, one of matches being adapted to burn without flame, and other match being detachable and adapted to burn with flame.

Mining Summary.

SPECIALLY COMPILED AND REPORTED FOR THE MINING AND SCIENTIFIC PRESS.

ALASKA.

Five miners report having located placer gold diggings at the headwaters of the Sushitna river, in Western Alaska. The strike is on the east side of that river, 65 miles from Slate creek. The find was made on Aug. 16, when the prospectors were ready to return to Valdes, after having spent the summer in prospecting the lower tributaries of Sushitna river. Pay was found on Valdes, White and Wickersham creeks, and prospects on other creeks. Two men, shoveling for fifteen days into two lengths of sluice boxes, cleaned up 100 ounces of gold. Monohan, Clarkson, Smith, Johnson and Windemeller say that bedrock is 4 feet from the surface. They came out from the diggings to Valdes in thirteen days. The winter route will be from Valdes and over the Valdes glacier, a distance of 200 miles. The summer route will be via Copper Center and up the Tazelina river.

A ledge of free gold-bearing rock has been crosscut on the Alaska Perseverance and Greek Boy mines, near Juneau. After drifting 2200 feet, at depth of 1300 feet below the surface, a ledge of 22 feet of ore is reported cut in the Greek Boy. The same ledge traverses the Alaska Perseverance. The latter is owned by W. J. Southerland and J. T. Gilbert of New York. Southerland is also interested in the Greek Boy. Arrangements have been made for a 200-stamp mill on the Alaska Persoverance mine and a 40-stamp mill on the Greek Boy.

ARIZONA.

Cochise County.

Superintendent C. C. Warner of the Copper Glance mine, in Warren district, near Bisbee, says they have put in additional pumping facilities and sinking has been resumed. All of the pumps have a capacity of 700 gallons a minute. The shaft is down 540 feet.

Work is progressing in cutting out the pump station on the 700-foot level of the Con. C. Co.'s shaft at Tombstone, says the Prospector. This station will be 16 feet wide, 14 feet high and 83 feet long, while the sump into which the water will be pumped will be 10x12x40 feet. Foreman Saunders expects the work will be completed next week and work of putting the pumps in place started.

Gila County.

A strike of sulphide ore is reported in the Old Dominion mine at Globe, being cut on the tenth level crosscut, 400 feet uorth of the old shaft and 350 feet beyond any ore previously found, says the Silver Bolt. The ore body is 9 feet thick and carries 3% copper, but runs higher in sulphur than any sulphide yet found in the mine, and is a desirable matting material. The four-compartment shaft has reached 495 feet depth and is going down at the rate of 2 feet 4 inches per day, and by Jan. 1st it is expected the tenth level connection will be made. A heavy pump will then be set up and will handle over half the water now being raised with difficulty through the old shaft. The installation of the compressor of 2000 cubic feet per minute capacity is completed. Also an additional battery of boilers at the shaft has been bricked in and connections made. The foundation for the hoist is completed. The work of erecting the steel smelter and converter building is progressing. Work on the concentrator building is temporarily suspended. A battery of boilers for the smelter has been set up. The cable tramway above the old smelter has been raised hy building the two 30-foot towers to permit of railroad trains passing undor the tramway, says Superintendont Hoar. The converter at the old smelter is in operation.

Graham County.

W. Climo, superintendent of the Shannon mine, near Clifton, says he has 300 miners at work in their properties, which are producing an average of 600 tons of ore per day. During the past month 1000 feet of development work has been done and new ore bodies are being opened up. The Shannon mine is producing some high-grade ore and Climo says he has one stope 80 feet wide of low-grade ore. He has opened up a body of high-grade ore on the Sands group, owned by the Shannon Co.

Maricopa County.

(Special Correspondence).—R. E. Humphries has fifteen men at work on his group, near Hot Springs Junction, and more will be added.——The Mormon Girl mill, in Cave Creek district, will be put in operation this week, as an abundant supply of water for mill purposes has been developed.

G. Hamlin of the Relief mine, near Peoria, will build a mill. Water has been struck while sinking the shaft. This water will he utilized in the mine.

Phœnix, Oct. 26.

Yavapai County.

(Special Correspondence).—The Whipsaw Copper Co. is building a telephone line from its camp in Whipsaw gulch to connect with the main line of the Sunset Telephone Co., near Prescott. Development work is being done hy the company. A gasoline hoist has been put in.

Phœnix, Oct. 26.

(Special Correspondence).—The Bisbee Belle M. Co., near Constellation, is increasing development work. The tunnel is in 625 feet. The tunnel crosscuts several ledges and a body of high-grade sulphide ore was cut last week, says P. H. Hughes, superintendent.

K. Barrett, near Briggs, will start bis mill this week. The mill and mine are in Buzzard's Roost gulch.

Prescott, Oct. 27.

The Jesse M. Co., operating the Little Jesse group in Chaparral gulch, near Prescott, is increasing operations. A gallows frame will be placed over the double-compartment shaft, in which cages will be run. The shaft, down 657 feet, is being enlarged and retimbered. The shaft will he sunk to depth of 1000 feet. Air compressor and drills will he put in and a mill and cyanide plant will he built. J. S. Jones is manager.

Demory, Starks & Keaves are developing a group of claims on the flat between Groom Creek and Senator, says the Prescott Courier. They started a shaft on a lead of white quartz which showed on surface, and at depth of 30 feet are on a ledge 10 feet wide which assays $10. The ore is free milling.

CALIFORNIA.

Calaveras County.

The Othello G. & S. M. Co. has been incorporated in Stockton by D. C. Shepherd of Stockton, W. and A. Garland and J. M. and J. S. Shepherd of Murphys, to operate in Calaveras county.

Contra Costa County.

The Mitchell Bros.' S. & R. Co. has been incorporated by R. and H. Mitchell of Los Angoles, W. S. Gage of New York and W. H. Morrow of San Francisco. Negotiations for the Bay Point smelter of the Copper King, Ltd., have fallen through, and J. B. Miller for Mitchell Bros. has an option on forty acres of land east of Antioch for a smelter site. The advantages of the site near Antioch are transportation facilities on the Santa Fe road, with switching facilities with the Southern Pacific, with plenty of fresh water and water deep enough for oceau carriers to unload at their wharves.

Fresno County.

President J. M. Wright of the Peerless and Fulton Oil Co. of San Francisco has hought oil land near Coalinga, and north of the Caribou holdings. He will start operations this week.

The Genesee Oil Co. has been incorporated by W. H. Ingels, P. E. Daniels, W. G. Uridge, G. A. Hare and M. Hansen, to operate at Coalinga.——The Keystone Oil Co. has heen organized to operate on the Plymouth lease; and a contract has been let for No. 1 well, which will go 1650 feet if necessary. The property is east of the Commercial Petroleum Co. land.

Inyo County.

(Special Correspondence). — At Camp Lyon, near Ballarat, the Golden Argus M. & M. Co. are increasing work on the crosscut to tap main lodge. S. R. Phail is taking out ore on his Red Rock mine. At Millspaugh development work is progressing and next month they will have their mill rebuilt. In the Panamint range work is going ahead. At Tuba canyon J. P. Flint has men at work and expects to have his 12-stamp mill dropping next week. At Jail canyon it is reported C. C. Calkins has bought the property there and will hegin development work. At the Ratcliffe mine a few men are at work and the mill is kept running. The Cecil R. M. Co. has twenty men on the payroll. At the property formerly owned by the Ballarat M. Co. a mill is going up under Superintendent Vahrenkamp. At the Mineral Hill mine the crosscut will be completed next month, and they will be able to get the ore to the tramway on an economical basis.

Camp Lyon, October 27.

Nevada County.

T. Kohler of Grass Valley has bought the Belden one-half interest in the Gold Bank and Oro Fino mines and the entire Belden interests in the Anaconda mine, near Maybert. This mine was owned jointly by Belden & Fischer, and the interest of the latter has been honded hy T. Dorsey of Grass Valley. A 3-stamp mill will be huilt.

Superintendent W. H. Bray is building a canvas plant at the Posey mine in Willow Valley, near Nevada City.

Manager J. L. Bryson, of El Oro mines at Mayhert, says an aerial tramway will be built and the mill overhauled.

Machine drills are being put in at the New York-Grass Valley Co. mine at Forest Springs, near Grass Valley. The compressor is in place. The shaft has reached a depth of 600 feet. The mill is in operation.

The Suow Point gravel mine (the Hudson River claim), above Moore's Flat, near Grass Valley, will resume this week. Men will he put to work to run a tunnel to tap the channel. J. & J. Watton of Bay City, Mich., are at the head of the company. It is intended to run a lower tunnel.

The Excelsior Hydraulic M. Co. has heen incorporated at San Francisco to operate near Nevada City, and H. W., F. M. & E. C. Cowell, F. J. Ensign and C. E. Thomas are directors.

The South Yuba M. & S. Co. is increasing development work on the Virginia-Gold Hill copper mine at French Corral, says Superintendent J. F. McPherson. The vein carries both copper and gold. There are three tunnels, each over 400 feet in length.

Placer County.

R. Watson says he has leased the Haub mine of Shady Run, which has been idle for several years. Watson will repair the tunnel and increase development.

Riverside County.

W. H. Trenchard, manager of the San Diego Gem Co., owning the Cahuilla tourmaline mines near Cahuilla, says development work has been started. The company has a lapidary shop at San Diego.

San Diego County.

The Oro Blanco M. Co. of Banner will drivo their main tunnel 400 feet to the Bell mine.

At Mesa Grande, the Himalaya M. Co. has twelve men at work at its mines and tourmalines are being sent to New York to he cut. The San Diego Tourmaline M. Co. has mines at the same place and a lapidary establishment in San Diego.

The San Diego Gem Co. has heen incorporated by J. J. Hetzel, D. Wilson, C. O. Johnson, E. W. Peterson and W. H. Trenchard of San Diego, the last named being manager. The company owns five gem mines in San Diego county, also others in Arizona and Lower California, the product of which will be cut and polished at their lapidary establishment in San Diego.

The Fano gem mines, bought by E. A. Fano (known as the Fano Kunzite & Tourmaline mines), 15 miles northeast of Oak Grove, are heing opened up. The ledge has been prospected for 600 feet, and is being developed by cuts in several places.

Sierra County.

(Special Correspondence).—L. H. Carver of San Francisco, manager of the Mountain mine, near Sierra Buttes, 5 miles northeast of Sierra City, is preparing to reopen the property, which has been idle several years. The mine is 7000 feet above sea level and has been developed by a series of tunnels. An aerial tramway 6200 feet in length connects the mine with the 40-stamp mill, which is on the river, 1800 feet lower in elevation. Twenty stamps in the mill will be dropped to start with, until further development. Belt concentrators will be put in, as only amalgamating was done in previous operations. The principal development has been from No. 3 tunnel. A lower tunnel (No. 4) was started and will be continued to the vein, which contains several shoots. The ore values are mainly in free gold, with some auriferous pyrite.

Sierra City, Oct. 27.

Santa Barbara County.

The Graciosa Oil Co. has resumed drilling on its first well near Graciosa.

Superintendent Squier, of the Santa Maria Oil & Gas Co., reports drilling progressing. The Brookshire has begun drilling on well No. 2.——The Union Oil Co. is laying its pipe line from the wells to Graciosa station. The new tank, which has capacity of 35,000 barrels, is completed. Well No. 1, a producer, is capped awaiting completion of pipe line. Work on well No. 2 is progressing.

Siskiyou County.

Operations are being increasod in the Yellow Rose of Texas, Red Rose, Pirate of Coffee Creek, Rey Del Norte, Mayflower, Larboard Watch, Tubo Rose, Salmon River and Piedmont quartz mines, along boundary of Siskiyou and Trinity counties, on the headwaters of Salmon river and the tributaries of Trinity river, near Sawyer's Bar and Callahans. All these mines are under the management of the Yellow Rose G. M. Co.

The work of sinking on the coal mine at the Herr ranch, between Yreka and Ager, is progressing, says the Yreka Journal. They have considerable water to contend with. Some strata of good coal have heen found, hut the main coal hody is not expected to he reached till a depth of 300 feet.

Trinity County.

The Bullychoop M. Co., operating at the head of Indian creek on Bullychoop mountain, near Shasta, is running its mill on ore resulting from development in progress on No. 3 level. They have twenty men employed, and report thirty tons a day is heing crushed by working the mill half time. Manager W. B. Gester says an air compressor will he put in to supply power drills and a lower tunnel will be driven from the mill level. This tunnel will be driven on the vein.

Tuolumne County.

The M. McCormick Co. has bought the Flat Vein quartz mine on Bald mountain (the Cleveland claim), near Columbia. A fourth interest in the Lucky Jack quartz mine, 2 miles southeast of Confidence, has boen sold to J. F. Trailer; also a fourtb interest to E. W. Burley.

T. A. Piper and F. R. Moore, of Santa Clara, have a bond to huy the Morning Star, Comet, New York, North Star, Last Chance and Blue Gravel placer claims for $5000, within three years, during which time the present owners are to receive a royalty of 33⅓% of the net output of gold. Tho group is on Tahle mountain, 2 miles southeast of Tuttletown.

The Harvard mine at Jamestown has closed down indefinitely, says the Independent. —— At the Soulsby mine at Soulsbyville sinking the shaft is in progress. The 8-inch pump is working satisfactorily. The mill is not running during the dry spell. —— J. W. McGinn has bought the Golden Thread quartz mine, near Algerine.

The Dutch mine at Quartz is running and the twenty stamps in the mill are dropping regularly. Steam is used as power, with oil for fuel.——A half interest in the Hardtack quartz mine has beeu sold to A. White, of Vallejo, for $10,000.

COLORADO.

Boulder County.

The mill of the Caribou mine at Nederland has been leased to the United States Tuugsten Co. for treatmcnt of tungsten ore. Operations will he begun this week under suporintendency of G. Taylor, secretary of the company.

Chaffee County.

In Goldfield, the Cleo G. M. Co. has been organized by C. R. Miller, L. L. Palmer and L. Nugent. The company owns claims on Big Girl mountain. Palmer is manager.

The Yankee Blade and Excelsior mines (the Baxter group), on Cascara mountain, in Gunnison district, have heen sold to the Black Queen M. Co. This group adjoins the Black Queen properties, says W. W. Roller of Salida, part owner of the Yankee Blade.

The management of the Vivandier mine at Turret will build a 50-ton mill to treat its low-grade ores. Huntington rolls will be used.

Clear Creek County.

(Special Correspondence).—Within the uext 50 feet the Capital M. & T. Co., near Georgetown, expects to cut the Mills County lode at a depth of 700 feet, and have 200 feet to drive in the upper tuunel. The lower tunnel is in 1200 feet, and the country rock is granite. They are using one air drill, but will put in a second one. The group is composed of twenty-eight claims on Griffith mountain. They have a shaft 428 feet deep and intend sinking 300 feet dceper. They have put in a 4-drill compressor. W. Cooper is manager.

The Commercial Men's M. M. & T. T. Co., of which F. L. Miner is manager, has three claims on Leavenworth mountaiu, and has a tunnel in 450 feet, which cuts with 250 feet of drift the Colorado Central vein at depth of 250 feet.

C. W. Teagarden, manager of the St. Paul mine, in eight months has driven 300 feet of tunnel and has cleaned out 350 feet of tunnel on the upper level. There are three sets of lessees at work. This company owns 4500 feet of the Colorado Central vein and 1½ miles on the Curtley vein.

The Centennial G. M. Co., D. Kennedy owner, is being developed. The shaft is 600 feet deep and is taking out ore, and treating 15 tons per day in the mill. Some of the ore runs 5 ounces per ton in gold, and the concentrates, after shipping ore is taken out, runs $40 per ton. Negotiations are pending for sale of this mino and if closed, it is understood a 100-ton mill will he built.

The Kelly tunnel, which has been closed

down since September, is expected to remain closed until after the stockholders' meeting in January, 1904.

Georgetown, Oct. 25.

(Special Correspondence).—The Empire tunnel is in one-half mile and has cut twelve veins. Driving the tunnel has been suspended temporarily while work is being done on the dam to increase capacity. They expect to be working again in the tunnel Nov. 15.

Empire, Oct. 26.

(Special Correspondence).—The Commodore M. Co. has its tunnel on Red Elephant Mt., near Lawson, in 1200 feet, and expect to drive it to 2400 feet. The tunnel is 8x8 feet. They are running two machine drills in the breast.

Lawson, Oct. 26.

(Special Correspondence).—The Bonieta mill is dropping twenty stamps—all they can handle at present with water power; but they expect to be using steam next week. F. F. Reed is manager.——J. G. Roberts of the Jackson Concentrator has his mill running full capacity.

The Alpine mill is in operation. This mill has been overhauled and repaired.

Idaho Springs, Oct. 26.

(Special Correspondence).—An efficient powder thawer is in use by W. Cooper, manager Capital M. & T. Co., near Georgetown, arranged as follows: A small pipe is laid from the exhaust of the engine to a small building about 30 to 40 feet from boiler house and connected to a radiator. This, it is claimed, will thaw powder in large quantities with safety and no expense, as it uses exhaust steam.

Georgetown, Oct. 25.

It is reported that the Red Oak M. Co. will increase operations on its group, near Georgetown. Electric wire has been strung from Georgetown to the mine and an electric motor set up at the Scepter tunnel for running the suction ventilating fans. The crosscut from the Scepter to the Astor vein will be continued, and the directors will let a number of leases in the Scepter level, in addition to those in operation on the Sunburst.

Secretary Marihugh of the Marshall-Russell M. Co., operating near Georgetown, says they will resume work of driving the main tunnel. The Marshall-Russell Co. has a group on Miller mountain, which adjoins Covode mountain on the east, and is driving a crosscut tunnel to develop them. The course of their tunnel is nearly parallel with the Empire tunnel and its entrance is 1 mile east of the Empire tunnel mouth, the lodes to be cut being the eastern extensions of those of the Empire Co. The tunnel is in 500 feet.

Dolores County.

G. Lawrence has a lease on a block of United Rico M. Co.'s ground at Rico, and has started work.——Hedrick & Ditchfield, lessees on United Rico M. Co.'s ground, are shipping ore to the smelter at Durango.——Miller, Reid, Lee & Moore are shipping a carload of concentrates to Durango from their lease on the Vestal mine dump.

J. Mundt is doing development work on the Hibernian lode, near Rico.

Gilpin County.

The Mutual Benefit G. M. Co. has unwatered its Pleasant View mine on Gunnell hill, near Central City. Development work will be resumed in the lower levels. Ore is being shipped from the upper levels, says Superintendent W. C. Carnegie.

The Fortunate G. M. & M. Co. has been incorporated by M. U. Randel, G. E. Prehle, R. S. Beall, E. W. Morse and A. M. Stevenson, to operate the New Hampshire and Fortunate group of claims near the head of Lump gulch, in Central mining district, near Rollinsville.——It is reported the War Eagle mine, on War Eagle hill, between Perigo and Gilpin, will resume.

Work on the mill at Phœnix for the Blue Grass M. & M. Co. is under way. The plant will be equipped with ten rapid-drop stamps with cast iron concentrating tables, and also tables for slimes, and will be both amalgamating and concentrating. The power equipment will consist of a 25 H. P. slide-valve engine and 60 H. P. boiler. The mill is being built on Beaver creek and is expected to be ready for operation by Jan. 1. At the Lone Star mine of this company development work is progressing in south crosscut at depth of 154 feet, which has been driven in 120 feet, reports Superintendent R. L. Alexander.

Machinery is being put in at the Gilpin group, near the head of Lump gulch, near Rollinsville, which is under lease and bond to Omaha, Neb., parties.

On the Federal mine at the head of Graham gulch, near Russell Gulch, buildings are going up and Superintendent R. Hughes is putting in a hoist and a 30 H. P. boiler. The plant is on the Federal shaft, which is 75 feet deep, and sinking will be resumed to a depth of 200 feet. The Federal G. M. Co. has been incorporated, with J. F. Church, W. B. Lewis, F. E. Mulvihill and B. F. Threewit as directors. The company is operating both the Federal and Becky Sharp lodes.

Gunnison County.

D. J. Stuart & Co. are preparing to work their Italian mountain property, near Crested Butte.

At the Yankee Blade tunnel, it is expected, work will be resumed next week and continue during the winter. The drift will be extended until the Excelsior territory is reached and will then follow the vein entire length of the claim. The proposed Augusta tram will take the ore down the mountain by a spur connected with the Yankee Blade, and both tunnels will thereby be furnished transportation through the one main line, which will be 2 miles in length, says the Elk Mt. Pilot. The Augusta sawmill is cutting timbers to be used in construction of derricks and buildings. Drifting on the Augusta vein is progressing.

Lake County.

The Damascus M. Co., of New York, has a lease on the Maud Hicks mine, near Leadville, and has begun operations. Machinery has been put in, including a hoist, and the Maud Hicks shaft is being cleaned out and retimbered. The Maud Hicks is near the Ibex ground, toward the south.

The zinc production from Leadville camp at present will average 7500 tons daily, says the Carbonate Chronicle. Of this amount, 5000 tons is sorted zinc mineral and concentrates and the rest is dump material.

The Fryer Hill M. Co. has its pumps running in the Pride of the West shaft at Leadville and will put the shaft down. It is not expected that any great depth will be required, as the new shaft is already down 330 feet and in the contact. It is being sunk to catch the Progressive ore shoot. From the El Paso and other workings the company has increased its shipments and expects for month of October to make tonnage of 4000 tons of ore.

The Great Central M. Co. has been organized to develop a group of claims near Oro, including the Leo, Miner's Hope and Seven-Twenty. St. Louis people are interested, says Superintendent Dewecse, formerly with the Printer Boy.

La Plata County.

The Pay Day mine, near La Plata, has been sold to D. G. Miller of Denver for $50,000.

The Bonnie Girl M. Co., operating in La Plata mountains, 20 miles west of Durango, reports having improvements under way. These consist of a 100-ton stamp mill, equipped for cyanide treatment of the ores, offices, laboratory, etc., together with a gravity system of tram cars for transporting ore from mine to mill. The mill will be run by water power during greater part of the year, but a steam plant will also be installed to supplement this. The group comprises several claims, covering the ore bodies of the "Baker contact," which shows average value of $4.50 in gold and one ounce in silver per ton. The ore will be mined from open quarries and transported by gravity tram cars into the crushers at the mill. Boston and Denver men are interested.

Hinsdale County.

The Black Crook M. Co. is having 500 tons of ore milled as a test in the Golden Fleece mill, near Lake City, to determine if it should build a mill.——A new hoisting plant is being set up at the Ohio group, in Poverty gulch, says Manager Sherhino. The shaft is down 130 feet and shows a body of iron ore carrying values in gold.

Saguache County.

A 100-ton smelter will be built at Villa Grove by the Stoel Canyon M., M. & I. Co. of Florence, says the Times. They have opened ore in three of their properties and only the higher grade rock is being shipped, pending erection of their smelter.

San Miguel County.

Operations are again under way in the mines and mill of the Tomboy G. M., Ltd., near Telluride.

Summit County.

The Michigan mine, on Sheep mountain, near Kokomo, is shipping lead ore.——P. R. Arnold has started work on his group, which adjoins the Wilfley mine.

Teller County.

President D. Hanley of the Cripple Creek Enterprise M. Co., at Cripple Creek, last week resumed work with non-union men on the lease the company has on the Deadwood claim, owned by the United Mines Co.

The Cripple Creek Times gives the following list of men working in the mines, mills, samplers and plants that are declared "unfair" by the Western Federation of Miners:

Stratton's Independence, Ltd	370
El Paso & Lessees	150
Elkton & Lessees	134
Vindicator & Lessees	112
Strong	95
Gold Coin	73
Golden Cycle & Lessees	100
United Mines Lessees	80
Mary McKinney	52
Findley	41
Anaconda Lessees	40
Anchoria-Leland & Lessees	35
C. C. Enterprise & Lessees	14
C. K. & N.	39
Abe Lincoln	35
Gold Sovereign Lessees	31
Shurtleff	24

Colorado Trading & Transfer Co., Ore Haulers	50
Total	1786

The total output for month of October is expected to reach a total of 30,000 tons of $1,500,000 value. Few of the mines are working more than two shifts, but beginning November 1st will put on three. The Findley mine has thirty-two air drills in operation.

IDAHO.

Blaine County.

The Oregon Short Line traffic department has announced a rate of $4 per ton on low-grade ores shipped from Hailey, in Wood River district, to the Salt Lake smelters.

Boise County.

J. Turtle has a bond on the Champion and Eureka quartz claims, which are east extensions of the Gambrinus mine, in Gambrinus district, near Idaho City. Ore has been taken from a shaft sunk on the Champion. Turtle will run a tunnel to tap the ledge at depth.

J. T. Hodson of Boise, manager of the Lincoln mine and mill, says the mill is being run by electricity, replacing the gasoline engine formerly used.

Elmore County.

Operations will be resumed at the Old Bonaparte mine near Atlanta—a former producer—which had been closed down for several years. The property is equipped with a 20-stamp mill and other machinery. E. Hayden of Boise is manager. The mine is 4 miles east of Rocky Bar.

Idaho County.

The Crackerjack M. Co., operating at Buffalo Hump, will put in a fifty-ton cyanide plant and a four-drill compressor, says W. A. Stephens of Spokane, Wash., manager of the Crackerjack. The cyanide plant will handle the tailings, as they will put in a Huntington mill behind the stamps. Two more tunnels will be started.

Near Warren, at the Hixie mine, which is being developed by Hathaway & Co. of New York, they are putting up a mill, having moved down the Goodonough plant of ten stamps from Steamboat creek.

Lincoln County.

N. M. Ruick of Boise and J. E. Lane of Shoshone, for W. A. Clark et al. of Butte, Mont., owning land surrounding Shoshone, have filed with the State Engineer an application to divert 2000 cubic feet per second of the waters of Snake river to be used for developing electric power. The power house will be below Shoshone falls. The water will be conveyed thereto by a tunnel 2000 feet in length. It is proposed to generate 48,000 H. P. Associated with Clark are J. A. Croighton and Dewey & Stone of Omaha, Neb.

Shoshone County.

The annual report of the manager of the Bunker Hill & Sullivan M. & C. Co., operating a group of silver-lead mines near Wardner, shows a total of 260,070 tons of concentrating ore mined at a cost of $544,650 and 430 tons of shipping ore at $2721. The ore was obtained from the separate mines in the following ratio: Sullivan, 1.05%; Bunker Hill, 33.97%; Stemwinder, 61.13%; Tyler, 3.85%. Gross value of concentrates and shipping ore was $1,623,290; freight and treatment charges and discounts, $725,562; total operating costs at Wardner, $685,946. The operating costs were divided as follows:

	Total.	Per ton.
Stoping	$547,372	$2 101
Tramming	24,656	0 095
Concentrating	61,793	0 237
Shipping	6,996	0 027
Superintendent and office	24,549	0 094
Legal services	4,200	0 016
Contingent expense	16,380	0 063
Totals	$685,946	$2 633

Following are detailed costs of mining:

	Total.	Per ton.
Foremen, machinists, blacksmiths	$ 67,981	$0 261
Timbermen and carpenters	17,402	0 067
Miners	111,359	0 429
Car men	31,719	0 122
Shovelers	173,873	0 668
Power labor	8,612	0 033
Repair labor	9,960	0 038
Explosives	23,747	0 092
Illuminants	9,025	0 035
Lubricants	964	0 004
Iron and steel	5,075	0 019
Miscellaneous supplies	10,095	0 039
Timber and lagging	53,321	0 205
Power supplies	2,892	0 011
Wood	10,234	0 039
Stable and stock	2,153	0 008
Exploration	6,237	0 024
Totals	$541,650	$2 094

The total production was less than that of the preceding year. At the beginning of the present calendar year the stoping force was reduced 35%, decreasing the tonnage of ore mined. But the grade of ore handled was so maintained that the yield of shipping product was but slightly decreased under that of preceding months and the cost per ton of both shipping product and run-of-mine ore was reduced. The most important feature of the year's development work was completing connections between all mines of the group and the Kellogg tunnel. This suspended operation of the aerial tramway and affords a direct outlet to the concentrator for all the ore, as well as giving ventilation and drainage. Machinery is being put in to use electrical power in both mills and mines.

The Highland Chief mine, in Pine Creek district, near Wardner, reports having cut through 12 feet of carbonates in the lower tunnel. The strike was made on a contact vein. The tunnel had been driven 850 feet, giving a depth of 500 feet. When the vein was tapped water poured in on the miners, forcing them from the face, and 4 inches are flowing from its mouth, rendering work difficult. The mine is under bond for $150,000 to B. L. Grant, A. M. Phillips, J. E. King, C. C. Whitney and C. W. Stanton of St. Paul, Minn. In driving the tunnel four veins were cut.

MICHIGAN.

Houghton County.

The management of the Winona mine at Winona will sink No. 2 shaft to the sixth level this winter, bringing it to equal depth with No. 1, and all drifts will be opened through.

The Osceola Con. M. Co., near Calumet, reports that the production of the company, which for the month of September amounted to 800 tons refined copper, will be increased through careful selection of the rock to 1000 tons per month, or at rate of 24,000,000 pounds of copper per annum.

Houghton reports say a shortage of miners exists in the lake copper country. Some of the mines have drills to operate and stopes in which to place them, but cannot find enough men, although many are being thrown out of work in the iron country.

Keweenaw County.

The hoist and compressor bought by the Ahmeek mine, near Allouez, from the Meadow mine, will be set up at No. 1 shaft.

MISSOURI.

Jasper County.

The exodus of miners to Cripple Creek, Colo., Arizona and California, as strike breakers, has made machine men scarce in Joplin district.

The Ishpeming M. Co. has material on the ground to build a 100-ton mill at Reeds.

The Con. Troup M. Co. mines No. 1 and No. 2, near Webb City, are running steadily and mill No. 3 has been put in running order, to mill dirt from an adjoining shaft.

The Lima M. Co., since sinking a new shaft and cutting for air to the pump shaft, has drifted southeast and opened up a good prospect, says the Joplin News-Herald, and is running the mill on half time. Work will be resumed from the south shaft.

The Ora May M. Co., of Joplin, has been incorporated by E. O. Bartlett, J. F. Wise, H. Murphy, D. M. Sayers and J. H. Spencer.

The Florence F. mine, near Prosperity, will resume operations. A shaft will be sunk on a drill hole 200 feet west of the mill. In drilling, ore was struck 75 to 85 feet in lead, jack and lead 140 to 165 feet, and high-grade cuttings from 206 to 230 feet. Two other drill holes showed same formation in lower level.

The Chapman M. Co., at Prosperity, is running its mill steadily with satisfactory results, says the News-Herald. The company has put in a sludge table, is building roads and putting the ground in shape.

The Daisy Bell M. Co., composed of J. Boyd of Carthage and St. Louis men, is making output of thirty-five tons of jack per week. They are working with five hand jigs and six men in the ground.

Their lease covers sixty-five acres, and the Seven Devils mine on another part of the lease is making similar output to the Daisy Bell mine. The tract is 1½ mile south of Smithfield.

The Lill M. Co., on the Cherokee lease, near Joplin, will work the upper level, having good face of ore to start on. The company has been prospecting with drills. ——The Crescent M. Co., on the Forestall & O'Donald lease, has leased four lots on the O'Neill lease, adjoining them on the east, and a drill is prospecting the ground to locate continuation of the run of ore on which they have been running. The company, in cutting the prospect drifts, produced 697,447 pounds of zinc from August 3 to September 30, and sold at average price of $36 per ton.

MONTANA.

Beaverhead County.

A strike of silver ore is reported made on the Christie claim, in Bryant mining district, at Helena, owned by H. J. Just, C. Christie and J. Haylor. It is west of the Hecla claim, and the shaft is down 26 feet.

Fergus County.

The owners of the Victor group of mining claims on Plum creek, 1 mile north of the Kendall group, in the North Moccasin mountains, near Kendall, are preparing to increase development. The claims are owned by W. L. Martin, S. & H. Armstrong and M. Dunn of Great Falls. The Victor group shows a vein carrying a shoot of galena 1 foot wide and assaying $25.

The Gold Reef mine (formerly the Gilt Edge), the Barnes-King and the Kendall mines, near Kendall, are turning out monthly $130,000 and employing 350 men, says the Argus. E. W. King is also president of the Alder Gulch M. Co., in the Little Rockies, which property is turning out $10,000 a month. A new mill is running.

Flathead County.

The Libby M. Co. has given an option and bond on its Ida, a quartz claim in West Fisher district, Libby, to F. E. Lucas of Spokane, Wash. In addition to the claim the company owns a 2-stamp mill, which is on the mine and included in the deal. Lucas will begin development work this week. The property is in Fourth of July guleh, 2 miles from Cahinet, and adjoins the Illinois and Montana properties. The vein is 2 feet wide between slate walls. The values are in free milling gold.

Granite County.

The Hope mill, near Phillipsburg, was started up last week, after having been shut down for two years. Both steam and water power are used. The first run is on rich ore which has been stored in the mill. As soon as this is disposed of the ore in the ore bins at the mine and near the mouth of the Jubilee tunnel will be run through.

Jefferson County.

P. F. Dowling, working the Hiawatha mine, in Cataract district, near Basin, is putting on more men and is shipping smelting ore. The ore is quartzose and carries values in gold and silver, and is used in the converters in the smolters. Dowling is also working the Custer, adjoining, and is tapping this claim through the tunnel on the Hiawatha. The tunnel is in 400 feet and will tap the Custer at depth of 130 feet.

The B. F. Forbes' interests in thirteen claims in Dry Creek district have been sold to F. A. Heinze of Butte. They are the iron claims.

It is reported work will be resumed on the White Pine group of claims in Cataract district, near Basin. They have a shaft down 500 feet. H. Turner of Saginaw, Mich., is superintendent and manager.

Lewis and Clarke County.

Mulvahill & Ely of Helena have an option for a bond on a group of claims near Rimini. They are running a crosscut to tap the lead at the 75-foot level.

Madison County.

The Fortune group of mines has been sold to a company of St. Paul and Minneapolis mining men, with W. H. Nichols of Butte. R. Cook of Virginia City is manager. They will build a concentrator to have a capacity of fifty tons per day. The group is located on Williams gulch, 4 miles west of Virginia City, and comprises 300 acres. The Fortune claim is patented and developed by a tunnel 330 feet long and a 200-foot shaft near the mouth of the tunnel. There are eight claims in the group.

Operations are suspended temporarily at the Watseca mine, near Rochester, because of the large amount of water. The pump at the 600-foot level and two on the 450-foot level are drowned, but with five smaller pumps on the 400-foot level, they are preparing to put in heavier pumps.

Work on the Broadway mine, at Silver Star, has resumed, and the mill that was burned will be rebuilt. Superintendent Dahler is working the Hudson, adjoining, and is taking out ore.

Silver Bow County.

Judge Clancy, in the District Court of the second judicial district of Montana, has rendered a decision in the MacGinniss suit for a receiver for the Boston & Montana M. Co., temporarily refusing to appoint a receiver, but issuing an order to restrain the Boston & Montana M. Co. from transferring its stock to the Amalgamated C. Co. or from paying any dividends to that corporation. The Minnie Healey case is decided in favor of F. A. Heinze. As a result of these decisions, all the properties of the Amalgamated C. Co. in Montana have been closed down by the management, and it is estimated that 15,000 men are idle. The following properties are affected by the shut down: In Butte—Boston & Montana mines, Anaconda mines, Syndicate group, Butte & Boston mines, Parrott group, Colorado Co.'s mines, Washoe group, Colorado smelter, Butte & Boston smelter, the Butte, Anaconda & Pacific railroad; at Anaconda—Washoe smelter, lime kilns, Anaconda foundry, brick yards; at Great Falls—Boston & Montana smelter; at Belt—Belt Coal & Coke Co.; at Bonner—Blackfoot Lumber Co.; at Horr—Horr Coal & Coke Co.; at Diamondville—Diamondville Coal Co., curtailing production; Pleasant Valley Co.; in Jefferson county—Lime and silica quarries. In Butte the company employs 6500 men; in the smelters at Anaconda, Butte and Great Falls, 5000 men. A pay roll of $50,000 a day is cut off in Butte.——An appeal from the decision has been taken to the Supreme Court, but it is thought it may take several months before a hearing can be obtained. The duration of the shut down is uncertain.

NEVADA.

Eureka County.

(Special Correspondence). — A. Fraser and J. Fine, working the Cyanide claim on Adams hill, have obtained values from shipping ore sacked from old dump. Development work will be increased.——F. & D. Harris, working the Bullwhacker, are increasing developments and making shipments.

There are 200 shafts, drifts and open cuts on Adams hill, from which $4,000,000 have been taken, but none of these workings exceed 100 feet in depth. The formation is quartzite and limestone, with a porphyry dike running from southeast to northwest. This ore can be handled by cyanide treatment and averages $7 in gold and silver.

Eureka, Oct. 27.

Lander County.

P. Porter of Salt Lake City, Utah, manager of the Keystone group of mines at Cortez, says development work is progressing and ore shipments have begun. In the tunnel 4 feet of ore averaging 12% copper, 25 ounces silver and 19% lead has been opened at 400 feet in the tunnel.

Lincoln County.

A half interest in the Chief mine, between De Lamar and Panaca, has been bonded to Whitmore & McDermott, of Salt Lake City, Utah, for $20,000. A body of ore has been opened up and by the terms of the bond a cyanide plant, capable of handling thirty tons per day, will be put in. It is reported the vein averages $9 per ton.

Lyon County.

The Nevada Chief mine at Rockland is shut down, throwing fifteen men out of employment.

Manager Rae of the Como-Eureka mine in Como, near Dayton, says the water supply for his milling plant has been cut off. The Como-Eureka is in Como district, while the North Rapidan mine is in the Palmyra district, the elevation of the former being several hundred feet higher than that of the latter, says the Virginia Report. Before the North Rapidan drain tunnel had attained its present length of 2000 feet, there was an abundance of water available in the Como-Eureka shaft for supplying the mill batteries, but this supply gave out, due to the water finding its way through crevices in the formation to the North Rapidan tunnel level, which accounts in a measure for increase in flow of water through the tunnel, which has also drained the main shaft of the North Rapidan mine. As the Como-Eureka is near the summit of the Como range, Manager Rae says to obtain a supply of water for the mill hatteries he will have to sink the Como-Eureka shaft to water level or move the mill to a lower altitude. The company owning the Como-Eureka has expended $30,000 in installing a dynamo plant on the Carson river at Dayton and building a pole line to its property for transmission of power to operate its mill and hoisting plant.

Storey County.

Work at the Ward shaft at Gold Hill, on the Comstock, is under full headway, and three shifts of four men each are repairing the shaft. This will be continued to the 1675-foot level, or Sutro tunnel level, when a drift will be run 275 feet to the east to connect with the south lateral.

There are twenty-five mines in operation on the Comstock lode at present, exclusive of those interested in the drainage of the Ward shaft between Gold Hill and Virginia City. The Bullion, Alpha, Julia and Exchequer are included in the number defraying the expenses of recovering the lower levels by that method. The Davis drill on the Brunswick and the Butters Cyanide Co. are not included in the above figures.

Washoe County.

E. S. Bach of Colorado Springs, Colo., secretary of the Con. Nevada M. Co., says operations will be resumed on their group near the Wedekind mine, near Reno. Development will be carried on to determine if the Reno Star ore body continues its trend through their property. A. F. Price is superintendent and manager.

White Pine County.

A. D. Campton has men at work taking out high-grade silver-lead ore from the Stromberg mine in Duck Creek district, near Ely. The mine is owned by Campton & McGill.

The Butte gold mine, lying parallel with the Maggie Maud, being worked under lease by Miller & Peterson, in Cocomungo canyon, 5 miles south of Cherry creek, has men at work sinking a working shaft on a lodge of free gold ore.

NEW MEXICO.

J. E. Sheridan, United States mine inspector for New Mexico, in his annual report shows the coal mining industry of the Territory to be increasing, both by reason of increased operation and favorable showings made in new fields being opened. Production for the fiscal year ending June 30, 1903, was 1,359,530 tons, an increase of 19.99% over preceding fiscal year. The number of men employed was 2233, 1597 men being employed under ground and 636 on outside work. There were fifty-six boys employed underground and fifty-three outside. In addition to the men working at the mines, a large number of others find employment cutting timber for the mines.——The production by counties is given as follows: Colfax county, 558,805 tons; McKinley county, 539,910 tons; Lincoln county, 98,096 tons; Santa Fe county, 92,359 tons; Rio Arriba county, 39,100 tons; Socorro county, 29,460 tons; San Juan county, 1800 tons. Socorro county returns were only approximated, as the principal coal operator of the county had not yet sent in his returns when the mine inspector closed his report. The returns from Socorro county may be 25% larger than given in the list, says the New Mexican.

Grant County.

Litigation over the Wild Cat mine and mill having been settled by compromise, the Clifton C. Co. again assumes full control of the property and will resume work this week. They will increase the concentrator from 65 tons to 150 tons daily capacity. The Wild Cat mine is near Santa Rita, and has a vein averaging 40 feet of 3% copper ore.

President Lister of the North American M. Co., near Lordsburg, reports the 35 H. P. steam engine has been set up, and sinking has been resumed. Lister is sinking the shaft on the Black Sam, one of the group owned by the North American Co. The vein shows values in gold, silver and copper.

Taos County.

Metallurgist M. Stewart of the Glenwoody M. Co., at Glenwoody, says they are building a cyanide mill. The quartz will be crushed in a Huntington mill of fifty tons daily capacity, and another of sixty tons capacity will be added later. The ore averages $3 per ton in gold. Besides the gold property the company has a vein of high-grade copper ore, but little work has been done on it. W. N. Woody is principal owner.

OHIO.

The United States Court of Appeals at New York handed down a decision on the 22nd inst. upholding the validity of the so-called Bradley patent for smelting by the use of electricity. The suit was brought by the Electric Smelting and Aluminum Co., of Cleveland, against the Pittsburg Reduction Co. The court reversed the decision of the lower court, granted the Cleveland Co. an injunction restraining the Pittsburg Reduction Co. from the use of the process at present employed and ordering an accounting of the profits for the time it has been manufacturing aluminum in infringement of the Bradley patent (twelve years). The Bradley patents sustained by the court were taken out by C. S. Bradley in 1891 and 1892, and covered the use of the electric current to fuse and electrolyze a material, the current acting both to maintain the compound in a fused state without the use of external heat, and to separate it into its constituent parts, aluminum being separated from clay in this manner. The patent is a general one, applying to the electrolysis of any material.

OREGON.

Baker County.

Development work has been started by Manager M. E. Bain at the Overland mine in Cable Cove district, near Sumpter. The first work will be driving on the three Overland veins opened by surface work. They will open the first, or larger, and crosscut from these workings to the others.

Douglas County.

The 30-stamp mill of the Oregon Securities Co., near Bohemia, is about completed and will begin dropping stamps next week.

Jackson County.

The New York & Western Mines Co. is preparing to increase development work at the Oregon Belle mine, in Forest Creek district, 7 miles southwest of Jacksonville. Manager Gunnell, of Grant's Pass, says they will put in a steam hoist, compressor and other machinery, and it is proposed to build a mill in the spring. A tunnel has been started and will be driven in 200 feet below the old workings.

Grant County.

The Red Boy mine, near Alamo, has been placed in the hands of a receiver, and will remain closed pending adjustment.

Josephine County.

The New York & Western M. Co. is preparing to increase development work at the Oregon Belle mine in Forest Creek district, near Grants Pass. Manager Gunnell says they are putting in a steam hoist, compressor and other machinery. By next spring they expect the property will be ready for a mill. A tunnel has been started and will be driven in 200 feet below the old workings.

The double-compartment shaft being sunk in the Granite Hill mines on Granite Hill, near Grant's Pass, by the American Gold Fields Co., has cut an 11-foot ledge, and 5 feet of the hanging wall carries average values of $50 a ton. The remainder of the foot wall averages $11 a ton. Free gold and galena are shown. This shaft will be sunk to depth of 600 or 700 feet and the ledge crosscut at every 100-foot level. The 5-stamp mill is kept at work on ore of the upper stopes. A 10-stamp mill is being built. A boiler, hoists, compressors and air drills have been put in at the Granite Hill mines, says Superintendent Wickersham. A sawmill is operated by the company in the heavy fir timber of its claims. There are also several hundred acres of placer ground on the Granite Hill properties, equipped with a hydraulic plant, which will be operated this winter.

The dam which the Golden Drift M. Co. is building across Rogue River, near Grant's Pass, is about completed, says the Jacksonville Times. It is built to its required height across the stream and men are filling in the cribs. The machinery will not be put in till spring. There are fifty men employed in construction of the dam and operating the sawmill. This dam will be capable of supplying 10,000 H. P., part of which will be used in operating the pumps that will supply the giants in Dry Diggings placers with water. The Golden Drift Co. owns 1000 acres of placer ground in Dry Diggings that will be piped off when the dam is completed and the pumps and giants put in.

Lane County.

Near the Blue river the Great Northern mine has been bonded to W. S. Standish, who has put men at work running additional tunnels. A 2-stamp mill is on the property.

SOUTH DAKOTA.

Lawrence County.

The Gilt Edge-Maid M. Co. is doing development on its property near Galena. It is expected next spring work will be started on a cyanide mill for the mine. G. A. Duncan, of Deadwood, is superintendent.

J. Couzette, president of the Ruby G. M. & M. Co., operating in Bear Butte section, northeast of Deadwood, says he is arranging for machinery for his company's mill, the building for which has been completed. It is intended to put in a Chilian mill, operated by gasoline engine of 40 H. P. A cyanide plant is also expected to be added.

W. W. Kelley of Des Moines, Iowa, of the Gladiator Con. G. M. & M. Co. says a 10-stamp mill will be built on the Gold

Fish group of their claims on Lead Hill, ¼ mile from Lead City. Development work is being increased. The ore carries values in free gold, besides containing bismuth, telluride and arsenical pyrites. C. H. Crabtree is secretary and manager.

The report of the Homestake M. Co. for fiscal year ending June 1, 1903, shows production, amounting to $4,526,942.04, exceeding the former year by $258,964.47. This increase is due to the continuous operation of the stamp mills, made possible by the new water supply from Spearfish river, the starting of the Father De Smet mill and the working of the two new cyanide plants. The Homestake's output has increased by half in four years as regards bullion production and tons of ore milled, while the average value per ton has decreased from $4.373 to $3.539 since 1899. The largest single item of expenditure is mine labor. Its property purchases were smallest in the past year. Its taxes have nearly doubled since 1900. The Ellison shaft was sunk from the 900-foot level to the 1100-foot level, and the Golden Gate, a new shaft at north end of mine, sunk from surface to 700-foot level. They are preparing to add 100 stamps to the Amicus mill, but the time required to get a necessary new engine will delay their dropping until next summer. A comparison of the figures for the last three years, says the Black Hills Review, is shown in the following table:

	1901.	1902.	1903.
Tons milled	935,441	1,218,089	1,279,075
Total production	$3,639,232.03	$4,303,977.57	$4,526,942.04
Average per ton	$3.890	$3.533	$3.539
Dividends paid	$1,260,000.00	$1,260,000.00	$ 819,000.00
Property purchased	114,075.64	302,451.95	5,167.76
Ellison Shaft	13,834.86	21,753.12	205,869.76
Mine Labor	1,226,143.27	1,463,626.47	1,548,447.07
Taxes	53,944.95	59,506.00	67,530.59
Water	52,891.86	379,878.58	96,099.44
Interest	23,993.42	25,539.20	31,139.56
Indebtedness	1,038,327.49	510,406.66	425,784.97

The company's indebtedness has been reduced since 1901 by the proceeds of $1,000,000.00 from sale of the Black Hills & Fort Pierre R. R. Co. and the increased earnings of the operation and reduction in dividends.

Pennington County.

(Special Corrospondence).—Work has been resumed in the Gopher mine, near Hill City, after being closed down several years on account of reported loss of the veins. The Lona shaft, 110 feet deep, and the Gopher shaft, 175 feet deep, have been unwatered and several crosscuts will be driven at the lowest levels to cut the veins. The mine is equipped with buildings, hoists, air compressor and drills. A. H. Elftman is consulting engineer, with A. D. Arundel superintendent at the mine.

Hill City, Oct. 26.

The Central Black Hills C. Co. is preparing to put its leaching plant in operation. It is in the copper belt in the southern part of Pennington county, 12 miles northwest of Custer City. The plant has a capacity of 100 tons a day, using sulphuric acid lixiviation process, and precipitating copper on scrap iron.

E. C. Johnson, manager of the Gertie Tin M. Co., operating near Hill City, says his company proposes to build a tin mill at the mine. The mine is developed by an incline shaft 500 feet deep, in which the vein has been explored to the bottom. It carries a good percentage of tin and is 8 feet wide. A test of the ore is being made in the Golden Slipper mill. The plant is a stamp, amalgamating affair, equipped with concentrators, but the tin ore pulp from the stamps is run direct to the concentrators.

UTAH.

Beaver County.

Work has been resumed on the Lenora mine in Elephant canyon, near Milford, owned by Burns et al, and high grade ore is being shipped. F. Killam is superintendent.

Juab County.

Work has been resumed on the Manhattan mine, at Mammoth, and the shaft will be sunk an additional lift.

Manager C. E. Allen of the Centennial-Eureka mine, at Eureka, says they succeeded in hulkheading the drifts leading to the Bullion-Beck and Eureka Hill workings—shutting off the gas and smoke from the fire that has been burning there since the 5th inst. Work has been resumed in the Centennial-Eureka and shipments are again going out. The bodies of seven mules which were suffocated were found and removed. The mine is now accessible down to the 1400-foot level. Superintendent Earls says he is forcing his way toward the fire region slowly at the Bullion-Beck and on the 24th inst. reached within 200 feet of the Caroline stope with the air line. He expects to turn a stream of water into the Caroline. Smoke still continues to emerge from the Eureka Hill shaft in dense volumes.——During the temporary shut-down at the Gemini, Superintendent Jackson is having the new boilers set up and a general clean-up made.

Salt Lake County.

The New Eugland G. & C. M. Co. will build a mill at the Nast mine, near Bingham, to handle their low-grade ore, says Manager Adkinson. Framing, foundation and other preliminary work will be done this fall and wintor, so that machinery can be put in place on its delivery in the spring. The Nast has milling ore in both new and old workings, some of it accumulations of twenty years, says the Bingham Bulletin, and is in the way of further developments. The mill will have fifty tons daily capacity.

Tho directors of the Utah Con. C. Co., operating the Highland Boy mines at Bingham and the smeltor in the valley, have authorized expenditure of $250,000 on enlargements at the smelter, which will add 40% to its present capacity. They expect within six months to bo turning out copper at rate of 20,000,000 pounds per annum. The elevation of the main stack at tho smelter to heigbt of 350 feet (50 feet above the former top), is in progress, says Superintendent Fischer. D. O. Jackling of Colorado Springs, Colo., is manager.

The Dalton & Lark tunnel at Bingham has unwatered the Dalton shaft.

At tho Columbia mines, at Bingham, five machine drills have been put in operation, being supplied with air from the United States Co.'s compressor. Tho hoist has been set up at tho winze below tho main tunnel and in the All's Well vein, and the winze will bo sunk to depth of 200 feet. At depth of 80 feet tbe winze is in ore that averages 10% copper, says Manager Tibbitts.

A series of twenty-seven locations were filed at Salt Lake City last week, covering 5000 acres of oil lands on the edge Great Salt Lake, by C. K. & L. J. Rowland, P. S. & N. F. Keogh, J. A. Kuykendall, T. J. Anderson and J. F. & M. E. Hinton. Tho tract is situatod botweeen the city and the lake, beginning west of Beck's hot springs and running toward Saltair. Drilling rigs will be put up and the oil indications developed.

The Bingham Bulletin says the Fortune mine, together with its ore dumps, is under lease to tho Bingham Con. C. Co., and a track connecting its main tunnel with the Dalton & Lark Electric tramway is being huilt.

Summit County.

C. E. Myers has put men to work in the East Valeo mine near Park City, and work will he done on the contact. The shaft is down 150 feet and a crosscut 200 feet run from this point.

Superintendent Sherman of tho Daly-West mill at Park City says the management will enlarge the plant, and he has hegun grading for an auxiliary one with which to recover the metals that have passed away with the slimes. This will increase the capacity of the concentrator to 300 tons daily, or 75 tons more than it is now reducing. Of the mass of tailings that have collected in the ponds and to which is heing added a large amount daily, he will be equipped, independent of the main plant, to handle 250 tons daily. The concentrator is recovering 97% of the lead contents of the ore and a satisfactory percentage of the silver, says Sherman. But, carried away in the slimes, is sufficient to enable the management, with a slimes plant, to create a product containing from 8% to 10% lead, 45 to 50 ounces silver and some gold, with an iron excess. In addition to these improvements, a set of storage hins will he built and an automatic sorting belt put in.

Tooele County.

Superintendent E. J. Raddatz of the Honerine mine at Stockton says water is coming out of the drain tunnel at the rate of 5000 gallons per minute, 3000 of which is coming through the face where the men ceased work when the water channel was hroken into. Little can be done in the tunnel until the volume decreases. The nearest shaft is that of the Black Diamond Co., which will be the first unwatered. The nearest Honerine shaft is 1800 feet away. Before starting the drain tunnel the Honerine Co. operated pumps, which hoisted water out of the mine at the rate of 3000 gallons per minute.

WASHINGTON.

Ferry County.

Considerable development work is being done in Park City district, on the south half of Colville reservation, south of Republic, says the Spokesman-Review. The Montana and Iron Mountain claims, owned by J. Stack of Repuhlic, E. Dill and F. Birney of Spokane, have a 12-foot vein that runs $6 per ton in gold and silver. It has been developed by an open cut, two 10-foot shafts and a tunnel. The vein is an extension of the Mountain View group and is between the Park and Central mine and Park City. R. Parcell and H. Crounce have a year's lease of the Mountain Boy and are getting out silver-lead ore to ship to the smelters. Q. R. Reisser and W. J. Casey are working the Cliff group, which adjoins the Mountain Boy. Superintendent D. Coughlan has five men working on the Ramore group and getting out gold-silver-copper ore. Coughlan, who is part owner in the Wasco group, has arranged to continue driving the tunnel, which has cut three veins of ore. Balthus & Sharp are at work on the Galena King group driving a tunnel, which is in 260 feet.

Okanogan County.

Superintendent H. Thompson of the Interstate M. Co. reports a find of lead ore on their Delate mine at Chesaw, showing 20% lead, with values in gold and silver. Superintendent Thompson has men at work at the concentrating plant owned by the company 2 miles south of Chesaw. The mill will bo remodeled and a water flume built.

Snohomish County.

Tin is reported found in the Cascade Range, near Snohomish, by J. J. Minnis, while working placer ground.

WYOMING.

Carbon County.

G. Smith and A. LaMarsh of Dillou report finding a deposit of jet near there.

A hurricane passing through southern Wyoming last week is reported to have done considerable damage to the 16-mile aerial tramway of the North American C. Co., from their mines at Rudefeha to their smelter at Grand Encampment.

Converse County.

A gas discovery is reported in Brenning Basin, 11 miles west of Douglas. Tho flow was struck at depth of 475 feet, and it forced the heavy drill out of the well and threw gravel and dirt over the top of the derrick. The well has been cased and capped. It is proposed to pipe the gas to Douglas, Caspar and Glon Rock.

At the Oriole and Tenderfoot mines, near Douglas, owned by the Oriole C. M. Co., of which C. D. Clark is president, development work is progressing and sulphide ores are being opened up with depth. There are four lode claims with a millsite in the Oriole group, and an abundance of timher within half a mile, says the News. They are equipped with machinery which has capacity for hoisting from 600 feet. The main shaft is down 155 feet, and at 145 feet passed into a vein of carbonates 3½ feet in width, and running well in copper. The discovery shaft, 300 feet south of the main shaft, is 76 feet in depth, with a 50-foot crosscut. The Tenderfoot group comprises six lode claims on which machinery with a depth capacity of 700 feet is being set up. The shaft is 90 feet in depth and in ore showing 4½% copper. One factor in the future development of the Oriole and Tenderfoot will be the natural gas which has been struck nearby. In one well the gas registers a pressure of 500 pounds and will be used as fuel for milling and smelting purposes.

Laramie County.

The Copper Belt M. Co., in which Omaha, Neh., and Black Hills, S. D., men are interested, is preparing to increase development work on its copper mines at Rawhide Buttes. They will build a 40-ton matte smelter. The Copper Belt Co. owns thirty-five claims adjacent to the forty claims of the Sunrise C. Co., owned by A. A. Spaugh et al. of Manville. They will sink two 300-foot shafts and drive a tunnel.

FOREIGN.

AUSTRALIA.

New South Wales.

The New South Wales gold output for month of September was 60,613 ounces, valued at £219,374, making the yield for 1903 to Oct. 1, 237,054 ounces, valued at £866,461.

Victoria.

The gold yield of Victoria for 1903 to Oct. 1 amounted to 587,058 ounces, an increase of 24,951 ounces over same period of 1902.

Western Australia.

Searching for the deepest of the two telluride shoots cut by the diamond drill is under way at the 1050-foot level of the Associated Northern mine, near Kalgoorlie. Under Superintendent Roberts prospecting work is being done in other parts of the property. The ore treatment plan is ready for operation.

Diamond drilling of the leases held by the Hannans Reward Mt. Charlotte Co., at Kalgoorlie, has been started to test these properties in deep ground. This work is being subsidized by the Government and 1500 feet of horing will be done.

The Great Boulder main lode is being further prospected in depth hy diamond drilling from the 1000-foot level of Laue's shaft at Kalgoorlie. The first bore is being put in a northerly direction to determine if the Great Boulder and Horseshoe lodes join at depth in the south end of the former.

BRITISH COLUMBIA.

East Kootenay District.

The Gold River M. & P. Co. will put in a sawmill to cut lumber for a flume at Bull river, near Fort Steele.

Slocan District.

An aerial tram is being built to connect the No. 4 tunnel with the main line on the Ivanhoe mine, near Sandon.

During month of September the Arlington mine at Erie shipped five carloads of ore to the smelter. The net smelter returns were $5341.95, says the News-Advertiser. The expenses were $4322.02 for the month.

From January 1 to October 3, 1903, shipments from the district have been as follows:

	Tons.
American Boy, at Sandon	666
Antoine, McGuigan	212
Arlington, Slocan Lake	40
Bosun, Slocan Lake	975
Blue Bird, Sandon	37
Enterprise, Slocan Lake	615
Fisher Maiden, Slocan Lake	280
Hartney, Slocan Lake	42
Idaho, Sandon	81
Ivanhoe, Sandon	695
Lucky Jim	103
Mercury	41
Monitor, Sandon	640
Meteor	52
Ottawa, Slocan Lake	126
Payne, Sandon	1,778
Queen Bess, Sandon	204
Rambler, McGuigan	1,448
Reco, Sandon	153
Republic	70
Ruth, Sandon	417
Red Fox, McGuigan	119
Slocan Star, Sandon	1,975
Silver Glance, McGuigan	55
Eleven others, a total of	122
Total	10,946

Vancouver Island.

The mule drivers at the coal mines at Extension returned to work last week, their differences with the colliery company having been adjusted.

The fire in the coal mines at Cumberland is still burning, says tho Rossland Miner of last week. A crosscut is being driven to gain access to the seat of the combustion. J. Dunsmuir, owner, and Superintendent Little are at Cumberland supervising the fire-checking operations.

Yale District.

A 300-ton smelter will be built 3 miles below Kamloops, on the Thompson river, says Manager W. E. Wood. It will be so constructed that its capacity can be increased to 500 tons a day whenever required. New York and Montreal men are interested. The company owns copper-gold claims on Coal hill, back of Kamloops. The ore is mostly low grade. The Python mine is in position to supply 100 tons a day and, besides other Coal hill properties, the smelter will draw on Adams Lake and Cherry Creek camps. Placer mining is also going on in that section, as well as dredging. At Tranquille creek an average of forty ounces of gold per week are taken out with a dredger.

MEXICO.

Tho Boletin de Estadistica Fiscal, issued by the Mexican Treasury Department, gives the following statement of Mexico's gold and silver production during the twenty-five fiscal years from 1877–78 to 1901–2, inclusive:

Year.	Gold.	Silver.
1877–78	$ 746,630	$24,836,903
1878–79	881,301	25,135,264
1879–80	941,958	27,555,627
1880–81	1,012,697	29,234,398
1881–82	936,223	29,239,078
1882–83	955,539	29,568,577
1883–84	1,055,184	31,695,841
1884–85	914,179	33,226,211
1885–86	658,020	34,208,214
1886–87	683,153	37,584,104
1887–88	664,365	39,867,983
1888–89	684,480	41,347,626
1889–90	700,909	39,156 687
1890–91	920,702	41,874,411
1891–92	1,074,637	47,096,156
1892–93	1,269,907	55,245,434
1893–94	1,244,621	58,210,150
1894–95	4,744,542	58,204,085
1895–96	6,085,038	61,003,672
1896–97	6,861,126	63,689,112
1897–98	7,584,182	70,149,606
1898–99	9,846,541	72,498,723
1899–1900	7,823,701	70,218,914
1900–1901	9,327,542	74,326,406
1901–1902	9,982,676	72,530,983

The value of the gold is calculated at the rate of $675.416 per kilogram and of silver at $40.915 per kilogram. From these figures it is seen that the depreciation of silver in foreign markets has not prevented an increase in the silver production of Mexico, and has been an impulse to gold production.

Chihuahua.

G. W. Boyce reports work progressing on Shamrock No. 1, Shamrock No. 2 and Burnham mines in Terrazas camp and the Senorita mine at Victorino. He will start work next week on the Cruger, near Bustillos, the Josephina, near Cusihuiriachic, and on the La Cabrisa copper mine, over

the line in Sonora, says the Chihuahua Enterprise.

R. D. Jackson, manager of the Buena Tierra and other mines at Santa Eulalia, has started diamond drill work. Another drill will also be put in operation.

Jalisco.

R. Eames, Jr., manager of La Fortuna M. Co. of New York, is pushing development work on the company's property near Ahualuco. Over 2000 feet of work has been done. Two tunnels are being driven, one of which is in 1095 feet and the other 530 feet. Ore is being blocked out and 1000 tons are on the dump. A reduction plant will be built.

Lower California.

(Special Correspondence). — Recently some newspapers have published accounts of rich placer gold deposits having been found in the district of San Antonio, the truth of which has been investigated by a reliable man. His purpose in contradicting these reports is to dissuade prospectors and miners from spending money to reach that most inhospitable region, where they are certain to meet with disappointment. The district mentioned is 35 miles southeast of the port of La Paz, on the west coast of the peninsula of Lower California, about midway between the Pacific ocean and the Gulf of California. The existence of shallow gold placers in this region has been known since its earliest settlement, and there are records of their having been worked, off and on, since 1780, but never with any measure of profitable success. The country is extremely dry. There are no streams of running water, and very few springs, and the rainfall of that region is limited, so much so that the land is uncultivated and food for man and beast is imported from the mainland of Mexico. Many forms of mechanical appliances called "dry washers" have been tried in efforts to recover the gold from these placers, but without success. Miners who go to that region in search of easily won gold will not find it.

La Paz, Oct. 15.

The H. Johnson gold placer mines and ditch in the Socorro district, 80 miles southeast of Ensenada, have been sold for $100,000 cash to the Lindley-Stevens Co. of Chicago, Ill. Johnson, after obtaining concession from the Mexican government, built a ditch from the San Pedro Martir range to the placers, a distance of 18 miles. The new owners will increase development work on the placers and make the 18-mile ditch more permanent by use of cement.

At the El Sueno mine, owned by San Diego and National City, Cal., men, they are putting in additional machinery and will increase developments. The mine is 12 miles below the California line. This company has been shipping concentrates, and with the new machinery will increase the output.

Puebla.

I. Cahrera and A. Ziegler are exploiting a copper find which they report located in the Higo mountain, district of Teconcingo, owned by A. Mora, governor of Guerrero. The mine has been named 'Gambrinus."

Sonora.

The Gold Treasure mine in the San Jose mountains, near Altar, will have a mill. The company has been reorganized as the Arizoua M. & Dev. Co., and C. G. Jones is president.

In his report to the stockholders of the Greene Con. C. Co., operating at Cananea, President W. C. Greene shows that during the fiscal year ended July 31st last, there were extracted and treated from the mines of the company 333,329 tons of ore, giving product of 43,228,120 pounds, containing 42,310,554 pounds of pure copper, 397,426 ounces of silver, and 2392 ounces of gold, and having a gross value of $5,706,192. Of this product 12,424,696 pounds of copper were sold between August 1, 1902, and January 31, 1903, realizing $1,454,500. For the seven months beginning January 1, 1903, and ending July 31, there were sold 26,819,974 pounds of copper, realizing $3,592,126. The average selling price of copper for the first period was 11.7 cents per pound. For the latter period the average was 13.39 cents a pound. In addition there were sold 295,845 ounces of silver, realizing $149,153, being an average price per ounce of 50.45 cents. During the samo period there were sold 1650 ounces of gold at $19.80 per ounce, realizing $632,684. There remained on hand unsold on August 1st, 1903, 3,065,874 pounds of copper and 101,581 ounces of silver, which on basis of last salos had value of $477,778.

Zacatecas.

At Chalchihuites, in northern Zacatecas, the Compania Beneficedora Metales de Chalchihuites is building a 25-ton concentrator and a 25-ton smelter. The smelter will ho ready for operation hy Feh. 1st.

——The Chalchihuites M. Co. of Newark, N. J., is developing a group of 192 pertenencias. They have put in a 50 H. P. hoist on their San Nicolas mine and have opened up ore, says President E. H. Jones. They also own two copper claims.

SWEDEN.

United States Consul R. S. Bergh at Gothenhurg writes that a large establishment for electric smelting of zinc ores hy a method invented by G. de Laval, of Stockholm, is heing built at the Hallstahammar Works, in Province of Vestmanland. The method is the same as that employed both at Trollhattan and Norway. The power station is at Hallstahammar Bruk, where the Kolhack creek falls 35 feet. The smelter is expected to he finished hefore Jan. 1st.

PERSONAL.

W. A. BOLEY is now assayer of the Spearfish G. M. & R. Co., Cyanide, S. D.

A. D. ARUNDEL of Hill City, S. D., is superintendent of the Gopher mine, near Hill City.

J. BROOKS is superintendeut of the Dewey mill of the Columhia C. Co., at Bingham, Utah.

J. H. HAMMOND, consulting engineer of Stratton's Independence, Ltd., is in Cripple Creek, Colo.

H. R. OGDEN is superintendent of the Federal Loan mine in Willow Valley, near Nevada City, Cal.

RICHARD ADDOMS is superintendent of the Alpine mine, near Sumpter, Or., vice Rearden, resigned.

L. MCDONALD, a mine owner of French Gulch, Shasta county, Cal., is in San Francisco on husiness.

H. J. MEISEL, assayer and chemist for the Rawhide G. M. Co., near Jamestown, Cal., is in San Francisco, Cal.

H. EDDY has resigned as superintendent of the Federal Loan mine in Willow Valley, near Nevada City, Cal.

W. C. MARSHALL has resigned as manager of the Marshall-Russell M. Co., operating near Georgetown, Colo.

J. C. JENS is in southern Mariposa county, Cal., making a report on a copper property for New York people.

C. R. DOWNS, superintendent Bunker Hill mine, near Amador City, Cal., is in San Francisco, Cal., on business.

H. K. WHEELER has returned to Los Angeles, Cal., from an inspection of Encampment, Wyo., mining property.

F. A. MAXWELL is manager of the Marshall-Russell M. Co. at Georgetown, Colo., vice W. C. Marshall, resigned.

A. H. ELFTMAN of the Wabuse mine, Silverton, Colo., is at Hill City and Deadwood, S. D., on professional husiness.

WEBB SMITH is superintendent of the Kennedy M. Co. at Jackson, Amador county, Cal., vice J. F. Parks, deceased.

R. J. KING has resigned as superintendent of the Esperanza Oil Co. at Coalinga, Cal., and has returned to Hanford, Cal.

F. B. CALDWELL of Woodland, Cal., is in San Francisco, Cal., after an extended visit on mining husiness to Durango, Mexico.

W. E. DEFTY of Phœnix, Ariz., is in Cochise county, Ariz., and will go from there to Sonora, Mexico, to examine mines.

I. J. COLE, manager and superintendent of the Pine Hill mine, near Grass Valley, Cal., has gone East on company husiness.

DUNCAN MCVICHIE, of Salt Lake City, Utah, manager of the Bingham Con. C. Co., Bingham, is in Helena, Mont., on husiness.

W. H. CHILD, manager of the Sheba mine, south of Wells, Nev., has returned to Salt Lake City, Utah, from a trip to the mine.

J. A. VEATCH of Napa, Cal., interested in La Mina Espiritu Santo of Darien, Colombia, is in San Francisco, Cal., on mining husiness.

MANAGER P. PORTER of the Keystone group at Cortez, Lander county, Nev., returned to Salt Lake City, Utah, last week from Nevada.

ALEXANDER HILL, consulting engineer of the Le Roi Two C. Co., has returned to London, England, from their mines at Rossland, B. C.

B. E. BURGER of San Jose, Cal., interested in the Fair Play mine in Nevada county, Cal., is in Nevada City, Cal., on mining husiness.

H. ANDERSON of Bakorsfield, Cal., is superintendent of the Esperanza Oil Co. at Coalinga, Fresno county, Cal., vice R. J. King, resigned.

C. C. WARNER, superintendent of the Copper Glance mine, in Warren district, near Bishee, Ariz., is in Marquette, Mich., on company business.

ALLEN C. MASON of Tacoma, Wash., president of the Big Indian mine near Helena, Mont., was in New York last month on a husiness visit.

W. E. THORNE of San Francisco, Cal., has gone to Oroville, Cal., to collect Butte county mineral specimens for the State Mining Bureau exhihit at the St. Louis Exposition.

JOHN M. BECKWITH of London, England, formerly manager of the Silver King, Ltd., of Calico, Cal., is now exploring in the gold regions of Egypt for an English company.

C. C. MALTMAN, formerly in charge of the gold mines at Thompson, Ga., left San Francisco, Cal., this week for the Sahino M. Co.'s mines at Alamos, Sonora, Mexico, of which he is manager.

W. BROADBRIDGE, who has had charge of the Sons of Gwalia, Ltd., mines at Leonora, Western Australia, has been appointed manager of the Vivieu G. M., Ltd., at Lawless, Western Australia.

W. A. PRITCHARD, formerly superintendent of the Keystone mine, Amador City, Cal., now manager for Bewick, Moring & Co. in West Australia, has been elected a vice-president of the Chamher of Mines of Western Australia, and W. J. Loring, formerly of Angels, Cal., is a member of the executive council.

ALBERT T. DE FOREST, who has heen district manager of the American Steel & Wire Co., Cleveland, Ohio, is in San Francisco, Cal., where he will make his future headquarters in the interest of the company. Mr. De Forest has heen prominent in the company's affairs for several years, having general direction and active management of their mills and business in the Cleveland, Ohio, district.

D. H. JACKSON, president of the Ida Mitchell M. & M. Co., Placerville, Cal., was in New York City last month on a purchasing trip. The Ida Mitchell Co., of which he is the head, was incorporated last spring at Lancaster, Pa., and has among its officers W. W. Apple, G. R. Heisey of Lancaster, R. S. Apple of Hamhurg, Pa., and H. K. Fox and A. A. Jackson of Philadelphia. It is proposed to equip the new plant electrically throughout. The company's Philadelphia offices are in the North American building.

Obituary.

LEVI STAPLES, a pioneer of Utah and a merchant and mining operator in Mackay, Idaho, died at Mackay on the 23rd inst., at the age of 76 years.

GORDON ALLEN, a mining operator of Joplin district, Mo., was shot and killed at the Aylor mine, near Prosperity, Mo., on the 16th inst. in a discussion over litigated properties. Deceased was 32 years of age.

R. E. GOODELL, a pioneer mine operator of Leadville, Colo. died at Denver, Colo., on the 19th inst. Deceased was horn at Pomfret, Conn., in 1827. At age of 15 he was postmaster of Ottawa, Ill. Later, he was elected Secretary of State of Illinois. He enlisted and served through the Mexican War, and at the outhreak of the Civil War was colonel of the Twentieth Illinois Infantry. He is survived hy a widow, four daughters and a son.

J. P. O'BRIEN, pioneer prospector and mining man of Leadville and of Denver, Colo., died at Denver, Colo., on the 21st inst., as result of falling from the eighth floor of the Equitable Building, down the air shaft. Deceased was the discoverer and locator of the O'Sullivan claim at Leadville. He was lately interested in other mining properties, among which were the Bell Mahone group and the Anna Lee group, also in mining properties near Waunita Springs, Gunnison county.

L. DE L. KELLOGG died at Westfield, Mass., on the 24th inst. Deceased was a pioneer miner of Plumas county, Cal., coming to this State in 1852 and engaging in mining at Rich Bar, on the east branch of the north fork of Feather river. Later he went to Trinity and Shasta counties. During the early '60s he owned and worked the surface placer grounds at Round valley, near the present town of Greenville, and, still later, the Kittie mine at Cherokee until 1870. After disposing of his property there, he was employed by Hearst, Haggin, Tevis, et al., to investigate mining properties in Arizona, New Mexico, Utah and Dakota. He hought for them the Father De Smet and Deadwood-Terra mines in the Black Hills, S. D., and was the general superintendent of these for several years. He was 76 years of age.

Commercial Paragraphs.

THE A. Lietz Co., scientific instrument makers, move into new and enlarged quarters, 207 Montgomery St., San Francisco, Cal., Nov. 2.

A COMPANY has been organized to erect and operate the Ferris wheel during the St. Louis Exposition, and the engineering work of the taking down, transportation and erection of the wheel has heen intrusted to Robert W. Hunt & Co. It is estimated that it will involve an outlay of about $125,000. This work will he under the direction of L. V. Rice, who superintended the original erection of the wheel at the Columhian World's Fair, its subsequent taking down and removal and re-erection upon its present site in North Chicago. As this will he the only structure from which the whole Louisiana Exposition can be viewed, and as there will not he any towers or any other high novelties to compete with, it is believed that it will repeat its World's Fair success.

Books Received.

"Electric Railway Economics" is the title of a new volume on this increasingly important subject, by W. C. Gotshall. It deals with the preliminary problems of construction, both in office and field; careful estimates of earnings and expenses; construction; comparison of various systems; power stations; storage hatteries; rolling stock and motors, etc. It also contains many figures and illustrations. Latest Market Reports.

SAN FRANCISCO, Octoher 30, 1903.

METALS.

SILVER.—Per oz., Troy: London, 28d (standard ounce, 925 fine); New York, har silver, 60⅝c, refined (1000 fine): San Francisco, 60⅝c; Mexican dollars, 48@50c San Francisco, 46½c New York.

During the past week silver has fallen a fraction in price, heing quoted to-day at 60⅝. The withdrawal of the Government from the market is evidently making an impression. Still, it is helieved the price will not go below 60 cents, and it may advance again.

COPPER.—New York: Standard, $14.00; Lake, 1 to 3 casks, $14.00; Electrolytic, 1 to 3 casks, $13.75; Casting, 1 to 3 casks, $13.50; San Francisco: $15.00. Mill copper plates, $17.00; bars, 18@24c. London: £54 10s spot per ton.

Copper had taken a slight advance during the week, heing quoted at 13.50 to 14 cents. The foreign market is stated to be in hetter shape than for some time past, with a more active inquiry for copper. A pronounced buying movemont, which had been anticipated, is manifest, with a consequent higher price.
